## LEAD AND ZINC PIGMENTS AND

By C. E. SIEBENTHAL and A. STOLL

### GENERAL CONDITIONS

Lead and zinc pigments and salts are made both by chemical processes. Sublimed lead, or basic lead, the various lead oxides are lead pigments produced in oxidizing furnaces; basic carbonate white lead and are made by chemical processes. Sublimed lead, or basic lead, is made directly from ore, but the lead oxides as well as lead salts are made from pig lead.

Zinc oxide and leaded zinc oxide are made by the French process directly from ore by sublimation in an oxidizing furnace. Zinc oxide is made in this country by the French process. Metallic zinc is sublimated in an oxidizing furnace. Zinc salts are made by chemical processes, the zinc being obtained from zinc ore, metallic zinc, galvanizers' ashes, or scrap. Lithopone is made by mixing equivalent portions of zinc sulphate and barium sulphide, which brings about the precipitation of zinc sulphide and barium sulphate either in combination or as a very intimate mixture.

The sales of nearly all lead and zinc pigments and salts by producers, showed gains in 1924 as compared with 1923. Sublimed lead, or basic lead sulphate, made the greatest gain, 15 per cent. Demand for white lead, or basic carbonate white lead, reported good and sales increased 15 per cent. Sales of zinc oxide showed a continued increase, making a gain of 11 per cent. in 1923. The sales of zinc oxides also kept pace with demands and advanced 5 per cent.

The French process zinc oxide plants of the Inland Zinc Refining Co., at Akron, Ohio, and East Chicago, Ind., reported operation in January, 1924, and October, 1924, respectively, doubling their capacity. Some crude zinc oxide was produced in 1924 at the Bully Hill plant of the California Zinc & Chemical Co., Calif. The lithopone plant of the Chemical & Pigment Co., Glena, Md., doubled its capacity. Increased capacity was reported for the lithopone plants of the Krebs Pigment & Chemical Co., New York, Del., and the St. Louis Lithopone Co., St. Louis, Mo. A new lithopone plant of the Mineral Point Zinc Co., Mineral Point, Wis., reported a substantial output. Former producers of

have either permanently or temporarily discontinued the manufacture of this product are: American Smelting & Refining Co., Omaha, Nebr.; American Steel & Wire Co., Donora, Pa.; American Zinc & Chemical Co., Langloeth, Pa.; Bartlesville Zinc Co., Bartlesville, Okla.; Bertha Mineral Co., Austinville, Va.; Trenton Zinc & Chemical Co., Trenton, N. J.; and Utah Zinc Co., Murray, Utah

### PRODUCTION

In this chapter the pigments and salts sold are taken to represent the production, no account being taken of the stocks on hand at the beginning and end of the year. The amounts used by producers at their own plants are included under sales.

Lead pigments and salts sold by domestic manufacturers in the United States, 1923 and 1924

\* Includes also lead recovered in zinc oxide and leaded zinc oxide. The source of the lead contained in lead salts is unknown to the authors, as statistics are collected biennially by the Bureau of the Census and for odd years only. Lead is recovered from granulated lead, and from white-lead residues. Lead arsenate is made from nitrate. All having been derived from pig lead, their content has already been counted.

Zinc ashes, skimmings, drosses, and old metal.

### IMPORTS AND EXPORTS

The following statistics of imports and exports of lead pigments and salts have been compiled from the publications of the Bureau of Foreign and Domestic Commerce, of the Bureau of Mines.

Basic carbonate white lead, red lead, litharge, and orange mineral imported for consumption in the United States, 1920-1924

| Year      | Basic carbonate white lead |          | Red lead |         | Litharge |         | Orange mineral |         |
|-----------|----------------------------|----------|----------|---------|----------|---------|----------------|---------|

## PRICES AND VALUE

The total value and the average price per ton received from sales of lead and zinc pigments and salts in 1924 are given on preceding pages of this chapter.

Figure 3 shows the relation of the average weekly price of lead in New York in 1924 to the weekly quotations on the lead pigments—sublimed lead, white lead, litharge, red lead, and orange mineral—

FIGURE 3.—Relation of weekly prices of lead pigments and salts to the average weekly quoted price of lead at New York, 1924

and the lead salts—lead arsenate and lead acetate. The quotations, taken from issues of the Oil, Paint, and Drug Reporter, represent the following grades and forms:

Sublimed lead, or basic lead sulphate (white), "in casks."  
White lead, basic lead carbonate, "American, dry, in casks."  
Litharge, "commercial, powdered, in casks."  
Red lead, "dry, in casks."  
Orange mineral, "American, in casks."  
Lead acetate, "brown, broken, in barrels."  
Lead arsenate, "paste, in barrels."

## LEAD AND ZINC PIGMENTS AND SALTS

Figure 4 shows the relation of the average quoted price of western slab zinc in St. Louis to the weekly quotations on the pigments—zinc oxide and lithopone—and on the salts—zinc sulphate and zinc chloride.

FIGURE 4.—Relation of weekly prices of zinc pigments and salts to the average weekly quoted price of western slab zinc at St. Louis, 1924

and zinc sulphate. The quotations, taken from issues of the Oil, Paint, and Drug Reporter, represent the following grades and forms:

Zinc oxide, "commercially lead-free, in barrels."  
Lithopone, "in barrels."  
Zinc chloride, "solution, in drums."  
Zinc sulphate, "industrial, in barrels."

