SUBJECT: CONOCO QUERY ON SWECO SCREENING EFFLUENT

A John McGulley of Conoco, Ponca City, Oklahoma (405-767-3634) called to give us something and to ask for something.

He gave: The results of Conoco's investigation of their tank car excess flow valves. Of 50 cars checked, two valves were defective. The cars were purged and the valves were physically checked in some manner with workers inside. The procedure is too expensive to do on a regular basis and they are looking into means of testing the valves in actual operation. They, of course, consider 2 of 50 to be an unacceptable failure rate.

He asked for: Opportunity to discuss with someone at Perryville the Sweco screening of Suspension Plant solids from effluent. He had heard from a vendor that Perryville had such a device. They are considering a rotating basket screen for their suspension resin waste water. I agreed to come back to him on this with some answer. If we decline to discuss it, he will understand. If there is no proprietary interest involved, it would be a way of continuing our good neighbor policy.
