INCINERATION OF PCBs

W. B. Papageorge - B2NA

Attached is a note from Bill Ward of GM Corporate Engineering Staff with attached article from "Solid Waste Report" on destruction of PCBs in solid waste at temperatures of 1100°F. (exhaust gas). Of particular note, however, is that PCB levels in the sludge ranged from only 0-105 ppm.

Bill asks if we could supply more information on our incinerator than I supplied to him by phone. Basically, I covered the information given in your 9/27/72 letter to S. Roehr of Monsanto Europe. I assume Bill's interest is in possibly having an incinerator built for GM or finding someone closer to Detroit to burn the large amount of old Pydraul fluids from Michigan GM plants.

Would you please give Bill pertinent details of construction and operation of our incinerator at WGK. Your assistance is appreciated.

J. H. Davidson