## PRODUCERS

The following companies reported sales of lead and zinc salts of their own production in 1924:

## White lead:

|                                                   |          |
|---------------------------------------------------|----------|
| Anaconda Lead Products Co. (electrolytic process) | East (C) |
| Carter White Lead Co.                             | West     |

| CONSUMPTION <sup>2</sup>                                           |  |
| Apparent consumption of primary lead, refinery stocks disregarded. |  |

<sup>1</sup> "Primary lead," which is produced directly from ore, is here distinguished from secondary lead, which is obtained by refining skimmings, drosses, and old metals. The figures are given on p. 162. In this report the word "lead" used without qualification refers to primary lead.

<sup>2</sup> For method of calculating consumption see p. 164.

The output of refined lead in the United States in 1924 was 566,407 tons, valued at \$90,625, selling price of pig lead, a gain, as compared with 1923, in quantity and of 19 per cent in value.

## PRODUCTION

*Quantity and value.*—The total refined lead produced in the United States from 1720 to 1924 from domestic ores and base bullion and its value are shown in the following table.

Refined lead produced in the United States, 1

| Year      | Short tons        |                        |             |                  |                                     |                   |
|-----------|-------------------|------------------------|-------------|------------------|-------------------------------------|-------------------|
|           | Desilverized lead | Desilverized soft lead | Soft lead   | Total production | From domestic ores and base bullion | From foreign ores |
| 1720-1912 | 7, 176, 407       | 328, 991               | 2, 020, 180 | 10, 425, 668     | 8, 545, 383                         | 1, 880, 285       |

| 1923      | 366, 241          | 61, 332                | 190, 749    | 618, 322         | 543, 841                            | 74, 481           |
| 1924      | 423, 426          | 68, 419                | 208, 615    | 699, 460         | 566, 407                            | 133, 053          |
|           | 11, 093, 113      | 1, 002, 300            | 5, 045, 933 | 17, 141, 346     | 14, 496, 162                        | 2, 645, 184       |

<sup>1</sup> The lead content of antimonial lead is excluded; see p. 161.

<sup>2</sup> Desilverized soft lead is excluded.

<sup>3</sup> Revised figures.

<sup>4</sup> Chapters on lead giving more than ordinary detail were published in the statistical table of production and 1918 (the lead industry in relation to the

Details for years prior to 1913 are shown in the annual chapters. The value for years prior to 1917 is based upon the average price in New York; beginning with 1917 the value is based on the total sales of each producing company.

The argentiferous lead ores of the Western States are desilverized to recover the silver and to refine the lead. The nonargentiferous or soft lead ores of the Central and Eastern States do not carry enough silver on the average to pay for desilverizing or to make that operation necessary. For certain purposes, however, a considerable quantity of lead ore from southeast Missouri has been desilverized each year.

**Production by States.**—In addition to the domestic lead ores smelted in this country, small quantities of domestic lead ore have been exported to smelters in Canada. Ores from Washington yielded 1,388 tons of lead at Canadian smelters in 1918 and 3 tons in 1919, but no lead ore from the United States was treated in Canada in 1920-1924.

*Primary lead smelted or refined in the United States, 1920-1924, by sources, in short tons*

\* The lead produced by these States is nonargentiferous or soft lead. A small quantity of the lead produced from Colorado and New Mexico ores is also nonargentiferous.

## LEAD

**Soft lead.**—The lead ores of the Mississippi from silver, and the lead produced from them. The output of the lead pigment basic lead sulphate is derived from these ores.

The lead ores from the southeastern Missouri little more silver (slightly over an ounce to the ton in all) than those from other regions of the Missouri. Likewise small quantities of other metals, so that though soft, is resistant to acids and is much used in acid chambers. It is known to the trade as 'soft lead'.

*Soft lead produced in the United States from domestic ores*

| Year      | Soft pig lead  |              |         | Soft lead recovered in pigments |
|-----------|----------------|--------------|---------|---------------------------------|
|           | Undesilverized | Desilverized | Total   |                                 |
| 1920..... | 189,954        | 66,068       | 256,022 | 15,200                          |
| 1921..... | 157,613        | 62,747       | 210,360 | 9,800                           |
| 1922..... | 200,250        | 74,305       | 274,555 | 13,800                          |

| 1924..... | 203,616        | 63,440       | 267,056 | 15,300                          |

\* Includes domestic refined lead, domestic lead in antimonial lead, and foreign lead.

The zinc ores from Western States that are may contain some lead which goes into the product. It is not strictly accurate to speak of the lead as entirely soft lead.

In addition to the domestic lead so recovered is also recovered in pigments. Prior to 1919 it was not distinguished from that of domestic origin. Of foreign lead recovered in zinc pigments was 1920, 808 tons; in 1921, 169 tons; and in 1924, lead was used in pigments in 1922 or 1923.

**Antimonial lead.**—The production of by-product from argentiferous lead ores derived from all soft lead refineries operating in this country, is shown in 1871-1914 in Mineral Resources, 1914, and for 1920-1924 in Mineral Resources, 1920.

*By-product antimonial lead produced in the United States*

**Lead pigments.**—Leaded zinc oxide, zinc-lead oxide, sublimed white lead, and sublimed blue lead are made directly from ore; white lead, red lead, orange mineral, and litharge are manufactured from pig lead. These pigments are discussed and their output given elsewhere in this volume in the chapter on lead and zinc pigments and salts.

