COTTAGE GROVE D1 AND D2 AREAS
CONSTRUCTION COMPLETION CERTIFICATIONS

- Construction mobilization commenced the week of December 29, 2009. Excavation activities were completed on January 14, 2010, January 25, 2010 and May 14, 2010 for Area D1 South, Area D1 North and Area D2, respectively. Site decommissioning activities were completed in May 2010, and the final site walkthrough occurred on May 24, 2010.
- The limits of removal, as specified in the October 7, 2009 Interim Response Action Plan (IRAP) for the Cottage Grove Site, were all met or exceeded.
- 823 truckloads, equaling 14,089 cubic yards (20,905 tons) of material, were hauled to SKB Landfill in Rosemount, Minnesota.
- 59 truckloads, equaling 940 cubic yards (1,289 tons) of material, were hauled to the EQ Landfill (Wayne Disposal, Inc.) in Belleville, Michigan.
- 11 overpacks were generated from the D1 North Area and disposed in the Cottage Grove incinerator, including 6 overpacks of drum carcasses and 5 overpacks of gas canisters.
- The work was performed with no lost time, injuries, or near misses.

1. INTRODUCTION

On behalf of the 3M Company (3M), Weston Solutions, Inc. (WESTON®) has prepared this Construction Completion Report (CCR) for the Perfluorochemical (PFC) Remediation at the D1 and D2 Areas at the 3M Cottage Grove, Minnesota Site. 3M is submitting this document to the Minnesota Pollution Control Agency (MPCA) in compliance with the May 2007 Settlement Agreement and Consent Order (Agreement) between 3M and the MPCA, the requirements of the approved *Interim Response Action Plan for the D1 and D2 Areas* (IRAP) (WESTON, 2009a) and the requirements of the approved *Remedial Design/Response Action Plan for the Cottage Grove Site* (RD/RA Plan) (WESTON, 2009b). All construction activities were completed in accordance with the IRAP submitted to the MPCA in August 2009, the RD/RA Plan submitted to the MPCA in November 2009 and information provided in this report.

1.1 BACKGROUND

1.1.1 Site History

The 3M Cottage Grove, Minnesota facility, formerly the 3M Chemolite facility, has been in operation since 1947. The facility currently manufactures a range of products, some of which include adhesive products, specialty paper, industrial polymers, abrasives, and reflective road sign materials. The facility also engages in research and development of a proprietary nature.

Since the 1980s, 3M has worked cooperatively with state and local authorities in conducting investigation and remediation programs for various environmental media at the 3M Cottage Grove facility located in Cottage Grove, Minnesota (the Site). More recently, 3M has been involved in assessments of the presence of PFCs in these media.

Three former waste disposal areas at the Site, known as the D1, D2, and D9 Areas, were found to contain PFCs at concentrations greater than the Minnesota Industrial Soil Reference Values (SRVs). The performance of remedial construction activities at the D1 and D2 Areas is the focus of this report. Remedial construction activities are being conducted at the D9 Area at the time of this report and a separate CCR will be prepared for the D9 Area when these activities are completed.

The D1 Area was constructed as a concrete-lined basin and reportedly was used from the mid 1960s to the early 1970s to neutralize hydrofluoric acid (HF) tars with lime. The area was closed, material was removed and the area filled with local soils in the early 1970s.

The D2 Area, located west of and adjacent to the D1 Area, received sludge or dredged material from the wastewater treatment ponds at the east end of the Cottage Grove Site. The area was closed and covered with soil between 1973 and 1975.

The locations of the D1 and D2 Areas are depicted in Figure 1-1.

1.1.2 Perfluorochemical (PFC) Program

Since 2004, 3M has been working with the MPCA to assess the presence and extent of PFCs at the Site. Specifically, field activities were conducted by 3M to assess the presence of PFCs in groundwater, surface water, sediment, and soils as part of a site remedial investigation. On April 7, 2006, 3M submitted the *Fluorochemical (FC) Data Assessment Report* (Data Assessment Report) (WESTON, 2006) to the MPCA. This document contained a summary of the assessment activities, the results of these activities, identification of data needs and recommendations for the future course of action.

3M and the MPCA also entered into a Settlement Agreement and Consent Order (Agreement) with the MPCA for the purpose of conducting remedial investigations and response actions to address PFCs at the Site. The Agreement became effective on May 22, 2007. It required that 3M conduct a Remedial Investigation/Feasibility Study (RI/FS) and prepare a Remedial Design/Response Action (RD/RA) Plan with respect to the release or threatened release of PFCs at and from the Site.

The *Remedial Investigation Report (Phase 2 Fluorochemical (FC) Data Assessment Report)* (RI Report) (WESTON, 2007) was submitted by 3M to MPCA on June 29, 2007. The RI Report, together with the April 2006 Data Assessment Report, met the RI requirements of the Agreement, as stated by MPCA.

On March 13, 2008, 3M submitted the *Feasibility Study for the Cottage Grove Site, Cottage Grove, Minnesota* (FS Report) (WESTON, 2008a) to the MPCA. The FS Report was followed

by Addendum 1 in April 2008 (WESTON, 2008b) and Addendum 2 in January 2009 (WESTON, 2009c), which were prepared and submitted to the MPCA in response to MPCA's requests for more information on the FS alternatives and additional PFC investigation.

FS Addendum No. 1, entitled *Addendum to the Feasibility Studies for the Oakdale, Woodbury, and Cottage Grove Sites, Minnesota* (WESTON, 2008b), was submitted by 3M to the MPCA on April 16, 2008. It was prepared to provide a description of off-site disposal locations reviewed and considered, along with a recommended disposal facility, for soil and sediment excavated from the Oakdale, Woodbury and Cottage Grove Sites under the MPCA-approved soil and sediment response action alternatives. The recommended disposal facility was the SKB Industrial Landfill (SKB) in Rosemount, Minnesota, where a separate, engineered cell would be constructed to contain the excavated PFC-containing materials.

In a letter to 3M dated April 30, 2008, the MPCA provided to 3M conditional approval of the FS Report and FS Addendum No. 1. MPCA indicated its concurrence on the recommended Sitewide Alternative SW-2 and provided specific requirements for the implementation of the institutional controls. The MPCA concurred that an enhanced groundwater recovery system is needed at the Site to control migration of groundwater containing PFCs, and granted approval to proceed with pre-design activities regarding the proposed system in Groundwater Alternative GW-1. The MPCA also recommended that Soil and Sediment Alternative S/S-3 be implemented and indicated that 3M had approval to conduct additional activities to refine the areas of soil and sediment removal.

On January 6, 2009, 3M submitted to the MPCA FS Addendum No. 2, entitled *Feasibility Study Report Addendum No. 2 (Pre-Design Data Report and Alternative Refinement) for Cottage Grove Site, Cottage Grove, Minnesota* (WESTON, 2009a). FS Addendum No. 2 contained a description of the pre-design activities completed in 2008 and the associated results. In addition, FS Addendum No. 2 contained a description of Refined Soil and Sediment Alternative S/S-3 and a justification for the Groundwater Alternative GW-1. In a letter to 3M dated February 19, 2009, the MPCA approved FS Addendum No. 2.

At a meeting with the MPCA on May 7, 2009, it was agreed that it would be possible for 3M to implement components of Refined Alternative S/S-3 that address the D1 and D2 Areas as an

Interim Response Action (IRA) and to submit to the MPCA an Interim Response Action Plan (IRAP). The D1 and D2 Areas were well-defined with respect to identification of soils containing PFCs greater than the Industrial SRVs. Under the IRA, soils containing PFCs greater than the Industrial SRVs in the D1 and D2 Areas would be removed, along with the concrete basin and overlying soils at the D1 Area, and disposed at the SKB Landfill in Rosemount, Minnesota. Implementation of the IRA at the D1 and D2 Areas would allow for the expeditious removal of PFCs from site soils while the Site proceeded through the RD/RA process.

On August 14, 2009, 3M submitted the *Interim Response Action Plan* (IRAP) (WESTON, 2009a) for the excavation and off-site disposal of the PFC-containing soil in the D1 and D2 Areas. The response actions for the D1 and D2 Areas were consistent with the FS-approved Alternative S/S-3. Additionally, 3M prepared the IRAP for the D1 and D2 Areas consistent with the requirements of the RD/RA Plan so that the D1 and D2 Area information would not have to be duplicated in the RD/RA Plan. On October 7, 2009, the MPCA approved the IRAP with comments. Completion of the IRA in accordance with the approved IRAP would constitute the final remedy for the D1 and D2 Areas.

During the timeframe that 3M was working with the MPCA to obtain approval for the D1 and D2 Areas IRA (i.e., from May to October 2009), the Site continued through the RD/RA process. Specifically, on May 20, 2009, the MPCA issued the *Proposed Cleanup Plan for PFCs* (Proposed Plan) (MPCA, 2009a) for the Cottage Grove Site, placed a public notice in the *South Washington County Bulletin*, and held a public meeting on May 27, 2009 to present its recommended alternatives (Sitewide Alternative SW-2, Groundwater Alternative GW-1, and Refined Soil and Sediment Alternative S/S-3). The public was given the opportunity to provide written and oral comments on the proposed remedy.

On August 28, 2009, the MPCA indicated its selection of final response actions in the Minnesota Decision Document (MDD) (MPCA, 2009b) for the Cottage Grove Site. The selected final response actions were a combination of alternatives consistent with those presented in the Proposed Plan and are described as follows:

- Sitewide Alternative SW-2 - Institutional controls, access restriction and groundwater monitoring.

- Groundwater Alternative GW-1 - Enhanced groundwater recovery with treatment prior to discharge.

- Refined Soil and Sediment Alternative S/S-3 – Remove D1 Area concrete basin structure and overlying soils; excavate soil with PFC concentrations that exceed Industrial SRVs at the Eastern Disposal Areas (D1, D2 and D9 Areas) in accordance with the MPCA-approved RD/RA Plan; stabilize the flow channel and remove PFC-containing sediments throughout the East Cove; remove portions of the sandbar at the cove outlet; transport excavated materials to the SKB Landfill in Rosemount, Minnesota; backfill excavations with clean soil, grade for positive drainage, and revegetate; and collect leachate at SKB for treatment at the 3M Cottage Grove facility.

The MPCA also indicated in the MDD that the selected remedy (i.e., disposal at the SKB Landfill) meets the requirements of the Agreement for an isolated, engineered permitted facility to contain the excavated PFC-containing material. 3M submitted to the MPCA the RD/RA Plan on December 1, 2009. The MPCA approved the RD/RA Plan with comments on February 1, 2010.

As presented in the RD/RA Plan, the major elements of the response actions at the Cottage Grove Site consist of the following:

- Excavation and off-site disposal of soils from the D1, D2, and D9 Areas in accordance with Refined Soil and Sediment Alternative S/S-3.

- Excavation and off-site disposal of sediment from the East Cove and sandbar in accordance with Refined Soil and Sediment Alternative S/S-3.

- Implementation of response actions in accordance with Groundwater Alternative GW-1 as well as Sitewide Alternative SW-2.

Due to the length of time required for implementation and completion of the entire RD/RA Plan program, it was agreed between 3M and MPCA that Construction Completion Reports (CCRs) would be prepared for each major response action element when completed. Thus, four CCRs would be submitted to MPCA, one each for: the D1 and D2 Area soils, the D9 Area soils, the East Cove and sandbar sediments, and site groundwater and institutional controls.

The excavation and off-site disposal of soils from the D1 and D2 Areas was performed in winter 2010. Final grading and backfill of disturbed areas was completed in spring 2010. These backfilled areas will be used for staging and stockpile construction for the D-9 and, possibly,

East Cove Removal projects. After those projects are completed, the D1 and D2 Area can be revegetated and/or stabilized. Thus, this CCR provides documentation of the completion of the D1 and D2 Area response action activities under Refined Soil and Sediment Alternative S/S-3.

1.2 REFINED SOIL ALTERNATIVE S/S-3: D1 AND D2 AREAS

With respect to the D1 and D2 Areas, Refined Soil and Sediment Alternative S/S-3 includes removal of the D1 Area concrete basin and overlying soils and excavation of the D1 and D2 Area soils with PFC concentrations that exceed the Industrial SRVs. The PFC soil characterization data for the D1 and D2 Areas are shown in Figures 1-2 and 1-3. It is important to note that SRVs for PFOA and PFOS were revised on June 22, 2009 after FS Addendum No. 2 was submitted to and approved by MPCA. The Industrial SRV for perfluorooctanoic acid (PFOA) was revised from 23 to 13 milligrams per kilogram (mg/kg) (or parts per million [ppm]). The Industrial SRV for perfluorooctane sulfonate (PFOS) was revised from 12 to 14 ppm. As a result of the SRV revisions, the soil analytical data for the D1 and D2 Areas were reviewed. This review indicated that there were no additional areas where PFC concentrations were greater than the SRVs other than those already presented in Addendum 2 to the FS and the subsequent IRAP.

As stated in the FS Report, FS Addendum No.2, and the IRAP, in the D1 Area, soil from 0 to 5 ft bgs would be removed from soil boring location SB D104, where a PFOA concentration greater than the Industrial SRV (14 ppm) was detected. The soil boring is located outside and adjacent to the D1 concrete basin structure. The D1 Area concrete basin structure and overlying soils would also be removed.

