Hot-Flow* SOFTENERS SAFE BOILER FEEDWATER

Hot-Flow Softeners combine heating and softening of feed-water and de-aeration when desired, in a single unit. Removal of the bulk of carbonate hardness and silica absorption by lime treatment reduces dissolved solids, silica, and alkalinity. Non-carbonate hardness is removed by use of soda ash in conjunction with lime. The result—low hardness, low silica, SAFE water for boiler feed. Chemicals used less than lime and soda ash may be used when required to provide final water of desired characteristics.

When would you like to have one of our engineers call? INFILCO Inc., 337 W. 31th Place, Chicago 16, Ill.

*Trade Mark Reg. U. S. Pat. Off.

EXCLUSIVE DESIGN. Incoming raw water is heated and mixed with chemicals in the upper annular section and flows slowly around and downward. Chemical reactions are completed in the annular outer compartment, and on reaching the bottom, direction of flow is reversed and treated water rises in the central cylindrical zone to the top. Precipitates formed settle as a sludge in the conical bottom.

COCHRANE HOT PROCESS SOFTENERS

high in alkalinity, waters having low hardness and low solids, as well as waters containing considerable quantities of encrusting matter and solids can be treated satisfactorily with this method. * With various chemical reagents considerable reduction in silica and organic matter can be effected. * With lime and soda as reagents the hardness is reduced to 15 to 25 ppm. and with the use of phosphate either in the single or two-stage method to zero. * The Cochrane Detering Hot Process Softener (illustrated above) combines in one piece of equipment the operations of softening water, preheating it and deterring it by atomization to remove dissolved oxygen and other gases. Write for Publication 3000.