The lead recovered from domestic and foreign ore in the form of pigments during recent years is given in the following table, which also gives the primary and secondary lead used in making those pigments that are made from pig lead:

Quantity and source of lead in pigments,\* 1920-1924, in short tons

| Year      | Domestic ore | Foreign ore | Primary metal † | Secondary metal † |
|-----------|--------------|-------------|-----------------|-------------------|
| 1920..... | 15,212       | 808         | 215,431         | .....             |
| 1921..... | 9,989        | 169         | 200,599         | .....             |

| 1923..... | 13,612       | .....       | 236,841         | .....             |
| 1924..... | 18,338       | 645         | 250,930         | .....             |

\* Includes lead recovered in zinc oxide and leaded zinc oxide.

† Primary metal is that made from ore; secondary metal is that derived from old metal and from drosses and skimmings.

**Secondary lead.**—Secondary lead is obtained mainly from skimmings, drosses, old metal, and alloys, such as babbitt, solder, and type metal. The recovery of lead by refining these materials constitutes an integral part of the lead industry.

Secondary lead recovered in the United States, 1920-1924, in short tons,

| Year      | Pig lead | Lead in alloys | Total recovered lead | Value        |
|-----------|----------|----------------|----------------------|--------------|
| 1920..... | 58,360   | 68,300         | 124,660              | \$10,914,000 |
| 1921..... | 46,370   | 57,410         | 103,780              | 9,340,000    |
| 1922..... | 75,480   | 84,080         | 159,560              | 17,652,000   |
| 1923..... | 98,430   | 98,060         | 194,490              | 27,229,000   |
| 1924..... | 90,400   | 114,100        | 204,500              | 32,720,000   |

**Mine production.**—The preceding tables give the quantity of lead recovered by smelting and refining operations either as metallic lead, or in the alloy antimonial lead, or as lead in pigments. The origin of the lead is much more accurately shown by the reports of mines, because smelters necessarily treat mixtures of ores, sometimes long after they have been received, so that the actual output of metallic lead may not correspond at all closely to the product of the mines for the same year.

The following table gives the mine output of lead from 1920 to 1924, inclusive. The statistics of mine production, which for years prior to 1921 had been expressed as lead content of ore mined, were reduced to recoverable lead in the chapter on lead for 1923 by deducting an assumed loss in smelting and refining, thus making the figures comparable to the statistics of mine production of zinc, which have always been stated as recoverable zinc. In these calculations the loss

## LEAD

in smelting and refining has been taken as (at plants with bag houses) the soft nonarg the Mississippi Valley, and about 5 per cent the argentiferous lead ores of the Western assumed factors are close to the truth is sh discrepancy between the mine and smelter outp the table of comparison on page 136 of the ch Resources, 1923, and in the following section

#### COMPARISON OF MINE AND SMELTER TOTALS

The Geological Survey published annually from 1907 to 1920 the statistics of lead output by mines, but because of lack of knowledge of the average smelting loss for the whole country, the total was, in general, given as lead content of ore mined, not as recoverable lead. Beginning with 1921, the lead output of the mines has been expressed as recoverable lead by estimating as closely as possible the losses in smelting and refining. For the sake of the following comparison the mine totals for 1906 to 1920 have likewise been calculated as recoverable lead. In addition to the domestic lead recovered at smelters as refined desilverized lead from argentiferous ores, as soft lead from Mississippi Valley ores, and as lead in antimonial lead and in pigments, considerable lead has been recovered at Canadian smelters from lead ores exported from the United States. This is included in the recovered lead given in the table below, which balances the primary lead recovered in all forms against the estimated recoverable lead in the ore mined for 18 years, the whole period for which such data are available.

Domestic primary lead balance sheet, 1907-1924, in short tons

| Year | Recoverable lead (mine production) | Recovered lead (smelter production) | Mine excess (+) or smelter excess (-) | Year | Recoverable lead (mine production) | Recovered lead (smelter production) | Mine excess (+) or smelter excess (-) |
|------|------------------------------------|-------------------------------------|---------------------------------------|------|------------------------------------|-------------------------------------|---------------------------------------|
| 1907 | 364,715                            | 365,506                             | -791                                  | 1917 | 628,464                            | 578,925                             | +49,539                               |

#### SUPPLY OF LEAD

The future of the lead industry depends on the latter on supply and demand, and the supply in new and old fields as well as on higher recovery through metallurgical methods; these of course have always been factors in the industry, although imaginary factors in speculative movements. Relief from the present may therefore be afforded by discovery of new ore, improvement in separation and concentration, by which graver methods are added to the country's or world's methods in reduction, which accomplish the same thing the cost of reduction or by effecting a separation process of reduction; and lessening of demand either by substitution of other metals.

The price of lead has fluctuated greatly in the past, owing to the opportunity for speculation offered by spot lead at times. These fluctuations have produced and the consuming branches of the industry have aroused fears for the adequacy of the future supply of the country. Of course, a temporary shortage of lead indicates that the lead reserves of the country are partially failed of the wheat or corn crop indicate of the soil is waning. When production runs below the average, however, and a greater supply is necessary, it takes time to find and open new deposits and to reopen old ones. The constancy of price only the experienced, farseeing companies will undertake such work. The smaller companies will remember that though lead averaged 8 cents in 1915 and has averaged 6.8 cents for 1916 to 1924, inclusive, for 1921 was 4.5 cents, the same as the pre-war average in 1915. Many promising prospects and mines must be closed down and the operating companies wiped out in the receipts for their product and high postwar cost. There is yet hope that some of them will be reopened.