As stated in the FS Addendum No. 2 and the IRAP, considering the additional pre-design PFC analytical data collected in June 2008, Soil and Sediment Alternative S/S-3 was refined with respect to removal of soil from the D2 Area as follows. As shown in Figure 1-4, targeted soil removal would be conducted in the central portion of the D2 Area and would encompass the locations of soil borings SB D202, SB D205, SB D206, SB D207, SB D208, and SB D209. In the area of SB D209, the excavation would extend to a depth of 5 ft bgs and in the area of SB D202, SB D205, SB D206, SB D207, and SB D208, the excavation would extend to a depth of 12 ft bgs. This excavation would reduce migration of PFCs from soil into the groundwater and prevent contact with all accessible (0 to 4 ft bgs) and potentially accessible (4 to 12 ft bgs)

surface soil with concentrations greater than the Industrial SRVs. Further excavation to increase mass removal is described below.

Excavation activities for waste removal would be conducted so that the historic sidewalls of the D2 Area continue to remain intact (they were constructed of soil, not waste material) and act as a barrier to possible movement or sloughing of disturbed waste material downgradient to the East Cove or Mississippi River. If feasible, considering sidewall stability and space limitations, excavation would be continued in the area of SB D205 and SB D208 to 15 to 20 ft bgs, and in the area of SB D202, SB D206, and SB D207 to 25 ft bgs. This additional excavation would increase mass removal and reduce migration of PFCs from soils to groundwater. Any remaining PFC mass in the D2 Area that may migrate to groundwater will be captured by the groundwater extraction system to be implemented in accordance with Groundwater Alternative GW-1, which will capture/contain the groundwater beneath the D2 Area.

Based on this information, the Refined Soil and Sediment Alternative S/S-3 includes the following components at the D1 and D2 Areas:

- Remove the D1 Area concrete basin structure and overlying soils.
- Excavate soil that exceeds the PFOA and PFOS Industrial SRVs or a PFOS concentration of 12 ppm. This would include selective removal of the soils in the D1 Area to 5 ft bgs and in the D2 Area between 15 and 25 ft bgs.
- Transport excavated soil and other debris to an existing permitted off-site landfill to provide engineered isolation and containment of PFCs for these materials.
- Backfill the excavation with clean fill and grade the area to facilitate stormwater drainage.

Excavated soils would be transported to the SKB Environmental (SKB) Landfill in Rosemount, Minnesota, subject to the landfill's acceptance criteria. Soil not meeting SKB's permit criteria would be segregated and disposed at a separate and appropriate off-site facility.

1.3 PURPOSE OF THE CONSTRUCTION COMPLETION REPORT

The purpose of this CCR is to document the response actions that have been completed at the D1 and D2 Areas at the Cottage Grove, Minnesota Site. This CCR will be followed by separate

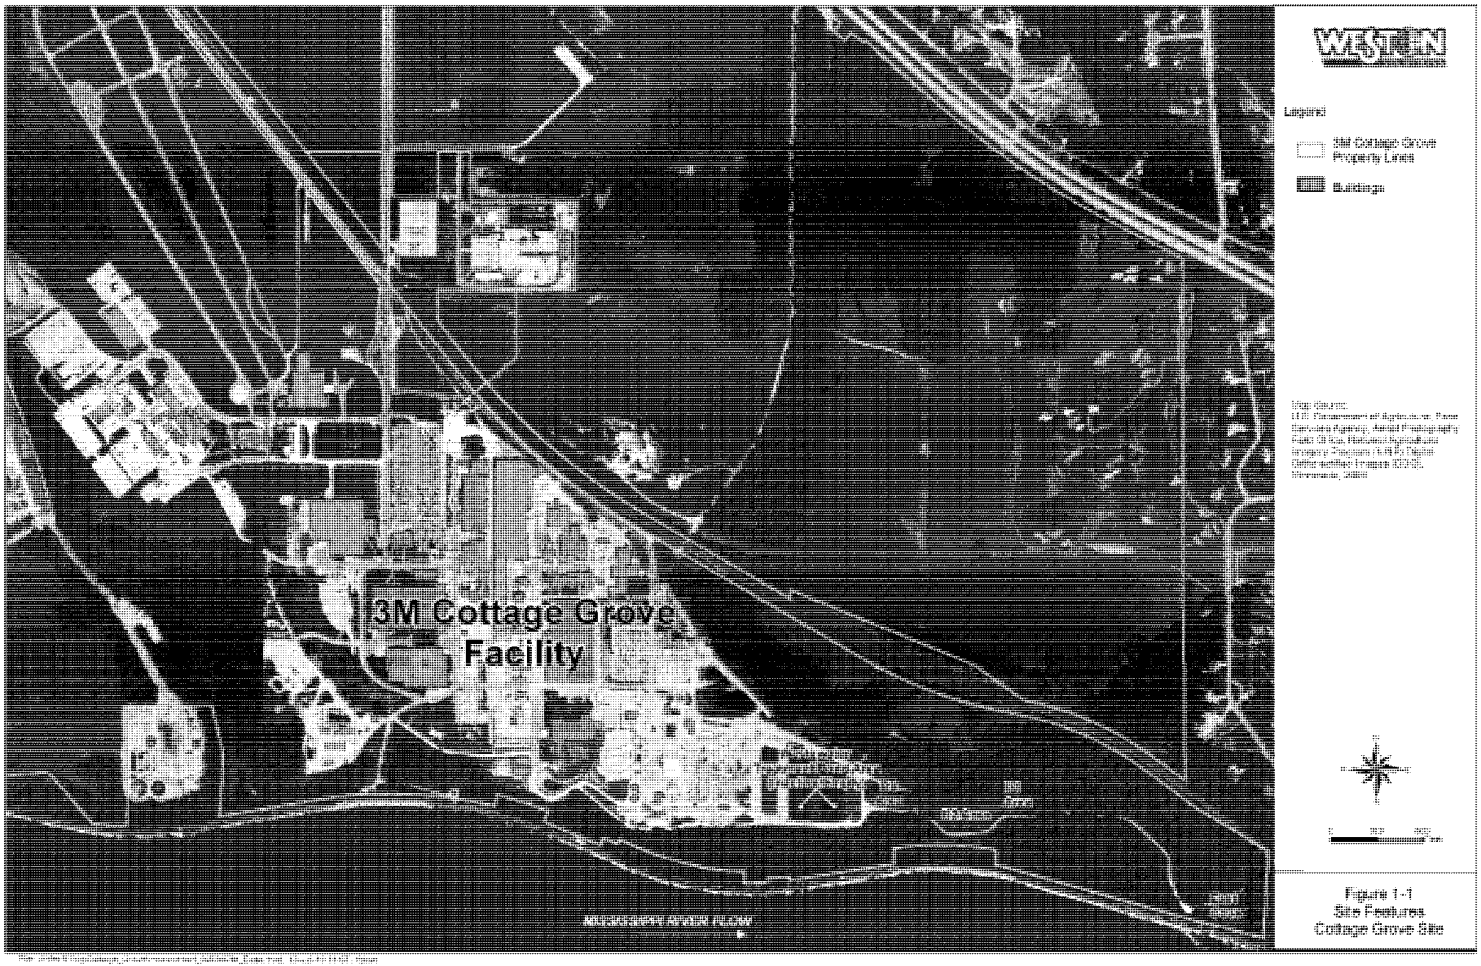

CCRs for response actions at the D9 Area, the East Cove and for groundwater extraction and treatment as they are completed in accordance with the RD/RA Plan.

1.4 RESPONSE ACTION OBJECTIVES

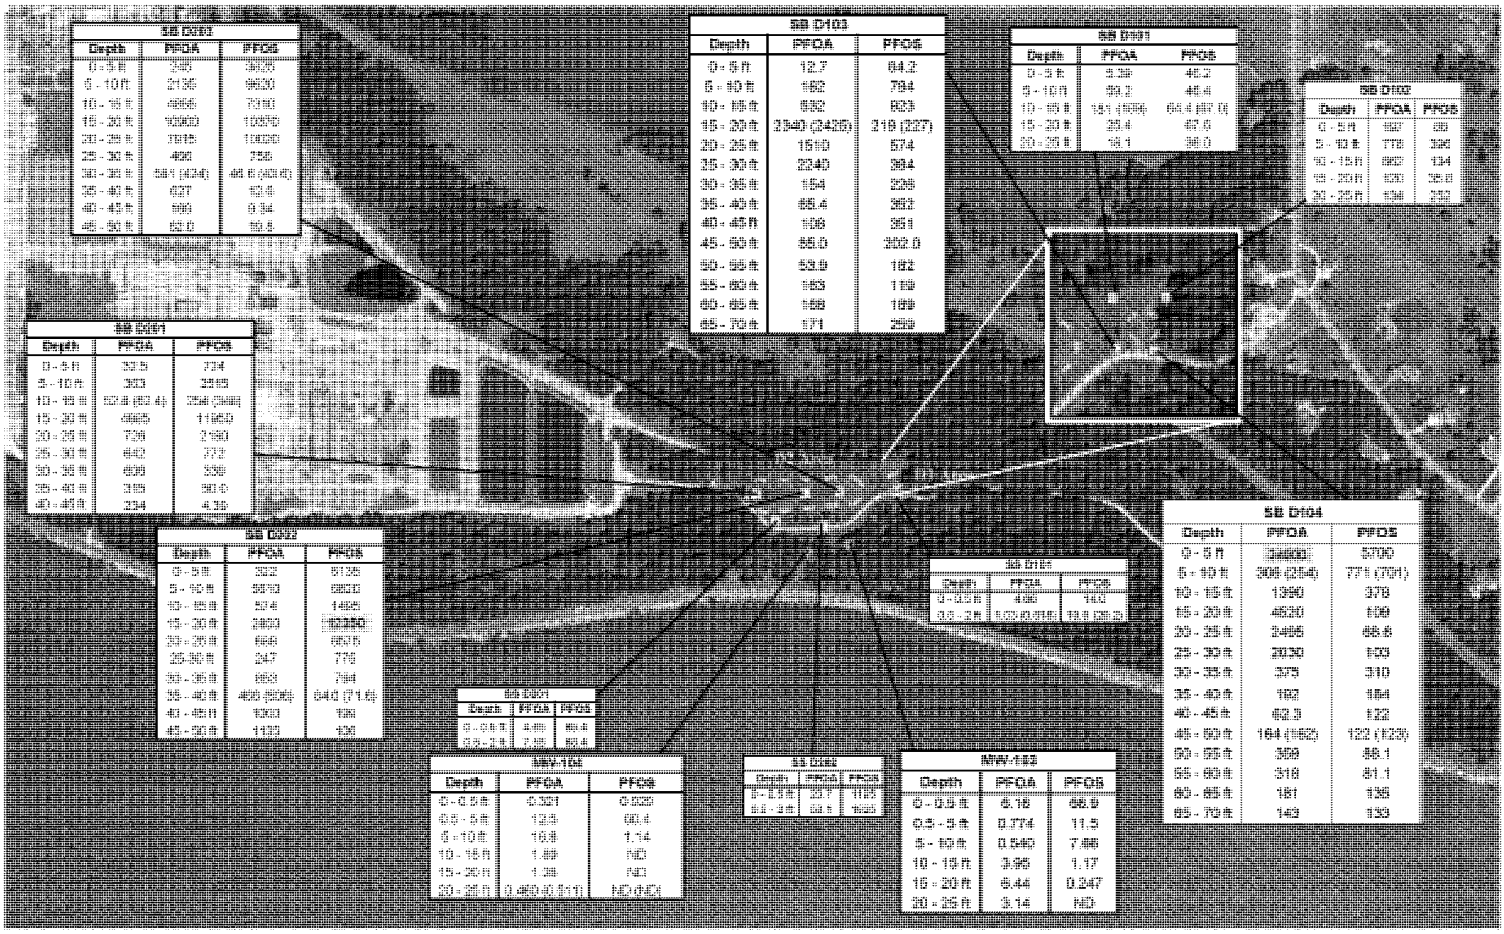

In accordance with the MDD, the objectives of the response actions at the Cottage Grove Site that will be met by the D1 and D2 Area Removal, in addition to the other specified site response actions, include the following:

- To eliminate unacceptable human risk exposure to PFCs in soil.
- To reduce unacceptable human or environmental risk exposure to PFCs in groundwater.
- To control migration of PFC contaminated groundwater to adjacent surface water.
- To reduce unacceptable human or environmental risk exposure to PFCs in surface water.
- To reduce PFC concentrations in sediments.

2. INTERIM RESPONSE ACTION PLAN

2.1 BACKGROUND

Early in the RD/RA process, the D1 and D2 Areas were well-defined with respect to identification of soils containing PFCs greater than the Tier 2 Industrial SRVs. In May 2009, the MPCA agreed with 3M that components of Refined Soil and Sediment Alternative S/S-3, which address the D1 and D2 Areas, could be implemented as an Interim Response Action (IRA). This would allow for the expeditious removal of PFCs from site soils while the Site proceeded through the RD/RA process. The removal would be conducted as an IRA since it would be initiated before the Cottage Grove Site RD/RA Plan submission to the MPCA.

The MPCA requested that 3M prepare an Interim Response Action Plan (IRAP) for the D1 and D2 Areas and in August 2009, 3M submitted the IRAP to the MPCA. It was prepared consistent with the requirements of the Cottage Grove Site RD/RA Plan. As such, information regarding the D1 and D2 Areas would not be repeated in the RD/RA Plan, but the RD/RA Plan would reference the IRAP for D1 and D2 Area design and response activity details. The MPCA approved the IRAP in October 2009.

Subsequently, 3M submitted the RD/RA Plan for the Cottage Grove Site in December 2009, and the MPCA approved the RD/RA Plan in February 2010. Completion of response actions at the D1 and D2 Areas in accordance with the IRAP would constitute the final remedy for these areas and would also result in complying with the Cottage Grove Site RD/RA Plan requirements.

