Re: SAWING MARANITE

In view of the analysis of the above product, we certainly agree that a threshold limit value for a weighted 8-hour repeated daily exposure would be 5 MPPCF. One of the things we are anxious to avoid, though, is misinterpretation of the meaning of threshold limit values for pneumoconiosis-producing dusts. Certainly, atmospheric levels of 2 to 3 times the threshold limit value for repeated daily exposures of 1 to 2 hours would be well within the interpretation of this limit provided the individual is not exposed to significant atmospheric levels of other pneumoconiosis-producing dusts during the day.