If the price of lead could remain steadily at the present level, no one need doubt that our production would be sufficient of a scarcity of spot lead. If lead had no more price with the average of metals and metal products would have sold in 1924 for about 6.9 cents.<sup>1</sup> With the average of all commodities it would have been 6.6 cents in 1924; if with agricultural products, with nonagricultural products, at 7.2 cents; and with living, at 7.6 cents. It would seem, therefore, with other commodities (except, of course, copper and silver), the average for 1924, is not unfair.

The present situation with regard to the lead supply is this: The United States and Mexico produced more than ever before. Canada has quadrupled her production since the war and is still expanding her capacity. Australia has been well up toward her large war-time production in the last two years. The chief reserves upon which Australia and Canada

<sup>1</sup> Bureau of Labor Statistics, Monthly Labor Review, Department of Labor.

been recently said to be equal to about 20 years' draft at the present rate. Moreover, a new field is under development in Queensland, and a concentrating method is being sought for the extensive Read-Rosebery complex ores of Tasmania. The Burma output has nearly trebled since the war and the reserves are equal to nearly 20 years' output at the present rate, disregarding current additions to reserves by mine operations. The output from other sources of lead in Africa, Asia, and South America remains about stationary, but Europe is approximately 220,000 tons short of her pre-war production, chiefly because of the lessened output of Spain, Germany, and Poland. Apparently, the Old World misses the efficient ore-gathering machine of the German metal companies. The world's production in 1924 was the largest in history by over 125,000 metric tons, according to the American Bureau of Metal Statistics.

Residence and business building has been extremely active in this country ever since the World War, and has required supplies of plumbing and other lead material. Such construction was needed not only to accommodate the great expansion of business immediately after the war but also to catch up with current needs and with arrears in residence building. Dow's Agency recently noted that apartment building is threatened with overproduction in certain directions, and continuing the erection of business buildings is, of course, contingent upon continued business prosperity. The automobile industry consumes much lead, but the saturation point in that industry must be reached eventually, and then the salvaged lead will practically equal the consumption of new lead. There is, moreover, a pronounced trend toward the use of less lead. A substitute for lead in underground cable coverings will probably be found. Moreover, encouraging experiments are under way on reduction in the size of individual cable wires as well as in the amount of insulating material, which will permit many more wires in the same space and reduce the consumption of lead for cable covering. Recently a radio tube has been put on the market which uses alternating current, where that is available, instead of the more usual storage battery or the occasional step-down transformer on external direct-current supply. Transformers and rectifiers which eliminate "B" batteries (some of which are lead storage-batteries) have been in use for some time. There is now a tendency to make the ordinary tube set more portable by replacing lead storage-batteries with dry batteries which use no lead.

According to the American Bureau of Metal Statistics, storage batteries (all kinds, of course) consumed the largest amount, about 170,000 short tons, of lead in 1924; white lead took 150,000 tons, and cable covering, 138,000 tons. France, Soviet Russia, and Argentina have legislation, not yet in effect, restricting the use of white lead, hence legal measures or economic necessity might force substitution of other white pigments for part of the lead used in white lead. The examples of lead conservation cited show that the rapidly increasing consumption of lead in the immediate past may not continue indefinitely. Lastly, attention is again called to the 100,000 tons of lead in ore, matte, and bullion in bonded warehouse, December 31, 1924.

## METALLURGY

## ADVANCE IN METALLURGY

Recent advances in the separation and concentration of lead ores have been made possible mainly by roasting, especially differential flotation, but also by volatilization, and by leaching or volatilization. These advances are to be important to the lead industry because they will increase the supply of lead by allowing the use of lead from ore, and especially by making available complex sulphides or mixed sulphide and oxide ores previously unworkable, some because of the penalty exacted for their treatment which may thus become an asset.

The present movement for more effective concentration of lead ores started at the Sullivan mine in British Columbia by the Consolidated Mining & Smelting Co. after much experimentation by differential flotation in overcoming the objection of the loss of lead and zinc in the ore, has been the largest sulphide ore body in North America. Success in treating the ores the company has been able to increase the capacity of the lead smelter and the electrical power required. A plant accomplishing the same result has been constructed a custom plant which pays miners for the complex ores. A plant accomplishing the same result has been started by the International Smelting Co. at Tooele, Utah; and still others have been built by independent companies. Operation of such plants increases the supply of lead because greater quantities of the lower-grade ores can be treated.

No attempt will be made to discuss the advantages of the proposed roasting, leaching, or volatilization processes. It seems advisable to review a few processes which are being developed commercially.

The Coolbaugh process, now operated by the Coolbaugh & Refining Co. in connection with its lead smelter, by a closely controlled roast renders a high grade concentrate leachable as zinc sulphate; the residue from the lead smelter. It has not yet been marketed as an outlet for the zinc sulphate will be as good as lead-free zinc oxide, or electrolytic zinc.

At Harold, Utah, the Tintic Standard Mill is using the Dern process for an oxidized silver-lead ore. The ore is roasted with salt and coal dust and leached with bromine. Finally lead and silver are precipitated separately. The lead is melted into refined lead bars in a suitable furnace. The initial output in 1924.

The Combined Metals Reduction Co., a subsidiary of the Lead Co., is using the Snyder-Christensen process. The finely ground unroasted lead concentrate is leached with acid brine, silver is precipitated by lead, and

<sup>1</sup> The following papers will be found useful in reviewing this metallurgy of lead: Trans. Am. Inst. Min. and Met. Eng., G. L., "Present tendencies in treatment of complex ores"; Trans. Am. Inst. Min. and Met. Eng., A. B., "Progress in hydrometallurgy of lead"; Trans. Am. Inst. Min. and Met. Eng., vol. 119, 1926, pp. 65-61.

cooling the liquor and is reduced to bars by melting with a mixture of lime and coal dust. As the ore is worked at Bauer the zinc is mainly floated in concentration, but any zinc remaining in solution is precipitated by  $H_2S$  and filtered off for electrolytic reduction or shipment to zinc smelters.

