TO: J. F. Herber

The subject report accompanies this memo. Dietary levels of 0, 50, 150, 500 and 1500 failed to reveal any evidence of chick edema factor. No mortalities were observed in any of the treated groups. Body weight gains were depressed slightly at the highest treatment level.

These data indicate that this material was virtually free of the lower chlorinated homologs (tri and tetra) of the dibenzofurans or dibenzodioxins.

Paul L. Wright
