

between smoking habits and the incidence of mesothelioma; this disease is equally prevalent in smokers and non-smokers alike. Of the studies listed in Table 4, only Study no. 13 of chrysotile factory workers shows a lung cancer mortality that would be expected from the smoking habits alone.

Asbestos miners and millers. Men working in the mining and milling of asbestos ore are generally exposed to only one form of fiber. A few exceptions occur in the mining regions of South Africa, where some workers have been employed in crocidolite, amosite, and chrysotile mines. Anthophyllite and tremolite asbestos miners may have been exposed to some chrysotile asbestos, because these minerals can coexist in metamorphosed ultramafic rocks, for example those of Paskkila, Finland, and Kamish, Idaho.

Epidemiological studies of asbestos miners and millers who were exposed to only one form of asbestos are useful for understanding how the different asbestos minerals affect human health. In Table 5 are given the mortality data for the five major epidemiological studies of asbestos miners and millers. In addition, three studies are given of miners exposed to cummingtonite and grunerite amphibole dusts and one study of tunnel workers exposed to hornblende amphibole dust. Some classify these amphiboles as asbestos, even though they do not possess the physical properties requisite to be valuable commercially. Such a classification has been made in the case of taconite mining by the courts (United States District Court for Minnesota, 380 F. Supp. 11) and by the U.S. Environmental Protection Agency (Reserve Mining vs EPA, U.S. Court of Appeals Eighth Circuit, March 14, 1975), which has sued to prevent the Reserve Mining Company from dumping taconite tailings into Lake Superior because of the perception that these tailings contain "amosite asbestos" and thus constitute a threat to public health. For a complete review of the case, see 514 Federal Reporter, 2d Series, 492-542, 1975; 256 North Western Reporter, 2nd Series, 808-852, 1977. Of interest regarding this suit are the health studies accomplished on the Reserve iron ore miners exposed to cummingtonite and grunerite in the taconite rock (Table 5, Study XI) and on the Homestake gold miners exposed to

1. The first step is to identify the problem or goal. This involves understanding the current situation, the desired outcome, and the constraints. It is important to be clear and specific about what you want to achieve.