At the Bunker Hill & Sullivan Mining & Concentrating Co., U. G. Tainton and others have developed a process for the treatment of the zinc-lead ore from the Star mine. The ore is roasted and leached, the zinc recovered by Tainton's "high-acid" process, and the leady residues leached with brine and precipitated electrolytically. The contracting of the Star mine's zinc concentrates to Belgian smelters, as recently announced, may delay the construction of a commercial plant employing these Tainton processes.

It is to be noted that these methods of brine leaching are applicable not only to the complex ores, both sulphide and oxidized, from the mines and to tailings and middlings from their concentrating plants, but also to tailings from electrolytic zinc plants, to leady flue dusts, and to leady sludges from sulphuric acid chambers, and the like. In this adaptability lies much of their promise.

### LEAD SMELTERS AND REFINERIES

#### UNITED STATES

- California:  
Selby—Selby plant, American Smelting & Refining Co. Refinery also.
- Colorado:  
Durango—Durango plant, American Smelting & Refining Co.  
Leadville—Arkansas Valley plant, American Smelting & Refining Co.
- Idaho:  
Kellogg—Bunker Hill & Sullivan smelter. Refinery also.
- Illinois:  
Chicago—Goldsmith Bros.' Smelting & Refining Co.<sup>1</sup>  
Chicago—Great Western Smelting & Refining Co.<sup>2</sup>  
Chicago—Illinois Smelting & Refining Co.<sup>3</sup>  
Chicago—U. S. Reduction Co.<sup>4</sup>  
Collinsville—St. Louis Smelting & Refining Works of National Lead Co. Refinery also.  
Federal—American Smelting & Refining Co. (Formerly Federal Lead Co.)
- Indiana:  
East Chicago—International Lead Refining Co.<sup>5</sup> Refinery only.  
Grasselli—U. S. S. Lead Refinery (Inc.).<sup>6</sup> Refinery only. Betts electrolytic process.
- Kansas:  
Galena—Galena plant, Eagle-Picher Lead Co.
- Missouri:  
Granby—American Zinc, Lead & Smelting Co.  
Hercules—St. Joseph Lead Co.  
Joplin—Eagle-Picher Lead Co.
- Montana:  
East Helena—East Helena plant, American Smelting & Refining Co.
- Nebraska:  
Omaha—Omaha plant, American Smelting & Refining Co. Refinery only. Betts electrolytic process.
- New Jersey:  
Irvington—Irvington Smelting & Refining Co.<sup>1</sup>  
Newark—Balbach Smelting & Refining Co.  
Perth Amboy—Perth Amboy plant, American Smelting & Refining Co.
- Oklahoma:  
St. Louis—Ontario smelter, Eagle-Picher Lead Co.

#### TRADE CONDITIONS

#### WORLD'S SMELTER PRODUCTION

In the following table, prepared by W. I. of Mines, the figures in italic type are taken of the countries named; those in ordinary yearbook of the American Bureau of Metal sources regarded as reliable. However, substituted when they are available, as in official set of statistics of world production set like that of the American Bureau of Metal.

There is always a possibility of duplication of world's production, for some countries sell bullion to other countries for refining. For antimonial lead are often included in the production, so that to put the United States statistics it would be necessary to include in the output of secondary lead and antimony the United States represent refined lead from the try, whatever the source of the ore.

<sup>1</sup>Subsidiary of American Smelting & Refining Co.  
<sup>2</sup>Subsidiary of Anaconda Copper Mining Co.

## World's production of lead, 1918-1924

\* Since July 1, 1915, the Bureau of Foreign and Domestic Commerce has classed all foreign lead smelted or refined in this country and exported as "domestic exports of pigs, bars, etc., produced from foreign ore." The above figures include also the exports of foreign lead imported in the form of pigs and bars.

† Not separately classified after 1922.

## Domestic and foreign pig lead exported from the United States, 1923-24, by destinations

## PRICES AND VALUE

The accompanying graph (fig. 5) shows the trend in the quoted price of lead for prompt delivery in the New York market in 1923-24. The price rose from 8.3 cents a pound at the beginning of the year to 9.87 cents the last of February, and then declined to 7 cents in June. A decided upward trend through the remainder of the year culminated in a quotation of 10.2 cents at the end of December. The average quoted price for the year was 8.3 cents, compared with 7.4 cents in 1923. A graph of the lead prices quoted in London is shown for comparison; in it fluctuations in exchange have been taken into account.

The following are prices quoted on lead throughout 1924 by the American Smelting & Refining Co., in cents a pound:

|      |              |      |              |      |              |

| Apr. | 3..... 8.75  |      | 15..... 8.00 |      | 26..... 9.60 |

The average selling price, based on total sales, was 8 cents a pound in 1924, compared with 7 cents in 1923. The value of the refined lead produced in the United States from domestic ores, based on the average selling price a pound, was \$90,625,000 in 1924, compared with \$76,138,000 in 1923.

