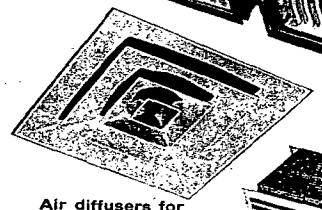
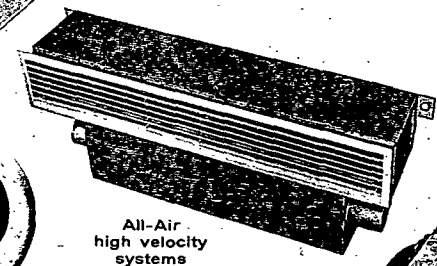
ANEMOSTAT®

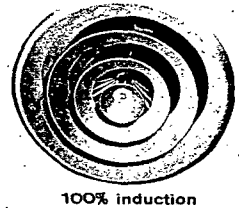
presents a complete line of equipment for



DRAFTLESS AIR SYSTEMS



Constant volume turbulators



Units for school systems

Air diffusers for conventional systems

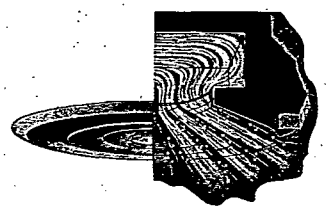
All-Air high velocity systems

100% induction air diffusers

Anemotherm Air Meter for *balancing any air system*

THE BEST WAY TO HANDLE AIR IS ANEMOSTAT®

A.I.A. File Number 30-J



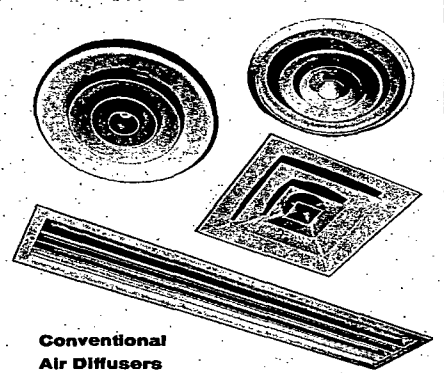
DATA ON ANEMOSTAT •

Principle of Aspiration

The Anemostat Air Diffuser splits the supply air into multiple, separate air streams and at the same time creates low pressure areas in certain parts of diverging passageways. This causes room air to be drawn into the device where it is thoroughly mixed with supply air. The mixture is discharged in a series of expanding turbulent air layers and, therefore, readily entrains a large amount of additional room air.

As a result, temperature and humidity are equalized throughout the room and a continuous air motion in the occupancy zone within low acceptable velocity limits is established. Stagnant air pockets are also avoided.

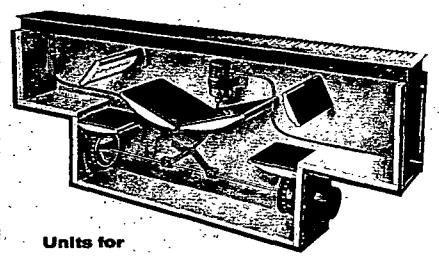
The quantity of room air drawn into Anemostat Air Diffusers depends on the specific design, size and type of the various units and is equal to as much as 35 per cent of the supply air. This effective aspiration distinguishes Anemostat Air Diffusers from all other air outlets.



Smaller Ducts

Aspiration permits the use of higher temperature differentials and higher supply air velocities than customary, which results in savings in the initial cost of fans and ducts and in the operating cost of fans. Duct layouts may be simplified because Anemostat Air Diffusers distribute air evenly in spite of unusual room plans, columns or other obstructions.

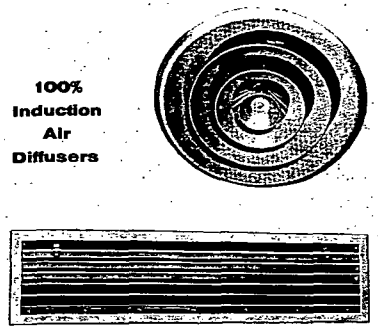
Research and Engineering



Anemostat Corporation of America maintains a large, well-equipped laboratory manned by experienced scientific and technical personnel for testing purposes and the development of new products. Engineers from all over the world have visited the Anemostat laboratory to witness demonstrations of Anemostat products and their applications to any conceivable problem pertaining to air diffusion. Anemostat has spent millions of dollars in research and engineering and will continue to make substantial contributions to the progress of the science of air distribution.

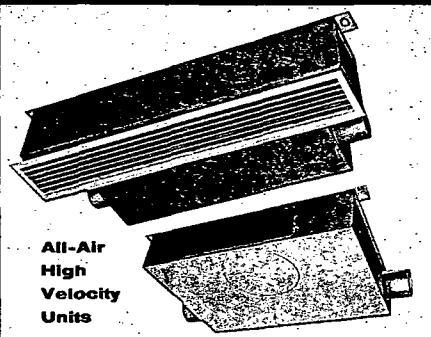
ANEMOSTAT®.....has a product for every air distribution need

Conventional Air Diffusers



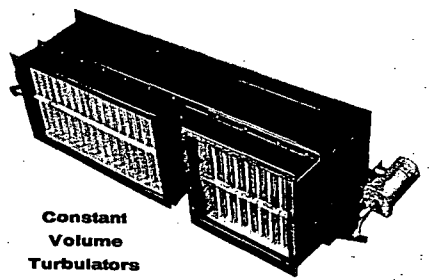
Anemostat air diffusers for conventional heating, ventilating and air conditioning systems provide thorough draftless comfort and uniform air distribution. They are the only air diffusers which have both primary (aspiration) and secondary characteristics. The cumulative effect of both primary and secondary induction assures the superior mixing and distribution of air. Only Anemostat Air Diffusers aspirate. More than a million of these units are serving in installations throughout the country.

Units for School Systems



Anemostat Corporation of America has developed by research the ideal unit for heating and ventilating or cooling of classrooms from kindergarten through college and for all climates. When Anemostat Dual Duct Units are used students and teachers work in a controlled atmospheric environment, which protects their health and promotes the efficiency of teacher and student.

Metal cabinets are available where architectural designs require free standing units. Anemostat All-Air under-the-window units can also be built in on exterior walls.



100% Induction Air Diffusers

Anemostat high induction air diffusers provide good diffusion with high temperature differential. Because supply and return ducts, fans and filters are reduced in size in direct proportion as the temperature differential of the distribution air is increased, there is a definite and logical trend to use higher temperature differentials in both low and high velocity systems. Anemostat 100% induction air diffusers meet these needs, thus help provide vital space savings in system design.

All-Air High Velocity Units

Anemostat high velocity units are being used through the country in many applications such as hospitals, schools, office buildings and plants. The Anemostat all-air high velocity draftless system offers many important architectural and engineering advantages. It permits greater flexibility of design and reduces building costs because it can be used with smaller than conventional ducts. It can be installed faster. It requires no coils, thus eliminates leakage, clogging and odors. The Anemostat all-air high velocity system has earned wide-spread acceptance because of the simplicity of its design, installation, control, operation and maintenance.

Constant Volume Turbulators

The Anemostat Constant Volume Turbulator is a standardized high capacity dual duct unit handling from 800 to 7000 CFM. It provides an economical solution to many air distribution problems in which a large volume of air at controlled volume or pressure, and temperature, is involved.

With the Anemostat system, all thermal functions—heating—cooling—ventilating—are accomplished with air. Coils and resultant coil lag are eliminated together with required piping. Pressure losses are low and so are noise levels. Quality-built Anemostat Turbulators function automatically. They are easy to install, simple to maintain.

Anemotherm Air Meter

The Model 60 Anemotherm Air Meter, developed by the Anemostat Corporation of America, gives you—in one convenient instrument—a simple, rapid method of balancing and checking any air system. It puts at your fingertips, by means of color-coded pushbuttons, air velocities, air temperature and static pressure—all vital readings you need. Model 60 Anemotherm Air Meter pays for itself on time saved on only one major job.

•

Selection Manual #60 contains selection and application data on Anemostat Draftless Aspirating Air Diffusers for conventional, 100% induction and high velocity systems.

This new catalog describes the Anemostat Dual Duct High Velocity Air Distribution for heating and ventilating schools. You will find in these pages, typical classroom layouts, performance data, control diagrams and other essential information.

This informative bulletin gives vital data on Anemostat Constant Volume Turbulators for modern air distribution systems. It explains important design features, shows practical applications, contains selection and application data.

Anemotherm Air Meter Bulletin #55 describes the most modern way to balance heating and ventilating and air-conditioning systems. It tells how the Anemotherm Air Meter gives you all vital readings with pushbutton ease.

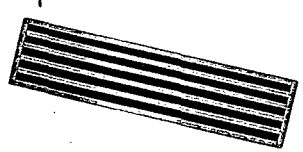
kno-draft®
air diffusers

Connor Engineering Corporation produces a complete line of Kno-Draft air diffusers and high velocity valve terminators, the result of intensive research and development. They are designed to fit every industrial, commercial and residential requirement.

Kno-Draft diffusers distribute air in an effective spiral stream pattern which eliminates drafts and equalizes room temperatures through maximum induction. All models feature the patented cobra-tail sleeve damper which permits precise air volume regulation.

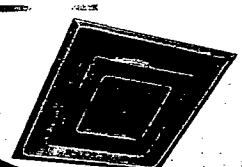
Kno-Draft diffusers are precisely made, accurately assembled and rigidly inspected before shipment. Standard finish for all types is baked aluminum enamel. Oyster enamel is also available on special order to match any ceiling finish.



TYPE KDA

Circular Flush-Mounted Air Diffuser

Illustrated is the Kno-Draft KDA adjustable air diffuser. The sleeve damper, together with the adjustable lower cone, permits independent air volume and air direction adjustment after installation. Constructed of light, sturdy spun aluminum, Type KDA diffusers are available in a wide range of sizes from 5" to 36" neck diameter. Bulletin K-20-A.



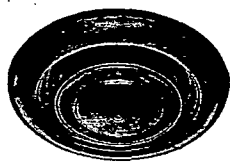
TYPE KLS

Slotted Air Diffuser

Kno-Draft Series KLS all aluminum, adjustable slotted diffusers are particularly adapted to board rooms, foyers, lounges and similar spaces. The harmonious, classic lines of the extruded aluminum vanes complement any decor. These handsome units may be installed singly or butted in series to form a continuous slot for heating or cooling. Series KLS diffusers are complete with built-in air volume and air directional control. Available in lengths from 2 to 6 feet; widths of 3½" and 6" for single direction air pattern, 12" for two-direction air pattern. Bulletin K-27.

TYPE KP

Square Air Diffuser

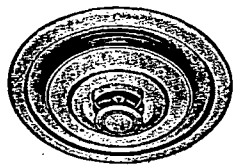


The attractive Kno-Draft square air diffuser is available in two types designed for quick, easy installation — Type KP (overlap) for flush mounting on plaster or certain acoustical ceilings — Type KPT for T-Bar ceilings where the diffuser snaps into the ceiling construction. Both models are identical in air performance characteristics. Despite their square design air is distributed in a true circumferential pattern for maximum effectiveness. Fabricated of pressed steel with baked enamel finish in sizes 5" to 14" neck diameter. Bulletin K-27.

CONNOR ENGINEERING CORPORATION Danbury, Conn.

kno·draft air diffusers

TYPE KDASM

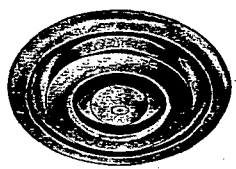


Circular Surface Mounted Diffuser

Building space is conserved with surface mounted Kno-Draft diffusers. The deep streamlined outer cone saves inches in the ever dwindling area above the ceiling by shifting the diffuser body downward. Performance characteristics are identical with the flush mounted KDA diffuser with the further advantage that the deep outer cone inhibits ceiling smudging. Fabricated in spun aluminum in sizes 5" to 18" neck diameter. Bulletin K-38.

TYPE KDSP

Circular Loudspeaker Diffuser



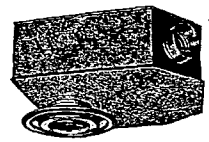
Kno-Draft single air stream, dual-cone design permits the addition of a loudspeaker to the diffuser. As shown, a loudspeaker can be mounted above the center cone allowing both the sound source and diffuser to utilize the same strategic ceiling location. Any 8" speaker may be used and a totally enclosed baffle provides extended frequency response. Sizes 14" to 24" neck diameter with performance characteristics and dimensions identical to standard KDA diffusers.

An integral light may also be provided with Kno-Draft diffusers (Type KDAL). Light fixture units are available in sizes 6" to 16" neck diameter with performance characteristics identical to standard KDA diffusers. Bulletin K-20-A.

TYPE SRD

Circular Supply-Return Diffuser

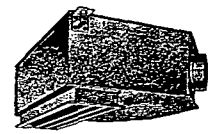
This Kno-Draft diffuser is used where air is both supplied and returned through the ceiling diffuser. It is so designed that supply air is ejected radially away from the center return air opening, precluding short-circuiting of supply air. The patented sleeve type damper and adjustable cones provide for independent air volume and air direction adjustment. Constructed of spun aluminum in sizes 6" to 24" neck diameter. Bulletin K-20-A.



kno·draft series 45 valve attenuators

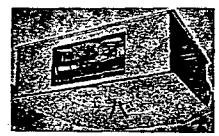
Kno-Draft Series 45 Valve Attenuators

The Series 45 Valve Attenuator is the result of ten years' experience in the design and application of high velocity units. Features incorporated in its design are all-important to the successful operation of high velocity systems . . . assuring better balanced air delivery and constantly controlled air diffusion.



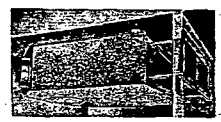
These are the only high velocity units with patented Helical Neoprene-Coated Spring Dampers to insure quiet operation and complete shutoff. Constant Volume Control insures uniform air delivery at all mixture conditions despite static pressure fluctuations. A Manual Control option is available for use when duct design permits. While all units operate quietly, a patented Sinuous Sound Baffle may be added when exceptional silencing is necessary. Series 45 Valve Attenuators are suitable for both dual and single duct systems. Complete information including selection tables, noise specifications, and duct design data in Bulletin K-33-A.

CIRCULAR OR SQUARE DIFFUSER MODEL



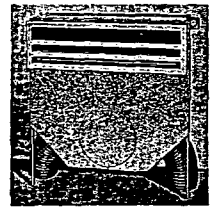
The Diffuser Model has a Kno-Draft ceiling diffuser mounted directly beneath the valve attenuator eliminating inter-connecting low pressured ducts. The linkage and pneumatic components are mounted within the unit and are removable through the diffuser ceiling opening. Six sizes, 80-1500 cfm air delivery.

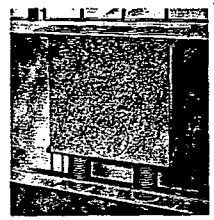
LINEAR DIFFUSER MODEL



This Model has a Kno-Draft linear diffuser mounted either beneath or at the front of the valve attenuator, permitting ceiling or wall mounting of the linear diffuser. Three sizes, 80-450 cfm air delivery.

OPEN END AND GRILLE MODELS

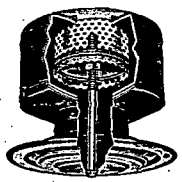




The Open End Model valve attenuator is used to supply remote diffusers or grilles through low pressure duct-work. Two types of outlet connections are available: 1. Single rectangular opening for low pressure rigid duct connection. 2. Multiple round outlets for flexible duct connections.

The Grille Model is identical with the Open End Model except for a larger discharge opening to insure quiet grille operation. Both models are supplied in six sizes, 80-1500 cfm air delivery.

UNDER-WINDOW DUAL DUCT MODELS

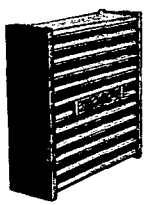


Under-window Models are provided in two standard types as shown. Models with 45° inlets provide front or top outlets to discharge from the wall beneath the sill or directly from the sill as desired. Either front or top air delivery produces the same draftless air flow pattern — upward along the window and out under the ceiling.

Models with vertical bottom inlets are available only with top discharge. The units are dropped through the grille opening and clamped to mounting plates permitting this model to be installed after ductwork and plastering is completed. Accessibility is ideal and access panels are eliminated.

Under-window Models can be equipped with internally mounted thermostats. Sheet metal cabinet enclosures are also available. Three sizes, dual-duct only, 80-450 cfm air delivery.

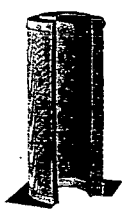
SERIES HPC VALVE ATTENUATORS



Series HPC Valve Attenuators are manually balanced, single duct units for mounting under rectangular ducts. The HPCI Model is specifically designed for exposed duct installations. Two sizes 90-180 cfm air delivery.

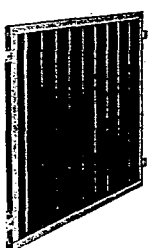
The HPCK Model, similar in internal construction, has a Kno-Draft air diffuser below the valve for flush ceiling installation. Six sizes, 100-1000 cfm air delivery.

dorex®



air recovery equipment

Air Recovery is the conversion of contaminated air to fresh air. Dorex Air Recovery equipment adsorbs all air entrained odorous, vaporous and gaseous impurities in the same manner as a gas mask. Its action is positive, neither adding to, subtracting from, nor otherwise altering the chemical composition of pure air. Dorex Air Recovery (air purification) can serve three functions. The purification of (1) recirculated air (2) outside air intake (3) exhaust air.



TYPE C CELLS

Dorex Type C Cells are perforated steel cells 24" x 24" x 8¾" deep filled with granular activated carbon. Three models provide different carbon bed thickness and weight for varying applications. Capacities range from 700 to 1000 cfm at 95% efficiency. Cells are installed in sturdy supporting frames and can be designed into new or existing duct systems with no more engineering than standard dust filters. Highly effective corrosion resistant coating available for industrial applications. Bulletin 108.

TYPE H CANISTERS

Type H Canisters lend themselves to a variety of arrangements. Mounted in multiple on supporting manifold plates they can be installed in practically any duct system regardless of space limitations. Supplied in two types with ½" or ¾" carbon bed thickness, each canister will purify from 25 to 30 cfm. Standard construction is steel but stainless steel and plastic are also available for highly corrosive conditions. Bulletin 108.

TYPE R PANELS

The Type R Panel is a semi-disposable activated carbon filled panel designed for installation with standard dust filters. Carbon may be easily replaced when saturated. All metal galvanized construction, four sizes, 16" x 20", 16" x 25", 20" x 20", and 20" x 25" for range of 640-1000 cfm. Bulletin 107.

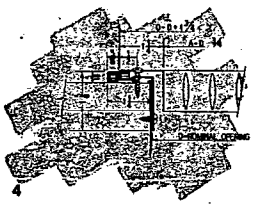
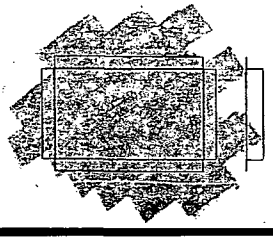
NOTE THESE ADDITIONAL SPECIFICATIONS:



A. These added features are standard on each SUPPLY GRILLE.
1. ¼" sponge rubber gasket.
2. Countersunk screwholes.
3. Attractive softone gray lacquer finish.
4. Special mullion support where louvers exceed 20" in length.

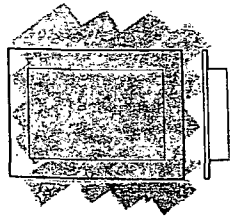
B. VOLUME CONTROLLERS have standard black lacquer finish. Gaskets furnished on all AG-25 and AG-35s. Models are designed to fit into duct by friction.

C. RETURN AIR GRILLES are made extra heavy to withstand low sidewall abuse. Finished with standard gray softone lacquer.



D. RETURN REGISTERS are made with extra heavy steel to withstand *low sidewall use and abuse. Provide volume control or* complete shutoff. Have gray softone prime finish.

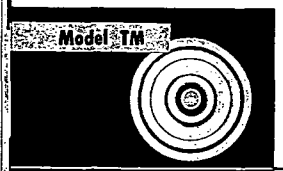
TITUS ALL-PURPOSE FRAMES

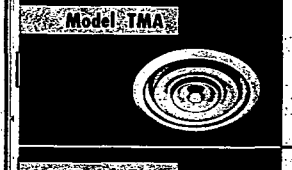


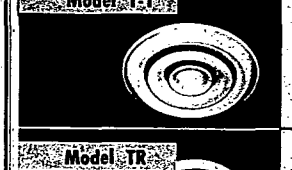
NO. 115 FRAME

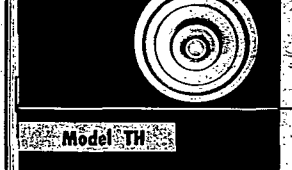
For all Airfoil grilles and registers. Can be installed before or after plastering has been completed. Frame may be imbedded in plaster. Sponge rubber gasket to prevent air leakage. Designed for use with Titus Airfoil registers and grilles only.

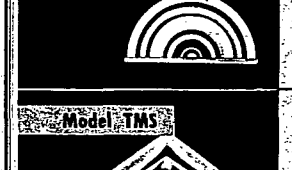
NO. 2 STEEL ANGLE FRAME











Attaches inside duct outlet with metal screws. Strengthens duct edge for easier and better plastering. Grilles fit inside frame. Grille border conceals lip of frame inside.

NO. 3 FRAME

For installation before or after plastering. No. 3 frame is built to actual listed size. Duct openings should be ⅛" larger to accommodate frame.

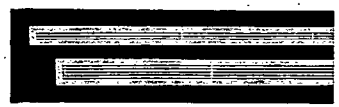
CEILING

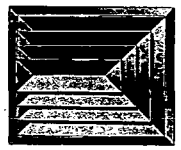
STYLE	SIZES	APPLICATION	DESCRIPTION
Model TM 	6" 16" 8" 18" 10" 20" 12" 24" 14" 30" 36"	For exposed ductwork or flush mounting	A fixed cone ceiling outlet with exclusive Titus curved contour cone construction. 4 cones. Ingenious spring lock arrangement permits quick, easy removal or installation of inner cone assembly. Inner cone assembly adjustable at factory or on job to 3 different air patterns — vertical, horizontal, or intermediate.
Model TMA 	6" 16" 8" 18" 10" 20" 12" 24" 14" 30" 36"	For exposed ductwork or flush mounting	A fully adjustable outlet with Titus curved contour cone construction. Simply turn small center cone to adjust to any air pattern desired for any heating or cooling application. 3 center cones move in unison, retaining same relative position for maximum uniformity of design, minimum pressure loss. Inner cone assembly quickly, easily removed.
Model T-1 	6" 14" 8" 16" 10" 18" 12" 20" 24"	For exposed ductwork or flush mounting	A 3-cone supply outlet that combines economy with excellent diffusion performance. Inner cone assembly removes for fast, easy installation. Adjustable — on the job — to 2 air patterns by simply changing screws on inner cone assembly. Heavy-duty sponge gasket around outer edge of diffuser assures air-tight installations.
Model TR 	8" 18" 10" 20" 12" 24" 14" 30" 16" 36"	For exposed ductwork or flush mounting.	A combination air supply and exhaust diffuser for heating, ventilating and cooling. Especially designed for use where simplification of ductwork is desirable.
Model TH 	6" 14" 8" 16" 10" 18" 12" 20"	Primarily for ceiling application but can also be used on sidewall.	A half round supply air diffuser with removable inner cone assembly for quick, easy mounting. Adjustable — on the job — by simply removing inner cone assembly and adjusting screws to air pattern desired. Equally efficient for heating, cooling, ventilating.
Model TMS 	4" 12" 5" 14" 6" 15" 8" 16" 10" 18"	For exposed ductwork or flush mounting.	A square diffuser designed to deliver supply air for heating, ventilating, cooling in a 360° pattern. Blank-off baffles available to supply a wide variety of other air distribution patterns. Ingenious spring lock arrangement permits quick, easy removal and installation of inner assembly.

• Also available but not pictured is TITUS Model TL CEILING DIFFUSER (supply air diffuser combined with attractive lighting fixture). Write for literature

TITUS CEILING DIFFUSERS ARE:

A. Furnished in beautiful metalescent aluminum finish. (Unless otherwise specified)





B. Individually packaged in sturdy damage-proof cartons.

DIFFUSERS AND ACCESSORIES

		FOR USE WITH DIFFUSER MODEL	DESCRIPTION
MODEL AG-65 COMBINATION DAMPER AND GRID		TM TMS TMA T-1 TL	A combination equalizing grid and damper that is quickly, easily installed in take-off. Blade opens up directly into air stream permitting precision air volume control. Installs flush with duct take-off.
MODEL AG-75 RADIAL DEFLECTOR DAMPER		TM TMS TMA T-1 TL	Four sets of gang-operated blades distribute air evenly over diffuser or duct — completely eliminating need for equalizing grids. Unique design permits the precision metering of air flow to any degree desired from full open to complete shut-off. Heavy gauge, vibration-free metal blades hold desired settings in spite of air pressure variations. Quickly, easily adjustable from face of diffuser.
MODEL AG-85 BUTTERFLY DAMPER		TM TMS TMA T-1 TL	A butterfly damper that provides the ultimate in simple, easy, economical control of air volume. Friction pivots on heavy gauge metal blades keep blades at desired setting. Can be mounted directly on diffuser. Fully adjustable from face of diffuser.
MODEL AG-85S SUPPLY DAMPER		TR	A circular type supply damper used to distribute supply air uniformly around circumference of Titus TR combination supply and return diffuser. Also used to control volume of supply air when balancing system — and as a method for baffling unit to give correct air distribution in irregular spaces. Individually adjustable blades have friction pivots to keem them at desired settings.
MODEL AG-85R EXHAUST DAMPER		TR	A butterfly type damper used on Titus TR combination supply and return diffusers. Easily and effectively controls volume of return air when balancing the system. Heavy gauge metal blades have friction pivots to maintain desired settings.
MODEL EG EQUALIZING GRID		TM TMS TMA T-1 TL	Used to equalize the flow of air into the neck of diffuser or duct — and to give directional control of air flow whenever needed. Features famous Titus solid metal Airfoil louvers designed to give maximum air control with minimum noise and turbulence. Individually adjustable louvers spring-tensioned to rigidly maintain desired settings — and provide silent, rattle-free performance.
MODEL CC CEILING CONE (Pictured with Model TMA Diffuser)		TM TR TMA TL	An attractively styled, scientifically designed accessory that not only affords maximum protection to ceiling — but actually enhances appearance of diffuser unit used with it. Adapts Titus diffusers to flush mounting on exposed ductwork — or flush with ceiling.
MODEL PMR PLASTER MOUNTING RING		TM T-1 TMA TR TL	An ingenious combination plaster mounting ring and duct ring that greatly reduces cost, time, work of flush mounting. Fastens by neck to duct and serves as plaster stop. Automatically provides correct ceiling opening and centers diffuser to it. Eliminates cutting hole in plaster. Does away with extra duct-work — extra connections. Sturdy metal construction.
MODEL AG-75½ VOLUME CONTROLLER		TH	An opposed acting damper that serves as an air flow equalizer — as well as a volume control. Positive shut-off when desired.
DUCT RING		TM TR TMA T-1 TL	Made of heavy gauge steel. Available for exposed duct work and other applications.
SECTORIZING BAFFLES		Specify side for baffle.	Blanking baffles available for special applications.

