RISK 220620 - KOPPERS COMPANY, INC.  
JACK SEEL - CLAIM OD-181520

On behalf of the employer, we are writing this memorandum to bring the following facts to your attention. Please consider this information as you evaluate Mr. Seel in reference to his industrial claim and the alleged contact dermatitis condition.

1. Licking County Hospital Reports of January 15, 1982, January 25, 1982, and February 4, 1982, denote a change of diagnosis from contact dermatitis to atopic eczema.
2. At the district hearing, Mr. Seel indicated his problem developed due to the addition of ferric chloride in the asphalt. The research of Koppers Company's Corporate Safety Director and Corporate Toxicologist indicates that the ferric chloride concentration level is too low to cause any harm, as the level is 100 gallons of ferric chloride per 30,000 gallons of asphalt. Furthermore, excess fumes are burned off at 1,300 degrees fahrenheit.
3. The employer can substantiate that their asphalt system is completely self-contained. As the asphalt is placed in the containers at 340 degrees to 640 degrees fahrenheit, any contact, although not possible, would result in third degree burns, not contact dermatitis. The wand used to dispense the asphalt is approximately six to eight feet in length, with the nozzle designed to avoid splashes. Because the work environment is entirely a closed system, Koppers Company wishes to refute any allegations made by the claimant that he was covered by asphalt during the course of his daily work.

We have attached the pertinent research material substantiating this memorandum. Thank you for your review of this matter.