## GOLD, SILVER, COPPER, AND LEAD

(MINE REPORT)

By V. C. HEIKES

## PRODUCTION

The mines of Arizona produced in 1924 lead valued at \$99,610,379. Compared with 1923, the output decreased \$4,690,821, or 4.6 percent. The mines of Arizona, United Verde, United Eastern, Arizona, and mining companies paid dividends amounting to \$1,000,000. Phelps Dodge Corporation, operating mines in Arizona, and also in Mexico and New Mexico, is not included in the total given above.

Although the quantity of copper increased, the value decreased. This decrease in value formed the greater part of the decrease in the State total, though there were also a decrease in the value of silver, and no zinc was reported. The value in gold and silver decreased from 71

## Mine production of gold, silver, copper, and lead

|                                     | Number of producers | Ore and tailings | Gold •      | Silver •    | Copper •  |
|-------------------------------------|---------------------|------------------|-------------|-------------|-----------|
| 1924.....                           | 275                 | 19,820,505       | \$4,878,465 | \$3,649,276 | \$677,000 |
| Increase or decrease from 1923..... | -60                 | +2,805,337       | -1,242,650  | -694,406    | +58,000   |

• Includes placer production.

## ORE

Copper ore led in quantity the ores mined, and siliceous gold ores and lead ore followed. The value of the metals in the ores and tailings were as follows: copper ore, \$94,575,415; lead ore, \$2,308,900; silver ore, \$65,182. In addition the placers produced \$3,157. Thus the State total was \$99,610,379.

## Zinc dust sold by producers in the United States, 1919-1924

| Year | Prepared "blue powder" |           |                   | Zinc dust "atomized" |           |                   | Primary zinc recovered as zinc dust (short tons) |
|------|------------------------|-----------|-------------------|----------------------|-----------|-------------------|--------------------------------------------------|
|      | Short tons             | Value     |                   | Short tons           | Value     |                   |                                                  |
|      |                        | Total     | Average per pound |                      | Total     | Average per pound |                                                  |
| 1919 | 4,083                  | \$801,366 | \$0.098           | 2,715                | \$566,294 | \$0.104           | 3,430                                            |
| 1920 | 2,060                  | 2,009,117 | .111              | 2,463                | 555,773   | .113              | 6,424                                            |
| 1921 | 2,006                  | 333,390   | .083              | 999                  | 152,161   | .076              | 1,880                                            |
| 1922 | 3,394                  | 531,225   | .078              | 3,859                | 573,220   | .074              | 2,118                                            |
| 1923 | 3,676                  | 643,766   | .088              | 4,376                | 702,923   | .080              | 2,450                                            |
| 1924 | 3,894                  | 620,078   | .080              | 4,063                | 621,221   | .076              | 1,861                                            |

The average price of zinc dust, "blue powder," as calculated from sales during the year, was 8 cents a pound; "atomized" zinc dust brought 7.6 cents a pound. "Blue powder" brought a higher average price than "atomized" dust, because much of it was sold in the far West, where higher prices prevailed. The weekly fluctuation in the quoted price of zinc dust is shown in Figure 7 (p. 253).

The following operators reported the production of zinc dust in 1924:

Bartlesville Zinc Co., Bartlesville, Okla.  
 John Finn Metal Works, San Francisco, Calif.  
 Grasselli Chemical Co., Clarksburg, W. Va.  
 The Merrill Co., San Francisco, Calif.  
 New Jersey Zinc Co., Palmerton, Pa.  
 United States Zinc Co., Sand Springs, Okla.

## ZINC PIGMENTS AND SALTS

Zinc forms the base, either in whole or in part, of three white pigments—zinc oxide, leaded zinc oxide, and lithopone. Two zinc salts, the chloride and the sulphate, are likewise made in part from ore and in part from secondary zinc. Details of the production of zinc pigments and salts and of market conditions are given in the chapter on lead and zinc pigments and salts.

The zinc content of the pigments and salts made in the United States from ore, both domestic and foreign, for the period 1919-1924, is given in the table below. Statistics of the secondary zinc recovered in the form of pigments and salts are given under the next heading.

Primary zinc content of zinc pigments and salts made in the United States, 1919-1924, in short tons

| Year | Salts | Pigments | Year | Salts | Pigments |
|------|-------|----------|------|-------|----------|
| 1919 | 3,303 | 96,817   | 1922 | 1,801 | 63,112   |
| 1920 | 6,284 | 110,695  | 1923 | 1,573 | 115,970  |
| 1921 | 3,749 | 53,480   | 1924 | 1,075 | 108,282  |

## SECONDARY ZINC

## Secondary zinc recovered in the United States,

|                                                        |       |

See p. 235 for definition of secondary zinc.

## BY-PRODUCT SULPHURIC ACID

An important by-product of zinc smelting is sulphuric acid made from the sulphur gases of sulphide ores preparatory to their distillation as oxide or to zinc salts. Sulphur gases from zinc smelters are utilized by Matthiessen & Hegeler, at La Crosse, Wis. There are numerous acid plants using these gases. They may be at zinc smelters and zinc oxide plants, or at synthetic separating plants, at the mines, or at the roasted concentrates being shipped to zinc plants.

