exactly how much of the wear debris consisted of asbestos fiber?

A No, at this point X-ray diffraction techniques were not capable of providing quantitative data at that level.

Q So you left your characterization just by saying very little asbestos dust was found?

A As best we could do with the techniques we had available at the time.

Q Okay.

Can you tell me either from your own knowledge or from your review of the report if any of the samples that you took exceeded the standards that were in place under the law today?

A No, not at that time. In fact, the letter quotes the 1971 emergency temporary standard.

Q Which I understand was 10 fibers per milliliter?

A No, 5 fibers per cc with a 10 fiber peak.

Q I am sorry, I misread that.

How long was that the standard?