Air Foil
AIR CONDITIONING OUTLETS

OTHER TITUS DIFFUSERS

LINEAR TYPE air diffusing grilles 	Designed for continuous line use in sidewalls, window sills, floors of banks, hospitals, schools, other public buildings. Equally efficient for cooling, heating, ventilating.	Extruded aluminum, 1½", 2", 2½", 3", 3½" and 4" widths. **Model C-2500**—louvers in front fixed at 0° deflection. **Model C-2615**—louvers in front fixed at 15° deflection. Choice of borders, dampers. Any width or length on special order.
Series **TMD** SQUARE AND RECTANGULAR AIR DIFFUSERS 	Provide efficient, draftless, noiseless air distribution from any ceiling or sidewall location. For standard installations, tile ceilings, drop frame installations, surface mountings.	Square or rectangular—1, 2, 3, or 4-way patterns. Standard type TMD or type TMDC with interchangeable cores and choice of 4 styles of mounting frames.
PERIMETER DIFFUSERS  Models P-125 and P-75	New advanced design with dual adjustment feature assures plenty of capacity and the correct air patterns for both heating and cooling. For use in any size room—install on inside or outside walls.	MODEL P-125—adjustable for heating, adjustable for cooling—simply move control. Built-in damper. Neutra-Tone finish. 24" in length. MODEL P-75—same as Model P-125 above except does not have heating or cooling adjustment feature.

NOTE: Titus Perimeter Diffusers are packed 12 to a carton with each diffuser individually packaged in strong, damage-proof cardboard sleeve.

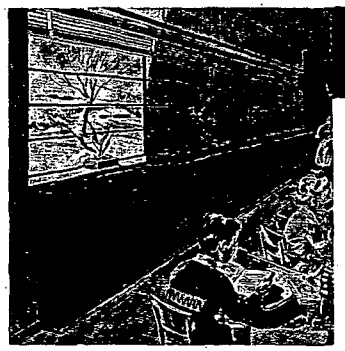
(Furnished in lengths up to 12 feet in increments of 1 inch)

Steel LINOVECTOR furnished threaded or chamfered for welding. Copper LINOVECTOR furnished for solder-joint fittings.

ACCESSORIES	SPECIFICATIONS	
Style X Grilles available in flexible segments for angular installations. Also, corner pieces, end enclosures, sloping and ceiling type grilles.	Expanded metal type, ½" diamond mesh (No. 16-18 gage steel). Black or ivory finish. Any lengths up to 8'.	STYLE X GRILLES 
End enclosures, "Flexi-Corner" (inside or outside), Flush Joints, Dampers, Access Panels and Enclosures for inverted mounting.	18-, 16- or 14-gage zinc-coated, rust-resistant, bonderized steel, or prime coat. Lengths up to 8'.	SLOPING TOP ENCLOSURE STYLE CS STYLE CSW DELUXE CS 
Full line available. Flush joints, "Flexi-Corners", Dampers and End Enclosures.	18-, 16- or 14-gage zinc-coated, rust-resistant, bonderized steel or prime coated. Furnished in lengths up to maximum of 8' in one piece. One unit front and top.	STYLE KS ENCLOSURES 
"Flexi-Corners", End Enclosures, and Joining Pieces (2½" wide for outside joining).	Solid front. 18-, 16- or 14-gage zinc-coated, rust-resistant, bonderized steel or prime coat finish. Lengths up to 8 feet.	STYLE F COVERS 
Full line of matching accessories, including all flush joints, rounded end enclosures and knob-operated dampers.	Available with top and front louvre outlets-or-either. 18-, 16- or 14-gage zinc-coated, rust-resistant, bonderized steel or prime coated. Lengths up to 8'.	SILL-TRIM ENCLOSURES 
Full line of matching accessories, including rounded end enclosures and knob-operated dampers.	Sturdy baseboard design. Full line of elements available. 18-, 16- and 14-gage zinc-coated, rust-resistant, bonderized steel or prime coated. Full back optional. Rugged cover support brackets.	INSTITUTIONAL BASEBOARD 

JOINTS — all enclosures shown above, except Style X and Style F, available with "H" joint (no screws or bolts needed).

LOUVRES — "Mini" (small size) louvres available only in 18- and 16-gage steel, in 2" increments. Standard louvres available in 18-, 16- and 14-gage steel in 3" increments.

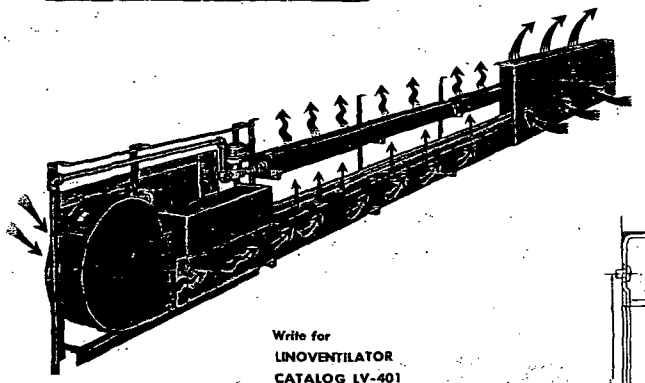


HEIGHT — all enclosures available in 1-, 2- and 3-row high, except Institutional Baseboard (only 2-row high).

BAKED ENAMEL — all enclosures, except Style X, available in 8 standard baked enamel colors (at extra cost). See Vulcan Color Guide.

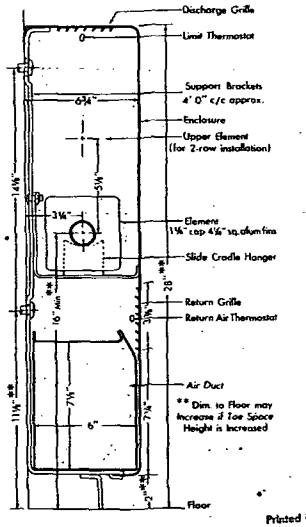
LINOVECTOR CATALOG 625B available showing full line of VULCAN elements, accessories and enclosures, including complete ratings.

Vulcan LINOVENTILATOR*



A Quality Schoolroom Heating-Ventilating System At Lowest Cost To Fit Almost Any Budget!

New Heating-Ventilating System Meets All Requirements . . .



The completely new Vulcan LINOVENTILATOR SYSTEM is the latest innovation in classroom heating and ventilating. *It has been designed for economy, efficiency and functional beauty, with* remarkable savings in installation and operating costs. This has been made possible by unique engineering that introduces an entirely new concept in heating and ventilating.

The LINOVENTILATOR SYSTEM meets the exacting requirements for schoolroom heating-ventilating as established by recognized authorities. It now places heating-ventilating, heretofore impossible because of high cost, within the reach of local school budgets.

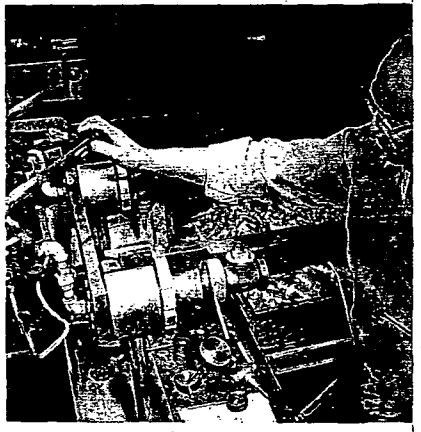
HAMMOND...

LEADER IN BRONZE VALVES



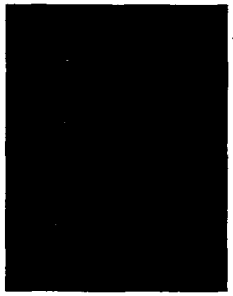
Aerial view of Hammond Brass Works . . . considered one of industry's outstanding examples of a highly efficient, completely integrated valve manufacturing plant.

Hammond Bronze Valves are produced in this modern factory building in Hammond, Indiana. Complete facilities for valve production include everything from foundries which pour the initial bronze castings down to specially developed testing equipment used to individually test each valve before it leaves the factory.

Hammond has been a leader in the bronze valve industry for over 47 years . . . and bronze valves are the only product of the Hammond Brass Works. Therefore, they receive the undivided attention of Hammond's engineering staff. This specialization in bronze valves is one of the principal reasons behind Hammond's leadership in the industry.

Hammond's production operations are distinguished by mass production, automatic methods . . . a fine example of "automation in action." These large volume automatic operations result in savings which are passed on to Hammond customers . . . allow Hammond to offer a premium in quality without any increase in price . . . for the "best valve and value in the bronze valve field."

Hammond valves are readily available from coast to coast through leading wholesalers. Forty-seven strategically located factory warehouse stocks insure up-to-date inventories.

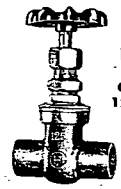


Heavy duty check valve being tested hydrostatically, the toughest test a valve can get. Every Hammond valve is tested before it leaves the factory.

HAMMOND BRASS WORKS HAMMOND, INDIANA

HAMMOND

HEAVY-DUTY VALVES



600 SERIES GATE VALVES

No. 609
N. R. S. GATE, 125 lb. WSP

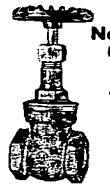
With solid wedge disc. Complies with Federal Spec. No. WW-V-54, type 1, class A. May be repacked when fully open. Recommended for heavy-duty services up to 125 lb. w.s.p. and 200 lb. w.o.g. Available ¼" to 3". *Also available with drainable end. Specify on order.*

No. 613
N. R. S. GATE S. J., 125 lb. WSP

Construction features identical to No. 609, but with sweat end connections for use with copper tubing. Meets Federal Spec. No. WW-V-54, type 1, class A. Available ⅛" to 3".

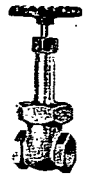
No. 617 & No. 618
UNION BONNET GATE, 125 lb. WSP

Rising stem, solid wedge disc gate valve. Rated 125 lb. W.S.P. Meets MIL Spec. WW-V-54, Type 2, Class A. No. 618 features double disc, meets WW-V-54, Type 3, Class A. Sizes ½" to 3". *Both styles available in copper-to-copper as No. 617c and 618c.*



No. 619
N. R. S. GATE, 150 lb. WSP

With solid wedge disc. Meets Federal Spec. WW-V-54, type 1, class B. Large sized, generously proportioned, with extra strength for service requirements at 150 lb. w.s.p. and 300 lb. water, oil or gas. Available ¼" to 3".



No. 622
BRAZING TYPE N.R.S. GATE, 150 lb. WSP

With construction features and ratings similar to No. 619, but with socket ends for brazing. Used for industrial construction and general piping where resistance to shock is of primary importance. Available ¼" to 3". *No. 615 available for 125 lb. w.s.p.*

No. 626
RISING STEM GATE, 150 lb. WSP

With double wedge disc. Sturdily designed for services to 150 lb. steam, 300 lb. w.o.g. Available ½" to 2".

No. 629 & No. 631
UNION BONNET GATE, 150 lb. WSP

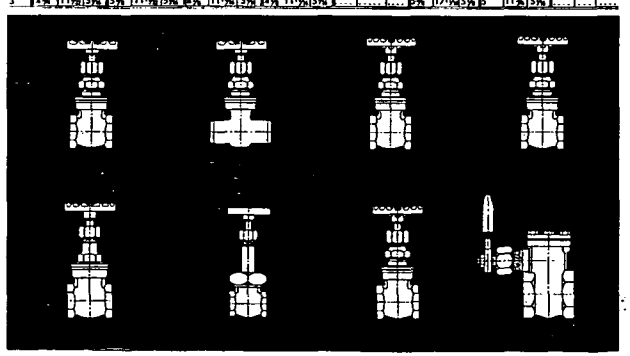
Rising stem, solid wedge disc gate valve. Meets MIL Spec. WW-V-54, Type 2, Class B. No. 631 features double disc, meets spec. WW-V-54, Type 3, Class B. Sizes ½" to 2". *Both available in copper-to-copper as No. 629c and 631c.*

No. 611
MONEL STEM GATE, 100 lb. WSP

Non-rising monel stem solid wedge disc gate valve. Meets military specifications MIL-V-1189, type A. Rated for 100 lb. w.s.p. 200 lb. w.o.g. Available ¼" to 2".

No. 612C & No. 612
N. R. S. GATE, 200 lb. WSP

Heavy-duty, non-rising stem gate valve with solid wedge disc. Rated for 200 lb. w.s.p. Also available as Fig. 612 with monel trim to meet government specifications MIL-V-20231A (Ships). Available ¼" to 3".



No. 610
QUICK OPENING GATE, 125 lb. WSP

Solid wedge disc is operated with quick opening lever. Meets military spec. MIL-V-12126 (CE), class 1. Rated for 125 lb. steam and 200 lb. non-shock on water, oil or gas lines. Available in ½", ¾", 1", 1¼", 1½" and 2" sizes.

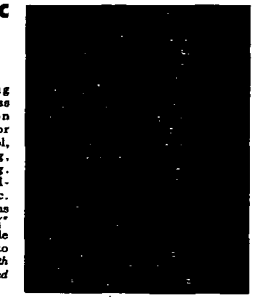
HAMMOND

HEAVY-DUTY VALVES

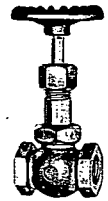
400 SERIES GLOBE VALVES

No. 410
BRONZE DISC GLOBE, 125 lb. WSP

Sturdily constructed. All sizes have swivel discs—¾" size and larger have renewable discs. Meets all service requirements up to 125 lb. working steam pressure, 200 lb. water, oil or gas. Available ⅛" to 2".

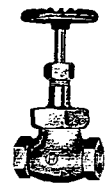


No. 410D
UNION BONNET GLOBE, 125 lb. WSP

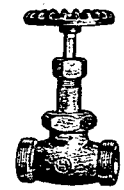


Extra strong brass disc globe valve with union bonnet. Meets Federal Spec. WW-V-51A, type 1, class A. Ratings and sizes same as No. 410.

No. 411 & 411C
REGRINDING GLOBE, 200 lb. WSP



With plug type brass disc, union bonnet. For close control, throttling, regulating. Meets military spec. MIL-V-1202-A, type A. Stems of monel. Has gland follower. ¾" size and larger have renewable and swivel discs. Sizes ¼" to 2". *Available as No. 411C with high tensile bronze stem instead of monel.*

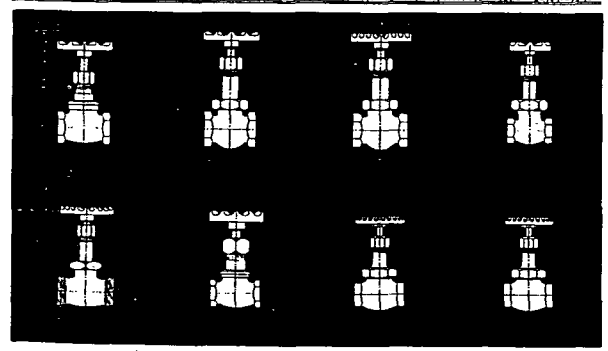


No. 412 and 412C
REGRINDING GLOBE, 300 lb. WSP

Construction features similar to No. 411 but more heavily constructed for all types of service up to 300 lb. steam, 600 lb. water, oil or gas. Monel stem and disc. Meets military spec. MIL-V-1187, type A. Sizes ¼" to 2". *Also available with high tensile bronze stem and disc instead of monel as No. 412C.*

No. 413
COMPOSITION DISC GLOBE, 150 lb. WSP

Has slip-on type disc holder for quick disc replacement, stuffing box, gland follower, union bonnet. Complies with Federal Spec. WW-V-51a, type 1, class B. For industrial steam service up to 150 lb. steam, 300 lb. w.o.g. Sizes ⅛" to 2". *Also available in copper-to-copper as No. 423.*



No. 414
MONEL DISC GLOBE, 200 lb. WSP

With double union ends, meets Bureau of Ships spec. B-164, alt. 7. Has monel seat ring, union bonnet. Double union ends used for silver brazing. Primarily for ship board use. Rated 200 lb. steam, 400 w.o.g. Available ¼" to ¾". *Also available in angle type, No. 460, ¼" size only.*

No. 415
NEEDLE VALVE, 200 lb. WSP

Produced to Federal Specification, meets requirements of 200 lb. working steam pressure. Available in ¼", ⅛", ⅜", ½", ¾" sizes.

No. 435C
"500 BRINELL" GLOBE VALVE PLUG TYPE

With "500 Brinell" hardened stainless steel disc and renewable seat. Rated 300 lb. steam, 600 lb. w.o.g. *Available ¼" to 2". No. 433 and 434, 150 lb., 200 lb., designs of No. 435C.*

No. 435, "AAR" globe, meets MIL-V-1187B, type 2.

ROTH

PACKAGED BOILER FEED UNITS

DUPLEX MODELS

Certified Hot Water Performance in Factory Assembled Systems for Boilers of 40 to 500 HP Operating at Pressures up to 200 PSI.

The Roy E. Roth Company will certify the hot water performance of any model taken from the selection table (page 4) at the stated capacity and pressure listed therein when such certification is requested with the purchase order. Certification will be based upon a special hot water test run upon the pump ordered. A small additional charge will be made to cover the cost of the hot water test.

All pumps on these units will deliver at least 150% of rated evaporation at 210°F.

ROTH turbine boiler feed pumping units are a line of factory assembled systems for boilers from 40 to 500 HP operating at pressures up to 200 PSI. *Factory assembly reduces costly erection labor on the job site and insures factory responsibility for the proper selection and function of the entire unit.*

ROTH boiler feed units consist of one or more motor driven pumps combined with a hot water storage tank or receiver and an automatic make-up valve to replace system losses. These units are used with most fire tube and scotch marine boilers when operated for process steam at pressures above 20 PSI. They are also used in modified form with water tube boilers.

The motor driven pump operates intermittently and is controlled by a special float switch or pump controller mounted on the boiler water column, starting the pump at low water level and stopping it at high water level.

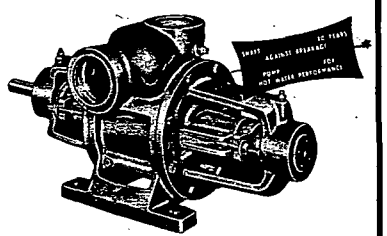
Water pumped from the vented receiver is usually at least 70% hot condensate and varies from 180°F up to boiling point, depending on the amount of flash steam returned.

Boiler feed pumps with low suction head tend to lose capacity as water temperature approaches 212°F. By lowering the suction head to zero and raising the water temperature to 212°F it is possible to vapor lock any turbine or centrifugal pump. For this reason the buyer should be protected against hot water fall-off by performance guarantees in which suction head and temperatures are clearly stated as in the selection table (see page 4). *All pump models furnished with ROTH Boiler Feed Units are thoroughly charted for performance in handling water close to boiling point and are rated for their capacity at 206°F.*

In addition to certified hot water performance, ROTH engineering has resulted in many other design improvements assuring long, dependable operation. By eliminating ball bearing end-play, impeller position is permanently maintained. *The new ROTH pumps have heavier shafts than any previously manufactured equipment and are covered by a written guarantee (see page 12).*

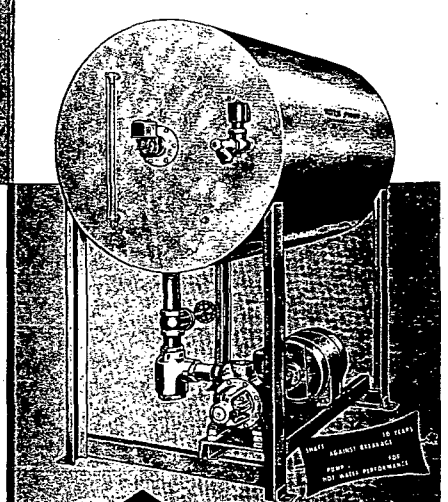
Other components of ROTH Boiler Feed Units are manufactured with equal care. Welded steel receivers are of 3/16 inch copper-bearing steel and internally coated with a rust-resistant phenolic resin lining. Large diameter piping between receiver and pump eliminates pressure drop and includes a large strainer especially made for use on these units. Mechanical make-up valve for receivers up to 100 gallon capacity is float operated. A solenoid valve controlled by a float switch is supplied for units with 180, 250, 350, and 500 gallon receivers.

Available at additional cost are the following items:



(1) Separable tank cradles instead of welded legs available on all sizes.

(2) Dished head receivers made to 75 lb. ASME specifications, with or without code stamp can be substituted for 3/16 inch steel flat head receivers.



(3) Perforated tube heaters with manual or automatic temperature-controlled steam valves.

(4) Magnetic starters, alarm bells, pressure gauges, and signal lights.

(5) Motorized valve in place of solenoid valve.

ROTH TWO-STAGE TURBINE POWER PLANT PUMPS delivering up to 200 PSI at 1750 RPM are standard on this line of equipment. Large passages between stages, special suction entrance modification, and the inherent vapor handling characteristics of the ROTH turbine impeller contribute to this pump's ability to efficiently handle hot water at high pressure differential and low suction head.

SIMPLEX MODELS

ROTH Boiler Feed Units may be had in simplex or duplex models either as packaged or erected down units. Both are engineered and manufactured with the full and precision characteristics of all ROTH equipment.

SPECIFICATION FORM

Furnish and install as called for on the drawings one Roth Model ..... (specify simplex or duplex) boiler feed unit suitable for ..... GPM at a discharge pressure of ..... PSI. The unit shall consist of the following components:

(1) One (substitute two for duplex) Roth Model ..... standard fitted power plant pump certified by the manufacturer for a minimum of ..... GPM of 206°F water at ..... PSI with 4 ft. suction head. The pump shall be guaranteed by the manufacturer for one year against defects in workmanship and material and shall be guaranteed for ten years by the manufacturer against shaft breakage when flexible coupled to a motor of recommended rating. The pump shall contain an internal system for relief of pressure on the packing to insure maximum packing life.

(2) One non-code welded steel receiver made of 3/16" thick copper-bearing steel with phenolic resin lining, integral supports, and connection for inlet, outlet, drain, vent, make-up valve, thermometer, and gauge glass. (Substitute if desired one dished head receiver built to ASME code for unfired pressure vessels rated 75 lb. working pressure with or without ASME inspection stamp but with separable cradle supports and connections for inlet, outlet, vent, drain, thermometer, gauge glass and make-up valve also with hand hole or manhole for cleanout per ASME code depending on the diameter of the receiver.)

(3) One fresh water make-up valve consisting of a ¾ inch solenoid valve (specify 1 inch on 500 gallon receivers) controlled by a float switch mounted on the receiver for ..... phase ..... volt current, (substitute ¾" float operated mechanical valve with pressure reducing valve set for 15 PSI for units with 60 and 100 gallon receivers).

(4) Piping between the receiver and pump to consist of one (substitute two for duplex) vertical section containing a gate valve and one (substitute two for duplex) horizontal section connected by Roth L-Type strainer to insure minimum pressure drop between receiver and pump.

(5) One (substitute two for duplex) 1750 RPM drip proof motor for ..... phase ..... volt current. Motor shall not be loaded in excess of NEMA service factor for integral drip proof motors. Make shall be General Electric, Louis Allis, Howell or equal.

(6) One (substitute two for duplex) magnetic starter of approved type suitable for the above motor, with holding coil for ..... volts.

(7) Gauge glass of proper size.

(8) Tank thermometer.

(9) When provision for heating water in the receiver is required add, "One brass perforated tube heater installed in the receiver." When automatic temperature regulated heater is required specify, "One brass perforated tube heater installed in the receiver connected to one temperature controlled regulating valve mounted on the heater connection."

SERIES 3000 and 2000

ROTH Two-Stage Power Pumps serve a variety of applications found in steam power service such as feeding water to steam boilers in a range of 100 to 500 PSI as well as condensate return, autoclave, desuperheater, and vacuum condenser service.

Series 3000 and 2000 have excellent hot water handling characteristics due to the large passages between stages, the special suction entrance modifications, and the inherent vapor handling characteristics of the exclusive ROTH turbine impeller design.

Both series are ruggedly built with extra heavy duty, flexible coupled shafts guaranteed for 10 years against breakage (see ROTH Guarantee, page 12). End-play has been completely eliminated and pressure lubricated ball bearings maintain precision performance and assure long life under hardest usage.

Steam engineers understand the proper use and maintenance of packing far better than the harder-to-replace mechanical seal. To cater to this preference, ROTH Power Plant Pumps are designed to handle hot water at high pressures with ordinary packing. Pressure on the packing has been reduced by approximately 85% through the installation of a throttle bushing between the impeller and stuffing box in each side. Packing maintenance is minimized and adjustment made simple and easy.

SERIES 3000 two-stage turbine power plant pumps consist of ten models divided into two general frame sizes.

Balanced design is one of the several factors resulting in the better performance and long life of ROTH series 3000. In these pumps, the two stages are arranged so that loads

are balanced between the two stages. This is achieved by opposing the point of discharge of the two stages and connecting discharge of first stage with suction of second stage by an external channel.

Pumps are standard fitted, bronze fitted, and all bronze and are supplied with ASA flanged connections.

Models 3521, 3711, 3721, and 3741 have the by-pass between stages located under the pump. Two impellers are arranged in series.