Refined Soil and Sediment Alternative S/S-3 includes excavation of PFC-containing soil from the D1 and D2 Areas as depicted in Figure 1-4 of the IRAP and is summarized in the IRAP as follows:

- Soils will be removed to approximately 5 ft bgs from the area surrounding soil boring location SB D104. This excavation area is designated as D1 South on Figure 1-4.
- The D1 Area concrete basin structure and overlying soils will be removed. Actual horizontal and vertical extent of excavation will be based on visual field determination of reaching and removing the concrete base and sides. This excavation area is designated as D1 North on Figure 1-4.

- In the D2 Area, soils on the east side of the excavation will be removed to a depth of 5 ft bgs and soils on the west side of excavation footprint will be removed to a depth of 20 ft bgs. In the center of the excavation, if feasible, soil will be removed to a depth of 25 ft bgs. Excavation activities for waste removal will be completed so that the historic engineered sidewalls of the D2 Area remain intact and undisturbed and act as a barrier to possible movement or sloughing of disturbed waste material downgradient to the East Cove or Mississippi River.

2.2 SOIL DISPOSAL PROFILE SAMPLING

Considering the history of the site and previous soil analyses, it was expected that soils containing VOCs, as well as PFCs, could be encountered during excavation activities. In accordance with Refined Soil and Sediment Alternative S/S-3, the excavated PFC-containing soils would be disposed at the SKB Landfill in Rosemont, Minnesota. However, the presence of VOCs or PCBs in the soils could potentially prevent their acceptance at SKB. To better assess VOC and PCB concentrations in the soils to be excavated, sampling for non-PFC disposal profile parameters was conducted from soil borings in accordance with the Construction Sampling Plan (CSP) (Attachment 1 to the IRAP). On July 1, 2009, one soil boring was drilled through the D1 South Area and eight soil borings were drilled through the D2 Area. Boring locations are shown in Figure 2-1. Vertical samples were collected from each boring at 5-ft intervals to the final depth of excavation designated for the area. For example, if a boring was located in an area designated to be excavated to a depth of 20 ft bgs, then soil samples were collected from 0-5 ft bgs, 5-10 ft bgs, 10-15 ft bgs, and 15-20 ft bgs intervals. Analytical data from the July 2009 soil disposal profile sampling conducted in the D2 Area were obtained to supplement soil profile data from soil borings installed in November 2008. The soil boring disposal profiling data are provided in Appendix D.

It is important to note that no soil boring sampling for disposal profiling was conducted at the D1 North Area in accordance with the IRAP. All disposal profile sampling for the D1 North Area would be conducted on excavated and stockpiled soils (i.e., ex situ) in accordance with the CSP (Attachment 1 to the IRAP).

Based on the soil boring sampling results, soil blocks were classified as requiring ex situ sampling or as a solid waste. In each soil block classified as requiring ex situ sampling (shown in purple in Figure 2-2), at least one soil sample collected within the block indicated a PCB

concentration greater than 50 ppm or contained certain waste constituents at concentrations greater than their Industrial Tier 2 SRVs. However, none of the soil samples collected within these soil blocks met or exceeded one of the Resource Conservation and Recovery Act (RCRA) characteristic criteria. These soil blocks were excavated and divided into smaller more representative stockpiles (approximately 50 cubic yards) and sampled (ex situ) for further disposal profiling.

For each of the D2 soil blocks classified as solid waste (shown in yellow in Figure 2-2), none of the soil samples collected within the blocks met or exceeded the RCRA characteristic criteria, none indicated a PCB concentration greater than 50 ppm, and none contained waste constituent concentrations greater than the Tier 2 Industrial SRVs.

In a letter dated December 21, 2009, 3M requested from the MPCA a determination as to whether the SKB Landfill would be able to accept such soil classified as solid waste as well as stockpiled soils subjected to ex situ sampling and demonstrated to meet solid waste criteria. MPCA responded to 3M in a letter dated December 21, 2009 with the following comments:

- "The assumption here is that the analytical results presented for each grid are representative of the soil in that grid. If there are indications that it is not, additional samples should be collected."
- "Soils identified by the in situ sampling as being below the Industrial SRVs, below 50 ppm PCB, and showing no characteristics of a hazardous waste can be managed as a non-hazardous waste and disposed at the SKB Landfill as approved by SKB."
- "Soil to be stockpiled should be stockpiled in the area of contamination (AOC) prior to ex-situ sampling and managed in a way to prevent further release."
- "For the stockpiled soil, all stockpiles that exceed 50 ppm PCB based on ex-situ sampling should be managed as hazardous waste."
- "Stockpiled soil may be treated in the AOC to lower VOC concentrations below the Industrial SRV or to remove the hazardous waste characteristic. 3M should inform the MPCA how they intend to treat the soil if necessary prior to treatment. It is likely that excavation and stockpiling of soil will decrease VOC levels in most cases. If ex-situ sampling results indicate the stockpiled soil is below the Industrial SRVs, is no longer characteristic, and contains less than 50 ppm PCB, the soil may be managed as a non-hazardous waste if disposed at the SKB Landfill as approved by SKB."

In further correspondence between 3M and MPCA by email on February 17, 2010, 3M requested clarification on making waste determinations for the 3M PFC sites. 3M stated its understanding of the determinations as follows:

1. MPCA typically encounters commingled waste sites involving multiple parties where it is hard to identify any specific party or waste stream that was disposed. In those scenarios, MPCA requires that all waste codes and related constituents be considered and compared to the SRVs unless site-specific knowledge is available that would suggest limiting those codes.

2. At a 3M only site, reasonable knowledge should be used to determine the types of wastes disposed and if applicable coded constituents need to be evaluated against SRVs.

3. In either scenario 1 or 2 above, only those compounds identified under an applicable waste code need to be evaluated against SRVs. If all applicable compounds are less than the industrial SRV, then the material is non-hazardous and can be disposed at SKB. If any applicable compound is greater than an SRV, then an applicable waste code must be applied and the material disposed as hazardous waste at a permitted facility.

4. Evaluation of D-listed [RCRA toxicity characteristic] criteria needs to be considered regardless of the site-specific knowledge.

Material containing PCBs greater than 50 ppm would still need to be managed at a TSCA-approved facility.

MPCA responded that 3M was essentially correct, but expanded on item 3 and stated that "MPCA may also take into account the presence of hazardous constituents that may be the result of the release of a listed waste, but not specifically identified in the listing, such as the potential for vinyl chloride to come from the release of F001 or F002 waste. Also MPCA allows for the treatment of soil contaminated with a listed waste on site in the area of contamination to below the ISRV [Industrial Soil Reference Value] in an effort to keep the soil from being considered a hazardous waste."

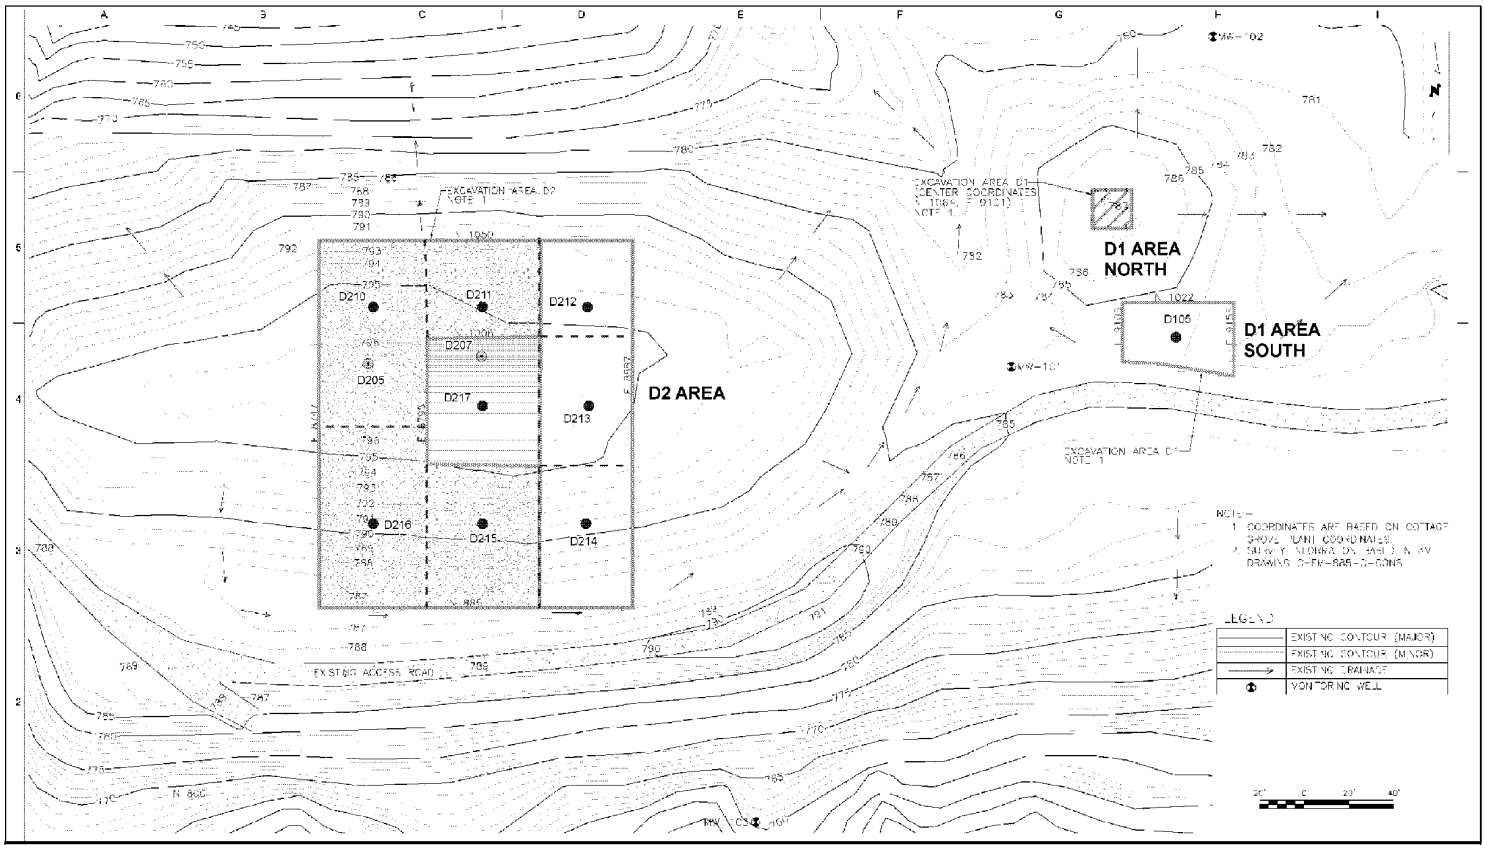

With this clarification, 3M reviewed the history of the D1 and D2 Areas. It is important to note that no party other than 3M disposed of waste on its Cottage Grove facility property, and this includes the D1 and D2 Areas. Further, 3M indicates that no known listed wastes were disposed

in these areas. Accordingly, comparison to Industrial SRVs would not apply to these areas, but evaluation for RCRA characteristic criteria and PCB concentrations would apply.

Soil boring data for soil blocks L2-1 and L3-2 indicated that only one compound, xylene, exceeded the Industrial SRV. Soil boring data for soil block L5-4 indicated that only three compounds (benzene, xylene, and toluene) exceeded the Industrial SRVs. However, since there was no known disposal of listed waste in the D2 Area, the SRVs were determined to be not applicable. None of the data from these blocks indicated an exceedance of RCRA characteristic criteria or PCBs greater than 50 ppm. Therefore, the blocks could be classified as non-hazardous solid waste and direct-loaded for disposal at the SKB industrial landfill. As such, the soil block figure was revised for soil blocks L2-1, L3-2, and L5-4 to remove ex situ sampling and classify this soil as solid waste for direct load to SKB. Figure 2-3 is the revised soil block figure for the D2 Area.

The performance of construction and excavation activities for the D1 and D2 Areas is described in Section 3. These activities were conducted in accordance with the MPCA-approved IRAP.

3. CONSTRUCTION COMPLETION

The following sections contain a summary of the activities that were conducted to implement the components of Refined Soil Alternative S/S-3 for the Cottage Grove Site D1 and D2 Areas as presented in the MDD, the MPCA-approved IRAP and the MPCA-approved RD/RA Plan. The numbered photographs referenced throughout the text of this CCR can be found in the photograph log provided in Appendix A.

3.1 CONSTRUCTION CHRONOLOGY

Excavation of the D1 and D2 Areas at the Cottage Grove Site commenced in December 2009. A timeline of preconstruction and construction activities is as follows:

- October 7, 2009 – Approval of the IRAP by MPCA.
- December 1, 2009 – Submission of RD/RA Plan to MPCA.
- December 9, 2009 – Site Preparation.
- December 29, 2009 – Construction activities begin in the D1 Area.
- January 14, 2010 – Backfilling of the D1 South (D1S) Area.
- January 20, 2010 – Construction activities begin in the D2 Area.
- January 21, 2010 to January 25, 2010 – Backfilling of the D1 North (D1N) Area.
- February 1, 2010 – Approval of the RD/RA Plan by the MPCA.
- April 22, 2010 to May 6, 2010 – Decommissioning activities.
- April 28, 2010 to May 14, 2010 – Backfilling of the D2 Area.
- May 24, 2010 – Final site walkthrough.

In October 2009, 3M conducted procurement activities and selected a contractor, Carl Bolander and Sons, Inc. (Bolander), to conduct soil excavation and removal followed by backfill and restoration. As indicated in the IRAP and RD/RA Plan, WESTON performed on-site construction and environmental oversight, sampling, survey control and verification, perimeter monitoring activities and documentation.