The following table gives the output of sulphuric acid made at or in association with zinc smelting in 1919, 1921, and 1923, as collected by the Bureau of Mines, and in 1924, as collected by the Bureau of Mines from the output of zinc smelters:

By-product sulphuric acid produced at zinc-blend smelters, 1919, 1921, 1923, and 1924

| Year | Number of establishments | Acid reported as 60°-60° B. | Produced | Consumed at works | Sold  | Value of acid sold | Total | Average | Total acid sold, equivalent in 60° B. | Quantity | Value | Consumed at works (60° B.) |
|------|--------------------------|-----------------------------|----------|-------------------|-------|--------------------|-------|---------|---------------------------------------|----------|-------|----------------------------|

## TANTALUM

Tantalum and its close associate, columbium, are still among the experimental metals—those possessing attractive properties but not shown to have wide uses that some other and cheaper metal or alloy will not fill as well or better. Inasmuch, however, as constant experimentation is developing numberless new uses for the elements and their alloys and compounds, other uses than those now known—uses they will be particularly adapted to fill—will probably be found for these metals.

To obtain these metals in a pure state, or a state of purity comparable to that of the iron, aluminum, or copper of ordinary commerce, is difficult and tedious, though not impracticable. Like vanadium, however, they can be converted into ferroalloys with comparative ease. Several patents have been taken out for their use in steel, but the steels have been made only in experimental lots. So far as is known the steels made have all contained both tantalum and columbium, and the effect of either metal alone is therefore not known.

The only known output of ores of these metals made in the United States for several years has been that shipped by Dr. A. T. Roos, Rapid City, S. Dak., who states that the production of columbite in 1924 was 1,197 pounds, "valued at about \$598. The columbite has come from pegmatite dikes near Keystone and Hill City, in the southern part of the Black Hills, and all the ore is thought to have been used for experimental purposes, most of it in ferro-tantalum-columbium, without separation of the two metals.

Columbite, mined in the United States, shipped in 1918-1924

| Year      | Pounds | Value   | Year      | Pounds | Value |
|-----------|--------|---------|-----------|--------|-------|
| 1918..... | 4,500  | \$2,250 | 1922..... | 000    | \$240 |
| 1919..... | 300    | 90      | 1923..... | 1,350  | 540   |
| 1920..... | 4,000  | 1,450   | 1924..... | 1,197  | 598   |
| 1921..... | 3,400  | 1,150   |           |        |       |

No imports of tantalum ores were recorded in 1922. The records of the Bureau of Foreign and Domestic Commerce show that 5,600 pounds of "tantalum steel-hardening ores," valued at \$3,031, were imported for consumption in 1923, but none were imported in 1924. American ores are not sufficiently free from columbium to make them suitable for the manufacture of tantalum under present processes.

The Funsteel Products Co., of North Chicago, Ill., markets a charger for storage batteries in which tantalum is used as an electronic valve. The use of tantalum in stellite has been patented.<sup>10</sup> Columbium has been found more difficult to isolate than tantalum, and is not known to have been put to practical use.

## TITANIUM

So far as the Bureau of Mines knows the only titanium mineral produced in the United States during 1924 was ilmenite mined from

<sup>10</sup> Figures are published with the express permission of Doctor Roos.  
<sup>11</sup> McCurdy, Frederick T., Tool alloy containing cobalt, tantalum, and a chromium-group metal. United States Patent 1440338, Mar. 20, 1923.

## RARE METALS

the beach sands about 4 miles south of Pablo, Cal., by the Titanium Pigment Co. (Inc.), a subsidiary of the U. S. Steel Corp. (Inc.), which in turn is controlled by the U. S. Steel Corp. During the year 4,769 short tons of ilmenite, containing about 52 per cent  $\text{TiO}_2$ , were shipped from the plant of the Titanium Pigment Co. at St. Louis. Also shipped from the same deposit 281 short tons of rutile.

Titanium minerals produced in the United States

| Year      | Rutile concentrates |        |
|-----------|---------------------|--------|
|           | Short tons          | Pounds |
| 1920..... | 277                 |        |
| 1921..... | 310                 |        |
| 1922..... | 270                 |        |
| 1923..... |                     |        |
| 1924..... |                     |        |

\* Bureau of Mines not at liberty to publish values.

The Titanium Pigment Co. formerly had a plant at Falls, N. Y., but during 1924 erected a new plant with a considerably increased capacity.

On the shore of Monterey Bay, near Aptos, southeast of Santa Cruz, Calif., the Titanium Pigment Co. is working to work titanium-bearing sands of the beach. The beach is 100 or 200 feet long and as much as 50 feet wide. Detrital bluffs carry layers of black sand from 1/2 board to as much as 5 or 6 inches, separated from the beach by a thickness of several feet. The sand is said to carry 5 per cent of black sand, though the eye.

The sand is said to be mostly magnetite, containing 16 per cent of  $\text{TiO}_2$  in the form of ilmenite. The sand is said to carry 40 per cent of  $\text{TiO}_2$ . To use the magnetite and martite for making pigment without melting, and to save the ilmenite for treatment. The sand was used by another company for the manufacture of pigment.

During the year the Bureau of Standards has issued specifications for outside white titanium zinc pigment. The following ingredients for pigment:

Specifications for white titanium zinc pigment

| Ingredients                  |
|------------------------------|
| Titanium pigment.....        |
| Zinc oxide.....              |
| Extending pigments.....      |
| Matter soluble in water..... |
| Lead.....                    |
| Sulphide sulphur.....        |

In no case shall the sum of the titanium pigment and zinc oxide be less than 90 per cent. The titanium pigment shall contain 25 per cent titanium oxide, the remainder to be blanc fixe (precipitated barium sulphate).

Many patents covering the use of titanium in alloys have been granted during recent years, but many seem to cover efforts to forestall discoveries by some one else rather than discoveries that have been tested. Ferrotitanium for use in steel, like the titanium white pigment, is made from ilmenite.