Models 3751, 3756, 3771, 3776, 3791, and 3796 have the by-pass between stages located at top of pump. Models with numbers ending in digit (1) contain impellers arranged in series. Models with numbers ending in digit (6) contain impellers arranged in parallel.

SERIES 2000 two-stage turbine power plant pumps consist of fifteen models divided into two general frame sizes.

Standard fitted, bronze fitted, and all bronze pumps are supplied with ASA screwed connections.

ROTH

VERTICAL CONDENSATE UNITS

(with cast iron or welded steel receivers)

SPECIFICATION FORM

Furnish and install as shown on the drawings one vertical condensate unit, Roth Model ..... or equal for ..... sq. ft. EDR at ..... PSI.

Pump shall be 1750 RPM vertical submerged type with corrosion resistant liners and stainless steel shaft.

Motor shall be General Electric or equal 1750 RPM, all angle, drip proof construction, mounted above the high water level for ..... volt (specify actual operating voltage) ..... cycle ..... phase current. Motor shall be non-overloading at any working pressure below design pressure.

Float switch shall be 2-pole Square D or equal, direct actuated by all-copper float and float rod with visibly adjustable float rod collars and suitable for across-the-line starts on single phase current up to 1 HP load.

A magnetic starter shall be provided suitable for the motor supplied. (Specify for 3 phase current only.)

The receiver shall be of high quality close grain cast iron with 2 inch inlet 7 inches above floor level (specify 9-7/16 inches for 23 gal. rec.) and provided with vent, overflow, and drain connections.

DESCRIPTION

ROTH Vertical Condensate Units are rugged, dependable, long-lived equipment engineered to include the most desirable features needed in pumps for local condensate collection or small steam heating systems.

These units are especially useful where condensate must be drained from low return piping. (Floor to inlet distance on 10 and 15 gallon receivers is 7 inches.) A minimum of floor space is required due to location of motor and switch on top of receiver which also permits shallow pit installation without hazard of flooding the electrical parts.

All models listed in the selection data below operate at 1750 RPM providing a full range of pressures up to 60 PSI for radiation up to 20,000 sq. ft EDR. This low operating speed plus special bronze bearing makes for unusually long, trouble-free service.

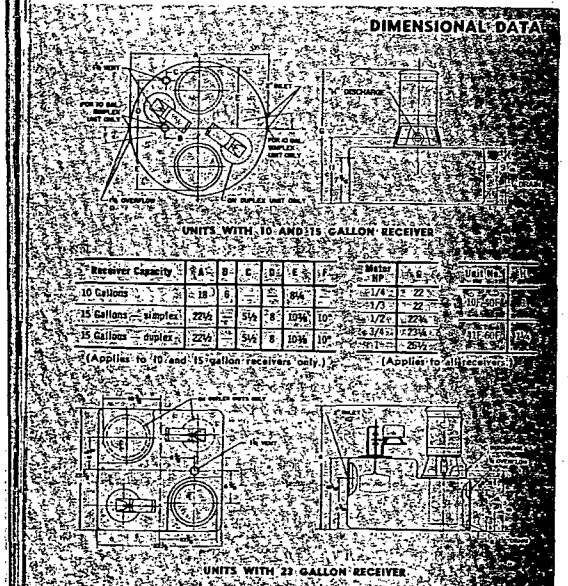
Up to 20 PSI working pressure, the pump operates on centrifugal phase. It will not vapor bind at 210°F. All working parts are of bronze or stainless steel.

A fully guaranteed General Electric or equal drip-proof, all-angle motor with thrust load carried on ball bearings is standard equipment. The unit is controlled by a heavy Square D, 2-pole float switch adequate for across-the-line starts on single phase current up to 1 HP load.

All cast iron receivers are equipped with 2 inch inlet plus drain, overflow, and vent connections.

SIMPLEX UNITS are float switch operated and provided with cast iron receivers of 10, 15, or 23 gallon capacity.

DUPLEX UNITS are standard with two float switches, one connected to each pump separately. Floats are set at separate levels to start second pump at peak returns. They are furnished with cast iron receivers of 15 or 23 gallon capacity. (Mechanical alternator can be substituted for the two float switches at slight additional cost.)



Units also available with heavy gauge welded steel receivers made from copper-bearing steel having .20% copper content and lined with phenolic resin.

1. All pump capacities shown are delivered at temperatures up to 200°F.
2. Will not vapor bind at 210°F.
3. Consult factory for selections involving enclosed motors or switches.
4. Select the unit according to design pressure and maximum expected square feet of direct radiation on the location.
5. Specify simplex or duplex.
6. Specify current and voltage. A specific operating voltage should be specified rather than dual voltage to assist in the proper selection and installation of the equipment.

ROTH

UNDERGROUND CONDENSATE UNITS

(with cast iron or welded steel receivers)

DESCRIPTION

ROTH Underground Condensate Units are indicated where condensate must be drained from underground piping. The floor-to-inlet distance is 12 inches to make possible a pipe slope for draining purposes. Low silhouette design permits flush floor installation, locating under storage tanks, etc.

Motor, motor mounts, and pump are essentially the same as used on the vertical condensate unit shown on preceeding page.

All underground condensate units operate at 1750 RPM providing a full range of pressures up to 60 PSI for radiation up to 20,000 sq. ft. EDR. This unusually low operating speed plus special bronze bearing makes for unusually long, trouble-free service.

The 1750 RPM pump operates on centrifugal phase up to 20 PSI working pressure. It will not vapor bind at 210°F. All working parts are of bronze or stainless steel. The impeller is precision-located between the adjacent faces in a fixed position to prevent it "riding" the lower face.

Motor is a fully guaranteed, General Electric or equal drip-proof, all-angle model with thrust load carried on ball bearings and controlled by a heavy Square D, 2-pole float switch adequate for across-the-line starts on single phase current up to 1 HP load.

All receivers are of heavy cast iron or welded steel construction flanged at top for bolt-down cover and equipped with 3 inch inlet plus vent connection. Interior is coated with a rust resistant, phenolic lining. Receivers are for atmospheric vented service only.

SIMPLEX UNITS are float switch operated with switches set to start at high level and stop at low level.

DUPLEX UNITS are standard with two float switches, one connected to each pump separately. Floats are set at separate levels to start second pump at peak returns. (One mechanical alternator can be substituted for the two float switches at slight additional cost.)

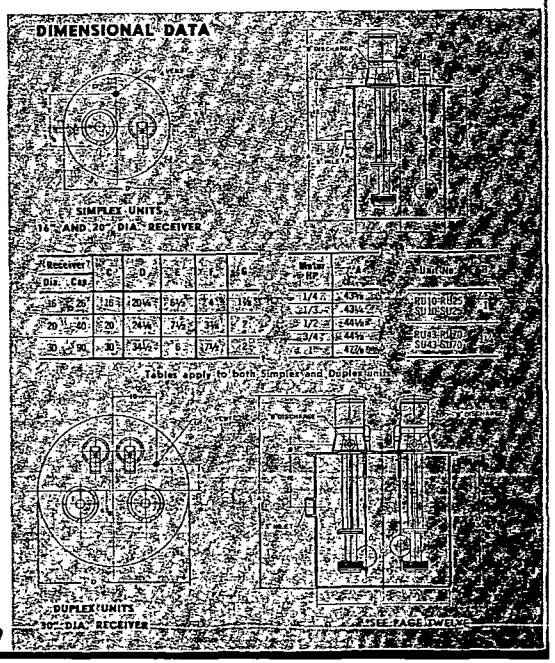
SPECIFICATION FORM

Furnish and install as shown on the drawings one underground condensate unit, Roth Model ..... or equal for ..... sq. ft. EDR at ..... PSI.

Pump shall be 1750 RPM vertical submerged type with corrosion resistant liners and stainless steel shaft mounted inside the receiver.



Motor shall be General Electric or equal 1750 RPM, all angle, drip proof construction, mounted above the high water level for ..... volt (specify actual operating voltage) ..... cycle ..... phase current. Motor shall be non-overloading at any working pressure below design pressure.

Float switch shall be 2-pole Square D or equal, direct actuated by all copper float and float rod with visibly adjustable float rod collars suitable for across-the-line starts on single phase current up to 1 HP load.

A magnetic starter shall be provided suitable for the motor supplied. (Specify for 3 phase current only.)

The receiver shall be of high quality close grain cast iron (or 3/16" welded steel with phenolic resin lining) with 3 inch inlet 12 inches below floor level.

ROY E. ROTH COMPANY TURBINE PUMP DIVISION ROCK ISLAND, ILLINOIS

*SEE PAGE TWELVE

DESCRIPTION

These units are essentially collection stations for condensed steam in heating or process systems. The package unit consists of a receiver tank and a motor driven pump controlled by a float switch mounted in the receiver.

Successful pumping of water at temperatures in the 190°F to 200°F range from low leg receivers requires special pumps designed for those temperatures.

High temperature returns are often caused by defective traps or local dumping of process steam and cause ordinary pumps to vapor bind. ROTH protects you from such occurrences by thoroughly testing and rating for hot water performance the pump models selected and guaranteeing them to perform as rated in the table. If desired, pump selection will be certified for 200°F temperature if request accompanies order. Such certification is based upon special test data obtained from hot water tests run upon the pump of your selection. (A slight charge is made to cover cost of test.)

Since many of these units will be located at points distant from the boiler room, maximum attention has been given to providing pumps that will give dependable service without constant maintenance. For this reason, these units are equipped with ROTH End Mounted Single Stage Pumps operating at

(continued next page)

SPECIFICATION FORM

Furnish and install as called for on the drawings one Roth model ..... simplex (or duplex) horizontal condensate unit or equal for ..... GPM at ..... PSI at 200°F to consist of the following:

One (substitute two for duplex) Roth 1750 RPM single stage end mounted pump with mechanical seal and sealed ball bearings certified for ..... GPM at ..... PSI at 200°F. Pump shall contain stainless steel shaft and bronze impeller and be guaranteed for 10 years against shaft breakage when driven by motor supplied.

One welded non-code vented receiver made from high quality copper-bearing steel sheets and internally lined with phenolic resin lining. (Substitute 75 lb. ASME code receiver with or without stamp on cradle legs if desired.)

One (substitute two for duplex) General Electric, Louis Allis, Howell or equal 1750 RPM drip proof motor selected within recommended service factors for intermittent service and guaranteed by the manufacturer at the point of selection. Current characteristics shall be ..... phase ..... volts.

One (substitute two for duplex) Square D two pole float switch or equal suitable for direct connecting to single phase motors up to 1 HP and for pilot service on larger single phase and all three phase motors. (Substitute mechanical alternator for two float switches if desired on duplex units.)

For units with three phase motors or large single phase motors one (or two) magnetic starter is required.) One (substitute two for duplex) magnetic starter of approved type suitable for the above motor, with holding coil for ..... volts.

The entire unit to be factory assembled and factory guaranteed.

1750 RPM and furnished with sealed factory-lubricated bearings and dependable mechanical seals, to eliminate the need of periodic lubrication and re-packing. (Grease fittings are provided to coat the bearing with a water-resistant perservative once or twice a year.) Packed pumps available if specified.
Because of the steep performance curve characteristic of ROTH turbine pumps, these units will maintain a fairly constant capacity over a considerable range of discharge pressures — a distinct advantage over comparable centrifugal-type pumps.

At operating pressures lower than design pressure the pump will not slug the boiler in heating systems. Also there is no increase in motor load at under-design-pressure conditions.

ROTH

TURBINE END MOUNTED SINGLE STAGE PUMPS

Check these Features:

- ✓ End mounted construction insures complete separation of liquid and mechanical end.
- ✓ Renewable liners provided in all models.
- ✓ Mechanical seal can be replaced without disturbing piping or motor.
- ✓ Factory lubricated sealed bearings eliminate need for periodic lubrication and protect against danger of overgreasing.
- ✓ Heavy stainless steel shaft and large bearings prevent coupling vibrations from being transmitted to impeller.

A PARTIAL LIST of ROTH BOILER FEED and CONDENSATE RETURN UNIT USERS

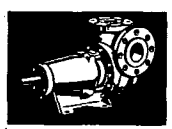
This list of ROTH customers indicates the nation-wide acceptance of ROTH Boiler Feed and Condensate Return Units, and Power Plant Pumps. Should you care to contact users in your area, please write for list of names.

ROTH GUARANTEES AGAINST SHAFT BREAKAGE!

The pump shaft is the keystone to good pump design. A rigid shaft properly supported by well protected ball bearings will prolong pump life by many years.

All Roth pumps are equipped with unusually heavy shafts or protected by balanced loads or both. Because of superior pump design, cases of shaft failure are extremely rare.

To emphasize this important quality the Roy E. Roth Company now offers this unprecedented guarantee:

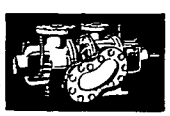


Guarantee

All Roth pumps sold after September 1, 1957 will be guaranteed by the company against shaft breakage for ten years from the date of shipment when flexible coupled to electric motors of sizes recommended by the factory . . . The company's liability under this guarantee will be limited to repair at the factory of any pump with a broken shaft when such breakage occurs within the specified period. Shipping cost to and from the factory to be borne by the owner.

CERTIFIED HOT WATER PERFORMANCE

The Roy E. Roth Company will certify the hot water performance of any model recommended in the foregoing tables upon receipt of request for certification with the purchase order. A slight charge will be made to cover the cost of a special hot water test.



TWO OTHER ROTH TURBINE-PUMPS AVAILABLE FOR SPECIALIZED APPLICATIONS

USAGE: Hot and cold water, acids, caustic solutions, liquified gases, solvents, and hydrocarbons.

RANGE: Head, 20 to 1000 ft.; differential, 0-450 PSI; capacity, 1-140; temperature, —60°F to +600°F; HP, ¾ to 30; NPSH, as low as 3 ft.

ROTH TURBINE CHEMICAL PUMPS—are a special adaptation of the turbine principle specifically designed for continuous, high pressure service under adverse conditions of corrosion or temperature. These pumps have a record of continuous service equalling and often surpassing that of other, more costly types of high pressure chemical pumps and are recommended for clear liquids to 100 cp viscosity.

USAGE: Ammonia, freons, methyl chloride, propane, butane, boiling liquids.

RANGE: Head, 150 to 1600 ft.; differential, 50-700 PSI; capacity, 2 to 100 GPM; temperature, —80°F to +320°F; HP, 5-40 BHP; NPSH, 1, 2, or 3 ft.

ROTH TURBINE LOW NPSH PUMPS—are designed to meet suction-loss problems in liquids having low suction heads with viscosities to 100 cp and temperatures to 300°F. This ability derives from their extremely low NPSH characteristic which is due to the low disturbance at the suction and a gradual pressure build-up throughout the pumping cycle. Available in single or 2-stage design with exclusive booster stage.

HEATING VENTILATING AIR CONDITIONING GUIDE 1959

On pages ●63–●476 will be found the Catalog Data of 309 manufacturers whose products are described and illustrated.

For the convenience of the user of THE GUIDE 1959 there are ten main divisions:

Air Conditioning	●63–●148
Air Conditioning and Heating Piping	●149–●154
Air System Equipment	●155–●269
Controls and Instruments	●270–●295
Expansion Joints	●296–●303
Fittings and Flanges	●304–●307
Floats	●308
Heating Systems	●309–●427
Insulation	●428–●459
Publications and Exposition	●460–●469

On pages ●7–●24, under each of the index headings—Air Cleaning Equipment, Fans, Humidifiers, Ventilators, etc., will be found a list of manufacturers of any desired products, fully cross-indexed, and the page numbers in the Catalog Data Section where the products are described.

By reference to these indices, the manufacturers' names and the page numbers, any item of equipment or materials, and the producer's address, may be located quickly.

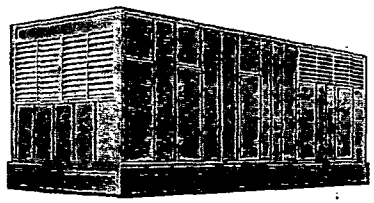
A&R TRADE MARK

ARTICULATED UNITS

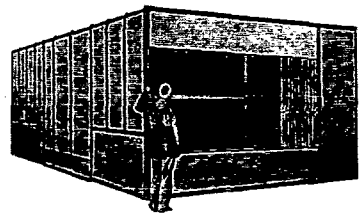
Units with unlimited capacities are furnished for standard, double duct or multizone distribution systems. Designed for each particular application, they incorporate coordinated equipment to fit within the space available. All units are factory test-assembled to assure fit of parts prior to shipment. We call them ARTICULATED UNITS.

COMPONENTS



A typical system often combines air mixing, filtration, washing, cooling and heating, humidifying or dehumidifying and air circulating equipment. More complete systems may also include the refrigeration compressor, water chiller, evaporative condenser, pumps and boiler with all being enclosed in a factory insulated casing. Blow-through multizone systems also require outlet air dampers for mixing hot and cold air streams for each zone.

HOUSINGS

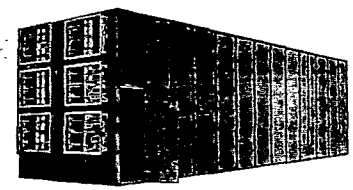


Unit housings are assembled using A & R factory insulated panels. Available in indoor or outdoor weatherproofed construction, the panels consist of an interior galvanized steel sheet to which is applied the insulation, aluminum vapor seal and outer protective sheet of tempered hardboard. For outdoor use an additional weatherproof skin of aluminum is added. To save additional cost, the machine room floor may be used as the bottom of each enclosure or an insulated drip pan may be included.

ADVANTAGES

Articulated units are custom engineered to suit the performance requirements and space limitations of each particular application. All parts are selected to work in co-ordination with the rest of the system.

EQUIPMENT ENCLOSURE—INSULATION IN ONE PREFAB PACKAGE



Office time and effort by the purchaser are reduced in adopting articulated unit construction. One purchase order covers materials and services normally requiring a number of separate contracts.

The factory insulated housings do away with the usual mess of field insulation and plastering. This may be an important factor, particularly in older buildings such as department stores, etc., where valuable stocks of merchandise cannot be removed. Prime coated before leaving the factory, the exterior presents a continuity and neatness of appearance which needs no field painting unless scratched or marred in handling and erection.

The panel type construction permits sections of units to be dismounted quickly and easily where it is necessary to remove bulky internal parts for repair or replacement.

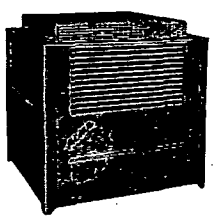
CATALOGS

For further information on A & R Articulated Units or Factory Insulated Panels, write direct to main office in New York, or contact factory representative in your area.

Acme INDUSTRIES, INC. 600 N. Mechanic St. Jackson, Mich.

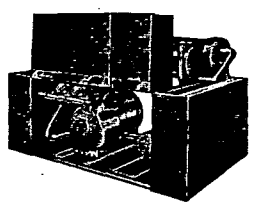
✱ COMPLETE AIR CONDITIONING AND REFRIGERATION SYSTEMS

✱ ADVANCED DESIGN COMPONENTS



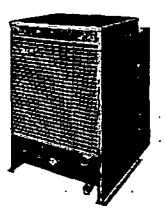
Look to Acme for all types of air conditioning systems. Acme supplies a complete line of air conditioning and process cooling equipment including packaged liquid chillers; and remote room conditioners, air handlers and multi-zone units for use in direct expansion or chilled water systems. Acme water saving equipment includes evaporative condensers, indoor-outdoor cooling towers and outdoor cooling towers.

In addition, Acme offers a complete range of self-contained air conditioners.

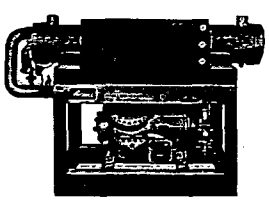


Acme components for built-up systems have long been recognized for excellent quality. All major manufacturers of air conditioning and refrigeration equipment have used Acme components for many years.

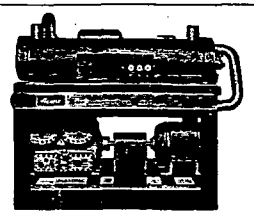
Call your Acme sales engineer for details on how he can help you with your air conditioning or process cooling problems.



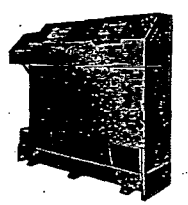
MANUFACTURERS OF QUALITY AIR CONDITIONING AND REFRIGERATION EQUIPMENT SINCE 1919



Flow Pac Packaged Chillers— 1¾ through 5 hp



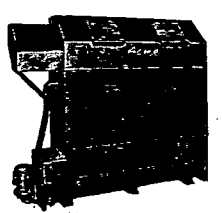
Flow Cold Packaged Water Chillers—3 through 30 tons



Flow Cold Cooling Towers— 3 through 20 tons

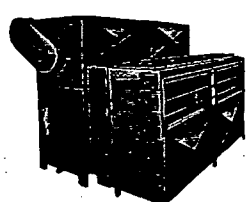
Model HE Flow Therm Packaged Water Chillers— 20 through 60 tons

Model DE Flow Therm Packaged Water Chillers— 20 through 125 tons



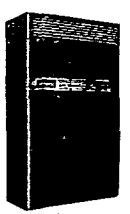
Flow Mixer Cooling Towers— 20 through 175 tons

Acme INDUSTRIES, INC. 600 N. Mechanic St. Jackson, Mich.

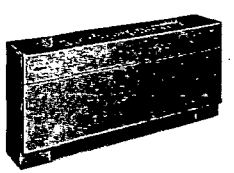


FOR COORDINATED BUILT-UP SYSTEMS . . . USE THESE Acme MATCHED COMPONENTS

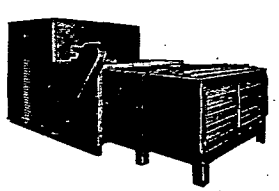
- **DIRECT EXPANSION COOLERS** *1 to 300 tons*
- **SHELL AND TUBE CONDENSERS** *1½ to 700 tons*
- **SHELL AND COIL CONDENSERS** *¾ to 10 tons*
- **HEAT EXCHANGERS** *3 to 150 tons*
- **LIQUID RECEIVERS** *3 to 150 tons*
- **OIL SEPARATORS** *5 to 100 horsepower*
- **AIR COOLED CONDENSERS** *3 to 100 tons*
- **DIRECT EXPANSION COILS**
- **WATER AND STEAM COILS**



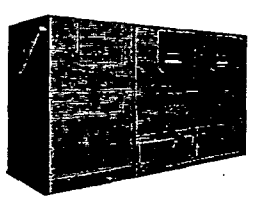
A complete range of sizes and capacities for almost every OEM, built-up system and replacement need.



Flow Mixer Evaporative Condensers— Capacities to 200 tons



Air handlers—4 types in 40 models from 665 to 19,200 cfm



Self contained packaged air conditioners—5 models from 3 to 15 tons, air or water cooled

Remote room conditioners— 4 types in 16 models from 200-600 cfm

Multi-zone air conditioners—5 models from 4,060 to 19,200 cfm

Self contained packaged air conditioners—24 models from 20 to 60 tons, air or water cooled

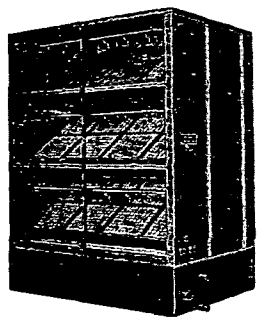
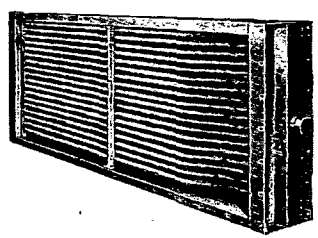
AIR CONDITIONING—HUMIDIFYING—DEHUMIDIFYING—VENTILATING—HEATING—VAPOR-ABSORPTION—DRYING—AIR WASHING AND PURIFICATION—EXHAUSTING EQUIPMENT AND MECHANICAL DRAFT APPARATUS

Type A



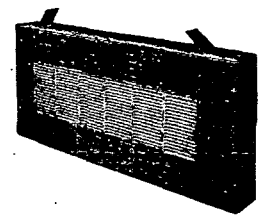
Type S



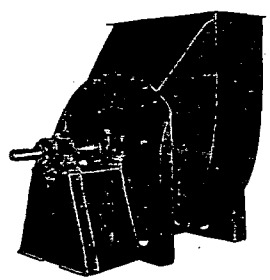
Type AB Multi-Zone Unit

Air Conditioning Units—four basic types. Eleven sizes. Capacities from 800 to 40,000 cfm, and for operation up to 9 in. static pressure. Type A for unitary-type applications: Summer cooling and dehumidifying, using chilled water, direct-expanded refrigerant, or brines; winter heating, using steam or hot water. Type S is the same basic unit as Type A, plus spray system, water recirculating pump and eliminators; combines the washing, air cleaning, humidifying, and evaporative cooling with the cooling and heating of the basic unit conditioner. Type AB Multi-Zone Unit for either horizontal or vertical air flow. Plenum and diffusion device provides even air distribution over coils. Type C combines the features of the capillary air washer with the basic Type A unit. Request *Bulletin 9227.*

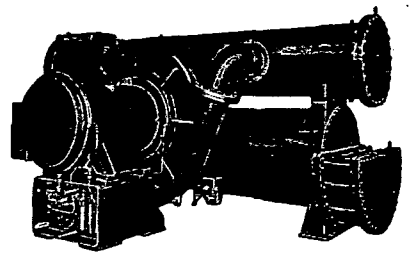
Capillary Air Washers—for high efficiency in cleaning, humidification, cooling and dehumidification of air. Air is forced at low resistance through long, irregular passages of small size formed by a large amount of thoroughly wetted glass surface. Write for *Bulletin 4125.*



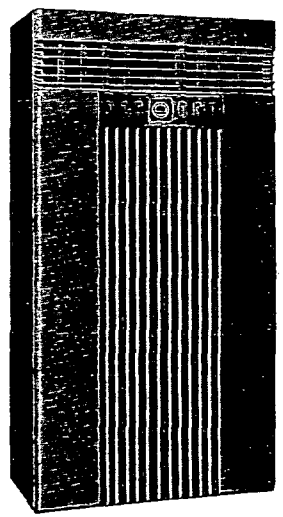
Heating and Cooling Coils—American Blower heating and cooling coils offer a number of improvements in design and construction. Available in a complete range of sizes and types, including:



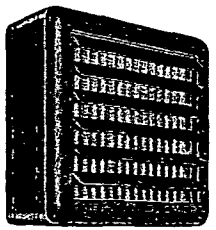
Bulletin B-1218	Type S steam coils
	Type D double tube coils
	Type U return bend coils
	Type B booster coils
Bulletin 1521	Type W water coils
	Type C cleanable water coils
	Type X direct-expansion coils
Bulletin B-1318	Type H heavy-duty coils
Bulletin B-1418	Type D-1 double tube coils



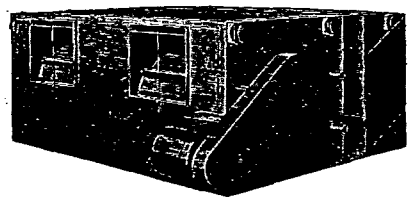
Diaflo® Conditioners—fan-coil type air-conditioning units for cooling and heating multi-room buildings with chilled or hot water. Fan draws fresh and recirculated air across coil, cooling or heating or dehumidifying it. Write for *Bulletin 9327.*



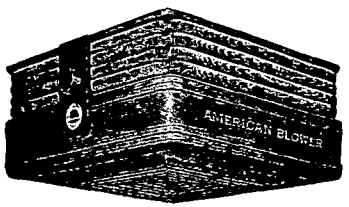
Inductor Units—small room air conditioners for cooling and heating multi-room buildings. Preconditioned primary air, supplied under pressure, induces a flow of room air through a coil in the unit, then into the primary air stream. Mixed air is discharged through top of unit. Write for *Bulletin 8827.*



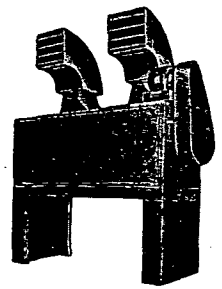
Sirocco High-Pressure Fans—especially adaptable to high-pressure air-conditioning systems. The multiple forward-curved blade design gives it a relatively high static pressure characteristic, so for a given duty it runs at about half the speed of backward-inclined blade fans. Data on request.