Site preparation activities were conducted by Bolander in December 2009 and consisted of clearing the excavation areas, placement of the construction trailers and sanitary facilities, set up of exclusion zones, installation of sediment and erosion controls, installation of stockpile staging and load-out areas, and improvement of the existing access road. WESTON and their subcontractor, TKDA (a Minnesota licensed surveyor), set up survey control and delineated excavation areas. The meteorological monitoring station was installed by WESTON on-site on January 5, 2010.

Additionally, WESTON and TKDA performed all of the verification and certification surveying for delineation of areas and limits of excavation. The contractor performed operational surveying for their crews and operators.

3.1.1 D1 Area

The D1 Area was comprised of two sub areas. The D1 South Area consisted of shallow soils with a PFOA concentration greater than the Industrial SRV. The D1 North Area was the location of a small concrete basin which reportedly had been used for neutralizing acid tars.

3.1.1.1 D1 Area - South

Construction activities in the D1 South Area excavation commenced the week of December 28, 2009. After surveying and delineating the limits of excavation, soils in the D1 South Area were excavated to 5 ft bgs, to remove PFC-containing material, and direct loaded for disposal at the SKB Landfill. As-built survey verification shots were measured by WESTON after the excavation.

Hauling soil off-site for disposal began on December 29, 2009. Removal of PFC-containing materials from the D1 South Area was completed and verified on December 30, 2009. The final as-built survey of the excavation limits was completed on January 4, 2010. Backfilling of the D1 South Area by Bolander took place on January 14, 2010.

3.1.1.2 D1 Area - North

The D1 North Area consisted of a small concrete basin which reportedly had been used for neutralization of acidic material. During the PFC characterization activities, one boring was constructed into the pit and encountered acidic material but a sample was not collected. The plan provided in the IRAP includes removal of the pit structure, contents and overlying material.

Construction activities in the D1 North Area excavation commenced the week of January 4, 2010 after WESTON surveyed and delineated the limits of excavation. Removal and stockpiling of PFC-containing materials from the D1 North Area commenced on January 6, 2010 with the excavation of the 0 to 4 ft bgs soil interval. The excavation continued below 4 ft bgs, but due to the low pH of the waste materials in the soil, lime kiln dust (LKD) was added for neutralization purposes. Photographs 1 to 3, provided in Appendix A, depict the LKD addition process. LKD, selected by Bolander and approved 3M, was the admixture material used throughout the excavation activities. Project specifications stated that the contractor could use an admixture to meet paint filter test requirements, to improve slope stability and sludge material strength and for neutralization purposes in D1N. A Material Safety Data Sheet (MSDS) was submitted for the LKD as part of the approval documentation.

During the excavation of the D1 North basin, LKD was added as a precaution to neutralize any remaining acidic tar material. Admixing and neutralization of this material was used to improve material handling and manage the health and safety issues associated with sampling and excavation of acidic material. After admixing, the material was stockpiled for disposal profiling.

All soils excavated from the D1 North Area were stockpiled for ex situ sampling because no in situ sampling for disposal profiling had been performed in this D1 North Area. In accordance with the IRAP and RD/RA Plan, excavation activities were to continue until the bottom of the concrete basin at the base of the D1 North Area was encountered and removed. It had been estimated that the depth of the pit was approximately 11 ft bgs. However, after the removal of the concrete basin, an asphaltic type of liner mat was encountered just below the bottom of the pit. The presence and purpose of this asphaltic mat was not known and 3M decided to remove this material. The matting extended laterally beyond the limits of the concrete pit. Some waste residue tar materials, canisters and drum carcasses were found above the matting. All of this

material was excavated and removed. Soils below the matting were not stained and visually were not impacted. The D1 North Area excavation was completed with the excavation of this asphalt mat liner. Photographs 4 to 5, provided in Appendix A, show this asphaltic mat liner discovered below the concrete basin.

Verification shots were recorded by WESTON after the D1 North Area was excavated, with the excavation completion survey performed on January 19, 2010. Backfilling of the D1 North Area excavation began on January 21, 2010 and was completed on January 25, 2010.

3.1.2 D2 Area

The D2 Area was an engineered cell for wastewater sludge disposal. Material in the center portion of the cell exceeded Industrial SRVs for PFCs; therefore, only a portion of the cell was to be removed.

The excavation of the D2 Area commenced on January 20, 2010 with the removal of potentially impacted material after WESTON surveyed and delineated the limits of excavation. The potentially impacted material that was excavated from the perimeter of the excavation to form stable side slopes was outside the limits specified for removal. This side slope material would be used for backfill and was stockpiled in two prepared areas within the exclusion zone, to the west of the excavation and to the southeast of the excavation. Removal of PFC-containing materials from the D2 Area commenced on January 20, 2010 with the excavation of soil block D2 1-1 and was completed on April 20, 2010 with the excavation of soil block D2 5-4. Hauling of all excavated material was completed on April 22, 2010 with the final stockpiled material from D2 4-2 and D2 4-5 hauled to SKB. Survey verification shots were recorded by WESTON after each soil block was excavated and after the final soil block removal on April 20, 2010.

As documented in the IRAP, the D2 cell was an engineered earthen structure. The design plans had been located by 3M and were used to define the removal boundaries. Because of the steep natural topography at the site and limited work area, the northern and southern cell berms would form the limits of removal. The original earthen cell berms on the north and south sides of the D2 Area were found in the field during construction and formed the limits of removal. In accordance with project specifications and the IRAP, the soil blocks adjacent to the engineered

clay berms were adjusted so the limits of excavation on both the north and south sides followed the existing berms. Photographs 6 to 8, provided in Appendix A, show the completed D2 Area excavation and the clay berms from the original cell construction.

The IRAP included a "decision tree" procedure to be used in the D2 Area for excavation into soft or potentially unstable soil conditions. Based on field conditions, the procedure would be followed as a basis for decision making on improving side slope stability and determining the depth of excavation. Admixture material (i.e., LKD) could be used as one option for improving the stability of excavation side slopes if it was determined to be necessary. During the course of the D2 Area excavation, it was not necessary to implement the "decision tree" process. LKD was added periodically by the contractor to the excavation material in the D2 Area to improve material handling and compaction.

Backfilling of the D2 Area began on April 28, 2010 and was completed on May 14, 2010. A detailed description of backfilling activities is presented in Section 3.9.

Decommissioning activities were conducted from April 22, 2010 to May 6, 2010 and included break-down and removal of the stockpile staging areas and the stripping and backfilling of the haul traffic areas, within the exclusion zone.

The final site inspection occurred on May 24, 2010. It should be noted that no final grading to surrounding contours, removal of exclusion zone fencing and revegetation or stabilization actions were taken prior to the final site inspection. The D1 and D2 Areas will be utilized during the D9 Area excavation for support, staging and stockpile construction. Therefore, final restoration of the D1 and D2 Areas (i.e., revegetation, stabilization) will be performed after the D9 and East Cove remediation projects are completed. It was decided to perform the construction completion inspection at this time rather than postpone it until after the revegetation/stabilization work is completed. A more detailed discussion of the final site inspection is included in Section 3.9.

3.1.3 Well Abandonment

On April 14, 2010, two monitor wells (MW-106 and MW-107), were abandoned. Although these wells were to be removed during the D9 Area remediation, they were plugged and abandoned at this time because the D9 Area was being used for storage of clean fill material hauled from SKB, which would be used for D2 Area backfill.

American Engineering Testing, Inc., a WESTON subcontractor, performed the well abandonment activities. Approximately twenty feet of well casing was removed from each well and the wells were sealed with bentonite. Photograph 9, provided in Appendix A, shows the well abandonment procedure at MW-106.

3.2 APPROVAL AND PERMITS

The following subsections provide a detailed description of the activities that were completed in the D1 and D2 Areas for removal and off-site disposal of PFC-containing materials in accordance with the MPCA-approved IRAP and RD/RA Plan.

The IRAP was submitted to the MPCA in August 2009 and the MPCA provided approval of the plan with comments in a letter to 3M dated October 7, 2009. Additionally, the RD/RA Plan, which included the IRAP by reference, was submitted to the MPCA in December 2009 and the MPCA provided approval of the plan with comments in a letter to 3M dated February 1, 2010. MPCA approval of the IRAP and the RD/RA Plan constituted approval to conduct the activities described in the Plans. The following permits also were filed and obtained:

- NPDES Construction Stormwater Permit - On December 10, 2009 3M submitted to the MPCA a Permit Modification Form for the existing National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Permit (ID # C00027036). The purpose of this modification was to add the Site excavation contractor, Bolander, on to the existing 3M NPDES permit. A copy of the completed Permit Modification Form and MPCA approval letter is provided in Appendix B.

- Grading Permits – Bolander, on behalf of 3M, submitted to the City of Cottage Grove, an application for grading and site work at the D1 and D2 Excavation Areas. The permit (No.: 2009-02149) was issued on December 4, 2009. A copy of the permit is provided in Appendix B.

- Contractor Construction Documents – Prior to construction activities, Bolander submitted to 3M a HASP, Decontamination Plan, Excavation Plan, and Transportation Plan for review and comment. 3M and WESTON reviewed the plans and provided comments which were then addressed by Bolander.

3.3 SITE PREPARATION

Bolander's site preparation consisted of completing additional clearing, establishing the exclusion zone around the excavation areas, construction of load-out zones, installation of a truck weigh scale, and construction of the stockpile staging areas. These features, as well as the excavation limits and soil block grids, were surveyed as shown in Figures 3-1 through 3-3.

The exclusion zone was delineated with black silt fencing and identifying signs. Additionally, orange construction fencing was added on March 24, 2010 around the D2 excavation area as a wildlife deterrent. Photographs 10 and 11, provided in Appendix A, show the established exclusion zone and wildlife deterrent fencing. The exclusion zone encompassed the limits of the excavation, the boundary for movement of excavation equipment, soil stockpile areas for ex situ disposal profile sampling, and potentially impacted material, and soil load-out locations. This ensured that excavation equipment contacting the PFC-containing soil remained in the exclusion zone at all times unless it was decontaminated. Additionally, the exclusion zone marked the boundary to which non-excavation equipment could approach the excavation limits. This prevented the haul trucks and other equipment from coming into contact with PFC-containing soil.

Any personnel entering the exclusion zone were required to wear the appropriate personal protective equipment (PPE) in accordance with the site Health and Safety Plan (HASP). The requirements of the HASP for the general site area included Level D PPE consisting of long pants, safety shoes, safety glasses, a hard hat, hand protection (as necessary), hearing protection (as necessary) and a Class 2 safety vest. Level C was required within the exclusion zone and the contaminant reduction zone. The additional PPE requirements for Level C included chemical-resistant coveralls, chemical-resistant outer boots or boot shoe covers, chemical-resistant gloves, and an air purifying respirator.

Upon preparing to exit the exclusion zone, the proper decontamination procedures were required. A Contamination Reduction Zone (CRZ), which included the area surrounding and inside the

decontamination trailer (Figures 3-1 through Figure 3-3), was set up on-site. Detailed decontamination procedures were outlined in the Decontamination Plan submitted by Bolander to 3M along with their Work Plan. Additional information is included in the WESTON Decontamination Plan, included as an attachment in both the IRAP and the RD/RA Plan.

A load-out zone was built along the exclusion zone fencing next to the haul road. The load-out zone consisted of a ramp within the exclusion zone and a tarp curtain at the edge of the exclusion zone. This allowed trucks, located outside of the exclusion zone, to be loaded using equipment inside the exclusion zone (Photographs 12 to 14, provided in Appendix A). The tarp curtain was stretched across the width of the load-out zone ramp to make a barrier approximately the height of a truck bed. It was installed to prevent spillage of soil being dumped during load out from falling outside the exclusion zone.

As shown in Figures 3-1 through 3-3, the truck weigh scale was installed outside of the exclusion zone and load-out areas. It was installed by Bolander to determine the net weight of soils for each load to be hauled to the EQ Disposal facility in Michigan and to ensure that the trucks were within their legal limit for hauling. Photograph 15 shows the weigh scale.

The stockpile staging areas, used for staging and ex situ sampling of soils for disposal profiling, were constructed by placing 10-mil poly liner on the prepared ground surface and covering the liner with six inches of clean sand. In accordance with project specifications, the liner was placed under the complete footprint of the stockpiled material with liner edges overlapping by at least 12 inches. The purpose of liner was to prevent contact between the excavated PFC-containing soils and the underlying ground surface. Bolander constructed and maintained the staging areas. If a staging area was compromised, showing rips in the 10-mil poly liner or washout of the berm, the staging area was repaired. Photograph 16, provided in Appendix A, shows a newly constructed soil stockpile staging area as well as the beginning stages of the construction of a second stockpile staging area.

Also as part of site preparation activities, a meteorological station ("met station") was installed by WESTON southwest of the D2 Area excavation. Photograph 17, provided in Appendix A, shows the meteorological monitoring station. The location of the met station is included in

Figures 3-1 through 3-3, and a more detailed discussion of the met station is provided in Section 3.7.2.

3.4 SURVEY CONTROL

TKDA, a registered land surveyor in the State of Minnesota, performed survey verification for the excavation activities. TKDA acted as an independent surveyor contracted to WESTON. Prior to the start of excavation activities, TKDA staked the excavation boundaries as well as boundaries of the sloped excavation sidewalls. Throughout the duration of the project, surveying was performed on an as-needed basis to guide the excavation and to confirm when delineated limits of each soil block were reached. Photographs 18 and 19, provided in Appendix A, show the survey procedure.

Copies of the survey documentation produced by TKDA throughout construction activities are provided Appendix C. Additionally, the site operations maps (Figures 3-1 through 3-3) show the locations of the on-site benchmark and survey control points that were used.

