K. Smith
H. T. Yee

asbestos fiber concentrations recorded in the survey were well below the OSHA standards. This meant that no asbestos dust problems were present in the testing laboratory during the survey period.

Comments

In view of the insignificant asbestos dust concentrations herein reported, a detailed discussion of the survey findings is considered unwarranted. However, it is pertinent to note that, according to the laboratory technicians, we did not encounter the worst dust conditions that could occur in the dynamometer room when large, 3' diameter, clutches were tested.