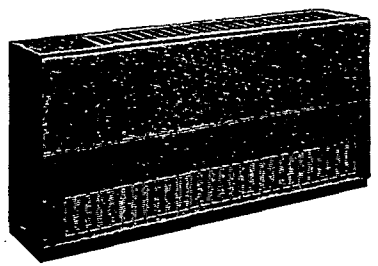
Tonrac®—single-stage hermetic centrifugal refrigerating machine. Maintains constant chilled-water temperature from 0 percent to 100 percent load. No cycling is required. Completely automatic load control—pneumatic or electronic. Induction motor suitable for any type of starting equipment with network and primary voltage. Bearings arranged for positive thrust and forced-feed lubrication. Single-level construction simplifies installation and maintenance. Request *Bulletin 1426.*



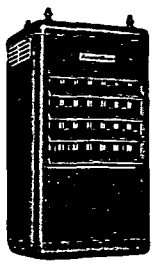
Packaged Air Conditioners—completely self-contained units that cool, filter, dehumidify, circulate air; heat, when equipped with heating coils. Hermetically sealed motor-compressor assemblies. Six sizes; 3 ton to 20 ton capacities. Exceptionally quiet. Request *Bulletin 6125.* Also air-cooled models, *Bulletin 8025.*



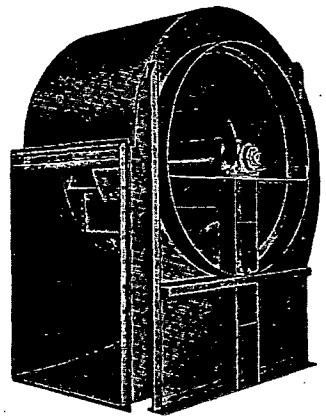
Venturafin® Horizontal Unit Heaters—available with one- or two-row standard steam and water coils, or serpentine hot-water coils (results in greater heating capacities at lower water volumes). These propeller-fan-type units heat quickly, quietly. Have adjustable-direction louvers. Request *Bulletin 9017.*



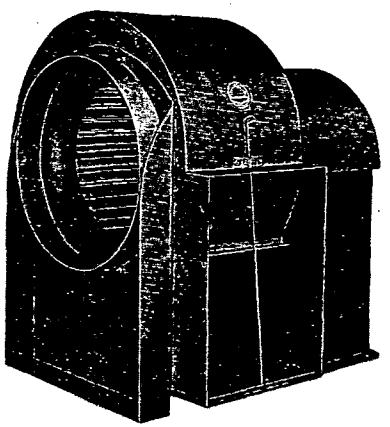
Heating, Ventilating and Multi-zone Units—with air filters and Aileron Control. For use where attractive, quiet, and economical heating and ventilating units are required. Wall, floor, or ceiling mounting. Units offer great flexibility of design and arrangement to meet specific needs. Request *Bulletin 8927.*



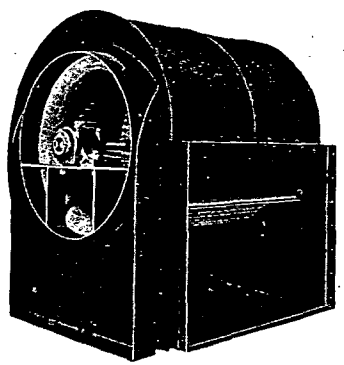
Venturafin Vertical Unit Heaters—can be mounted in minimum space at ceiling above craneways; has, as standard equipment, Equitemp Air Diffuser for maintaining desired even temperature. Capacities: 42,000 to 560,000 Btu at 2 lb steam pressure and 60 deg entering air. Standard steam and hot-water coils. Request *Bulletin 9017.*



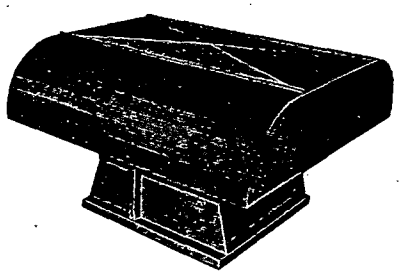
Industrial Heaters—feature quiet, low-speed centrifugal fans—V-belt driven to provide easy speed adjustments. Universal cowls adjust to direct air and heat where required. Four arrangements: wall, horizontal, inverted, and floor (shown). Request *Bulletin 7727.*



Cabinet Heaters—for offices, lobbies, showrooms, corridors—any application where appearance is important. Heavy-gauge steel cabinet houses high capacity steam or hot-water heating element and two or more centrifugal fans. Flexibility of mounting and inlet-discharge locations make numerous applications possible. Write for *Bulletin 9617.*



Gas Fired Heaters—self-contained units for clean, automatic, instantaneous heating. Adjustable louvers assure efficient heat distribution throughout the work area. *A. G. A.* approved. Write for *Bulletin 8517.*



HS Fans—used for ventilating, air conditioning, and in commercial and industrial applications such as: drying, heating, fume removal, and processing systems. They are available in both single- and double-inlet designs and may be specified for clockwise or counter-clockwise rotation in any of eight standard discharges. Single-inlet fans are built in seven standard arrangements, double-inlet fans in two arrangements. Write for *Bulletin A-605.*

Utility Sets—complete packaged units, directly connected or with V-belt overhung drive, for duct applications. Belt driven units available with Sirocco forward curved blade wheels or HS backwardly inclined blade wheels having nonoverloading power characteristics. Sizes for a wide variety of ventilating problems. Quiet, compact. Complete technical information in *Bulletins 8314, 8414.*

Sirocco Multiblade Fans—operate at lower rotative and peripheral speeds for a given duty. They operate quietly at low speeds, and deliver more air per revolution. (Double-inlet model shown.) Request *Bulletin A-801.*

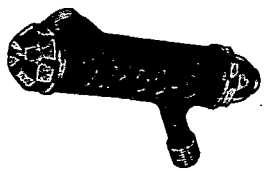
Power Roof Ventilators—weatherproof ventilators with V-belt drive and access door in fan housing. Model HRV exhaust ventilators (shown) are hood type, and have automatic shutters and 4-way discharge. Model VRV exhaust ventilators are upblast type and expel air high above roof, minimizing roof deterioration and preventing re-entry of air into supply ventilators. Model SSV supply ventilators, hood type, have motor-operated dampers and perimeter intake. Write for *Bulletin 3904.*

American Moistening Company

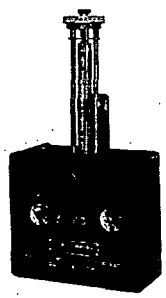
Cleveland, N. C.

ATLANTA, GA. . PROVIDENCE, R.I. . TORONTO, ONT.

AMCO



TEXTILE and INDUSTRIAL HUMIDIFICATION AIR CONDITIONING SYSTEMS

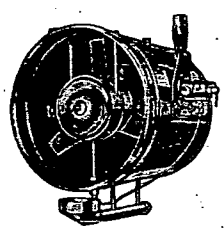


The American Moistening Company has been designing and manufacturing humidifying equipment for the textile industry since 1888. During this time, Amco has developed and introduced new equipment and control devices to solve atmospheric problems created by motorization, high speeds, new fibers, new machines, new techniques, and operation in varied climates.

Four basic advantages are to be found in all Amco products: superior performance, economy, durability, and simplicity with consequent ease of maintenance. The combination of all four is found throughout the complete Amco line.

AMCO ATOMIZER NO. 6

The automatically self-cleaning Amco No. 6 micro-spray atomizer delivers a smoke-like spray to a great distance for balanced distribution of humidity. Its fine performance and ease of maintenance make this atomizer popular for new installations and replacements. These units require compressed air for operation and obtain their water supply from a constant level, float controlled tank and piping.



AMCO HUMIDITY CONTROL

Model K-2, improved through redesign, maintains room humidity within the closest practical limits under both normal and unusual conditions. An Electro-Pneumatic mechanism, operating in cushion-mounted jeweled bearings controlled by two humidity-sensing membranes, regulates atomizer operating periods. A variable change anticipating mechanism compensates for mechanical lag and the time required for water vapor to mix with and change the relative humidity of the room atmosphere. This results in humidity control within limits not previously attained in a rugged, dependable device.

AMCO MODEL 35 HUMIDIFIER

Ideally suited for areas of light heat concentration, especially where cost of other types of humidification might be prohibitive. Propeller-type fan draws room air into rear of unit and forces it forward around periphery of atomizer disc—thus carrying atomized water into room where it quickly evaporates into surrounding atmosphere. Housed in stainless steel. Requires only simple water and electrical connections. May be adjusted to evaporate from zero to 22 pounds of water per hour while circulating 1200 cu ft of air per minute. Simple and reliable, it requires a minimum of maintenance.

ARMSTRONG MACHINE WORKS

851 Maple St., Three Rivers, Mich.

GUARANTEED: SATISFACTION OR YOUR MONEY BACK

Available from Factory Representatives in Major Cities, or Direct from Factory

Automatic Steam Humidifiers—Air-Modulating or Electric Operated

For Comfort Air Conditioning or Protection of Hygroscopic Materials in Industrial Plants

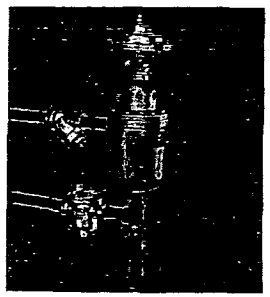
Armstrong Humidifiers are large capacity, automatic units which discharge dry steam into duct systems or directly into space humidified. Installation is simple. Maintenance is negligible.

Advantages of Steam Humidification

1—Steam is ready-made vapor which merely has to be mixed with the air.
2—Steam deposits no mineral dust such as comes from evaporated water droplets.
3—Steam can be shut off as soon as the control is satisfied—no over-run.
4—Steam comes on immediately when control calls for humidity.
5—Steam creates no sanitation or odor problems. Duct system and air-handling units are always dry.
6—With steam there is no accumulation of moisture to promote growth of algae or bacteria.
7—Steam eliminates corrosion problems in ducts or fan housing.

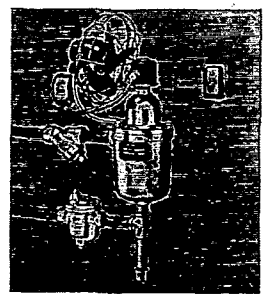
Armstrong Humidifier Advantages

1—Low cost and large capacity.
2—Minimum maintenance, proved by thousands of installations.
3—Quiet operation.
4—No carry-over or drip.
5—Immediate response to control
6—Low operating expense.
7—Guaranteed tabulated capacities.
8—Selection is simple and easy.
9—Small space required makes duct design easy.
10—Easy installation.



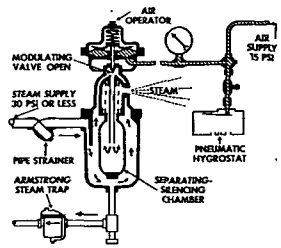
Size and List Price Range

Air-Operated Units



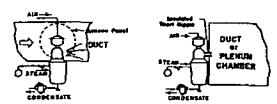
Model	List Price	Capacity, lb/hr
AM-32	229.25	31 to 150
AM-33	316.00	60 to 320
DA-34	593.00	145 to 1425

Electric Units



Model	List Price	Capacity, lb/hr
CL-2	170.00	25 to 76
CL-3	295.00	60 to 170
CK-4	545.00	145 to 1280

AM-32 Air-Modulating Humidifier complete with strainer, trap and hygrostat. AM-33 similar.



CL-2 Humidifier complete with fan and motor, humidistat, fine mesh strainer and trap. CL-3 similar.

Operation

Air-Operated Units—When relative humidity drops slightly below desired level, the pneumatic hygrostat increases air pressure in operator to open modulating valve in proportion to demand. When demand is satisfied air bleed closes the valve. Air-operated units usually discharge to ducts or are installed in plenums.

Electric Units—When relative humidity drops slightly below desired level, humidistat energizes solenoid to open steam valve and start fan. Steam flows through muffler to atmosphere and is dispersed by fan. When desired humidity is reached, humidistat closes valve and stops fan. Electrically operated units normally discharge directly into atmosphere.

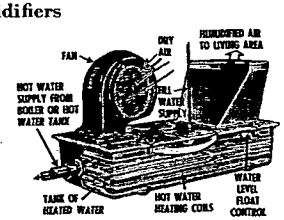
Simple duct installations of air operated units

Automatic Evaporative-Type Humidifiers

For Residential, Commercial and Industrial Service where the direct use of steam is impractical. Advantages:

BIG CAPACITY—up to 16 pints/hr.

AUTOMATIC CONTROL AND OPERATION—set it and forget it.



USE WITH ANY HEATING SYSTEM—hot water, steam or warm air.

FLEXIBLE INSTALLATION—Can be suspended from ceiling, mounted on floor stand, or attached to warm air duct. Enclosure available.

DUST FREE HUMIDIFICATION—"distilled" water vapor is used.

LIFE-TIME CONSTRUCTION—Fiberglass tank and corrosion resistant parts. List prices start at $195. *Bulletin No. 902* gives further information.

How It Works—When relative humidity drops slightly below humidistat setting, humidistat starts fan, blowing air across surface of heated water and thence to area to be humidified, or into a furnace plenum. Water level is kept constant by automatic float control.

Bahnson Company

ENGINEERS AND MANUFACTURERS

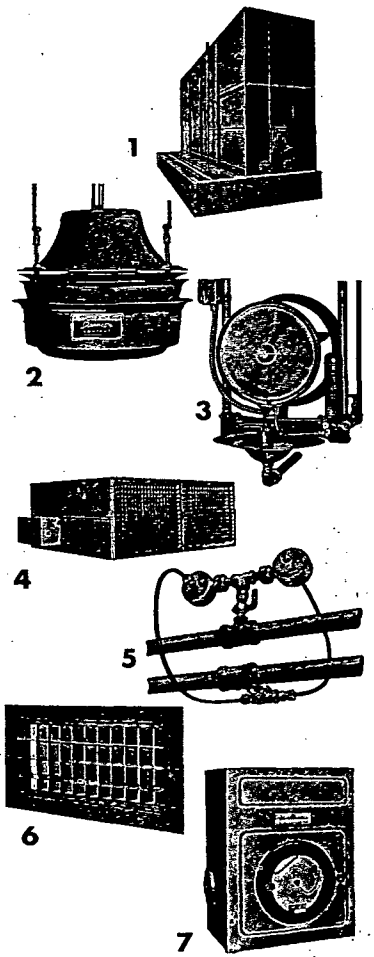
WINSTON-SALEM, N. C.

AIR CONDITIONING · HUMIDIFICATION · CLEANING · VACUUM COLLECTION · CREELS

1. AIR WASHER—Bahnson Type Y and Type DC Air Washers cleanse, cool, and provide humidity control. Available in standard sizes from *6,000 to 250,000 cfm*, they can be provided with spray systems best suited for the specific application. Write for *Catalog 1A*

2. TYPE E HUMIDIFIER—A self-contained unit with high evaporative capacity for installation in all types of industrial and commercial spaces requiring automatically controlled humidification. Evaporates up to *3 gph* with 360 degree radial distribution of moisture. Requires only water supply and electrical connection. Write for *Catalog 16A*

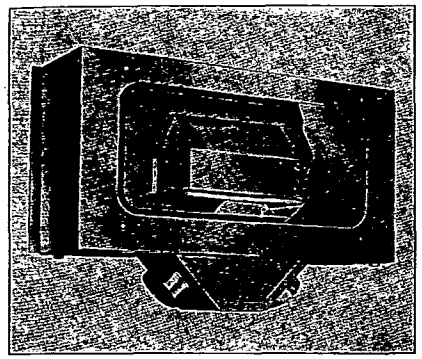
3. CENTRIFUGAL HUMIDIFIER—A self-contained unit for industrial use. Evaporation up to *12 gph* plus directional air flow with fractional horsepower motor. Installed singly or in groups with individual or group automatic control. Requires only water supply, drain, and electrical connection. Write for *Catalog 2A*



4. TYPE BA-2 HUMIDIFIER—A high-capacity unit for overhead suspension in commercial and industrial applications. Adjustable grilles give complete directional control of moist air delivered. Automatically regulated, the unit provides air flow, humidification and filtering. Requires only water supply, drain, and electrical connection; capacity up to *18 gph*. Write for *Catalog 17A*

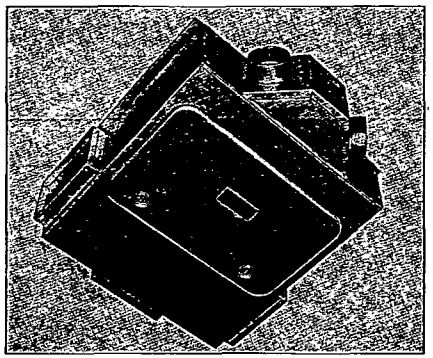
5. TYPE ESC-2 ATOMIZER—A self-cleaning pneumatic atomizer of quality design for direct humidification or supplementary evaporation. Uses air and water under pressure to provide high evaporation and fine spray quality, with minimum air requirements. Modulating control regulates evaporation in direct proportion to the room requirements. Write for *Catalog 5A*

6. GRILLES—Bahnson Type C and D Grilles are designed for air discharge with removable core for easier cleaning and access to distribution duct. The air-foil type blades in the grilles are wide-spaced for both horizontal and vertical blade deflection and are individually adjustable by hand for air flow control. Constructed of extruded aluminum, blades are mounted on 1½ in. centers and are 1½ in. in width. Type C Grille has flush type face mounting; Type D Grille blade section projects forward permitting unobstructed air flow in distribution duct. Write for *Catalog 6A*



7. HUMIDITY CONTROLS—Bahnson Controls are offered in either electric or pneumatic design. The control consists of a highly sensitive humidistat which actuates an electric or pneumatic relay in response to humidity changes in the conditioned area. The humidistat is mounted in an aspirated cabinet which constantly draws a sample of room air over the hygroscopic element. Manual selector switches in the cabinet provide automatic functioning of motor-operated valves supplying water or steam to humidifying units. Write for *Catalog 9A*

OTHER BAHNSON MANUFACTURED EQUIPMENT: portable humidifiers, steam humidifiers, air washer suction strainers, spray nozzles, and complete industrial air conditioning systems. In addition Bahnson manufactures vacuum collection and cleaning equipment and creels. Write for descriptive literature on your requirements.



BUENSOD-STACEY, INCORPORATED

45 WEST 18th STREET, NEW YORK 11, NEW YORK • CHARLOTTE, NORTH CAROLINA · RICHMOND, VIRGINIA

Type V3. Window-Wall Dual Duct unit (showing automatic volume control).

Type H. Overhead Dual Duct unit.

BUENSOD-STACEY AIR HANDLING UNITS WITH SELF-CONTAINED AUTOMATIC VOLUME REGULATION

Automatic volume control is a self-contained feature of every Buensod-Stacey air handling unit. By simple mechanical means it maintains a constant flow of air through each unit in the system within plus or minus 5% of the desired amount even though static pressure at the unit's inlet may vary as much as 8" wg. This makes it impossible for any zone in the system to become unbalanced. Automatic volume control operates *without* the need of any outside power source, sensing instrument or complicated arrangement of linkage.

SIMPLE TO INSTALL AND ADJUST

A screw setting of spring tension at the time of installation and the unit is permanently set for the specified volume. If, after installation, a change of air volume is desired, it can be made quickly by adjusting one nut. No linkage. The mixing valve is designed for direct, straight-line movement. On dual-duct units, compressed air from a local thermostat controls the mixing valve to provide the desired room temperature.

DUAL DUCT AIR CONDITIONING SYSTEMS

This method of air conditioning utilizes hot and cold air in parallel conduits. The two streams of air are carried throughout a building separately and are blended in each conditioned zone by an air mixing valve. Temperature is controlled locally by a thermostat. The occupant may select the temperature at which he is most comfortable. Without adequate automatic volume control in each unit zones become unbalanced very easily. It is much like what happens when a shower bath valve is opened on the ground floor of a building and pressure drops on the top floor. Automatic volume control prevents this.

TYPE V3 WINDOW-WALL UNIT

Designed for installation under windows. It discharges vertically upward . . . quietly and without draft.

TYPE H OVERHEAD UNIT

Intended for use above hung ceilings, it supplies air through conventional side wall outlets or overhead diffusers.

SINGLE DUCT AIR CONDITIONING

This is Buensod-Stacey's newest air handling unit. It has been designed for use with central systems where the air temperature is pre-determined by zone thermostat and a single stream of air is carried to each zone for distribution. When such an arrangement is used, the Type HSD unit, by using a volume regulating device as the valve, saves much field labor normally required for adjustment and balancing of the system.

All Buensod-Stacey Air Handling Units, both Single Duct and Dual Duct, are now available in aluminum. Where weight and handling are factors, this construction shows economy, and where corrosion is a factor, aluminum construction has many advantages.

HIGH PRESSURE DEHUMIDIFIERS

The development of a series of dehumidifiers for use with high pressure Dual Duct and Single Duct systems has proven to be essential. These factory insulated, specially braced, sprayed coil dehumidifiers are designed for pressures up to 10" wg.

BUENSOD-STACEY INCORPORATED

Literature describing the equipment mentioned here is available. To obtain information about it, write Buensod-Stacey or communicate with our nearest sales representative.

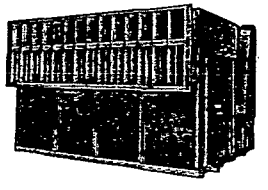
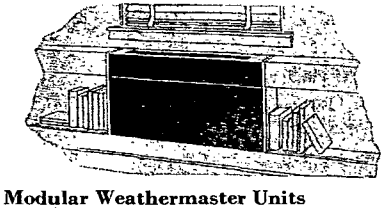
Weathermakers

These versatile self-contained air conditioners are excellent for use either singly or in multiples in all types of commercial and industrial buildings. Compact, attractively styled for use in or out of conditioned space, with or without ducts. Heating coils optional. Available in eight sizes, air or water-cooled models with capacities of 3, 5, 7½, 10, 15, 20, 25 and 30 tons.



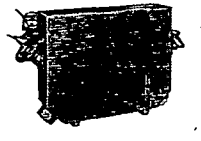
Year-Round Weathermakers

Complete year round air conditioning units for homes and smaller commercial and industrial buildings. All the elements for cooling, heating, filtering, circulation, humidifying and dehumidifying in one compact package. Air or water cooled models available with cooling capacities from 5 to 7½ tons; gas heating capacities are from 100,000 to 190,000 Btuh input.



Single Zone Weathermakers

Central station fan-coil air conditioning units for cooling and heating systems using remote sources of refrigeration and heat. *Building-block design offers extreme* flexibility of application. Adaptable to floor or overhead mounting in horizontal or vertical arrangements. In eight sizes with direct expansion, brine or chilled water coils. Capacities from 2400 to 40,750 cfm.



Multi-Zone Weathermakers

For air conditioning several zones of a large building with a single unit, using remote sources of refrigeration and heat. The multiple mixing dampers connect to hot and cold air plenums for independent temperature control of each zone. Eight sizes with coils for direct expansion, chilled water or brine and steam or hot water. Capacities range from 2400 to 40,750 cfm.

Modular Weathermaster Units

The high induction Weathermaster System uses these room terminals with primary air for cooling and ventilating and chilled water for supplemental cooling or heating. In four base unit sizes for furred-in application or with metal enclosures for floor-mounted or wall-hung installation. Adaptable to all types of fenestration, stool heights and wall construction.

All-Air Weathermaster Units

These high velocity room terminals combine efficient sound attenuation with effective control for every type of all-air system currently popular, including dual duct, single duct (with or without reheat), and dual conduit. Five models in six sizes from 50 to 1700 cfm offer choice for under-window or ceiling installation for both exterior and interior zone application.

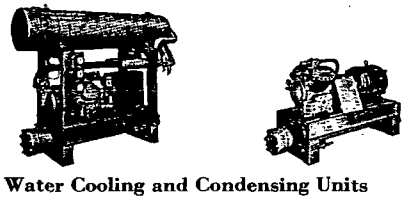
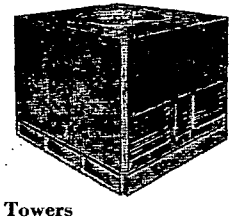
Centrifugal Refrigeration

For large scale air conditioning, process refrigeration, direct or indirect cooling of water, brines, hydrocarbons and other liquids. This compact refrigerating machine is comprised of an evaporator, condenser, and multi-stage centrifugal compressor. Available in a wide range of sizes with cooling capacities from 100 to 4,000 tons, for use with motor or steam turbine drive.