3.5 EXCAVATION ACTIVITIES

To conduct excavation activities, Bolander removed individual soil blocks one at a time within the delineated excavation area. This was done by establishing the corners of each soil block using survey coordinates. Lathe survey stakes were labeled and placed in the ground marking the corners of the individual soil blocks as well as the edges of the slopes. Photograph 20, provided in Appendix A, shows the staking of the top of slope in the D1 South Area. Stakes were surveyed and placed in the field to mark the top of slope and the sides of all soil blocks. Bolander dug out each block relying upon the survey markers. It should be noted that no clean soil cover was to be stripped from the D1 and D2 Areas prior to excavation and removal.

Soil material was excavated from the side slopes of the D1 North and D1 South excavations at a 1-1/2:1 slope per the project specifications. This slope material was outside the IRAP specified limits of removal and did not have to go off-site for disposal, but it was impracticable to segregate it from other soils in the D1 Area particularly for the over excavation performed in the D1 North Area. Therefore, this material was combined with the excavated material from the adjacent soil block and stockpiled or direct hauled with the respective soil block material.

The D2 Area slope material that was outside of the IRAP-specified limits of removal was placed in staging areas for potentially impacted material only and used to backfill the D2 Area excavation. No unexpected suspect material/debris was encountered in the D2 Area side slopes. Photographs 21 and 22, provided in Appendix A, show examples of potentially impacted staging material.

The D2 Area soil block figure (Figure 3-4) was referenced to determine the depth for each soil block excavation and whether, based on in situ sampling results and MPCA's waste determination, the soil block could be direct-loaded for off-site disposal (direct load soils) at the SKB Landfill or was required to be stockpiled for ex situ sampling (stockpile soils) in smaller piles for disposal profiling. This methodology was described in detail in the Construction Sampling Plan (CSP) which was approved in the IRAP. Excavation depths for the D1 North and D1 South Areas and where the soils would be sent for off-site disposal were outlined in the IRAP and RD/RA Plan.

3.5.1 Direct Load Soils

"Direct load" refers to those soils that can be excavated and directly loaded out to the SKB Landfill without the need for stockpile and ex situ disposal profile sampling.

On the D2 Area soil block figure (Figure 3-4), yellow colored blocks indicated soil that could be directly loaded onto haul trucks for disposal at the SKB nonhazardous industrial waste landfill in Rosemount, Minnesota. The in situ disposal profile sample results for soils represented by a yellow colored block indicated that none of the samples within the block met the RCRA hazardous characteristic criteria, none contained a PCB concentration greater than 50 ppm, and none contained VOC constituent concentrations greater than the MPCA Industrial SRVs. After being informed that soil blocks (L2-1, L3-2, and L5-4) that exceeded only Industrial SRVs could be sent to the SKB Landfill (see Section 2 for details), the soil block figure that was on display in the field trailer was updated so that these blocks were also yellow in color (for direct load), to avoid confusion.

To reduce the movement of equipment into and out of the excavation limits, Bolander placed each direct load soil block into a single staging stockpile for loadout. The direct load staging

stockpile was constructed within the lined stockpile area. From this staging stockpile, the soil was loaded out into haul trucks. Photograph 23, provided in Appendix A, depicts a large staging stockpile of direct load material placed in close proximity to a load out zone. A description of the soil loading/unloading activities is provided in Section 3.5.3.

The D1 South soil block was the only direct load block from the D1 Area approved by MPCA for disposal at SKB based on the in situ sampling results. As noted, the D1 North Area was not in situ sampled for disposal profiling. Additionally, material from all soil blocks except D2 4-1 and D2 4-5 from the D2 Area was handled for direct load and disposal at the SKB Landfill. A tabular summary of the in situ disposal profile results for these direct load soil blocks is provided in Appendix D.

Documentation was maintained for each truckload of soil leaving the site to track it to its final disposal location. A manifest and a haul truck inspection sheet were prepared by WESTON for every truck prior to the departure of the truck from the Site. For direct load soils, an SKB shipping manifest and a SKB haul truck inspection sheet were used. The SKB shipping manifest, as with all manifests used during this project, was produced by the landfill (assisted by WESTON), signed by a 3M representative (as the waste generator), completed by WESTON personnel, and signed by the transporter. Each SKB manifest consisted of 4 carbon copies, each to be maintained in the respective files of the waste generator (2 copies), transporter and landfill, creating a documentation trail for all excavated wastes from the point of generation through disposal at the landfill. The SKB haul truck inspection form was developed and completed by WESTON personnel. The haul truck inspection sheet was a pre- and post-loading checklist that documented the adherence to hauling procedures as presented in the Soil Transportation Plan, included in the project specifications.

A typical SKB shipping manifest (generator copy) and a typical truck inspection sheet for direct load soils are provided in Figures 3-5 and 3-6, respectively. A complete set of all SKB shipping manifests and truck inspection sheets are maintained by 3M and WESTON in the project files and the shipping manifests are provided in Appendix E.

Each SKB shipping manifest has a unique ID number and the shipping manifest is the primary document used for tracking each truck load of soil. Recorded on the manifest is the soil block

from which the load was excavated and the load number. For example, as shown in Figure 3-5, "D2 3-1" was recorded on SKB shipping manifest #724256 to indicate that the manifest represented the direct load material from excavated Soil Block D2 3-1.

Additionally, a unique "container ID", soil block source, and load number were recorded on the truck inspection sheet for each load. The unique container ID is a combination of the trailer number and the manifest number. For example, as shown in Figure 3-6, the unique container ID was recorded as "130-724256" to indicate that trailer #130 contained the load associated with SKB shipping manifest #724256. Soils that were shipped to the SKB Landfill, such as the direct load soils, were not weighed on-site, but were weighed at the SKB facility. When the weigh ticket for each load was received by Bolander from SKB, the load weight was recorded on the inspection sheet.

The SKB-accepted load summary list provided in Appendix E-1 contains the manifest number for each load accepted at the landfill, as well as the net weight in tons. This list was provided by the SKB Landfill at the conclusion of all trucking activities.

3.5.2 Stockpiled Soils

On the D2 Area soil block figure (Figure 3-4), purple colored blocks indicated that certain soil blocks, based on in situ sampling results and MPCA's waste determination, were required to be stockpiled for ex situ sampling for disposal profiling. The D1 North Area, as presented in the IRAP, was also stockpiled for ex situ sampling. These soils were excavated in accordance with the CSP and placed in approximately 100 cubic yard stockpiles in the lined stockpile staging areas. Each approximately 100 cubic yard stockpile was split into two sub-piles, approximately 50 cubic yards each.

Stockpiles were named by the soil block from which the material originated and then each 100 cubic yard stockpile was numbered in ascending numerical order. Each half of the 100 cubic yard stockpile was denoted with either a "-1" or a "-2". For example stockpile "D2 4-1 001-2" refers to material that originated in soil block D2 4-1 and is the second half of the first 100 cubic yard stockpile removed from that soil block. Photographs 24 to 27, provided in Appendix A, depict the placement of the stockpiles and the nomenclature for the stockpiled material.

The stockpiles were sampled in accordance with the CSP to determine the disposal destination for the particular stockpile or sub-pile. The analyses selected for the ex situ sampling of the stockpile were dependent upon the parameters that exceeded the non-hazardous criteria during the in situ sampling. For example, since all of the in situ samples tested for ignitability and reactivity were found to be negative for these RCRA characteristics, none of the ex situ samples required ignitability or reactivity analyses.

Sampling procedures were conducted in accordance with the CSP and Quality Assurance Project Plan (QAPP). Copies of the field sampling sheets for all soil stockpiles are provided in Appendix F. The complete set of analytical data packages are maintained in WESTON project files.

Stockpiles or sub-piles with ex situ analyses that met the nonhazardous solid waste criteria (soil leachate concentrations less than the VOC Toxicity Characteristic Leaching Procedure (TCLP) limits, soil leachate concentrations less than the metals TCLP limits, and/or soil PCB concentrations less than 50 mg/kg [ppm]) were managed as solid waste (nonhazardous) and sent to the SKB Landfill.

Stockpiles or sub-piles with ex situ analyses that did not meet the nonhazardous solid waste criteria (i.e., soil concentrations greater than the VOC TCLP criteria and/or soil PCB concentrations greater than 50 mg/kg [ppm]) were managed as potentially hazardous and sent to the Environmental Quality Company (EQ) waste landfill, also known as the Wayne Disposal, Inc. Landfill, in Belleville, Michigan.

As shown in Figure 3-4, the following soil blocks were excavated from the D2 Area and stockpiled for ex situ sampling: D2 4-1 and D2 4-5. The D1 North soil block was also excavated and stockpiled for ex situ sampling.

Sampling parameters for stockpiles from each D2 Area soil block are indicated in Figure 3-4 and were based on the in situ sampling results for the soil block as discussed above. Because no in situ disposal profiling data existed for the D1 North Area, stockpiles were sampled for a full suite of constituents, as outlined in the IRAP. A tabular summary of the ex situ sampling results for each stockpile and sub-pile is provided in Appendix D. The analytical results for each

stockpile and sub-pile were forwarded to the disposal facilities for review and approval prior to shipment.

3.5.2.1 Stockpile Management

Stockpiles were identified and managed in the exclusion zone using wooden survey stakes and a colored flagging system. A lathe survey stake with the soil block and stockpile number written on it was placed into the west side of the stockpile for identification. After the stockpile was sampled, a red flag was tied to the stake. The red flag signified that the pile was sampled and analytical results were pending. It served as a visual sign that the stockpile was not approved for hauling.

After the analytical results were obtained for each stockpile, the flag was changed. If, based on the stockpile sampling results, the stockpile was approved for disposal at the SKB Landfill, the red flag was removed and replaced with a green flag. A blue flag was also tied to the stake. The green flag was a visual sign that the pile was approved for hauling. The blue flag indicated that the disposal destination for the stockpile was the SKB Landfill.

If, based on the stockpile sampling results, the stockpile was approved for disposal at the EQ facility, the red flag was removed and replaced with a green flag. A yellow flag was also tied to the stake. The green flag was a visual sign that the pile was approved for hauling. The yellow flag indicated that the disposal destination for the stockpile was the EQ Landfill. Photographs 28 to 30, provided in Appendix A, demonstrate the stockpile flagging system.

As the stockpiles were marked for load out, WESTON personal monitored the operation to assure that the stockpiles were being manifested and handled according to the flagging system.

3.5.2.2 Disposal at SKB Nonhazardous Landfill

After receiving SKB approval for disposal acceptance, stockpiles or sub-piles with ex situ analyses meeting the nonhazardous criteria were shipped to the SKB Landfill via the highway route described in the IRAP. As with the direct load soils, an SKB shipping manifest and a haul truck inspection sheet were completed by WESTON for each truckload before leaving the site. On both documents, the load's source soil block and stockpile number were indicated. For

example, "D2 4-5 003-1" indicates that the load was from Soil Block D2 4-5, Stockpile 003-1. A typical SKB shipping manifest and a typical SKB haul truck inspection sheet for direct load soils are provided in Figures 3-5 and 3-6, respectively. A complete set of SKB shipping manifests are provided in Appendix E-3 (on CD). Manifests and truck inspection sheets are also maintained in the WESTON and 3M project files.

3.5.2.3 Disposal at EQ Hazardous Landfill

After receiving EQ approval for acceptance and disposal, stockpiles or sub-piles with ex situ analyses that did not meet the solid waste criteria were managed as hazardous and sent to the EQ Landfill in Belleville, Michigan via the route described in the IRAP. An EQ manifest and a haul truck inspection sheet were completed for each truckload before leaving the site. The EQ manifest used was generated from a standard Uniform Hazardous Waste Manifest. A typical EQ manifest and a typical truck inspection sheet for stockpiled soils that were shipped to EQ are provided in Figures 3-7 and 3-8, respectively. Copies of all the EQ manifests are provided in Appendix E-2 (on CD). Additionally, a complete set of EQ manifests and EQ haul truck inspection sheets are maintained in both 3M and WESTON project files.

It is important to note that, like the SKB shipping manifests, each EQ manifest has a unique ID number. Recorded on the manifest is the soil block and stockpile from which the load was derived. For example, as shown in Figure 3-7, "D1 North 004-2" was recorded on EQ manifest #007198023 to indicate that the manifest represented a load of soil from the D1 North Area, Stockpile 004-1. WESTON personnel monitored load-out activities and stockpile management, and denoted the source material on each manifest. The EQ shipping manifests were produced by the landfill (assisted by WESTON), signed by a 3M representative, completed by WESTON personnel, and signed by the transporter.

Loads that were shipped to the EQ Landfill were weighed on-site before leaving the site. As shown in Figure 3-8, the weight information (i.e., tare, gross, and net weights) was recorded on the truck inspection sheet as well as the soil block and stockpile from which the load was composed.

The EQ accepted load summary list provided in Appendix E-1 contains the manifest number for each load accepted at the landfill, as well as the net weight in tons. This list was provided by the EQ facility at the conclusion of all trucking activities. It should be noted that the weights reported by the landfill and those recorded on the manifest are slightly different. The weights reported by the EQ Landfill are considered accurate as the scale used at that facility is certified.

3.5.3 Truck Loading/Unloading Operations

The haul trucks consisted of an 18-wheel truck tractor and an aluminum dump trailer, with the occasional usage of a straight truck and a steel trailer. All haul trucks were inspected by WESTON upon arrival and departure from the Site to ensure that trucks were properly prepared to haul soils and that excavated materials were loaded properly and secured. The inspections were documented on the Haul Truck Inspection Forms (Figures 3-6 and 3-8).