For paint only very high grade ilmenite is desired; otherwise the consumption of chemicals is increased, more iron has to be removed, and obtaining a white pigment is more difficult.

The various titaniferous iron deposits of the country, such as those of the Adirondacks,<sup>17</sup> Iron Mountain, Wyo.,<sup>18</sup> and western North Carolina,<sup>19</sup> are magnetites containing only intergrowths of ilmenite plates, so that they are very much leaner in  $TiO_2$  than the Florida beach sands. The richest and best supplies of ilmenite yet found are the beach sorted materials that have been derived from weathered gneisses extensively intruded by pegmatites. Such was the origin of the ilmenite sands of Florida, Brazil, Travancore (southwest India),<sup>20</sup> and Ceylon.<sup>21</sup>

A new use for ilmenite-bearing iron ores is covered by a patent in which E. C. Eckel<sup>22</sup> describes the manufacture of a quick-hardening chemically resistant cement by smelting in a blast furnace titaniferous iron ore with enough lime and aluminous material to form a titanium-calcium-aluminum-iron slag, which consists essentially of calcium titanate ( $TiO_2 \cdot CaO$ ) with subordinate quantities of ferrites, aluminates, and calcium silicate, and contains 2 to 10 per cent of iron oxide. The remainder of the iron is reduced to metal and drawn out below as in ordinary smelting. The slag, finely ground, forms "titan cement." It is claimed that if the lime is kept below 50 per cent, preferably about 30 to 40 per cent, the cement hardens rapidly after a normal set, attaining high strength in 24 to 48 hours; that at all periods it is stronger than Portland or alumina cements; and that its resistance to chemical attack is higher than that of either Portland or alumina cement. The specific gravity is given as 3.35 to 3.55.

Rutile, the natural titanium oxide, is used mostly for arc-light electrodes and for potassium-titanium oxalate to be used in dyeing and in the manufacture of leather, but the demand is small. There can not be said to be a market price for titanium minerals, as the buyers are so few. Ilmenite may, perhaps, be said to be worth \$10 to \$25 per short ton for material carrying about 52 per cent  $TiO_2$ , if a buyer can be found. Concentrated rutile sells at 10 to

25 cents per pound, depending on quality, quantity, and above all, on the needs of the buyer and seller. Imports of "titanium-potassium oxalate and all mixtures containing titanium" in 1924 amounted to 39,763 pounds, valued at \$3,639. In 1923 they were 39,763 pounds, valued at \$3,639. In 1922, after September 22, when the new tariff took effect, the imports were 82,544 pounds, valued at \$20,596. The imports separately recorded prior to the new tariff.

The tariff act of 1922 provides duties (par. 91) on potassium oxalate, and all compounds and mixtures containing titanium, 30 per centum ad valorem." Paragraph 30 provides a duty on many ores, concentrates, and alloys, among them 25 per cent ad valorem on ferrotitanium and titanium.

#### TUNGSTEN

The year 1924 saw a considerable increase in the tungsten ore produced in the United States over other years since the Great War, but the tonnage was still small, that of the 10 years preceding the close of the war, only 374 short tons, which sold for \$200,000. Best tungsten ore produced during the year, 191 tons of ore that had been sold for \$87,000.

The table that follows shows the production of tungsten since 1900, which practically marked the beginning of mining in this country, and the average price per unit. Prices are surprisingly low in view of the great fluctuations in market quotations. Thus in 1907 \$15 per unit was the average price, in 1917 more than \$100 per unit, and in 1924 the quantity of ore was sold at \$75 per unit. On the whole, from 1900 and 1901, some ores sold for less than \$2 per unit.

Concentrated tungsten ores (reduced to an equivalent of pure tungsten) produced in the United States, sold in 1900-1924, with the unit

| Year      | Short tons | Value    | Average price per unit | Year      | Short tons |
|-----------|------------|----------|------------------------|-----------|------------|
| 1900..... | 46         | \$11,040 | \$4.00                 | 1913..... | 1,500      |
| 1901..... | 179        | 27,720   | 2.58                   | 1914..... | 900        |
| 1902..... | 184        | 34,040   | 3.08                   | 1915..... | 2,300      |
| 1903..... | 202        | 43,639   | 2.49                   | 1916..... | 5,000      |
| 1904..... | 740        | 184,000  | 4.12                   | 1917..... | 6,100      |
| 1905..... | 803        | 288,678  | 5.87                   | 1918..... | 5,000      |
| 1906..... | 928        | 348,867  | 6.26                   | 1919..... | 3,000      |
| 1907..... | 1,040      | 890,048  | 9.04                   | 1920..... | 2,000      |
| 1908..... | 671        | 229,955  | 5.71                   | 1921..... | 2,000      |
| 1909..... | 1,619      | 614,370  | 6.32                   | 1922..... | 2,000      |
| 1910..... | 1,821      | 832,962  | 7.68                   | 1923..... | 2,000      |
| 1911..... | 1,139      | 407,985  | 5.97                   | 1924..... | 1,911      |
| 1912..... | 1,330      | 502,158  | 6.27                   |           |            |

\* For the years 1901 to 1905 the tungsten content of the concentrates is estimated.  
 \* The output of 1923 was made by one company only, which sold to its own market above the market.  
 \* Includes 191 tons produced in 1919, sold in 1924 for \$87,000.

In 1924 the Wolf Tongue Mining Co., the only tungsten in Colorado, worked the Cold Spring mine, but conditions were not encouraging. All c