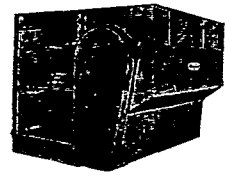
Hermetic Centrifugal Refrigeration

A compact, completely integrated water cooling machine designed especially for air conditioning or process liquid cooling applications. Features include a sealed, refrigerant cooled motor-compressor unit, automatic electronic controls, low demand motor circuiting and hydraulically powered capacity regulating vanes. In cooling capacities from 90 to 1500 tons.



Absorption Refrigeration

A heat operated refrigerating machine, using low-pressure steam or high-temperature water to chill water for air conditioning or process liquid cooling applications. Uses plain water as the refrigerant and lithium bromide as the absorbent. Operation can be fully automatic from full load to zero capacity. Thirteen sizes in cooling capacity range from 60 to 700 tons.



Water Cooling and Condensing Units

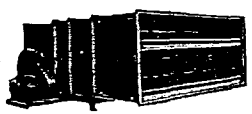
Completely packaged water-cooling machines include compact assembly of cooler, condenser, motor, compressor, refrigerant piping and control center all pre-engineered, assembled and factory tested. Capacities range from 5 to 139 tons. Compressors and condensing units for medium and low temperature applications range from 5 to 150 hp; direct, belt drive or hermetic.

Cooling Towers

Carrier induced-draft towers present an extremely compact design to reduce operating weight, structural support and maintenance. Galvanized steel construction with plastic fortified cellulose fibre fill insures long service life. Fan has adjustable pitch cast aluminum blades with close coupled, in-line motor drive. Single or multiple cell towers in sizes from 100 tons up.

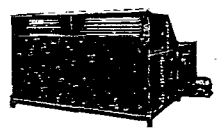
Evaporative Condensers

Fan-coil type refrigerant condensers for use with refrigerating compressors to supplant water-cooled condensers or cooling towers. Designed for outdoor or indoor installation, they provide an efficient, economical means of heat disposal where problems exist on water supply and disposal. The complete range of sizes covers refrigeration capacities from 5 to 250 tons.



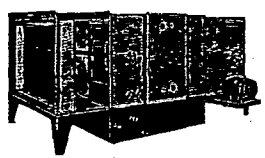
CLARAGE FAN COMPANY

Kalamazoo, Michigan

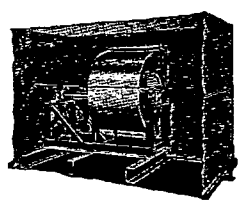


Air Handling and Conditioning Equipment

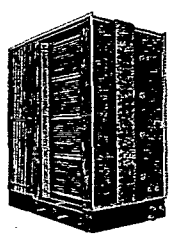
Sales Engineering Offices in All Principal Cities



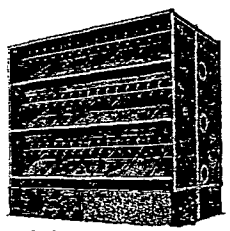
Since 1913 Clarage has been a leading manufacturer of air handling and conditioning equipment. By specializing—building a complete line of this equipment exclusively—Clarage has a concentrated "know how" that means important dividends to the user. (See "Air System Equipment—Fans and Blowers" for other Clarage products.)



DRAW-THRU MULTITHERMS (Design 1). For both comfort and process applications. Can be arranged to handle applications ranging from simple ventilation to multi-function air conditioning. Horizontal and vertical arrangements. 12 sizes. Capacities 500 to 35,000 cfm.



BLOW-THRU MULTITHERMS (Design 1). For central station zone control air conditioning. A single unit can handle different needs in as many as 8 different areas simultaneously. Hot and cold air is mixed to prevent stratification. Horizontal arrangement only. 12 sizes. Capacities 500 to 35,000 cfm.



SPRAYED COIL MULTITHERMS (Design 1). Draw-Thru type for applications requiring extremely close control of both temperature and humidity, or where continuous flushing of coil surfaces is desired. Capacities 500 to 25,000 cfm. Unit shown with sprayed coil section exposed.

HI-STATIC MULTITHERMS (Design 3). Principally for conduit type systems where high duct velocities and pressures to 8 in. sp are encountered. Horizontal arrangement only. Cut-away view shown. Capacities 2,500 to 22,000 cfm. Sprayed coil units also available.

UNICOIL UNITS. Sprayed coil equipment principally designed for cooling and dehumidifying service in central station air conditioning systems. Capacities, based on 500 fpm air velocity, range from 3,000 to 41,600 cfm.

AIR WASHERS. Capillary® washer (shown) primarily for air cleaning efficiency in comfort and process central station air conditioning systems. Equipped with capillary cells. Spray type for comfort air conditioning, dust removal, and product reclamation.

SOR-8

DOR-350

DOR-800

Desomatic Products, Inc. manufactures industrial dehumidification equipment for commercial and Government use.

Refrigeration as well as adsorption units are manufactured for storage rooms, underground caves and mines, cargo holds on ships, laboratories, packaging rooms and for process control. Some applications require combination refrigeration and adsorption systems, with refrigeration for moisture removal from warm humid air and adsorption for dehumidification of medium to low dew-point air.

Equipment is built for atmospheric as well as elevated pressures. Standard stock models available as well as custom engineered equipment.

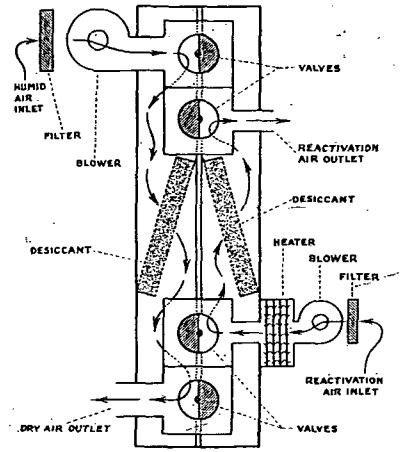
Dryomatic DRY CONDITIONER — DRYOMATIC CORPORATION

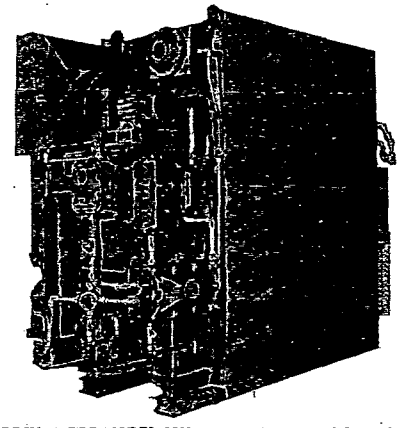


806 N. FAIRFAX STREET, ALEXANDRIA, VIRGINA

MANUFACTURERS OF COMMERCIAL, INDUSTRIAL AND HOME DEHUMIDIFIERS

Representatives in Principal U. S. Cities, Canada, & Abroad

DRYOMATIC manufactures a complete line of automatic dehumidifiers for accurate control of humidity in laboratory, processing, and storage operations. Desiccant type industrial and commercial air dryers are produced in a variety of standard models, and household dehumidifiers of both the mechanical and desiccant type are stocked in various capacities.



SCHEMATIC DIAGRAM

MODEL 1500—Schematic Diagram showing basic principle of design of all Dryomatic Dry Conditioners

DRYOMATIC dehumidifiers are sturdy, time-tested package units which automatically and continuously remove moisture from the air through the use of stable, solid adsorbents such as silica gel and activated alumina. These desiccants are self-reactivated upon saturation by electric heating elements. Regeneration by steam or gas is available as optional equipment on larger models. Air handling capacities range from 25 cfm to 1500 cfm with water removal rates from 1 to 45 lb/hr. Units in other capacities can be built to meet individual specifications.

DRYOMATIC desiccant dehumidifiers operate over a temperature range from −40 F to plus 120 F. Their particular efficiency at low temperatures enables them to maintain low dew points without the use of reheat, making them suited for dehumidification of refrigerated areas in conjunction with existing air conditioning and cooling systems. Special units containing molecular sieve desiccant, for operating conditions above 120 F, are available. Machines may be installed either outside or inside the controlled area, and require only electrical power and two simple flexible hose or galvanized duct connections.
Write for further details, requesting Inquiry Data Sheet for engineering recommendations or consultation regarding any phase of humidity control.

DRYOMATIC MODEL 1500—adsorption type dehumidifier with steam reactivation, explosion-proof electrical fittings, and water-cooled after-cooler

A DRYOMATIC DRY CONDITIONER FOR EVERY DEHUMIDIFYING NEED

f5 AIR CONDITIONING CORP.

Manufacturers of Air Cooled Fandaire Air Conditioners & Condensers

1815 South Maybelle • Tulsa, Oklahoma • CHerry 2-9266

Representatives and Distributors in Principal Cities

Fandaire condensers above are the 3 and 80 ton units

FANDAIRE AIR COOLED CONDENSERS

Available in 2 through 80 ton capacity

Conservatively rated, these condensers can be used on any application . . . either for new installation or as a replacement for outmoded equipment. While designed for outside installation, they work equally well inside. Their unique circular coil design delivers far greater operating efficiency than rectangular units. As standard equipment they incorporate many features normally sold as "extras."

FANDAIRE AIR COOLED AIR CONDITIONERS

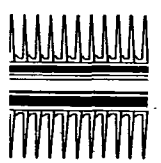
Available in 2 through 10 ton capacity

Fandaire air cooled air conditioners are very good for commercial, residential and industrial installation. The unique circular coil construction delivers far greater operating efficiency than rectangular units. They can easily be combined with existing heating systems. Fandaire advanced design incorporates, without extra charge, many features normally sold as "extras." Available with a full five year warranty.

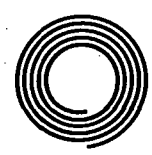
FANDAIRE FEATURES

on both the air conditioning and condenser units

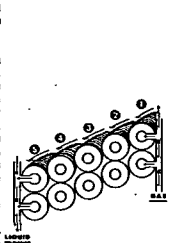
GREATER FIN SURFACE EFFICIENCY



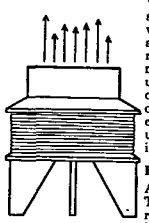
The fins are helically formed around a heavy-wall copper tube with a spacing of eight fins per inch to permit the free passage of lint and dust carrying air. This self-cleaning action helps maintain a higher operating efficiency. The shoulder of each fin is firmly swaged to the tube and to the adjoining fin. No foreign matter or corrosion can form between the tube and the shoulder to cause loss of heat transfer even after years of exposure to the elements. In addition, the shoulder provides a full 100 percent contact with the tube, guaranteeing the maximum amount of heat will be transferred to the fin. The fins are pyramidal in shape for sturdiness and to permit the best possible dissipation of the heat.



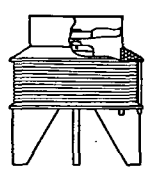
TRUE COUNTER FLOW



True counter flow is an action in which the hot refrigerant is gradually cooled by flowing against (or counter to) the cooling medium. In other words, the refrigerant flows hot to cool, or counter to the cooling medium which flows cool to hot. In Fandaire units, the hot gas enters the condenser tubes at the inlet header *inside* the condenser and makes five complete circles before leaving the tube at the outlet header. Since the cool air enters the condenser around the periphery of the coil and is pulled through the bank of tubes, the coolest gas is always in closest contact with the tubes carrying the coolest gas. This provides the best possible counterflow and assures a greater mean temperature at all times, giving a higher rate of heat transfer, lower condensing temperature and a greater degree of sub-cooling.



POSITIVE CONDENSATE DRAINAGE



Each row or layer of tubes slopes downward at a 30 deg angle. This means the tubes at the outlet header are lower than the tubes at the inlet header. This slope assures a better drainage of all condensate as fast as it forms on the tube wall. No pockets of compressor oil can form to act as an insulator between the hot gas and the air cooled tube walls.

STRAIGHT THROUGH FLOW

Each circuit consists of one continuous length of a single tube which completely eliminates ALL pressure drop caused by return bends. Laboratory tests have shown that up to 60 percent of the pressure drop normally found in rectangular units is due to the short radius return bends necessary in their construction. Fandaire's long-sweeping, one-circuit construction approaches the almost non-existent pressure drop of a single pass unit while retaining all the advantages of a five-pass unit.

VERTICAL AIR DISCHARGE

Vertical air discharge is part of the standard construction. No air scoop or wind deflector is necessary. This vertical air discharge eliminates any tendency to re-circulate hot air and is a "must" in multiple installations. With Fandaire units there are no dead spots to be found on the face of the coil since the air is drawn around the circumference of the coil. Wind from any direction can be used, it is not necessary to face the units in the direction of the prevailing wind.

HOUSING

All Fandaire models are weatherproof. They are housed in attractive, corrosion resistant housings of a spun construction. Models up to 7½ ton are made of aluminum alloy—all other models are galvanized after construction for a durable, maintenance free finish. The air conditioners are supplied with a two-piece, wrap-around skirt. Many other features, normally sold as "extras" on other units, are incorporated in the standard Fandaire design. These include legs, mounting brackets, fan guards.

MOTORS AND FANS

Either direct drive or belt drive weather proof or totally enclosed, ball bearing, permanently lubricated motors are used on all Fandaire models. Fans are axial flow type and are constructed from plated, heavy-duty corrosion-resistant steel or aluminum.

Allied Chemical — GENERAL CHEMICAL DIVISION

40 Rector Street, New York 6, N. Y.

Manufacturer of **genetron®** *Super-Dry Refrigerants*

"Genetron" 12—White Label—CCl_2F_2—Dichlorodifluoromethane; and "Genetron" 22—Green Label—$CHClF_2$—Monochlorodifluoromethane. Used in virtually all types of refrigeration and air-conditioning equipment, large and small, household and industrial, direct and indirect expansion systems.

Typical units in which "Genetron" 12 and 22 are used: refrigerators, freezers, frozen food lockers, window air conditioners, home or office console units, large custom-built units for commerical comfort or industrial process, large store units, mobile units for transportation equipment, large home units for addition to present hot air heating systems.

"Genetron" 11—Orange Label—CCl_3F—Trichloromonofluoromethane. For industrial and commercial refrigeration and air-conditioning systems using single or multi-stage centrifugal compressors. Can also be used for either direct or indirect expansion-type systems.

"Genetron" 113—Purple Label—$C_2Cl_3F_3$—Trichlorotrifluoroethane. Used in 50-ton and larger centrifugal compressors, primarily for large comfort cooling systems, brine cooling systems and other commercial and industrial air conditioning and refrigeration systems.

"Genetron" 114a—Blue Label—$C_2Cl_2F_4$—Dichlorotetrafluoroethane. Used in centrifugal and rotary compressors for commercial, industrial and household refrigeration.

* Inches of mercury vacuum.

- Guaranteed exceptionally low moisture content
- Non-corrosive to standard equipment materials
- Non-toxic, non-flammable, stable, safe
- Critical and freezing points well outside range of operating uses
- Solvent action on oil helps prevent solidification or congealing of lubricant
- Freely interchangeable and may be mixed in any proportions with comparable fluorinated hydrocarbons meeting the same strict refrigerant specifications
- Aid in lubrication of equipment; generally miscible with oil
- Available everywhere from refrigeration wholesalers throughout the country

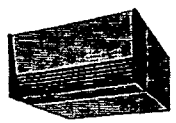
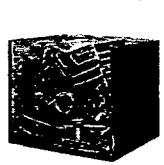
FOR STORES, OFFICES, FACTORIES

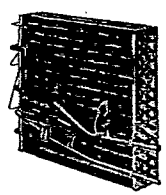


FLOOR MODELS. Self-contained—water-cooled. Capacities: 3, 5, 7½, 10, 15, 20, 25 and 30 tons. In-space air distributor for 3 to 15 ton units.

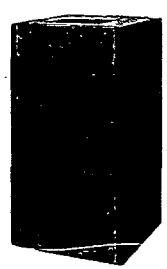
CEILING-MOUNTED. Self-contained—may also be shelf-mounted. Air-cooled in 3 and 5 ton capacities—water-cooled in 3, 5 and 7½ tons.



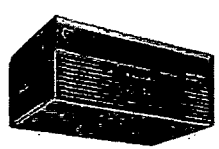
CEILING-MOUNTED. Split systems. Condensing unit air-cooled, weatherproofed for remote installation, indoors or out. Small, compact, lightweight air conditioner includes blower, evaporator filter. Capacities: 2½, 3, 4, 5, 7½ and 10 tons.



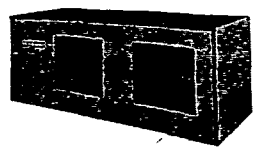
Zone-by-Zone installation permits individual control and servicing of each area. Accessory steam and hot water coils available for winter heating.



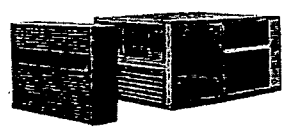
WHOLE-HOUSE RESIDENTIAL AIR CONDITIONERS



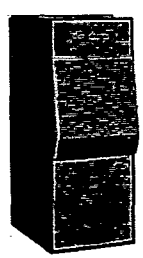
COOLING COILS to convert warm-air furnaces *into year 'round whole-house air conditioning.* Type "A" for low headroom, upflow or downflow—type "F" (flat) for upflow, downflow, horizontal. 5 sizes, 24,000 BTUH to 60,000 BTUH.



AIR HANDLING UNITS. Horizontal (shown with optional air diffuser) and vertical. For residential *and light commercial application when teamed with* remotely installed G-E air-cooled condensing unit. 2½ through 5 tons.



GENERAL ELECTRIC



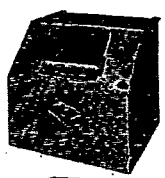
REMOTE CONDENSING UNITS. Factory-sealed, air-cooled, weatherproofed. For outdoor installation. For use with G-E cooling coils or air handling units. 6 models, 2 through 6 tons.

PACKAGED COOLING UNIT. *Compact, air-cooled,* self-contained—for homes with or without ducts. Decorative diffuser-filter frame for commercial in-space installation. Install in attic, crawl space, cellar, hallway—on roof, slab—through transom, wall. 2, 2½, and 3 ton sizes.

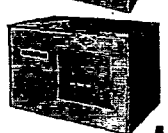
HOME HEATING UNITS

OIL FURNACE. High-pressure gun burner and other standard parts for easy servicing, replacement. Quick-heating "Vertifin" heat exchanger—dependable safety features. Smallest model takes only 28" x 22" floor space. All models fire-tested, assembled, wired at factory. *BTUH output, upflow,* 84,000 to 168,000—downflow-horizontal, 84,000 to 112,000

IMPERIAL GAS FURNACE



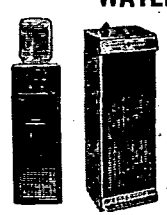
Cast-iron "Pinpoint" heat exchanger provides quick, economical heat. Simplified wiring, quiet performance, rugged construction. Smallest unit takes only 21" x 30⅛" floor space. BTUH input (upflow), 90,000 to 210,000.



STEEL GAS FURNACE. Smallest unit takes only 15" x 28" floor space. Minimum clearances approved by AGA:—*sides, rear and combustible flooring,* zero—front and flue, 6"—above plenum, 1". Ideal for closet installation. Simplified wiring, quiet blower, advanced cast-iron burner design, "Thermal-Trap" heat exchanger. Two types—one for normal heating and air conditioning, one for above-average cooling loads. *BTUH input (upflow and downflow),* 75,000 to 150,000—(horizontal), 70,000 to 140,000.

ALL FURNACES *"grow" into year 'round* whole-house air conditioning by addition of G-E cooling coils. All handsomely styled in two-tone grav.

COOLS WITHOUT WATER, heats without fuel, all-automatic. Capacities (self-contained), 2½ and 3 tons—(split systems), 2½, 3 and 4 tons. Weathertron not available in all states.



AIR-WALL* REGISTER SYSTEM

*Reg. Trademark of General Electric Company

G-E's perimeter system for distribution of conditioned air blankets walls with warm air in winter, cool in summer. No drafts.

WATER COOLERS

PRESSURE AND BOTTLE TYPES. Hot and cold combinations with and without refrigerated compartment. Cold water models with and without refrigerated compartments. Widest selection all safeguarded by G-E's protection plan.

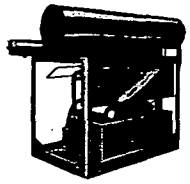
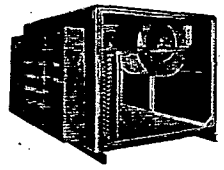
"Satisfabricated" Air Conditioners



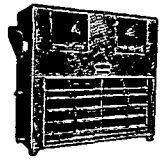
"SATISFABRICATED" for numerous choices of components and models.

SELF-CONTAINED AIR CONDITIONERS—completely packed air conditioners with evaporative condenser. Ready for connection to duct system—3 through 100 tons—multiple circuit refrigeration systems included—copper fitted condensers available.

SELF-CONTAINED MULTI-ZONE AIR CONDITIONERS—with evaporative condenser. Zoned conditioner section—hot and cold deck, with mixing dampers for each zone. Sizes 7½ through 80 tons—multiple circuit refrigeration systems included.

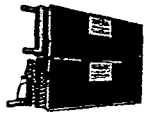


CABINET MODELS AVAILABLE with built-in or remote evaporative condenser.



SELF-CONTAINED CHILLER UNITS

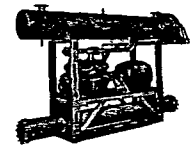
Standard equipment includes heat exchanger and built-in capacity reduction at no additional cost. 68 combinations available from 10 basic models. Capacity 10 through 120 tons. Factory tested before shipment.



AIR UNIT CONDITIONERS

Available in horizontal GHC unit (shown), or GVC vertical unit. From 3 through 150 tons. In 2, 4, 5, 6, 8 or 10 rows of coil depth. Variable face velocities from 400 to 600 fpm.

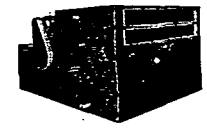
FAN AND COIL CABINETS — cooling, heating, humidifying, dehumidifying, ventilating, 1 through 100 tons, 500 to 40,000 cfm, vertical or horizontal types. Governair, multi-zone fan and coil units are available in sizes ranging from 5 to 80 ton capacity, suitable for individual zoning.



BLAST COILS—direct expansion, water steam—hydraulically expanded tubes for close fin spacing—mechanically expanded tubes for wide fin spacing—copper or aluminum fins—complete range of sizes.

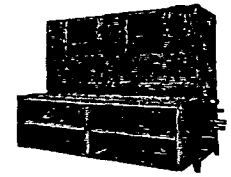
The copyrighted term "Satisfabricated" is defined as follows: A method of purchasing air conditioning equipment which allows the engineer to determine the completed unit, fulfilling specified requirements and dimensions by selecting the specific components to be used.

Kennard Division of American Air Filter Co., Inc.



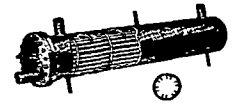
1270 North Price Road • St. Louis 14, Missouri

KENNARD



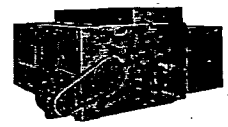
PACKAGED LIQUID CHILLERS

20 to 150 tons. Water and electrical connections only required for installation. Unloaded starting and multi-step capacity control. Automatic chilled water temperature control.



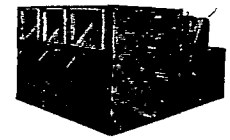
DUAL DUCT CENTRAL STATION AIR CONDITIONING UNITS

Normal and High Pressure Types, 7 sizes. Cooling Coil Face Areas up to 60 sq ft.



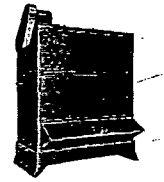
CENTRAL STATION AIR CONDITIONING UNITS

16 Sizes, 300 to 36,000 cfm. Cooling and heating coils up to 60 sq ft face area. Horizontal or Vertical. Single and double fan units. Flexibly adapted, by combining optional elements, to provide all or part of the air conditioning cycle, comfort or industrial. Choice of blower discharge positions simplifies ductwork, eliminates turns.



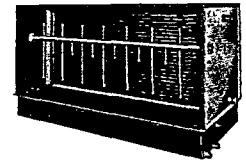
LIQUID CHILLERS

Direct Expansion, Shell and Tube Type. Internally-finned tubes. Capacities 2 to 200 tons. Kennard design eliminates refrigerant head gasket, prime source of refrigerant leakage. Controlled distribution of refrigerant to tube circuits. Rapid, positive response to control. Positive oil return.



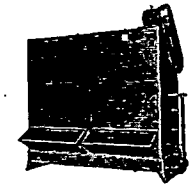
HEATING AND VENTILATING UNITS

16 Sizes, 300 to 48,000 cfm. Horizontal or Vertical, floor or wall mounting or ceiling suspension. Hot water or steam coils. Choice of blower discharge positions.



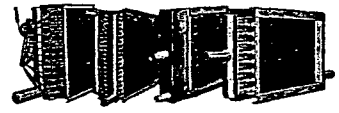
MULTI-ZONE CENTRAL STATION AIR CONDITIONING UNITS

9 Sizes. Cooling Coil face areas up to 60 sq ft. Choice of Direct Expansion or Chilled Water Coils for Cooling, and Steam or Hot Water Coils for heating. Standard units furnished with Zone Control Dampers and multiple individual zone outlets.



COOLING TOWERS

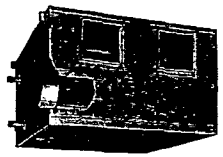
Outdoor or Indoor, 15 to 75 tons. Completely corrosion-resistant. Hot-dipped galvanized after fabrication. Stainless steel or bronze fastenings used throughout. Simple disassembly of blower, spray deck and sump pan sections facilitates field handling, hoisting and rigging.



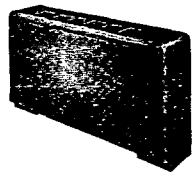
SPRAYED COIL DEHUMIDIFIERS

56 Sizes, Coil Face Areas up to 81 sq ft. Cooling, dehumidifying, evaporative cooling, and washed air, all in one compact unit. Direct expansion or water coils for cooling; steam or water coils for heating.