Some trucks would be hauling clean sand/imported fill from SKB for use as backfill for the excavations. Upon arrival at the Site, trucks hauling sand would proceed to a drop area to unload, while the trucks arriving empty would proceed to the lining station. At the lining station the trucks pulled up to a scaffold and were visibly inspected by WESTON to ensure that there was no sand or waste material remaining in the truck bed. The truck bed was then lined with disposable, 6-mil poly sheeting to prevent the truck bed from contacting the excavated soil and to ensure that free liquids (if present) could not leak out of the tailgate. The poly sheeting was tied to the rails of the truck bed to keep it in place during loading and shipment. On several occasions WESTON followed trucks hauling soils to the SKB Landfill to ensure liner integrity throughout the hauling process. Even though trucks hauling soils to the EQ Landfill never carried clean soils back to the Site, a bed liner was still installed prior to being loaded with hazardous material. Photographs 31 and 32, provided in Appendix A, document the lining procedure. Based on WESTON's observations during the loading and hauling operation, there was no evidence of ripping or tearing problems with the bed liner and the 6-mil thick poly sheeting was satisfactory.

A truck preparing to be loaded with materials to be hauled to the EQ Landfill would proceed from the lining station to the weigh scale for a tare weight, and then to the load-out zone. After loading, the truck returned to the weigh scale for a gross weight and then returned to the lining station. The trucks were inspected by WESTON to ensure the liner was in good condition, the

liner remained in place in the bed of the truck and that the height of the soil was lower than the sides of the truck. A Bolander employee then secured the tarp cover over the bed of their truck, updated the required placarding and signed the associated manifest before the truck departed from the Site. The trucks loaded with material for the SKB Landfill followed the same general procedure with the exception of the weigh scale. Trucks transporting material to SKB were not weighed until they arrived at the SKB Landfill. All trucks were weighed at the respective landfills using a certified weigh scale.

3.5.4 Non-Soil Debris

During the D1 North Area excavation, non soil debris was encountered. This debris consisted of crushed drum carcasses, drum fragments, and gas canisters. The drums were in poor condition and many were fragments or portions; however, some of the drum carcasses were empty and some contained black tar residue. Based on visual inspection, all of the gas canisters were not pressurized and contained a noticeable hole in the cylinder. The drum carcasses and fragments that did not contain visible tar residue were disposed of with the stockpile material where they were found. The drum carcasses that contained tar residue and all the gas canisters were packed into overpacks and transported to the on-site Cottage Grove incinerator for proper disposal. Photographs 33 to 37, provided in Appendix A, show the handling of the non-soil debris.

3.5.5 Water Management

During the D2 Area excavation, construction water that collected in the excavation was diverted and managed on-site to minimize the accumulation of this water in the active portion of the excavation. Trenches were dug on the east and west sides in the D2 excavation draining to a sump on the south end. No construction or excavation water was handled in the D1 Area. Photographs 38 and 39, provided in Appendix A, show the trench and sump management systems used in the D2 Area excavation.

The collected water was periodically pumped from the sumps by Warwick Construction, Inc., a 3M contractor. The pumped water was then either (1) transported by Warwick directly to the on-site 3M Cottage Grove wastewater treatment plant (WWTP) for disposal, or (2) stored in an on-site Frac Tank, prior to disposal at the WWTP. In total, 41 loads of construction water,

approximately 75,500 gallons was pumped from the site. A copy of the 3M Cottage Grove Wastewater Treatment Operations "Non-Routine" Hauled Wastewater Disposal Forms is provided in Appendix E-4. Photographs 40 and 41, provided in Appendix A, show the water removal activities.

Near the conclusion of the project, after the existing potentially impacted material was backfilled into the bottom of the excavation and prior to the backfilling with clean sand, the excavation equipment (that was operated within the exclusion zone) was decontaminated using a 300 psi heated pressure washer. Three passes were done with the pressure washer after visible debris was removed. The procedure was performed within the boundaries of the D2 excavation and decon water was allowed to percolate into the ground.

3.6 SURVEY VERIFICATION OF EXCAVATION LIMITS

Verification surveying was performed by TKDA, a Minnesota-licensed surveyor, as a contractor to WESTON. This arrangement provided the "third party" verification that the removal requirements specified in the IRAP and RD/RA Plan were being met. Surveying was conducted regularly during the excavation activities to confirm that the required horizontal and vertical excavation limits had been reached for each soil block. After the final excavation limits were verified to the lateral and vertical limits specified in the approved IRAP, backfilling was allowed.

It should be noted that soil block quantities for direct load and stockpiled soil blocks were surveyed differently in accordance with project specifications. The direct load soil block quantities were in-place volumes calculated from as-built survey shots of the excavation. In order to better quantify the volumes of these soil blocks, four corner survey shots were collected along with multiple interior ground check shots per soil block.

To quantify the amount of soil excavated from the potentially hazardous soil blocks the stockpile quantities were surveyed. Stockpile quantities were surveyed by collecting several survey shots around the base of the stockpile, as well as one or two shots at the top of the stockpile. As-built survey shots were taken at the four corners of each of the potentially hazardous soil blocks, but the corner shots were only used to confirmed the excavation met the required limits.

3.6.1 D1 Area

Figures 3-9 and Figure 3-10 provide the plan view results of final verification surveys for the base of the D1 South and North excavation. Figure 3-9 shows cross sections of the D1 Area South design excavation limits as well as the actual final excavation limits. Figure 3-10 shows cross sections of the D1 Area North design excavation limits as well as the actual final excavation limits. The figures demonstrate that the design excavation limits for the D1 Area were achieved and that the actual excavation limits met or, in the case of the D1 North excavation, extended beyond the IRAP and RD/RA Plan specified limits.

Table 3-1 provides a tabular summary of the D1 Area soil excavation volumes and soil stockpile final disposal location. The total volume of soil removed from the D1 South Area was approximately 530 cubic yards (738 tons), all of which was transported to the SKB Landfill.

The total volume of soil removed from the D1 North Area was approximately 1,930 cubic yards (2,574 tons). Of that, approximately 940 cubic yards (1,289 tons) were transported to the EQ Landfill and approximately 990 cubic yards (1,285 tons) were transported to the SKB Landfill.

3.6.2 D2 Area

Figures 3-11 through 3-15 provide the plan view results of final verification surveys for the base of each layer in the D2 Area (i.e., base of Layer 1 - 0 to 5 ft bgs, base of Layer 2 – 5 to 10 ft bgs, base of Layer 3 – 10 to 15 ft bgs, base of Layer 4 – 15 to 20 ft bgs, and base of Layer 5 – 20 to 25 ft bgs, respectively), which includes the corners of each soil block. Figure 3-11, 3-12 and 3-13 shows cross sections of the D2 Area design excavation limits as well as the actual final excavation limits for Layer 1, Layer 2 and Layer 3 respectively. Figures 3-14 and 3-15 demonstrate that the design excavation limits for the D2 Area were achieved and that the actual excavation limits met or extended slightly beyond the IRAP design limits.

Table 3-1 provides a tabular summary of the D2 Area soil excavation volumes and final disposal location. The total volume of soil removed from the D2 Area was approximately 12,569 cubic yards (18,882 tons). All soils removed from the D2 Area were sent to the SKB Landfill.

3.7 OPERATIONAL RECORDS

In addition to haul truck inspection sheets (Figures 3-6 and 3-8), additional operational records are maintained by WESTON documenting the excavation activities and ambient conditions during site activities. Such records include daily reports, meteorological station data, and perimeter monitoring as discussed in the following sections.

3.7.1 Daily Reports

The Daily Site Operations Log Form was completed for each day of site activity. The log form contains a summary of key site daily information such as activities performed, personnel on-site, soil blocks that were excavated, stockpiles that were generated, hauling information, monitoring information, and communications. All of the daily reports are maintained in WESTON's project files as part of the construction record.

Additionally, weekly construction meetings were held by 3M, typically on Mondays throughout the duration of Site Activities to review construction progress, plans for upcoming construction, and resolve construction questions or issues. These meetings were lead by the 3M project representative and were attended by 3M, Bolander, WESTON, and other parties such as AECOM (MPCA's contractor) and MPCA. Meeting minutes were e-mailed out weekly and copies are maintained in 3M and WESTON project files, as part of the construction record. Lastly, AECOM representatives periodically visited the site to observe and document excavation activities, on behalf of MPCA.

3.7.2 Meteorological Station Data

Daily weather conditions were recorded on the Daily Site Operations Log Form; however, continuous monitoring and documentation of on-site meteorological conditions were recorded by WESTON visiting an on-site meteorological monitoring station ("met station"). The met station, installed prior to excavation activities, was mounted outside of the exclusion zone on an approximate 18-foot tripod. The met station was located southwest of the exclusion zone and north of the construction trailer (Figures 3-1 through Figure 3-3). The meteorological data were recorded by a data logger and downloaded daily. The meteorological variables monitored included:

- Wind speed.
- Wind direction.
- Standard deviation of horizontal wind direction (sigma theta).
- Ambient air temperature.
- Precipitation.

The meteorological data were also used during construction activities to help foresee construction water issues. Of the twenty-two recorded precipitation events, nineteen were less than a quarter of an inch, two were between a quarter and a half an inch, and one was equal to three-quarters of an inch. Water removal throughout construction activities was conducted as needed, and did not directly correspond to precipitation events. A 6-foot-deep earthen sump was dug directly to the south in the D2 excavation to manage water during excavation activities. The sump accumulated water after precipitation events as well as from the release of perched water. This accumulated water was pumped on an as required basis.

Throughout the excavation activities the average daily directional wind originated from the south, including the southwest, south and southeast, 70% of the time. The average wind speed was 4.2 miles per hour.

The wind speed was monitored with a three-cup anemometer assembly mounted on a cross arm. Horizontal wind direction was monitored by a wind vane coupled to a precision low torque potentiometer. Precipitation was measured with a tipping bucket rain gauge. A table that provides a summary of the daily meteorological data is provided in Appendix G.

3.7.3 Perimeter Monitoring

Throughout the duration of the excavation activities, perimeter monitoring for VOCs and particulates was performed on a weekly basis and measurements recorded on a Perimeter Monitoring Form, as outlined in the IRAP and RD/RA Plan. A copy of the Perimeter Monitoring Forms is provided in Appendix H.

The following instruments were used for monitoring:

- MultiRAE photoionization detector (PID) for VOC ambient air monitoring.

- Thermo Electron Corporation personal DataRam (pDR) for PM_{10} particulate ambient air monitoring.
- Quest Noise Pro for noise monitoring.

As shown in Figure 3-16, there were three monitoring locations surrounding the excavation area in all directions. The monitoring locations were relocated slightly from those proposed in the IRAP and RD/RA due to access issues. The air monitoring locations were as follows:

- Station 1 -West of the excavation area next to the Decon Trailer
- Station 2 - South of the D2 excavation area.
- Station 3 - Southeast of the D1/D2 Excavation Areas

A total of nineteen monitoring events were performed throughout excavation activities. The frequency of monitoring events was considered sufficient, and did not need to be increased, due to the isolation of the excavation activities from surrounding properties.

There were two recorded events where readings above the action level were recorded. On both March 25, 2010 and March 31, 2010 PM_{10} readings were recorded at 0.099/0.131 mg/m^3 and 0.303 mg/m^3 at perimeter monitoring station 2. The action level for PM_{10} readings was 0.1 mg/m^3 above background and background was assumed to be 0.000 mg/m^3. On both these occasions it was noted that the increase in PM_{10} readings was attributed to haul road traffic. Perimeter monitoring Station 2 was located on the haul road directly south of the D2 Area excavation. It should also be noted that the PM_{10} readings at the other perimeter monitoring locations on these two days were well below the action levels (0.005 – 0.028 mg/m^3).

Aside from the two instances discussed above, the readings obtained for all the monitored values, across all perimeter monitoring locations, were well below the associated action levels. The VOC concentrations were consistently 0.00 ppm for several readings and never exceeded 1.1 ppm. The Action Level set in the HASP was a reading of 2.5 ppm above background as a 15 minute time weighted average. The PM_{10} concentrations recorded across all stations ranged from 0.000 mg/m^3 to 0.080 mg/m^3. These recorded concentrations were below the Action Level defined in the HASP of 0.1 mg/m^3 above background levels.

3.8 DECOMMISSIONING ACTIVITIES

At the conclusion of the construction activities, all stockpile staging areas were removed and hauled to the SKB Landfill, including the poly liner, overlying sand layer, and side berms. Approximately 1,200 tons of this material was hauled to SKB between April 27, 2010 and May 6, 2010.

Even though reasonable care was exercised in moving soils from the excavation blocks to the stockpile areas and then to the load-out area, incidental spillage occurred in the traffic areas inside of the exclusion zone. To address these traffic areas during decommissioning, it was decided to scrape a 6-inch layer of soil from these areas for disposal at the SKB Landfill in accordance with the Stockpile Staging Area Removal Plan.

This scraping of the haul traffic areas within the exclusion zone occurred on April 26, 2010. Approximately 600 tons of stripped material was hauled to the SKB Landfill between April 27, 2010 and April 28, 2010.

Following excavation activities, Bolander decontaminated all equipment used in the exclusion zone. Decontamination activities were performed under the guidance of the decontamination plan submitted by Bolander to 3M prior to excavation activities at the Site.

3.9 BACKFILLING, FINAL GRADING, AND REVEGETATION

Backfill documentation, including the date of backfilling activities and source of backfill material, was recorded in the daily reports. Backfill material was placed in 12-inch lifts and compacted.

In the D1 Area, the source of backfill material was the clean fill material hauled to the site from SKB. It should be noted that this imported fill source was sampled by WESTON on September 14, 2009 in accordance with the CSP for verification as clean backfill. This sampling occurred during the Woodbury Main Disposal Area project, and the source of backfill material for the D1/D2 project was the same and thus did not require further sampling. A tabular summary of the sampling results is provided in Appendix A. These results indicated that SKB was an acceptable source of backfill material.

