Subject: C-8 analysis at WW lab

Steve,
I imagine you had enjoyed in your Easter holidays.

We are at work on introducing new method of measuring C-8 level of waste water at Shimizu lab.

Traditionally methylene blue method has been used for this purpose here. For my understanding, you are involved in C-8 analysis at WW lab. And ECD GC is used for measuring the C-8 level at WW.

Now we are planning to install ECD Gas Chromatography apparatus as our new method.

For purchasing new ECD GC at Shimizu, any your comment or advise would be appreciated.

Thank you in advance.
Akito