EVAPORATIVE CONDENSERS

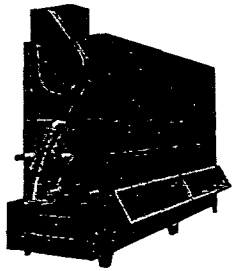


18 Sizes, 16 through 125 tons. Outdoor or Indoor. Fan wheels and housings, and sump pan, hot-dipped galvanized. Non-corroding, cleanable, swirl-type spray nozzles. Liquid sub-cooling coils available.

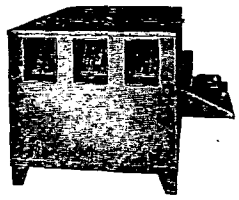


FINNED COILS

Direct Expansion Coils, Water Coils, Steam Distributing Tube Coils, Standard Steam Coils. Sizes up to 48 in. wide, 156-in. finned length.

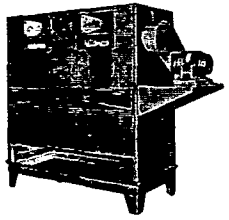


Marlo COIL CO. • 7100 S. GRAND BLVD. • ST. LOUIS 11, MO.

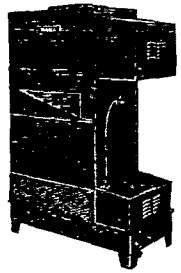


CENTRAL STATION AIR CONDITIONING UNITS cooling — heating — dehumidifying — humidifying. 38 sizes—1 to 175 tons —400 to 52,000 cfm. Ceiling, floor types. *All accessories.* *Bulletin 30*

REMOTE ROOM AIR CONDITIONING UNITS—Permit individual climate selection. No duct-work, only simple piping needed. Floor and ceiling type units. *Bulletin 33*

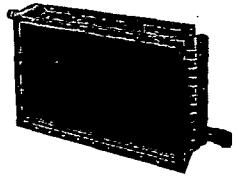


MULTI-ZONE UNIT—Complete winter and summer functions. Individual zone control—1,300 to 37,000 cfm. *Bulletin 31*

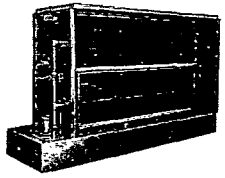


COOLING TOWERS AND EVAPORATIVE CONDENSERS—Industrial and commercial towers—20-100 tons—induced draft, wetted deck surface, water spray—indoor-outdoor. "Thrifti-Tower" adaptation for residential, light commercial use—2-16 tons.

Evaporative condensers, 3 to 250 tons —all refrigerants—all prime surface coils—no fins—quiet—indoor-outdoor. Also air cooled condensers.



Bulletins 50 ,55, 60, 61



INDUSTRIAL COOLERS —15 unit sizes—1,000 to 26,500 cfm —water, electric and continuous brine spray defrosting. Ceiling, floor types. *Bulletin 40*

BLAST COILS—Air conditioning —industrial refrigeration—heating. Any material—all refrigerants—every application. Pressure-expanded staggered tubes, continuous plate-type fins. *Bulletins 10, 11*

SPRAY COIL DEHUMIDIFIER—washing, cleaning, humidifying, dehumidifying, heating and cooling. Air volumes from 600 to 76,000 cfm. *Bulletin 37*

Factory and General Offices: Buffalo, N. Y.—Executive Offices, New York, N. Y.

AIR ENGINEERING

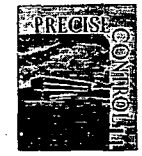
Bulletin describes Niagara equipment for heat removal by the air method, cooling liquids and gases, condensing vapors; heat and moisture control by complete function air conditioning; vapor equilibrium by direct liquid contact.

BULLETIN No. 135

COOLING AND FREEZING

Bulletin describes Niagara "No-Frost" Method; production of low air temperatures for industrial uses, such as testing or processing at extreme sub-zero temperatures or for control of air moisture in atmospheres below the freezing point of water.

BULLETIN No. 95



AERO HEAT EXCHANGERS

Bulletins describe evaporative cooling apparatus that keeps control of temperature within two degrees by modulating the flow of air. Saves 95 % of cooling water. Provides heat when needed.

BULLETIN No. 120
BULLETIN No. 124
BULLETIN No. 152

AIR CONDITIONING

Bulletins describe methods of obtaining precise control of temperature and moisture to help you make your product in any climate at any season. Illustrated with diagrams and photographs.

BULLETIN No. 122
BULLETIN No. 112

"NO-FROST" METHOD

Bulletin describes Niagara "No-Frost" Method of refrigeration for food freezing, frozen food warehousing, fresh food precooling and storage, giving completely automatic operation with no shut-down for defrosting.

BULLETIN No. 105

AERO AFTER COOLERS

Describes equipment for cooling compressed air or gases, holding temperatures below ambient atmospheric temperature to prevent condensation of moisture. Includes application to air liquefaction systems.

BULLETIN No. 130

AIR CONDITIONERS

Bulletin describes Niagara coil surface air conditioners for use with any refrigerant, offering any selection of air conditioning functions. Models available to match any load requirement.

BULLETIN No. 153

FAN COOLERS

Bulletins describe Niagara Fan Coolers, dry coil and brine spray types for use with brine, ammonia or freon refrigerants.

BULLETIN No. 110
BULLETIN No. 158

AERO VAPOR CONDENSERS

Providing high vacuum, independent of a large supply of cooling water. Solves the problems of water supply and disposal. Fully automatic. Saves power. Saves steam.

BULLETIN No. 139R

DRYING AND DEHUMIDIFYING

Bulletins illustrate air conditioning cabinet and drying installations including siccative coatings, paper, plastics, provisions, confectionery, pharmaceuticals, metallurgical uses.

BULLETIN No. 88
BULLETIN No. 112

AEROPASS CONDENSERS

Bulletins describe evaporative refrigerant condensers providing protection against scaling of tubes, controlling of compressor head pressures, saving condenser water.

BULLETIN No. 111
BULLETIN No. 123
BULLETIN No. 131

LIQUID COOLERS

Cooling for chilled water or solutions, with elimination of freeze-up damage, with rapid chilling of large fluid volume and close temperature control.

BULLETIN No. 104

HIGH PRESSURE STEAM HEATING

Bulletin describes method completely utilizing both the sensible and latent heat of high pressure steam. Trustworthy, long-lived equipment for heating or process.

BULLETIN No. 109

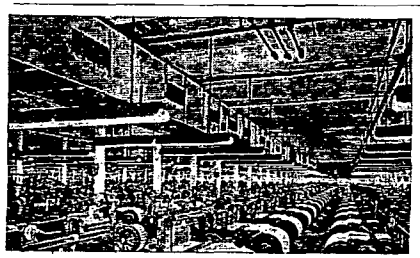
REFRIGERANT CONDENSERS

Bulletin describes evaporative condensers for ammonia and freon refrigerants offering high condensing capacity at a low cost per ton in power cost and upkeep as well as low installation cost.

BULLETIN No. 137

MOTOR BLOWERS

Bulletin describes blowers in two series up to 3½" static pressure. Available in one, two and three fan assemblies. Applicable to ventilating, drying, air conditioning.



BULLETIN No. 89

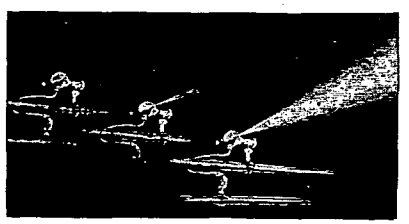
Industrial Humidifying and Air Conditioning Since 1904

AIR WASHER CERTIFIED CLIMATE



A complete system for conditioning the factory atmosphere, with positive air circulation and controlled ventilation. One or more air washer units. High humidifying and evaporative cooling capacity. Heating, filtering and refrigerated cooling where needed. Ducts with adjustable outlets distribute conditioned air uniformly. Slight air pressure also improves uniformity. Centralized maintenance. Used with or without booster humidification. Under gradual acting automatic control. Multi-speed control of fan improves economy.

Central Station Air Washer Units. Nozzles and Self-Cleaning Tank Screens for Central Station Air Washers.

AUTOMATIC AIRCHANGER

Improved system of forced air change and distribution used with direct humidification. Insures fixed uniform humidity and and maximum evaporative cooling. Amount of air change, and operation of humidifiers under gradual automatic control. For complete new installations or for supplementing existing direct humidifying equipment. Includes heating, refrigeration, filtering, where needed. With or without ducts.

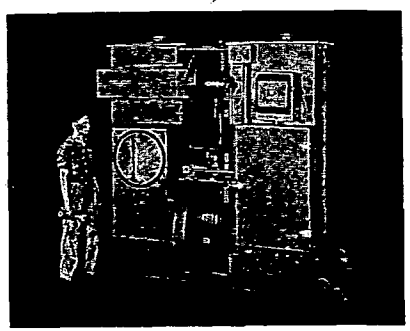
DIRECT HUMIDIFICATION

Atomizer humidifier for all uses. Evaporative capacities up to 16 pounds of water per hour. Turbomatic—gravity type, on-and-off, fixed output, several sizes. GraduVac—full range modulating control, applicable to any gravity type atomizer system. Gradumatic—water under pressure, full range modulation. All types—self-cleaning, used alone or with Airchangers or as boosters for air washer systems.

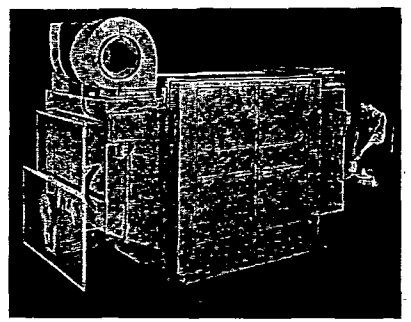
LABORATORY AIR CONDITIONING

An essential of good testing is adequate and dependable air conditioning. Accuracy in testing is maintained only when samples and room atmosphere are free from fluctuations in both temperature and humidity. A vertical or horizontal unit is located within or adjacent to the laboratory. Includes equipment for heating, humidifying, dehumidifying, refrigeration, circulation, filtering. Adjustable recorder-controller. Heat by steam or electricity.

CERTIFIED CLIMATE REGULATION



For humidity and temperature. Gradual acting, or on-and-off. Psychrostat—wet and dry bulb. Hygrostat—absorption type. Both types sensitive, rugged, reliable. Autographic recording included where desired.



PITTSBURGH LECTRODRYER DIVISION

McGRAW-EDISON COMPANY

P. O. BOX 1766 **PITTSBURGH 30, PA.**

This specially designed LECTRODRYER protects equipment in storage by maintaining a relative humidity of 35 percent or lower

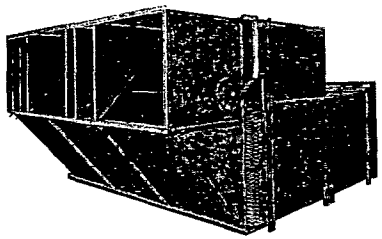
Air-conditioning (CH-type) LECTRODRYERS are used for automatic lowering of relative humidities in many types of industrial applications

INDEPENDENTLY CONTROLLED DEHUMIDIFICATION FOR INDUSTRIAL APPLICATIONS AND AIR CONDITIONING

Air-conditioning (CH-type) Lectrodryers provide an efficient, economical means of dehumidification in industrial areas in which the material in process or in storage requires a relatively dry atmosphere. Lectrodryers are used for this purpose in pharmaceutical houses, food processing plants, metal storage areas, and many types of packaging plants. The uninterrupted production, higher quality and safer storage made possible by the introduction of dry air in such applications often save the user many times the cost of the Lectrodryer. In addition, operating costs are negligible.

The dehumidification process is continuous and completely automatic. It is completely independent of any air-conditioning apparatus that might serve the same general area. If cooling is desired along with dehumidification—either for comfort air conditioning or in conjunction with an industrial application—an after-cooler is mounted directly on the Lectrodryer.

Wide Range of Sizes and Capacities

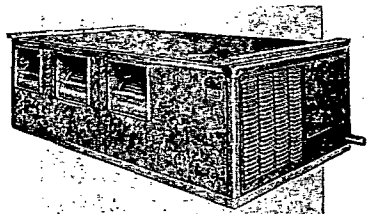


Relative humidities of 35 percent or lower are obtained with standard CH-type Lectrodryers. Capacities range from 350 cfm to as high as 15,000 cfm. Moisture is removed from the air by means of a solid adsorbent—activated alumina—with automatic reactivation being accomplished by gas, steam or electricity.

Lectrodryers require almost no maintenance. The only moving parts are the motor and blowers, and the valve drive mechanism. Units are shipped completely assembled, ready for easy installation. All are manufactured to rigid standards that have made Lectrodryer one of the world's foremost manufacturers of adsorbent dryers.

Write for full details.

RECOLD CORPORATION

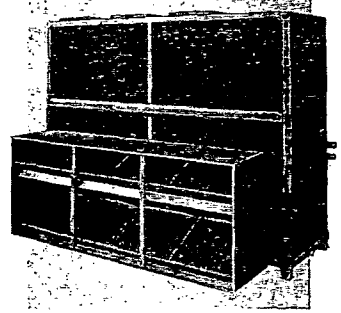


7250 E. Slauson Ave., Los Angeles 22, Calif.

MULTIZONE AIR CONDITIONING UNITS

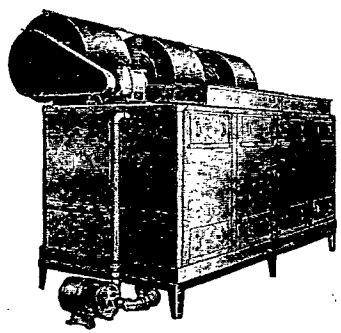
Capacities from 840 through 36,000 CFM. Intermediate coils provide 27 sizes in 9 basic cabinets. Cabinets may be horizontal or vertical. Zones may discharge horizontally and/or vertically. One unit simultaneously heats and cools up to 28 zones. Units are available with backward curved wheels for static pressures up to 6 in. Units are also available less zone dampers for double duct high or low velocity systems.

Catalog 55C7c



Horizontal Air Conditioning Unit

AIR CONDITIONING UNITS

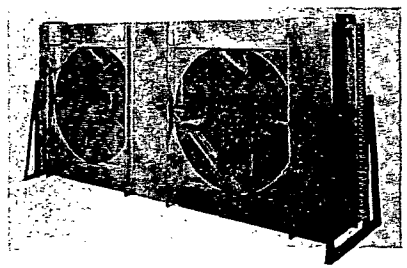


Horizontal and Vertical Air Conditioning Units. Capacities from 735 through 36,000 CFM. Intermediate coils provide 30 sizes in 10 basic cabinets. Cabinets may be horizontal or vertical. Units are available with backward curved wheels for static pressures up to 6 in.

Both Horizontal and Vertical units are available with the following accessories: *Insulation is ½ in. or 1 in. fiberglass* attached to panels with special mastic adhesive. Flat filter section for cleanable filters, removable from side, top or bottom on Horizontal units, or sides on Vertical units. Angular filter section for disposable filters, removed from sides. Face dampers for coils. By-pass dampers. By-pass section. Spray humidifier. Mixing box and dampers.

Catalog 54C7c

Vertical Air Conditioning Unit

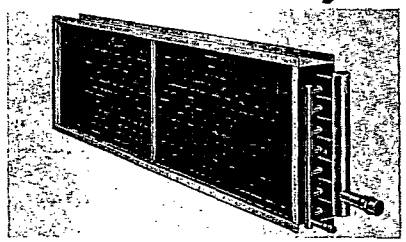


DRI-FAN EVAPORATIVE CONDENSERS & COOLING TOWERS

Capacities from 3 through 233 tons. Fan scroll assembly handles only dry air. Patented features include: clog-proof "bleed funnel," free-sliding "access doors," and "corner construction" that provides complete accessibility. Dri-Fan Evaporative Condensers are available with multiple circuiting and may also be used as jacket water coolers. Complete water cooler selection data appears in the catalogs listed below.

Dri-Fan Evaporative Condensers Catalog 30C8c
Dri-Fan Evaporative Cooling Tower Catalog 32C7a

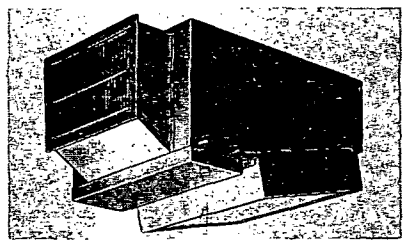
RECOLD CORPORATION



7250 E. Slauson Ave., Los Angeles 22, Calif.

DRICON AIR COOLED CONDENSERS

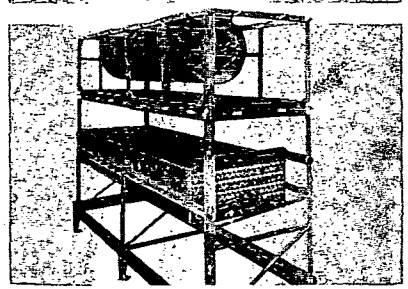
Capacities from 5 through 40 tons in seven cabinet sizes. Large, slow speed, belt-driven fans. Adjustable angle iron stand. Balanced circuiting. Multiple circuiting is also available. Complete water cooler selection data appears in the Dricon Air Cooled Condenser Catalog.



Catalog 34C8a

HEATING AND COOLING COILS

Each coil is especially circuited to insure a completely active coil for each individual application. Types of coils include: steam, water, direct expansion, non-freeze steam, heavy duty, low capacity, cleanable tube water coils and copper tube aluminum fin or copper tube copper fin coils.



Steam Catalog 51C7a
Direct Expansion Catalog 52C8a
Water Catalog 53C8a

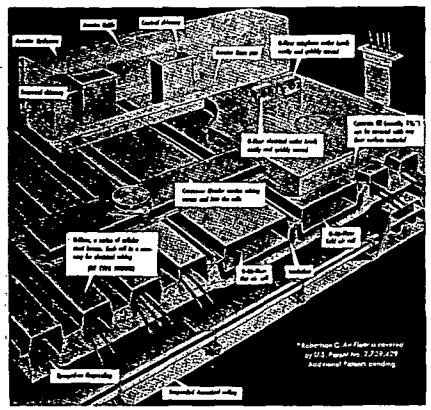
RE UNITS

½, ¾, 1 ton capacities, silent, compact, individual room units. *Units are available circuited for water or direct expansion* refrigerant. Standard equipment on Recold RE units includes: vertical bar adjustable grill; grill extension; filter box and filter; two speed switch and wall plate. Coils and drain pan are reversible for either right or left hand connections.

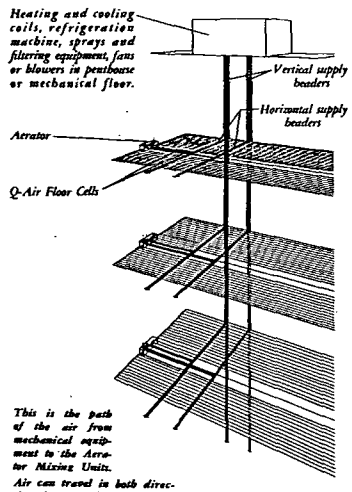
Catalog 56C8a

PATENTED "CORNER CONSTRUCTION" FOR COMPLETE ACCESSIBILITY

Recold's exclusive "corner construction" is used on all evaporative condensers, cooling towers, air conditioners and product coolers.



ELECTRICALLY WELDED ANGLE-IRON FRAME



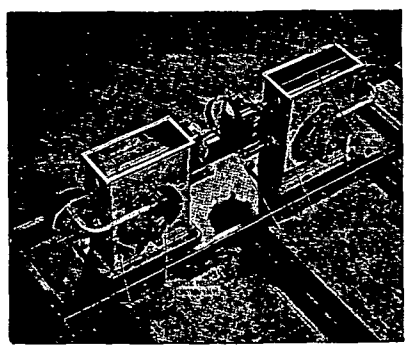
All concentration of weights, such as motor mounts, lifting channels, bearing, legs and coils are connected directly to the frame.

H. H. ROBERTSON COMPANY

2400 Farmers Bank Building , Pittsburgh 22, Pennsylvania

ROBERTSON Q-AIR FLOOR SYSTEM

This is the path of the air from mechanical equipment to the Aerator Mixing Units.
Air can travel in both directions in Air Cells. One direction is shown here for simplicity.



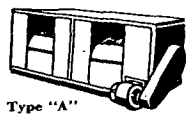
Robertson Q-Air Floor is cellular steel sub-floor construction that incorporates within its thickness structural, load-bearing cells that are available as electrical raceways, plus larger structural cells for use in connection with high velocity, dual duct air conditioning. (See cutaway illustration at left.) These special, load-bearing cells can be adapted by the air-conditioning contractor to transport air from horizontal supply ducts to mixing units for discharge into the room.

In Robertson Q-Air Floor, use of the floor cells for air passages reduces the space between ceiling and floor above. Overall building height can be reduced (without sacrificing ceiling height) by running the secondary supply headers through the web of the horizontal beams instead of below them. Great savings in power consumption, too, are a result because of the reduced cubage of the building. Except for peak summer cooling periods, Robertson's SEASONAL CHANGEOVER feature keeps the power requirements at about 65 percent of top consumption.

As with conventional dual duct systems, Q-Air Floor requires a central plant and a return air system.

Except for the change in width of occasional cells, Robertson Q-Air Floor is similar to standard Q-Floor—a product having the experience of 27 years and more than 15,000 installations behind it. Cell depth is the same and the 12-in. unit width of the large cell fits into the 6-in. Q-Floor module. Employment of cells to carry air is simply another use added to the widely accepted Q-Floor principle of using cellular steel units for load-bearing and electrical distribution.

The unique Robertson Aerator—shown below—is an ingenious piece of apparatus. In addition to its normal function as a mixing box, in which air from the hot and cold sides of the system is mixed in response to the setting of a thermostat, it also makes possible the conversion of the hot side for supplemental cooling use during the hot months of the year. This "seasonal changeover" device is the heart of Robertson Q-Air Floor and no other system has it.*

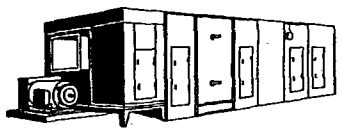


M. BLAZER & SON

PASSAIC NEW JERSEY

"WEATHER" HOT or COLD Think of Us

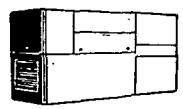
Manufacturers of Air Conditioning, Refrigeration, Heating and Ventilating Equipment



Air Handling Units

Type "A"

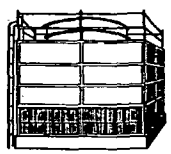
Custom fabricated air handling units for heating, ventilation and air conditioning. Available as illustrated in types "A" or "B".



Type "A". Made in horizontal or vertical units in 39 cabinet sizes, in 1, 2 or 3 fan assemblies, handling from 400 to 50,460 cfm at pressures up to 3 in. WG.

Type "B"

Type "B". High pressure type. Up to 9 in. WG sectionalized, factory assembled air handling units, in dry coil or sprayed coil type with double insulated casings, access plenums, filter plenums, mixing and return air plenums, etc. In capacities to 28,160 cfm at 9 in. static.



All units are available with steam or water heating coils, freon or water cooling coils and various filter media and arrangements. Humidifier, damper and recirculating spray assemblies, various insulations, motors and durable double casing construction. Made in Multizone and Hot and Cold Deck blowthrough types. Also specially designed to fit space limitations.

Self Contained Unit

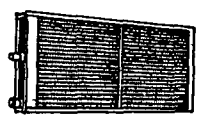
Self Contained Air Conditioning Units

Complete with refrigeration compressors, built-in evaporative condensers or water cooled condensers for use with remote towers or city water. Also available with receivers only for use with remote air cooled condensers. All units are completely piped, wired and shop-run before shipment. Available with any or all modifications listed under other equipment shown here. Can be ordered also in roof mounted units for outdoor duty with air cooled condensers and special insulation. In sizes from 5 to 100 tons.

Cooling Towers

Cooling Towers

All metal inside and outside and completely fireproof. In sizes from 10 tons up to unlimited thousands. Very good for cooling water with air through any range to a 7 deg approach to wet bulb. Available in transite paneled casings, galvanized steel or stainless steel. Entire casing is paneled for easy access into interior. Designed to require minimum maintenance. Requires the least floor area of any large tower with water loadings up to 7 gpm per square foot floor space. Evaporative condensers and coolers in similar construction are available for any type of cooling or condensing application.



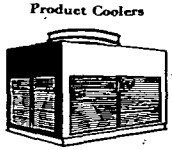
Mechanical Dehumidifiers

Mechanical Dehumidifiers

Utilize Freon compressors. In sizes from 5 to 60 tons, air handling from 640 to 11,850 cfm and moisture removal to 1,600,000 grains of moisture per hour at dewpoints to 36 deg. Greater capacities down to −25 deg dewpoint by spraying ethylene glycol over cooling coils to prevent frost. Double evaporator type with automatic defrosting also available. Completely wired, piped and shop-run.

Heating and Cooling Coils

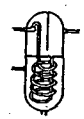
Helically finned type in copper, aluminum, carbon or stainless steel for all kinds of installations. Heating coils may be obtained for steam in standard and non-freeze types and water in regular or high temperature, high pressure type. Cooling coils for Freon, ammonia or brine in direct expansion, flooded, and standard or cleanable types for water. Available with from 1 to 36 tubes high, 1 to 30 rows deep, 6 in. to 180 in. finned length. Made in steel or non-ferrous casings. All coils tested to 300 lb pressure under water.



Coils

Product Coolers

Product Cooling and Freezing Units

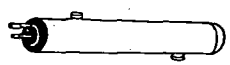


Blower capacities from 2,000 to 30,000 cfm. Btu ratings to 225,000 at 10 deg TD. Available for above and below freezing duty. Patented defroster or glycol spray permits use to −40 F.

Air Cooled Condensers

Air Cooled Condensers

Large heavy duty commerical and industrial air cooled condensers in sizes up to 300 ton. Unique penthouse type design gains high capacity from limited space. Available with specially circuited coils and discharge dampers for head pressure control.



Slug Eliminator

Patented Refrigeration Specialties

Balance Loaders for obtaining compressor capacity control in infinite steps from 0 to 100 percent.

Slug Eliminators for protecting compressors from breakage due to liquid slugging. In sizes to 100 ton.