In the D2 Area, the source of backfill material was the potentially impacted material, surrounding berm material, and imported fill material hauled to the Site from the SKB facility. The potentially impacted excavated soil material, from the slope of the excavation was the first material backfilled and compacted, per the project specifications. The second source of backfill material used was from the existing berm material. The areas surrounding the D2 Area excavation were leveled to six inches below the final grade. The last material used for backfill of the D2 Area was the SKB backfill material. This material was used to achieve the final grade as proposed in the project specifications. Photographs 42 to 45, provided in Appendix A, show the backfilling procedures.

Existing and final grading surface contours are provided in Figure 3-17. Overall, the final grading contours have been altered due to the removal of the existing berms surrounding the D2 Area. Prior to excavation, the D2 Area topography was a large mound that ran east to west. The mound sloped into a steep natural ravine to the north and towards the haul road to the south. After the excavation and backfill activities were completed, the D2 Area was graded to a more level plane that slopes slightly to the southwest for positive drainage. The final site survey was conducted on April 20, 2010 to complete the construction activities.

Final inspection of the site occurred on May 24, 2010. The final inspection consisted of a site walkthrough with representatives from 3M, Bolander, TKDA, AECOM and WESTON. It was explained at the walkthrough that the subgrade elevations we achieved and that the final elevations would be completed upon the completion of the D9 Area excavation. Since the D1/D2 Areas will be utilized for staging and stockpiling for the D9 Area Project and potentially the East Cove Project, the silt fencing was not removed and a Notice of Termination for the Stormwater General Permit was not filed at that time. The permit will remain open and will be transferred to the respective contractor for the construction activities occurring in the D9 Area beginning in May 2010. MPCA was notified on May 24, 2010 that the D1/D2 removal project had been completed. Final restoration (i.e., seeding, stabilization) of the D1 and D2 Areas will be completed after the D9 Area and East Cove remediations are completed.

SECTION 3 TABLE

Cottage Grove, MN 55016

RE: Coverage Under NPDES/SDS General Stormwater Permit for Construction Activity (MNR100001) for: Clearing and Grubbing - Cottage Grove - CSW (ID# C00027036)

Dear Ms. Vickie J Batroot:

Thank you for submitting your completed construction stormwater permit application for the above-referenced project. The Minnesota Pollution Control Agency (MPCA) is pleased to inform you that you have been granted coverage under the National Pollutant Discharge Elimination System (NPDES)/State Disposal System (SDS) Stormwater Permit ("Permit") for Construction Activity. Permit coverage for this project started on January 27, 2009, seven (7) days after the postmarked date of your completed permit application form.

You are required to comply with the terms of the Permit to prevent erosion and control sediment from your site with the procedures established in your Stormwater Pollution Prevention Plan (SWPPP). You are also required to upgrade your SWPPP and erosion prevention and sediment control Best Management Practices (BMPs) as site and weather conditions dictate throughout the entire term of the project.

Enclosed, with the **contractor's copy** of this letter only, you will find a "Notice of Stormwater Permit Coverage" certificate for this construction project. Once all construction activity has been completed at this project, you must submit a "Notice of Termination" (NOT) form to the MPCA within 30 days of meeting the conditions outlined in Part II (C) of the permit. Please check the MPCA website (www.pca.state.mn.us/water/stormwater/stormwater-c.html) or call to request an NOT form and fact sheet.

Please save this letter for your records. If you have any questions about permit coverage for this project, please contact the Construction Stormwater Program at 651-757-2119 or toll free at 800-657-3804.

Sincerely,

Brian Livingston
Supervisor, Stormwater Policy & Technical Assistance Unit
St. Paul Office
Municipal Division

cc: Ms. Vickie J Batroot

Minnesota Pollution Control Agency

520 Lafayette Road North
St. Paul, MN 55155-4194

Notice of Termination/ Permit Modification Form

NPDES Construction Stormwater Permit Program

Transfer or terminate your National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Permit. Allowable changes are permit termination and permit transfer for all or a portion of the site. This form replaces the Notice of Termination (NOT), Permit Transfer, Permit Modification, and Subdivision Registration forms used under the former permit.

Instructions for this form are located on the Internet at http://www.pca.state.mn.us/publications/wq-strm2-60i.pdf.

Form will be invalid and returned to sender unless the checkbox associated with the applicable actions is checked and the corresponding signature is provided in section A-1, A-2, A-3, and or A-4.

Please submit to: **Construction Stormwater Permit Program**
Minnesota Pollution Control Agency
520 Lafayette Road North
St. Paul, Minnesota 55155-4194

Existing Permit Identification

a. Current permit ID: C000 2 7 0 3 6 or SUB00 _ _ _ _ _

b. Project name: D1 & D2 Soil Removal Project - (formerly Clearing & Grubbing)

Project location: 10746 Innovation Road, Cottage Grove, MN 55016

South and east corner of the property near the ravine to the Mississippi River

Briefly describe where the construction activity occurs (for example: intersection of 45th St. and Irving Ave.). Include address if available.

Select Option 1, 2, or 3

1. Notice of Termination (NOT) for entire site by existing owner

Select this option when a project has achieved final stabilization with existing owner / contractor and no part of the site is being transferred to a new owner and all construction activity is complete.

c. ☐ Notice of Termination for entire existing permitted site or a subdivided site. (Current owner and contractor must sign under the "Current" Owner and "Current" Contractor sections respectively).

Check above box and sign section A-1 and A-2 on page 2.

2. Transfer of entire site to new owner or contractor (Transfer/Modification)

Select this option if the *entire* site (represented by the ID above) has either a new owner and/or new general contractor. *Check all the boxes below that apply.*

d ☐ New Owner for entire existing permitted site.
e. ☒ New Contractor for entire existing permitted site.
f. ☐ Current Owner for entire existing permitted site.
g. ☒ Current Contractor for entire existing permitted site.

Check above box(es) and sign section A-3 and A-4 page 3 and or check above box(es) and sign section A-1 and A-2 page 2

Both "Current" and "New" Parties must sign this form (preferred), however, separate forms are acceptable.

3. Transfer of a portion of a site to a new owner or contractor (Subdivision)

Select this option if a *portion* of a site (permitted under the ID above) has either a new owner and/or new general contractor. Check the boxes below that apply.

h. Describe the portion of the site being transferred: Lot _____ Block _____

Project location/address: _____

City, State, and Zip: _____

Example: SW quadrant of 45th Street and Irving Avenue or Lots 1-17 of block 20. Include list of addresses if available or include a map

i. ☐ New Owner for portion of existing site.
j. ☐ New Contractor for portion of existing site.
k. ☐ Current Owner of the portion to be transferred.
l. ☐ Current Contractor of the portion to be transferred.

Check above box(es) and sign section A-3 and A-4 page 3 and or check above box(es) and sign section A-1 and A-2 page 2

Both "Current" and "New" Parties must sign this form (preferred), however, separate forms are acceptable.

I also certify under penalty of law that I have read, understood, and accepted all terms and conditions of the National Pollutant Discharge Elimination System (NPDES)/State Disposal System (SDS) General Stormwater Permit Construction Activity (MN R100001) that authorizes stormwater discharges associated with the construction site identified on this form.

Authorized signature: Date: 12-10-09

*This Application must be signed by: **Corporation:** a principal executive officer of at least the level of vice-president or the duly authorized representative or agent of the executive officer if the representative or agent is responsible for the overall operation of the facility that is the subject of the permit application. **Partnership or Sole Proprietorship:** a general partner or the proprietor. **Municipality, State, Federal or Other Public Agency:** principal executive officer or ranking elected official.*

If you have questions about the administrative details of the permit process go to: http://www.pca.state.mn.us/publications/wq-strm2-60.pdf or call the Minnesota Pollution Control Agency at **651-296-6300** or **800-657-3864** and ask for *"Construction Stormwater."* If you have technical questions, ask for the *"Stormwater Policy and Technical Assistance Unit."*

AGREEMENT AND SWORN STATEMENT

The work for which this permit is issued shall be performed according to: 1) the conditions of this permit; 2) the approved plans and specifications; 3) the applicable City approvals, Ordinances, and Codes; and, 4) the State Building Code. This permit is for only the work described, and does not grant permission for additional or related work that requires separate permits. This permit will expire and become null and void if work is not started within 180 days, or work is suspended or abandoned for a period of 180 days any time after work has commenced. Applicant is responsible for assuring all required inspections are requested in conformance with the State Building Code.

Table Notes:
[1] Stockpile staged in two separate sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from soil's from both sub-piles.
"A" denotes a sample was collected from soils from each sub-pile for TCLP analysis.
All results reported on a "dry weight basis".
--- = Sample not analyzed for corresponding compound.

Data Notes:
Data tabulated by C. Armstrong of WESTON on 01/13/2010.
Data validation QA'd by L. Savage of WESTON on 01/14/2010.
Analytical data provided in Pace Analytical Services
data package # 0120082.

Cyanide, Reactive	< 0.025	---	---	---
Sulfide, Reactive	< 100	---	---	---
Flashpoint (F)				
Flashpoint	>210	---	---	---
pH (standard units)				
pH at 25 Degrees C	7.60	---	---	---
Percent Moisture (%)				
Percent Moisture	20.3	12.9	8.1	15.8

Table Notes:

[1] Stockpile staged in two separate sub-piles. A grab sample was not taken from each sub-pile. A composite sample was collected from soils from both sub-piles.
[2] A composite sample was collected from soils from each sub-pile for TCLP analysis.
All results reported on a "dry weight basis".
--- = Sample not analyzed for corresponding compound.

Data Notes:

Data calculated by D. Armstrong of WESTON on 01/13/2010.
Data tabulation QA'd by J. Savage of WESTON on 01/14/2010.
Analytical data provided in Pace Analytical Services
data package #10120082.

pH at 25 Degrees C	10.4	---	---	9.9	---	---	---
Percent Moisture (%)							
Percent Moisture	23.6	17.8	23.3	23.3	20.8	23.7	23.4

Table Notes:
[1]Stockpile 004 and 005 were each composited from two separate sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from soils from both sub-piles.
All results reported on a "dry-weight basis".
--- Sample not analyzed for corresponding compound.

Data Notes:
Data tabulated by D. Armstrong of WESTON on 01/26/2010.
Data tabulation QA'd by J. Savage of WESTON on 01/26/2010.

Table Notes:

[1] Stockpile composite was collected from discrete sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from soils from both sub-piles.

All results reported on a "dry-weight" basis.

--- = Sample not analyzed for this compound.

Data Notes:

Data tabulated by D. Armstrong of WESTON on 01/26/2010.

Data tabulation QA/QC by J. Savage of WESTON on 01/28/2010.

Analytical data provided by Test America Canton.

Data packages # 10120685 & 10120659.

Table Notes:
[1] Stockpile consisted of two separate sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from both sub-piles.
All results reported on a "dry-weight basis"
--- Sample not analyzed for CCR constituting compound.

Data Notes:
Data tabulated by D. Armstrong of WESTON on 01/23/2010.
Data tabulation QA'd by J. Savage of WESTON on 01/23/2010.
Analytical data provided by Pace Analytics Services
data packages # JT10885 & T10128

Table Notes:

[1] Stockpile staged in two separate sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from both sub-piles.

All results reported on a "dry-weight basis".

--- = Sample not analyzed for corresponding compound.

Data Notes:

Data tabulated by D. Armstrong of WESTON on 01/26/2010.

Data tabulation QA'd by J. Savage of WESTON on 01/26/2010.

Analytical data provided by Pace Analytical Services data packages 910122L030 & 910122L031.

APPENDIX E-4
HAULED WASTEWATER DISPOSAL FORMS

3 Cottage Grove
Wastewater Treatment Operations
"Non-Routine" Hauled Wastewater Disposal Form

This section to be completed by WWT Operations Environmental Compliance, Engineer, or Supervisor

3M Requestor and Bldg Location: Mark Hostrawser, D2 non-hazardous material area

Wastewater Source Generation: excavation
(containment basin, sump, process equipment cleaning, etc...)

Wastewater Description by Requestor:
standing water during excavation activities at the D2 area

Wastewater Physical Description *(if applicable and/or known)*:

1) Color: CLEAR/LIGHT BROWN
2) Odor: NONE
3) Number of Layer(s): _____
5) Is the wastewater pumpable? ☒ Yes ☐ No
6) Are there visible solids? ☐ Yes ☒ No
7) If Yes to #6, estimated total solids by volume: _____ %

Estimated Volume: _____ **Estimated Frequency/Duration:** 1 time

3M WWT Approver: Tina Berg
electronic signature 2/10/10

Approved Disposal Location: Phase 2 headworks
Bldg 183 unloading area

This section to be completed by Wastewater Transporter

Transporter Name: WARWICK CONST. **Date:** 2/18/10 **Time:** 8:15, 9:15, 10:00
3 LOADS

Wastewater Total Quantity Collected: 7,500 gallons

This section to be completed by Wastewater Operations

Received By: _____ **Date:** _____ **Time:** _____

Disposal Location: _____
Phase I Headwork, Phase II EQ basin, Phase III mix box at incinerator, etc...

Comments/Safety (PPE requirements):

pH of water measured at 7.41, 7.54, 8.02, 8.05

water collection only from SKB direct load locations; non-hazardous areas

Upon Completion, File WWT Compliance Files in Bldg 39 CHEM-E.5 Hauled WWT Forms

SOF-000015
Revision 1

Wastewater Source Generation: excavation
(containment basin, sump, process equipment cleaning, etc...)

