St. Louis, Missouri 63166

Dear Elmer:

Our estimate for the additional fish toxicity studies with the Aroclors is $2,700. It seems at the present time that we will not be able to achieve concentrations of 1260 sufficiently high to cause mortality. If this continues to be the case, the price may be somewhat reduced.

As we stated at the time of your most recent visit, the cost for conducting chick edema studies would be $750/material.

The cost for repeating the chicken study with Aroclor 1242 would be $6,000 if three dose levels and controls are utilized or $1,500/group. The cost per group would be the same if fewer than three dose levels are investigated.

The cost for conducting mutagenic studies using the chick embryo technique would be $3,500 for one material or $5,500 for two materials studied simultaneously.

I understand that Kep is sending you a separate quotation for an inhalation study with the thermal decomposition products of Skydrol.

With best regards.

Sincerely yours,

013712