Balance Loader

WALTON LABORATORIES, INC.

Irvington 11, New Jersey

Walton

One of the world manufacturers of the largest diversified line of humidifiers

ALL MODELS TROUBLE-FREE WITH THE WALTON CENTRIFUGAL *ATOMIZER*

For over 25 years this well balanced, whisper quiet atomizer has given positive humidification without pressure devices, nozzles, or other complicated auxiliary equipment.

PORTABLE ROOM HUMIDIFIERS

are available in both table and automatically controlled console models with attractive wood-grained finishes. There are no heating coils or filters; no wet packs to become odorous or clogged. No fans that create annoying air movements in confined areas.

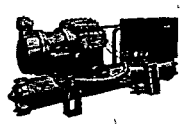
SPACE TYPE HUMIDIFIERS

for commercial and industrial installations requiring controlled moisture conditions for manufacturing operations or storage of products. Need only small water supply line and electric connection through a control circuit. No costly ducts, compressors or drains are required.

DUCT TYPE HUMIDIFIERS

for commercial and residential installations. The right way to add needed moisture to any warm air-circulating system. Use water supply line and electric connection. Drain unnecessary. Produce vapor instantly without adding heat.

WALTON'S CONSULTANTS' FILE



offers you literature on all types of humidifiers with their many commercial, industrial and residential applications. Tell us your needs and covering technical information will be forwarded to you.

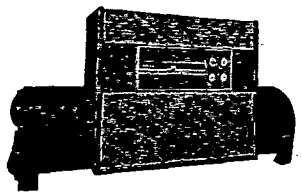
WORTHINGTON

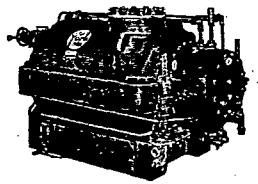
YORK CORPORATION



York, Pennsylvania

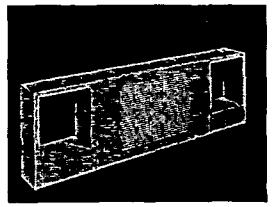
Factory Branches and Distributor Engineering and Sales Offices throughout the World
Subsidiary of Borg-Warner Corporation

Air Conditioning and Refrigeration for maintaining proper temperature and/or humidity for industrial processes or comfort requirements. Installations of unit and central systems in a wide range of capacities and types for every design need.

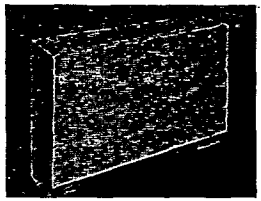


WATER COOLING SYSTEMS

YORK HERMETIC TURBOPAK



A packaged single stage hermetic centrifugal water cooling system for every air conditioning and process cooling purpose. Capacities range from 67 tons to 550 tons. Completely factory assembled and insulated with all controls factory mounted.



MULTI-STAGE TURBOS

Multi-stage centrifugal compressors for large comfort or industrial air-conditioning and refrigeration applications. Available over a wide range of capacities to 5,000 tons in a single unit. Suitable for motor or steam turbine drive. Pre-rotation vanes offer peak performance at peak or partial loads.

AIR CONDITIONING SYSTEMS

YORK INDUCTION SYSTEMS

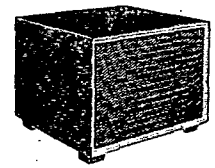
Utilizes York Hermetic Turbopak or Packaged Water Chiller as a cooling source. Air, brought into building at one intake by fan, is filtered, dehumidified and distributed in high pressure ducts throughout the building to individual units. Units in individual rooms also provide heat in winter by hooking into existing hot water system. Normal and high capacity units both available.

YORK FAN COIL SYSTEM

Cools in summer, heats in winter, uses Turbo or V/W compressor for cooling, building's hot water system for heating. Economical for buildings where space is at a premium. No large fan room required; units individually operated. Floor, wall and ceiling models available.

HEAT PUMPS

Developed by York, compound compression air source heat pumps without supplementary heaters are economical and practical even in cold climates. Providing all-weather heating and cooling as needed for every air conditioning application, the heat pump eliminates the need for boilers, fuel storage and stacks.

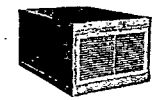


ADDISON PRODUCTS COMPANY

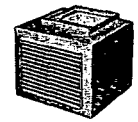
ADDISON, MICHIGAN

Contract Manufacturers

Central Air Conditioning—Self-Contained or Split Systems • Room Coolers • Dehumidifiers • Also Milk and Beverage Coolers—Other Refrigeration Systems to Your Specifications



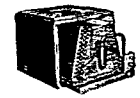
CENTRAL AIR CONDITIONERS—AIR COOLED SPLIT SYSTEMS



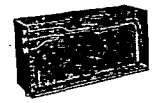
3 hp Condensing Unit

AIR COOLED CONDENSING UNIT—Sizes from 24,000 Btu/hour to 80,000 Btu/hour, single or 3 phase. Horizontal air flow. Completely weather-proofed for outdoor installation. *Underwriters'* approved. Equipped with oversized condensers for efficient, uninterrupted performance at high ambient temperatures. Compact design uses minimum space. Quiet operation—low velocity air flow through large openings. Completely accessible. Attractive appearance. Furnished for capillary feed or expansion valve applications. Optional refrigerant connections—including soldered, flared or improved quick connect couplings for use with refrigerant charged lines.

EVAPORATORS TO MATCH CONDENSING UNITS



"EB" Evaporator Blower Unit

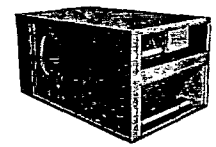


"UB" Universal Blower Unit

"EB" EVAPORATOR BLOWER—Quiet blower and smart appearance allow installation anywhere. Unit has adjustable four-way louvers. Return grille equipped with air filter. Fully accessible through removable panels.

"UB" UNIVERSAL BLOWER—Use with existing warm air system or separate ductwork. Blower assembly easily relocated to alternate positions—choice of vertical upward, horizontal or vertical downward discharge air connections. Fully accessible.

"A" Coils, Vertical Air Flow

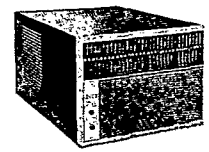


"H" Coils, Horizontal Air Flow

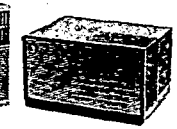
"A" COILS—Designed for vertical air flow plenum installation. Uses the ductwork and blower of the heating system. Minimum resistance to air flow. Fully insulated. Coils slide into housing through removable front panel.

"H" COILS—Designed for horizontal air flow using ductwork and blower of the heating system. Install in plenum chamber or supply ductwork. Minimum air flow resistance. Insulated condensate drain pan.

SELF-CONTAINED, CENTRAL AIR CONDITIONERS



4 hp Model



Available in 2 through 4 hp sizes. Designed and *Underwriters'* approved for outdoor installation. Equipped as factory assembled to meet *FHA* requirements. Compact designs allow installation through wall or in crawl space, attic or other limited access locations. Use with heating ductwork or as separate system. Capillary tube refrigerant feed system. Extra large centrifugal blower delivers volumes of low velocity air over maximum surface coils for smooth, silent operation.

Water Cooled systems also available.

WINDOW AIR CONDITIONERS (Approved by the Underwriters' Laboratories)

2 hp Unit

½ hp Portable

Models from ½ to 2 hp. Compact design—quiet operation. Automatic temperature control. Positive exhaust and ventilation. Designed for high temperature operation. Capillary tube refrigerant feed system. Easy access to all components. Variety of grilles and trim.

SPECIAL SYSTEMS FOR MOBILE HOMES, DEHUMIDIFIERS, BEVERAGE AND MILK COOLERS.

CHRYSLER AIRTEMP

AIR CONDITIONING FOR EVERY NEED

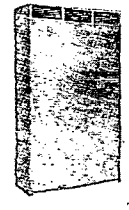
Dayton 1, Ohio **Engineered by Chrysler**

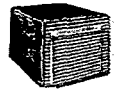
ROOM AIR CONDITIONER

Easily installed in homes, offices or buildings. *Chassis slides out if service* is required. Thermostatically controlled, cools, filters, circulates, ventilates, exhausts and dehumidifies air. Capacities in 1, 1½, 2 and 2½ hp. Models designed for 7½ and 12 amp, 115 and 230 volt operation, also for reverse cycle heating.

CASEMENT WINDOW CONDITIONER

Quickly installed from inside. No cutting or removing of glass; no outside projection. Window opens, closes, locks as before. Thermostatically controlled, cools, filters, circulates, ventilates, exhausts and dehumidifies air. Two-speed fan for super-quiet night cooling and exhaust features on Royal models. Capacities in ½, ¾, and 1-hp.



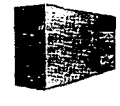


ROOM AIR CONDITIONERS

For *year-round cooling and heating* by connecting to central chilled and hot water systems. Designed for multi-room buildings, offices, and hotels. Three types—floor, wall, and ceiling. Built-in controls permit operation to suit tenant. Two quiet centrifugal fans provide air circulation.

PACKAGED AIR CONDITIONERS

Completely self-contained, assembled, factory-tested, easily installed. Waterless and water cooled in 2 to 30-hp capacities. These Airtemp air conditioners cool, dehumidify, filter, and circulate air. Free-air discharge or duct distribution. Heating coil for year-round air conditioning optional. Bonderized steel cabinet occupies minimum floor space. Famous Airtemp sealed compressor—quiet, all moving parts balanced and bathed in oil for long life. Flexible mounting reduces vibration. 5-year warranty on entire refrigerant circuit.



LOW-COST HOME AIR CONDITIONING

Compact waterless package installs easily in attic, dormer, or basement, either separately or connected to existing heating ducts, 2 and 3-hp capacities. Uses air and electricity only, no water piping needed.

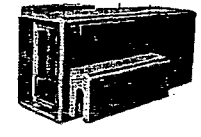
CENTRAL DUCT PACKAGED AIR CONDITIONERS

Self-contained Central Air Conditioners in 25, 40, 60, 75, and 100-ton capacities. Complete with Airtemp radial compressor and its exclusive features. Available with *evaporative condenser*, or for use with cooling tower.

CHRYSLER AIRTEMP

Air Conditioning Systems and Equipment

Dayton 1, Ohio **Engineered by Chrysler**

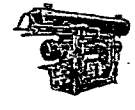


GAS AND OIL-FIRED AUTOMATIC FURNACES

Wide range to fit any application; Lo-Hi-Boy, Lo-Boy, and Counterflow automatic furnaces. Install in closet, attic or basement. Btu output from 65,000 to 250,000. Easy to add Airtemp cooling for year-round air conditioning.

HORIZONTAL GAS AND OIL FURNACES

For space-saving installation; in attic, under floor, or hung from ceiling Btu outputs from 64,000 to 168,000. Dual flue outlets. Draft diverter mounts on either side. Completely-automatic controls fully enclosed.



WATERLESS CONDENSING UNIT

Ideal for home or commercial use. Operates on air and electricity only—no water, no water piping, no cooling tower. Does not require winter shutdown. Can be installed outside. Cabinet is weatherproof. In 2, 3, 5 and 7½ hp sizes.

PACKAGED WATER CHILLERS

Capacity from 25 to 250-hp, using Freon 22; and 3 to 75-hp, using Freon 12. Each package is factory-assembled, piped, pressure-tested, and furnished with refrigerant holding charge.

RADIAL COMPRESSORS AND CONDENSING UNITS

10 to 125-hp capacities—heavy duty, for use with Freon. Specially designed for air conditioning or refrigeration. Compressors have direct drive and have forced-fed lubrication. Automatic capacity-reduction. Light weight, economical to operate.

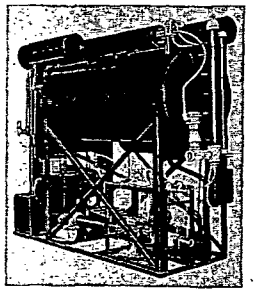
CENTRIFUGAL WATER CHILLER

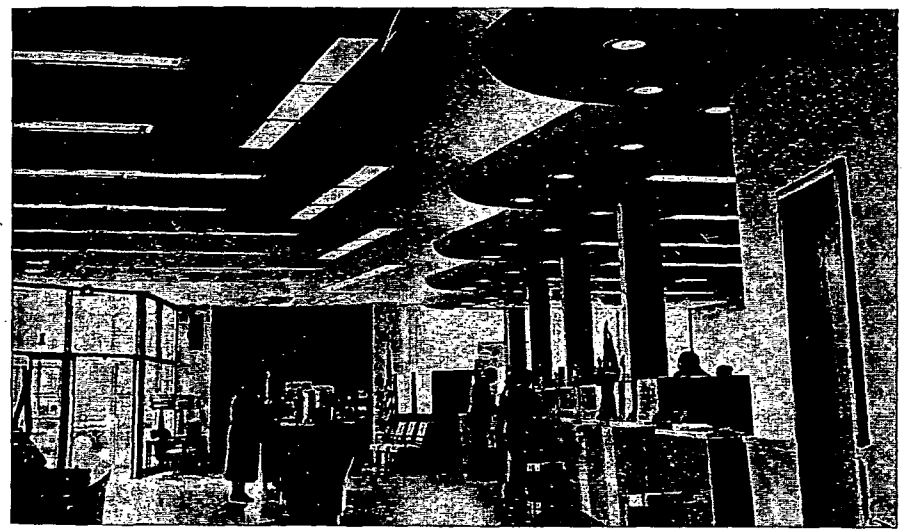
A complete refrigerating system with two-stage centrifugal compressor, evaporator, condenser, inter-connecting piping, purger, safety and operating controls. Wide application for summer air conditioning or process cooling. Capacities from 150 to 700 tons. Six compressor sizes, plus 64 evaporator and condenser combinations, meet any requirement.

AMERICAN GAS ASSOCIATION

ARKLA-SERVEL

. . . . . now we're cooling





Specify Arkla-Servel Gas Air

With their new Arkla-Servel Gas Absorptive Cooler, the La Grange Federal Savings and Loan Association keeps customers cool in summer with the same compact system that keeps them warm in winter.

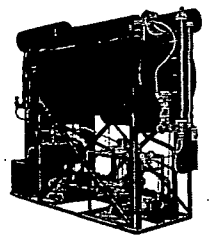
Before installing Gas, a complete study was made of available air conditioning systems. The Arkla-Servel unit—the only 25-ton absorptive cooler—was chosen because it is compact, easy to install, and costs are low for installation, operation and maintenance. No specially trained operating or maintenance personnel are required.

with GAS

Conditioning and you specify years of trouble-free comfort

Only Gas gives these important advantages:

- high efficiency at all times—even during the light loads
- temperature control is constant
- modular adjustment of capacity (instant automatic adjustment to match actual cooling requirements)
- dependability of fuel service at all times



Gas absorptive cooling can put your commercial and industrial clients' heating plant on a year around paying basis. It utilizes low pressure steam to cool water, has no moving parts to wear out, and provides quiet, economical operation. What's more, it's vibration-free.

Take advantage of the consulting services provided by your Gas company. They have trained specialists who have been working with contractors and builders for years. They belong to your associations or affiliations and are familiar with your problems. Check the facts about Gas and you'll see modern Gas air conditioning out-performs all other fuels. *American Gas Association.*

ABSORPTION-TYPE 25 TON WATER CHILLER—SERIES 3000

Also available in multiples of 50, 75, and 100 tons.

THE ARKLA-SERVEL SERIES 3000 Water Chiller is a factory-sealed absorption-type refrigeration unit with no moving parts, providing an *economical* source of chilled water for wide range of comfort air conditioning and industrial process applications. It is readily adaptable to multiple installations, with basic component of 25 tons. Water is the refrigerant, lithium bromide, the absorbent, and steam, the source of energy. Steam for operation is normally obtained from a *direct-connected* gas boiler, but can come from practically any source. The unit utilizes any steam pressure from 6 to 15 psi. It operates under a vacuum, eliminating pressure hazard; the chilled water circuit, however, is under pump pressure and not part of the vacuum system. A refrigeration "package," the unit requires no *field assembly*, and is easily installed on any floor of a building. Vibration dampening is unnecessary. Automatic modulation of steam input is provided by factory-installed steam controls.

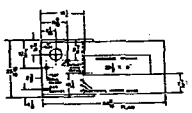
SERVICE CONNECTION SIZES

Steam Inlet	2" IPS
Steam Condensate Drain Connections:	
Generator Drain	1⅛" OD Copper
Diverter Valve	¾" IPS
Steam Inlet Drip Trap	½" IPS
Steam Vent at Diverter Valve	1½" IPS
Chilled Water (Male Connections)	2" IPS
Condensing Water (Female Connections)	2" IPS

RATED REFRIGERATION PERFORMANCE*

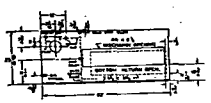
Tons Refrigeration	25.0
Total Capacity, Btu per hour	300,000
Steam Input:	
Btu per Hour, Max.	450,000
Pounds per Hour, Max.	464
Clean dry steam at any pressure above 6 lb is suitable, properly controlled.	
Chilled Water:	
Inlet Temperature, °F	50.0
Leaving Temperature, °F	40.0
Water Quantity, gpm	60.0
Pressure Drop, psi	7.6
Condensing Water:	
GPM at 75° Inlet	63.0
Pressure Drop, psi	13.9

* Refrigeration Capacity shown is based upon standard method of rating, specified by *American Society of Refrigerating Engineers;* Inlet condensing water at 75°F and chilled water entering at 50°F and leaving at 40°F.

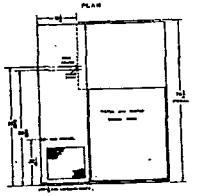


PHYSICAL DATA

Net Weight, lb	8,800
Shipping Weight, lb	9,225



ARKLA-SERVEL SUN VALLEY*
GAS Air Conditioners



THE ARKLA-SERVEL SUN VALLEY* All-Year Air Conditioner is a gas-fired, water-cooled absorption unit which automatically cools, dehumidifies, cleans and circulates the air at a controlled temperature in summer, and cleans and circulates the air at a predetermined temperature in winter. Principal parts of this single-package year-round air conditioner are an absorption combination refrigeration and heating unit, a filter section and a centrifugal blower . . . In cooling cycle, a gas flame in the generator boils a water-lithium bromide solution, producing a water vapor which goes to the condenser. The condensed vapor flows into the single coil, over which air is blown. Heat is removed from the air and the vapor, through absorption, is returned to liquid and flows by gravity to the generator for re-use. In heating, the water vapor by-passes the condenser and goes direct to the coil still hot. Then heat is taken from the vapor and the water by gravity returns to the generator . . . Circulation of the water, acting as refrigerant, and the *lithium bromide*, as absorbent, is achieved by differences in temperature and height of liquid columns, without moving parts. The unit operates under a high vacuum . . . available in two basic models, the Model 500, 3½-ton and Model 750, 5-ton.

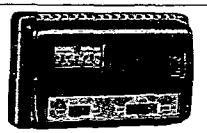
CBX COMBINEX® WEATHER BEAM

The Combinex Heating and Air Conditioning System (Patent Applied For) utilizes hot and chilled water and provides high-level discharge and low-level return for heating and high-level return and low-level discharge for air conditioning. Mounted in ceiling and discharges into plenum chamber or conditioned space. Has control lever for changing direction of air flow. Capacity: ¾ ton to 5 ton.

CXW CONCEAL-X (CEILING MOUNTED FAN COIL UNIT)

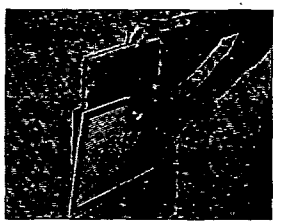


Adaptable for new or old construction. Uses hot and chilled water providing compact, high capacity forced air heating and cooling installations. Capacity: ¾ ton to 5 ton.

WCW CHILL-A-TRON® LIQUID CHILLERS

Completely packaged with water cooled condensers. Furnished with Kritzer patented Dimpled Tube exchanger surface. Easily installed. Complete hermetic unit with capacity range 2 ton to 22½ tons. Two to 5 ton units furnished for single or 3 phase, 220 v current; units 7½ to 22½ tons furnished for 3 phase, 220 v current. Larger models to 350 tons also available.

WRITE FOR LITERATURE containing complete specifications.



Kritzer Low Voltage Control

The Kritzer Unit control is completely factory wired and contains thermostat with thermometer, 3-speed fan control, heating and cooling cross-over switch and thermostat adjustment for heating and cooling.

Kritzer Live Air Grill

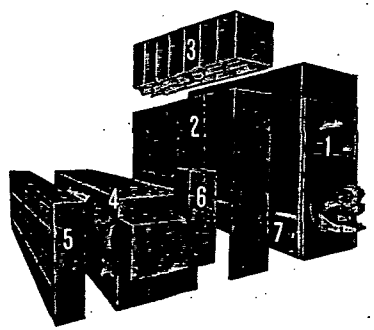
Beautifully designed. Has broad flat hammered glass vanes which provide for full spread of discharge air. Three sizes: 14 in. x 6 in., 22 in. x 6 in. and 30 in. x 6 in.

Kritzer Electrostatic Filter and Grill

Assembly furnished in sizes to suit systems. Grill is hinged and spring loaded and permits quick access to filter for removal and cleaning.

DEHUMID-I-TRON

A *direct expansion refrigeration type* dehumidifier with reheat. Capacities from ½ hp to 5 hp. Available in portable models or for permanent installations.



Direct expansion, water and condenser coils; cooling towers; and air-cooled condensers available in many models and sizes.

AMERICAN FOUNDRY and FURNACE COMPANY

Bloomington, Illinois

THE COMPLETE LINE IN WARM AIR HEATING—
ALL CAST IRON CONSTRUCTION FURNACES

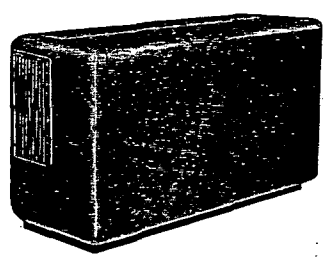
The New *June-Aire*® Optional Unit Construction. . . . The system that does not rely on excess outside air for temperature control . . thus is inherently more economical

"June-Aire" assemblies offer heating capacities from 222,000 to 3,420,000 btu per hour output and standard air flow from 2600 to 45,300 cfm.

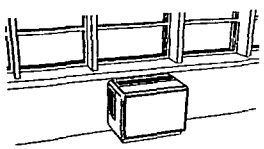
SYSTEM DESCRIPTION

A completely pre-engineered unit combining heating—ventilating—humidifying, providing for convenient addition of summer cooling and dehumidifying. Made up of the following components:

1. "June-Aire" Furnace Unit designed to accommodate all burner models.
2. By-pass unit with clearances for cooling coil.
3. Mixing damper unit.
4. Blower Unit.
5. Filter unit—Permanent or throw-away filters.
6. Control panel, pre-wired.
7. Humidifier.

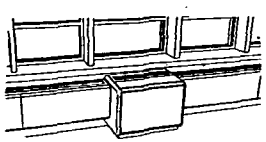


***June-Aire*®**



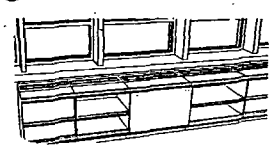
AIR DISTRIBUTION CONTROL CENTER

assures accurate, automatic room comfort



Designed for dual duct systems providing heating, ventilating and air conditioning. Unit contains both balancing and mixing dampers—suitable for any type of temperature control system.

- DRAFTLESS AIR DISTRIBUTION.
- QUIET OPERATION—No noisy fans or motors.
- FINGERTIP AIR VOLUME ADJUSTMENT.
- READY ACCESS TO DAMPERS AND OPERATOR.
- MINIMUM MAINTENANCE—Blowers, motors, filters, fresh air intake and humidifier all at central location.



Individual application of Air Distribution Control Center with side grills.

Air Distribution Control Center used with wing ducts.

Air Distribution Control Center used with air handling wall bookcases.

DAMPER SPECIFICATIONS

Frames—2 x ½ x ⅛ in. or 3 x 1 in. x 14 ga Steel Channel. Maximum dimensions single section 48 in. wide x 96 in. high.

Blades—#16 gauge steel dieformed. Width—Maximum 12 in. Minimum 4 in. Length—Maximum 48 in. Minimum 4 in.

Shafts—½ in. diameter steel rust-proofed.

Bearings—Oilite bronze Self-lubricating.

Finish—Commercial steel painted aluminum or Galvanized steel not painted.

Built to any dimension. Also available any material and any finish.

LOUVER SPECIFICATIONS

Constructed of commercial galvanized steel

Frames

Stationary—4 in. x ½ in. x 20 ga channel.

Adjustable—4 in. x 1 in. x 14 ga box channel or 4 in. x 1½ in. x 14 ga angle.

Blades

Stationary—#20 ga. Dieformed with weatherlip both edges.

Adjustable—#16 ga. Dieformed with weatherlip both edges.

Built to any dimension. Also available any material and any finish.

FIRE DAMPER SPECIFICATIONS

All meet requirements of *NBFU* as suggested in Pamphlet 90A.

Class A dampers are approved type for ducts passing through fire walls or fire partitions. Class B are acceptable for installation in ducts at other than fire-wall openings.

Protecting links are *UL* approved. Built to fit opening size specified.

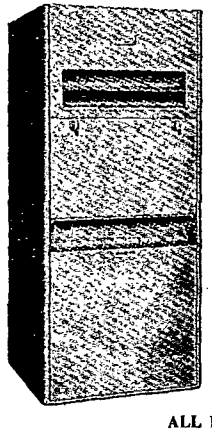
DUCT FURNACES

Heat exchanger constructed of Type 321 Stabilized Stainless Steel. Non-corrosive property of heat exchanger permits installation downstream of cooling coils, where codes permit, or washer. Heat exchanger will not corrode when subjected to continuous ventilation during the summer season. Designed for continuous blower operation for offices, theaters, schools, churches, and factories. Air throughput in either direction. Draft Hood and Vent Manifold reversible. 15 sizes, 45,000 to 675,000 Btu per hr input in 45,000 Btu increments. *A.G.A.* certified for all gases.



