MONSANTO RESEARCH CORPORATION

Inter-Office Correspondence

From LOCATION : B. J. Warner, Dayton Laboratory (1250) cc : F. N. Hodgson
DATE : 17 October 1978 D. G. Glasgow
SUBJECT : PCB Analysis of Monkey Tissue
REFERENCE :

TO : Dr. Peter Berteau
St. Louis - A2SC

Enclosed is the data for the samples analyzed for Aroclor 1254 thus far. Included in this report are the milk samples submitted, several baby skin and fat samples, and some adult fat samples.

I also will be sending you a second data sheet containing values for the remainder of the baby monkey samples and additional adult samples within ten days. Also included in this group will be data for the concentrations of seven samples sent with the original shipment of tissue samples that had been extracted by St. Louis, but not chromatographed. All of these samples have been processed; but due to a temporary problem with our gas chromatograph, the GC analysis has not been completed.
