

EX12

M. D.
D.D.S.
VIRGINIA

8, 1957

Dr. Mr. C. Arthur Jeffers

Dear Dr. Wallace:

This is a report on the above named patient.

HISTORY:

He complains of itching blurring and various types of irritation about the eyes. These are associated, in the patients mind, with the fumes at the plant.

EXAMINATION:

External-There is a mild grade of conjunctivitis in each eye.

Corneal Microscope-Not abnormal.

Internal-Within normal limits.

REFRACTION:

Right eye - +0.50 _____ = 20/15- N.A. +1.00
Left eye - +0.75 _____ = 20/15-

LABORATORY FINDINGS:

Numerous staphylococcus epidermoids in each eye.

COMMENT:

This patient was last seen on July 2, 1957. At that time the above refraction was done. Since he did not have bifocals these were recommended so as to eliminate any possibility of a refractive error causing the trouble.

The laboratory reports indicate there is a staphylococcus conjunctivitis which is difficult to relate to his employment, especially, without the findings of eosinophiles in the smears.

Sensitivity tests done on these organisms reveals aureomycin and erythromycin more effective. Consequently, these two drugs were ordered along with the new lenses and I would like to see this patient again in two weeks to see if the situation has improved.

DIAGNOSIS:

- (1). Conjunctivitis, mild, cause undetermined.
- (2). Presbyopia.

Sincerely yours,

Alfred J. Magee, M. D.

referred with Mr. Jeffers
by 7-9-57 - told him his
previous bills would be
paid by Homeauto & further
expenses would have to be paid
by him, since the disorder seems
non-occupational. L.B.W.