Wastewater Description by Requestor:
standing water during excavation activities at the D2 area

Wastewater Physical Description *(if applicable and/or known)*:

1) Color: non-clear / Light brown
2) Odor: None
3) Number of Layer(s): _____
5) Is the wastewater pumpable? ☒ Yes ☐ No
6) Are there visible solids? ☐ Yes ☒ No
7) If Yes to #6, estimated total solids by volume: ____ %

Estimated Volume: _____ **Estimated Frequency/Duration:** 1 time

3M WWT Approver: Tina Berg
electronic signature 2/10/10

Approved Disposal Location: Phase 2 headworks
Bldg 183 unloading area

This section to be completed by Wastewater Transporter

Transporter Name: WARWICK **Date:** 2/22/10 **Time:** 7:00AM - 11:00AM
1 8:24 + 10:20
2 9:06
3 9:43

Wastewater Total Quantity Collected: 10,000 gallons

This section to be completed by Wastewater Operations

Received By: Dennis Conaway **Date:** 2-22-10 **Time:** 0800

Disposal Location: P-2
Phase I Headwork, Phase II EQ basin, Phase III mix box at incinerator, etc..

Comments/Safety (PPE requirements):

pH of water measured at 7.41, 7.54, 8.02, 8.05

water collection only from SKB direct load locations; non-hazardous areas

Upon Completion, File WWT Compliance Files in Bldg 39 CHEM-E.5 Hauled WWT Forms

Wastewater Treatment Operations
"Non-Routine" Hauled Wastewater Disposal Form

This section to be completed by WWT Operations Environmental Compliance, Engineer, or Supervisor

3M Requestor and Bldg Location: Mark Hostrawser, D2 non-hazardous material area

Wastewater Source Generation: excavation
(containment basin, sump, process equipment cleaning, etc...)

Wastewater Description by Requestor: CONSTRUCTION/RAINWATER
standing water during excavation activities at the D2 area

Wastewater Physical Description *(if applicable and/or known)*:

1) Color: Light Brown
2) Odor: None
3) Number of Layer(s): _____
5) Is the wastewater pumpable? ☒ Yes ☐ No
6) Are there visible solids? ☐ Yes ☒ No
7) If Yes to #6, estimated total solids by volume: ____ %

Estimated Volume: _____ **Estimated Frequency/Duration:** 1 time

3M WWT Approver: Tina Berg
electronic signature 2/10/10

Approved Disposal Location: Phase 2 headworks
Bldg 183 unloading area

This section to be completed by Wastewater Transporter

Load #1 8:34

Transporter Name: Warren **Date:** 3/10/10 **Time:** _____

Wastewater Total Quantity Collected: 3,000 Gal gallons

This section to be completed by Wastewater Operations

Received By: _____ **Date:** _____ **Time:** _____

Disposal Location: _____
Phase I Headwork, Phase II EQ basin, Phase III mix box at incinerator, etc...

Comments/Safety (PPE requirements):

pH of water measured at 7.41, 7.54, 8.02, 8.05

water collection only from SKB direct load locations; non-hazardous areas

Upon Completion, File WWT Compliance Files in Bldg 39 CHEM-E.5 Hauled WWT Forms

SOF-000015

APPENDIX F
FIELD SAMPLING SHEETS

BLOCK NO: D1N **SAMPLE DATE:** 07-Jan-10

STOCKPILE NO: 001 **BLOCK PARAMETERS:** VOC, PCB, TCLP VOC, TCLP Metals, SVOC, Ignitability, Reactivity

Weather: Clear ( ) Cloudy ( ) Rain/Snow (X) Windy ( ) **TEMP.:** 8 °F

Stockpile Description (Check all that apply)
(X) Soil
( ) C&D Debris (Concrete, Asphalt, etc)
( ) Mfg. Debris
( ) Staining

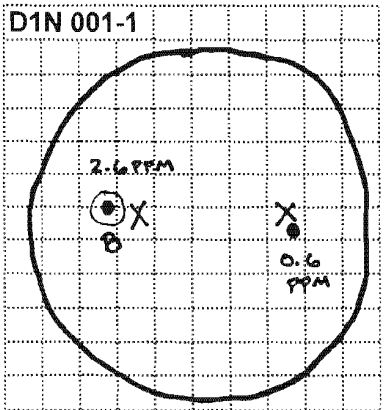

Soil Moisture: ( ) Dry (X) Moist ( ) Wet

Odor: Strong ( ) Mild ( ) None (X)

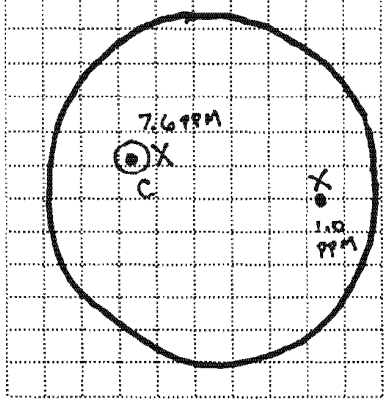

1. Sketch Stockpile, Establish Dimensions, Describe Soil, and Locate Sample Locations.
2. Screen Stockpile with PID and Record GPS Coordinates for selected sample locations.
3. Provide a Sketch of the Stockpile, indicate north, and show PID readings and Sample Stations.
4. Collect Samples, Record ALL Data, Prepare COC, Count Bottles.

Designate Sample Locations on the Sketch with Reference Letter.

D1N 001-1

D1N 001-2

- Headspace Readings (ppm)
- ⊙ Sample Location for VOCs
- X Composite Location for PCBs and TCLPs ("A" Sample)

Current site activities: Digging direct load soil block D2 2-4 (removing the sand road across the excavation). Staging the material near the load out zones in stockpile staging areas. Also using the loader to shape piles.
Wind S @ 5.0 mph

Cottage Grove Site - Perimeter Monitoring Form

1. Date:	**3/3/2010**	**2. Temp:**	**28.8 °F**	**Weather:**	**Sunny, Clear**

3. Prepared By: D. Armstrong

4. Ambient Air Monitoring - (VOCs) (Action Level - 2.5 ppm above background as a 15 min TWA)

Instrument used:	**Mini-RAE 2000**
Calibration performed? (Y or N)	**Yes**

Station / Sample Location	Time	Reading (provide units)
Station 1	9:46	0.0 ppm
Station 2	9:53	0.0 ppm
Station 3	10:00	0.0 ppm

COMMENTS:

Wind NE @ 2.4 mph

Bolander loading and shipping D1 North soils.

5. Ambient Air Monitoring - PM10 (Particulate Monitoring) (Action Level - 0.1 mg/m^3 above background)

Instrument used:	**MIE DataRam PDR**
Calibration performed? (Y or N)	**Yes**

Station / Sample Location	Time	Reading (provide units)
Station 1	9:46	0.001 mg/m^3
Station 2	9:53	0.003 mg/m^3
Station 3	10:00	0.004 mg/m^3

COMMENTS:

Wind NE @ 2.4 mph

Bolander loading and shipping D1 North soils.

Cottage Grove Site - Perimeter Monitoring Form

1. Date:	3/12/2010	2. Temp:	39.1 °F	Weather:	Foggy

3. Prepared By: D. Armstrong

4. Ambient Air Monitoring - (VOCs) (Action Level - 2.5 ppm above background as a 15 min TWA)

Instrument used:	Mini-RAE 2000
Calibration performed? (Y or N)	Yes

Station / Sample Location	Time	Reading (provide units)
Station 1	7:51	0.0 ppm
Station 2	7:43	0.0 ppm
Station 3	7:34	0.0 ppm

COMMENTS:

Wind SE @ 0.8 mph

5. Ambient Air Monitoring - PM10 (Particulate Monitoring) (Action Level - 0.1 mg/m^3 above background)

Instrument used:	MIE DataRam PDR
Calibration performed? (Y or N)	Yes

Station / Sample Location	Time	Reading (provide units)
Station 1	7:51	0.027 mg/m^3
Station 2	7:43	0.051 mg/m^3
Station 3	7:34	0.032 mg/m^3

COMMENTS:

Wind SE @ 0.8 mph

Cottage Grove Site - Perimeter Monitoring Form

1. Date:	3/17/2010	2. Temp:	57 °F	Weather:	Sunny, Clear

3. Prepared By: R. McLoughlin - Weston

4. Ambient Air Monitoring - (VOCs) (Action Level - 2.5 ppm above background as a 15 min TWA)

Instrument used:	Mini-RAE 2000	
Calibration performed? (Y or N)	No	
Station / Sample Location	**Time**	**Reading (provide units)**
Station 1	2:23	0.0 ppm
Station 2	2:16	0.0 ppm
Station 3	2:08	0.0 ppm

COMMENTS:

End of hauling activities to EQ. Wind NE
@ 5.3 mph

5. Ambient Air Monitoring - PM10 (Particulate Monitoring) (Action Level - 0.1 mg/m^3 above background)

Instrument used:	MIE DataRam PDR	
Calibration performed? (Y or N)	No	
Station / Sample Location	**Time**	**Reading (provide units)**
Station 1	2:23	0.000 mg/m^3
Station 2	2:17	0.018 mg/m^3
Station 3	2:08	0.000 mg/m^3

COMMENTS:

End of hauling activities to EQ. Wind NE
@ 5.3 mph

C:\Documents and Settings\mcloughr\My Documents\CGMN\D1 D2\CGMN D1_D2 Perimter Monitoring File\CGMN Permiter Monitoring 03.17.10,Perimeter Monitoring Form

Cottage Grove Site - Perimeter Monitoring Form

1. Date:	3/25/2010	2. Temp:	30.3 °F	Weather:	Sunny, Clear

3. Prepared By: R. McLoughlin - Weston

4. Ambient Air Monitoring - (VOCs) (Action Level - 2.5 ppm above background as a 15 min TWA)

Instrument used:	Mini-RAE 2000	
Calibration performed? (Y or N)	Yes	
Station / Sample Location	**Time**	**Reading (provide units)**
Station 1	10:48	0.0 ppm
Station 2	10:55	0.0 ppm
Station 3	11:06	0.0 ppm

COMMENTS:

Bolander adding lime kiln dust (LKD) and mixing soil block D2 3-3. Skid steer loader moving LKD bags from staging area across from construction trailer to the outside of the excavation. Winds ~7.6 mph SW.

5. Ambient Air Monitoring - PM10 (Particulate Monitoring) (Action Level - 0.1 mg/m^3 above background)

Instrument used:	MIE DataRam PDR	
Calibration performed? (Y or N)	Yes	
Station / Sample Location	**Time**	**Reading (provide units)**
Station 1	10:48	0.005 mg/m^3
Station 2	10:55 / 11:12	0.099 mg/m^3 / 0.131 mg/m^3
Station 3	11:06	0.008 mg/m^3

COMMENTS:

PM_{10} values are high and close to/slightly above the Action Level. These values are likely elevated due to road traffic and wind. The road traffic includes vehicles driving down haul road and the skid steer loader moving the bags of LKD. General observations are the PM_{10} is generally 0.055 - 0.080 mg/m^3. During a gust of wind the PM_{10} jumps momentarily to 0.1 - 0.2mg/m^3. When a vehicle drives past the PM_{10} values jump briefly to 0.9 - 1.3 mg/m^3.

Cottage Grove Site - Perimeter Monitoring Form

1. Date:	3/31/2010	2. Temp:	60.8 °F	Weather:	Sunny, Clear

3. Prepared By: D. Armstrong - Weston

4. Ambient Air Monitoring - (VOCs) (Action Level - 2.5 ppm above background as a 15 min TWA)

Instrument used:	Mini-RAE 2000
Calibration performed? (Y or N)	Yes

Station / Sample Location	Time	Reading (provide units)
Station 1	11:00	0.0 ppm
Station 2	10:51	0.3 ppm
Station 3	10:43	0.0 ppm

COMMENTS:

Winds NE @ 6.2 mph.

Bolander transporting lime kiln dust to D2 excavation area.

5. Ambient Air Monitoring - PM10 (Particulate Monitoring) (Action Level - 0.1 mg/m^3 above background)

Instrument used:	MIE DataRam PDR
Calibration performed? (Y or N)	Yes

Station / Sample Location	Time	Reading (provide units)
Station 1	11:00	0.028 mg/m^3
Station 2	10:51	0.302 mg/m^3
Station 3	10:43	0.011 mg/m^3

COMMENTS:

Winds NE @ 6.2 mph.

Bolander transporting lime kiln dust to D2 excavation area - road / equipment traffic kicking up large amounts of dust, resulting in a TWA PM10 reading above the action level of 0.1 mg/m^3.

Cottage Grove Site - Perimeter Monitoring Form

1. Date:	4/8/2010	2. Temp:	35.1 °F	Weather:	Cloudy

3. Prepared By: D. Armstrong - Weston

4. Ambient Air Monitoring - (VOCs) (Action Level - 2.5 ppm above background as a 15 min TWA)

Instrument used:	Mini-RAE 2000	
Calibration performed? (Y or N)	Yes	
Station / Sample Location	**Time**	**Reading (provide units)**
Station 1	8:16	0.0 ppm
Station 2	8:24	0.0 ppm
Station 3	8:31	0.0 ppm

COMMENTS:

Winds S @ 4.5 mph.

Bolander building roads / maintaining stockpile staging areas in exclusion zone.

5. Ambient Air Monitoring - PM10 (Particulate Monitoring) (Action Level - 0.1 mg/m^3 above background)

Instrument used:	MIE DataRam PDR	
Calibration performed? (Y or N)	Yes	
Station / Sample Location	**Time**	**Reading (provide units)**
Station 1	8:16	0.005 mg/m^3
Station 2	8:24	0.006 mg/m^3
Station 3	8:31	0.001 mg/m^3

COMMENTS:

Winds S @ 4.5 mph.

Bolander building roads / maintaining stockpile staging areas in exclusion zone.