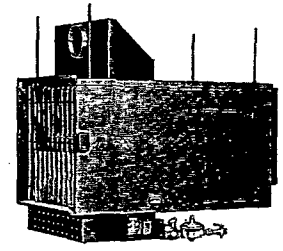
MODEL SED-E

Non-corrosive type 321 stainless steel heat exchanger. Permits installation downstream of cooling equipment, where codes permit, for continuous blower operation. Air through-put in either direction. 45,000 to 675,000 Btu input.

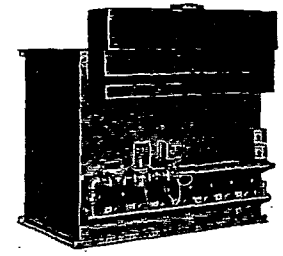
MODEL SED-S

Same as SED-E except controls are at the side, instead of at the end where accessibility requires. SED-S is available in sizes from 45,000 to 675,000 Btu input in increments of 45,000 Btu.

Both SED-E and SED-S can be used for industrial applications for drying.



FORCED AIR FURNACE MODEL SEC

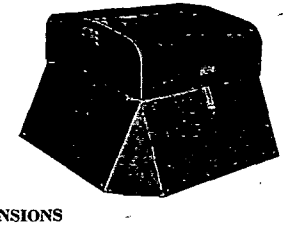


Heat exchanger constructed of identical die formed sections of type 321 stabilized stainless steel. Sections are seam and arc welded. One piece cast iron burners with drilled ports. Oversize double inlet blower. Long hour motor. Equipped with glass filters. Can furnish permanent filters at extra cost. Finished in baked silver gray. 6 sizes 70,000 to 245,000 Btu per hr input in 35,000 Btu increments. For natural, manufactured and L.P. gases. Can be used for 0 clearance.

ALL HAYES FURNACES ARE *A.G.A.* APPROVED

DUCT FURNACE MODEL SED-VF

Tested and approved as a DUCT FURNACE—Constructed of type 321 stabilized stainless steel. Equipped with air bypass. Handles large cfm per Btu input. Vent in front of furnace. Made in 6 sizes from 70,000 to 280,000 Btu per hr input in increments of 35,000 Btu. For natural, manufactured and L.P. gases.

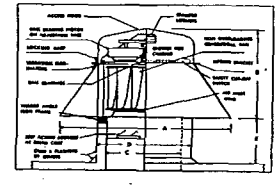


FORCED AIR SUSPENDED FURNACE, MODEL SES

Equipped to install in a suspended duct system. Inlet and outlet designed for sheet metal duct connection.

UNIT HEATER MODEL SEU

Used where room air is to be recirculated. Diffuser outlet with adjustable vertical and horizontal vanes. Both types of Suspended units are designed for factories, commercial and other large Btu requirements — equipped with brackets for suspension, save floor space. Double inlet forward curve blower. Continuous duty variable pitch drives; cast iron, raised port, precision machined burners. Made in sizes 80,000 to 480,000 Btu per hr input in 40,000 Btu increments. For natural, manufactured and L.P. Gas.



EJECTAIR Power Roof Ventilator by HAYES

Centrifugal backwardly curved blower type ... the blower wheel cannot be overloaded regardless of length or curves in the duct or variation in design. It is belt driven to provide flexibility. The ventilator is mounted on a built up curb on the roof. Special features include low profile with streamlined design and a corrosion resistant housing. The motor and fan bearings are grease packed ball bearings and are out of the air stream. A manually operated safety cutoff switch is provided.

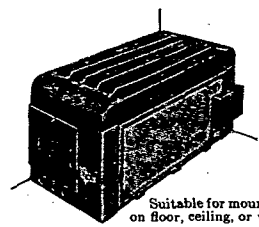
LARCO, INC.

LINTERN PRODUCTS

Route 20 East, Painesville, Ohio

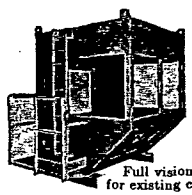
Crane Cab Conditioners • Pulpit Conditioners • Crane Cabs

For steel, copper, and aluminum plants, forge shops, paper mills, glass plants, foundries, cement plants, incinerators ... wherever on-the-spot cooling is required ... for temperature ranges up to 230°F.



Air Cooled Condenser... the model supplied for highest temperatures

CRANE AIRE-RECTIFIERS



This Lintern air conditioning unit is of the split system type allowing the condenser to be located high above the usual heat source on footwalk or trolley where the cab is so attached, as on soaking pit or stripper cranes.
The condenser is connected to the cooling coil in the cab by two refrigerant lines, of high pressure hydraulic hose especially designed for "Freon" refrigerants, fitted with high quality "Hoze-Lok" fittings, eliminating soldered copper lines.

CAB UNITS

This new Cab Unit is unique in that it can be easily mounted not only on ceiling or floor of crane cabs and pulpits, but also vertically against wall at any desired point between ceiling and floor.
Compactly designed, fabricated of 11 gage steel, the unit includes an all copper evaporator or cooling coil, electric heat, dust and dirt filters, and activated carbon filter for elimination of odors and waste gases. A feature is the condensate fiber glass drip pan, light, easily handled, non-corrosive, and with large drain connection.

Suitable for mounting on floor, ceiling, or wall

Full vision cabs for existing cranes

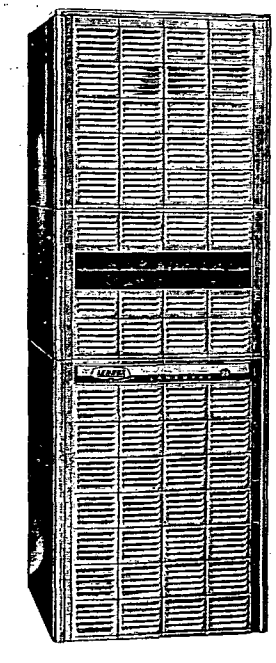
CRANE CABS

These full vision Lintern crane cabs are of our standard construction design requiring a minimum of engineering, permitting quick shipments, keeping costs down. They have a minimum of through-metal to reduce the cooling load. Provision is made for wiring controls and switches, as required. (Also furnished with new switches and controls, if desired.) Well designed, properly insulated, they centralize responsibility for proper, cooling performance.

PULPIT AIRE-RECTIFIERS

The Lintern Split System Aire-Rectifier allows for a minimum of space consuming equipment within the pulpit, provides thoroughly cooled, dehumidified even air distribution throughout the pulpit without costly, space-using air ducts.
Condensers are located conveniently adjacent to the pulpit, connected to the cooling coils within the pulpit by high pressure hydraulic hose, especially designed for "Freon" refrigerants, and attached with "Hoze-Lok" fittings. A majority of the parts are interchangeable with the Crane Cab Conditioners, minimizing the number of spare parts required in any mill.

Cooling Unit mounted on ceiling



LENNOX INDUSTRIES INC.

Marshalltown, Iowa

LANDMARK* SERIES, HEATING AND AIR CONDITIONING, SEPARATE COMPONENTS OF MODULAR DESIGN TO ASSEMBLE INTO FULLY INTEGRATED UNITS

One cabinet contains the air filter and blower; another contains the heating section, whether it is gas or oil, ranging from 68,000 Btuh with gas, and from 91,000 Btuh to 378,000 Btuh of input with oil. Another cabinet contains the cooling coil, or the combination heating and cooling coil in the case of the Heat Pump. Heat pump and electric strip heating can also be used with Landmark units. (Capacities can be increased by banking units.) Cooling and air handling capacities range from two tons through ten tons of refrigeration. Because of different capacities and different fuels for the heating section of each unit, the system designer can achieve perfect balance between heating and cooling in a building, whether it is residential or commercial, in the North or in the South.
For complete information on Landmark heating and air conditioning, or specialized assistance, phone, write, or wire Lennox Industries Inc., Marshalltown, Iowa.

*Oil Btu input based on 143,000 Btu per gallon. G—gas. P—oil.
Gas units also available, same specifications, for LP gas.

Here are furnaces for large homes, office buildings, churches, schools, lodge buildings, factories—furnaces *not* just made bigger but expressly designed to deliver high bonnet capacity with the desired space and fuel economy.

From top to bottom, these superbly engineered units are built for just one function . . . to extract every usable bit of heat from each unit of fuel and to deliver that heat quietly and efficiently through any type of modern forced-air system.

In the upflow models, tandem blowers are installed beneath the heat exchanger, while in the downflow models tandem blowers are mounted in a compartment above the furnace, delivering volumes of air into a *sub-floor* plenum for modern perimeter distribution. A separate blower compartment is provided with horizontal-flow models so that the blower unit may be mounted on either side or rear of the furnace.

Power gas burners with inputs of 250,000 and 400,000 Btu are furnished on the gas models. Oil burners are rated at 286,000 and 429,000 Btu input. Both oil and gas units utilize a pre-cast ceramic combustion chamber to shape and contain the flame for full efficiency. The heat exchanger is seam-welded of heavy steel plates and is surrounded by a four-tube secondary of unique design.

Majestic also offers a full line of smaller furnaces and a complete series of system-matching summer air conditioners in a wide range of sizes and types.

For full details and specifications, write The Majestic Co., Inc., Heating and Air Conditioning Division, Huntington, Indiana.

Pennsylvania Furnace & Iron Company

Warren, Pennsylvania
316 North Pine Street

Series 10A Pennsylvania Forced Air Gas Furnace

COMBUSTION CHAMBER: Extra large providing increased heating surface. Heavy gage metal insures long life.

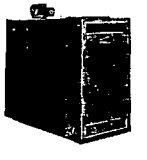
HEAT EXCHANGER: Die stamped corrugated sections furnish many flue ways from the combustion chamber and provide extra radiating surfaces. Corrugations create staggered flow of air across the flue ways. All seams in combustion chamber and heat exchanger are electric welded and gas tight.

BLOWER: Multiblade centrifugal type with double inlet and single bottom discharge equipped with special self-aligning bearings large oil reservoirs, rubber mounted for quiet operation, low speed motor, either split phase of capacitator type depending on size. Overload protector, adjustable pulley, and V-belt drive.

FILTERS: Spun glass. Large area for *efficient filtering* over long periods.

BURNERS AND CONTROLS: Cast iron burners with raised ports accurately drilled for each size furnace and for the kind of gas to be burned. Venturi injection tubes prevent flash back. Operation is noiseless. Controls governed by room thermostat. Entirely automatic.

CASING: Heavy and rigid. Doors provide easy access to blower and heating chamber. Controls enclosed. Finish hammertone steel blue enamel baked on. All *joints tight. Furnace* easily erected.



This furnace was designed for those who want a high grade and efficient unit in the better class of homes. Made in seven sizes. Input 75,000 to 225,000 Btu. *A.G.A.* approved.

SERIES 11 ULTRA FURNACE

This furnace is designed for gas or oil where standby equipment is specified. It is made of 12 gage in three sizes: 75,000, 100,000, and 125,000 Btu. Can be furnished with gas burners and controls or with gun type oil burner. Efficient on either fuel. *Has* the same blower and filter equipment as the 10A. (Furnace not shown).

SERIES 55 PENNSYLVANIA GRAVITY FURNACE

This line of gravity furnaces is made in three sizes with inputs of 75,000 to 125,000 Btu. The combustion chamber and radiators are cylindrical. The rectangular casing has corrugated inner lining providing efficient insulation. The burner is single port type with venturi outlet and chrome flame spreader. Controls are automatic with special safety feature. Casing is finished in steel blue baked enamel.

PENNSYLVANIA GAS CONVERSION BURNER

(Not Shown)

This is a single port burner with automatic controls suitable for installation in coal or oil fired furnaces. Three sizes are available; 75,000 to 350,000 Btu input.

PENNSYLVANIA MULTITUBE GAS CONVERSION BURNER

(Not Shown)

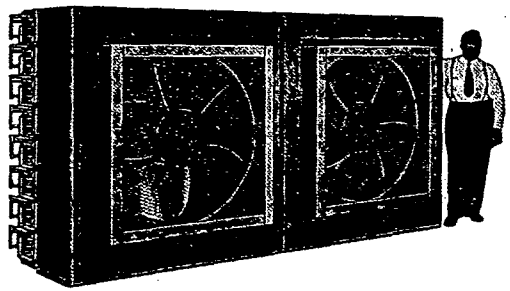
This burner is particularly designed for use in high pressure and tubular boilers in commercial and industrial installations. They are regularly installed through fire or ashpit doors in single or double units. Fully automatic controls are provided. Capacities range from 720,000 to 4,680,000 Btu.

REFRIGERATION APPLIANCES, Inc.

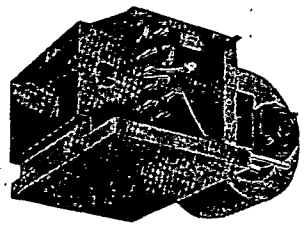
KRACK Refrigeration Appliances, Inc.

909 West Lake Street, Chicago 7, Illinois

Manufacturers of Freon, Ammonia & Flooded Ammonia Heat Transfer Equipment Since 1931



AIR COOLED CONDENSERS

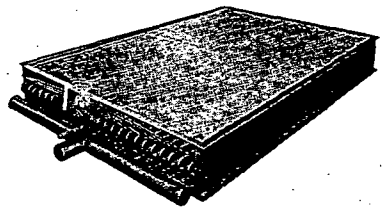


Quiet, remote type

Multiple banking in the field permits unlimited capacity ranges. Counter-flow refrigerant circuiting. Multi-circulating at no extra cost.

Automatic Winter Control: Unique design eliminates low operating pressure and expansion valve problems due to falling temperatures. One valve controls pressure in condenser, one controls pressure in receiver and a check valve stops liquid escape from receiver to condenser under all conditions.

Rated Capacities: Single units 7.5 to 50 tons (belt drive, patented semi-automatic adjustment), 1 to 7.5 tons (direct drive). Certified nominal capacities based on 110F condensing temperature, 90F ambient.

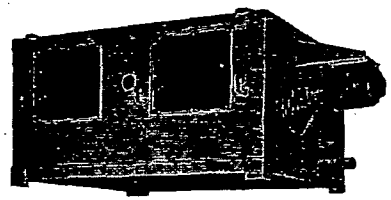


TRANSOM AIR CONDITIONERS

Quiet-remote type for small jobs

All aluminum construction. Insulated double drain pan. 3-speed control and thermal overload protection on motor.

Rated Capacities: 9000 and 12,000 Btu/hr.



STANDARD AIR CONDITIONING COILS

For new or old installations

Patented construction features. Positive fin spacing.

Rated Capacities: 2 to 50 tons, 4 or 6 rows deep.

Special sizes: ⅜, ½, ⅝ or ¾ in. OD tubes with 3 to 12 fins/in. available. All copper and steel hot-dip galvanized after fabrication coils available.

COOLING OR HEATING UNITS

Quiet-remote type

Choice of coil arrangements for direct expansion, water, steam or combinations.

Rated Capacities: 2 to 50 tons. Use with or without ducts for ceiling or floor. Insulated cabinets. Rust-resistant blowers.

FURNACE AIR CONDITIONING COILS

Low cost-bonnet type

Converts old or new forced-air systems to summer cooling.

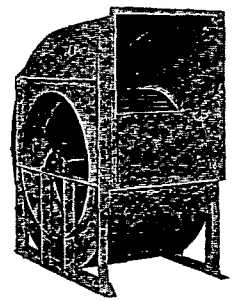
Rated Capacities: 24,000 to 90,000 Btu/hr.

EVAPORATIVE CONDENSERS AND COOLING TOWERS

Freon or ammonia for indoors and outdoors.

Rated Capacities: 5 to 100 tons.

REQUEST NEW DETAILED BULLETINS



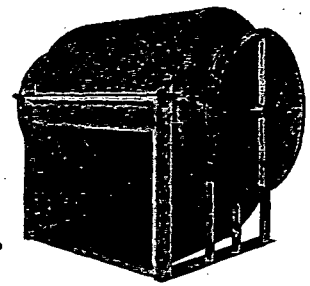
UTILITY FAN CORPORATION

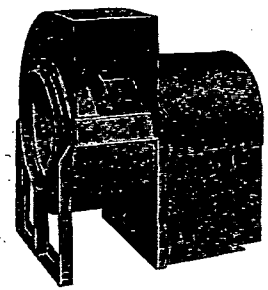
A Division of Utility Appliance Corp.

911 East 59th Street, Los Angeles 1, Calif.

Manufacturers of heavy and standard duty blowers for heating, air conditioning and ventilating installations. Producers of blowers and blower part for original equipment manufacturers. Built, tested and rated in accordance with ASHAE and *AMCA* codes.

- Sizes 12 in. to 73 in.
- **Write for catalog data.**





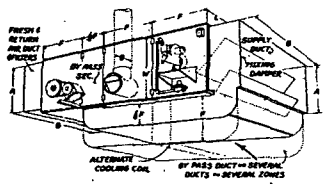
Heavy Duty Type "F" Design 29 Blowers are of the forward curved blade type for extraordinary efficiency and quiet operation. Low tip speeds give lower noise levels. These blowers are available in sizes from 12 to 73 in., single and double width, Class I and Class II construction and all standard drive arrangements and discharge positions.

• Heavy Duty Type "F" Blower, SISW

Heavy Duty Type "B" Design 29 Blowers are of the backward inclined blade type for high efficiency at higher static pressures and non-overloading horsepower characteristics. These blowers are available in sizes from 12 to 73 in., single and double width, Classes I, II, III and IV construction and all standard drive arrangements and discharge positions.

Heavy Duty Type "B" Blower with Variable Inlet Vanes, DIDW •

Utility Sets for a wide variety of ventilation and exhaust applications are available in sizes from 10 to 37 in. with Type "F" and Type "B" designs, single inlet arrangement Number 9 with rotatable housings for any desired discharge position. These Utility sets are completely self-contained units, ready to run with a weather-proof drive enclosure available for roof installation.



• Utility Set Type "B" with Weather-Proof Drive Enclosure

‡ For other air volumes and static pressures consult our Engineering Department.

¶ Dimensions given are for the heater KD to be assembled and welded in the building. Ordinarily the heater will be put in the building in one piece before the building construction has progressed too far.

§ An induced draft blower can be furnished if a stack or chimney is not available. The gas passages of the heaters are adequate so an inducted draft blower is not ordinarily needed.

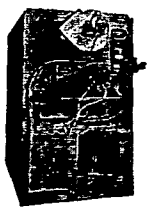
E. K. Campbell Co. Thermidaire

Thermidaire

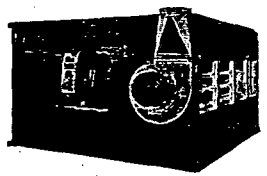
- Heavy Duty Warm Air Furnaces Capacities to 3,000,000 btu
- Builders of Custom Heating Equipment Since 1910



"Thermidaire" Design 10

"THERMIDAIRE" DESIGN 10 HEAVY DUTY FURNACES—CUSTOM HEAVY DUTY EQUIPMENT FOR ENGINEERED APPLICATIONS.

Typical Problems for which Design 10 Furnaces Offer an Excellent Solution:



- **Need for constant ventilation**—To maintain freshness in any structure, particularly where high occupancy loads occur, modulating face and by-pass zone arrangements are used to obtain constant air circulation with "Thermidaire" Design 10 Heavy Duty Furnaces.
- **Need for air conditioning**—Since most modern structures have either present cooling requirements, or will have at some future date, the large air capacities needed and the basic distribution system required are readily available in the structure using "Thermidaire" Design 10 Heavy Duty Furnaces.
- **Need for very large capacity equipment**—Where large loads exist, the high output capacity available from single units simplifies the solution. "Thermidaire" Design 10 Heavy Duty Furnaces available in standard sizes with output to 8,000,000 Btuh and 145,000 cfm, larger on special request.
- **Need to meet special design requirements**—For balancing Btuh vs. cfm component sizing, separate sizing of furnace and blower elements permits "Thermidaire" Design 10 Heavy Duty Furnaces to meet special requirements for very high or low air volumes, or temperature rises, and to handle unusual jobs, process needs, or exceptional buildings.
- **Need for flexible or special equipment arrangements**—Where building dimensions limit outlet or inlet duct arrangements, location of firing front or position of blower relative to air conditioning or furnace components "Thermidaire" Design 10 Heavy Duty Furnaces are excellent due to the extreme flexibility possible in arranging equipment.
- **Need for full convertibility to any fuel**—Where dual fuel equipment is required, or in event of future changes in fuel requirements, (including gas, L. P., oil light or heavy, and solid fuels), "Thermidaire" Design 10 Heavy Duty Furnaces offer complete protection since any of these fuels can be efficiently burned.
- **Need for extra quality equipment**—"Thermidaire" Design 10 Heavy Duty Furnaces are the highest quality equipment available, designed for continuous duty and long life on tough jobs and large loads.
  Only Heavy Duty blower equipment is used.
  Only highest grade burner and control equipment used.
  Extra Heavy welded steel construction throughout.
  Baked enamel exterior finish.
  Fiberglas insulated casing.
  Low Internal resistance to flue gases.
  Operating efficiencies up to 84 percent with resultant fuel economy.
  Counter-Flow heat transfer.
  Positive pressure or Drive through principle.
- **Need for special services**—
  Our half-century of application experience in the specialized field of heavy duty warm air heating is available to assist in arriving at the proper solution to your problem.
  We recognize that satisfactory solution of the Users problem is the end objective and we back our equipment with competent field service to accomplish this.

"Thermidaire" Design 40

"THERMIDAIRE" DESIGN 40 HEAVY DUTY FURNACES

Standard heavy duty equipment for general heating applications—Available from 250,000 to 2,000,000 Btuh output in vertical, horizontal, and inverted models—available for gas, oil or combinations. Provides convenient compactness, high efficiency, simple installation. Blower, burner, ID fan and controls, mounted, wired and fire tested. Normally shipped assembled.

"Thermidaire" Design 41

"THERMIDAIRE" DESIGN 41 HEAVY DUTY FURNACES

Standard heavy duty equipment for engineered applications—designed for use with face and by-pass, constant ventilation, or air conditioning—requires separate blower—has built in by-pass section—available in same models and fuels as Design 40, in sizes from 250,000 to 3,000,000 Btuh output. Provides convenient compactness, high efficiency, simple installation. Burner, controls and ID fan, mounted, wired and fire tested. Normally shipped assembled.

Stainless Steel Unit

Chicago Steel Furnace Co. announces the production of a new line of steel furnaces made of stronger 442 Stainless in capacities to 2½ million Btu's in all popular designs. Chicago's 442 Stainless line supplements the refractory lined series still available.

All models available with either duct flange connections or (optional) with 4-way adjustable diffuser heads and screened intakes.

Cuts and features here shown pertain to our stainless steel series of furnaces only. Firing equipment, all fuels, *UL* and *A.G.A.* inspected and approved.

DRAVO *Counterflo* COMMERCIAL SPACE HEATERS

350,000 to 2,000,000 Btu/hr output

Dravo Commercial Space Heaters, in addition to comfort heating, are easily adapted to heat curing and process drying, tempering or replacement air, as duct furnaces, and for summertime ventilation.

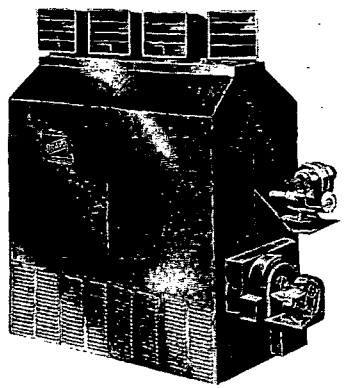
●**PYROJET BURNER**—Designed and built by Dravo exclusively for the Commercial heater, the induced draft Pyrojet burns gas, light oil, heavy No. 5 oil or combination gas/light oil. Combination firing has manual or automatic switchover control.

●**STAINLESS STEEL COMBUSTION CHAMBER**—Designed for maximum flame travel and efficient wiping action of air stream for efficient heat transfer. Ruggedly built for long, trouble-free service.

●**SAFETY TESTED**—Approved by *A.G.A.* and listed by *Underwriters Laboratories, Inc.*, Dravo Safety Control Circuit is accepted by *Factory Mutual Engineering Division* and *Factory Insurance Association*.

●**10-YEAR GUARANTEE**—All standard model **Commercial** Heaters carry a fully bonded 10-year guarantee on all parts in direct contact with flame or flue gases.

DRAVO *Counterflo* INDUSTRIAL SPACE HEATERS



400,000 to 2,000,000 Btu/hr output

●**ECONOMICAL**—Package type burner for gas, light oil, No. 4 oil or automatic switchover from gas to light oil. Easy to service, this is a rugged mill-type heater which will provide long-time, low-cost, efficient heating in most types of installations.

●**STAINLESS STEEL COMBUSTION CHAMBER**—Full floating stainless steel combustion chamber, designed for four-pass flame travel to assure maximum heat transfer. Economizer tubes whirlcool the hot gases for added efficiency.

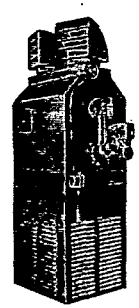
●**APPROVALS**—Burner and control components approved by *Underwriters Laboratories, Inc.*, and by *A.G.A.* where applicable.

●**10-YEAR GUARANTEE**—All standard model **Industrial** Heaters carry a fully bonded 10-year guarantee on all parts in direct contact with flame or flue gases.

The Dravo Industrial Space Heater is a rugged mill-type economy heater. Easy serviceability and long life make this the most economical buy for many installations. Is readily adaptable to process uses, for tempering of replacement air and many other applications.

DRAVO *Paraflo* SPACE HEATERS

200,000 to 250,000 Btu/hr. output



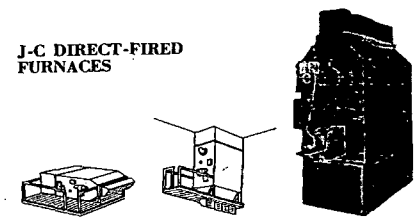
●**POWER AND FUEL**—Heater operates on 120 volt 60 cycle single-phase current. 440/220 volt three-phase operation can be supplied if desired. Burns light oil or gas.

●**FAST TRANSFER OF HEAT**—Stainless steel combustion chamber allows faster heat transfer and guarantees longer heater life and sustained efficiency. Equipped with *UL* approved gun-type oil burner or *A.G.A.* approved gas burner.

●**FLOATING COMBUSTION CHAMBER**—Supporting straps hold stainless steel chamber in place for inverted or horizontal mounting.

●**HEAT ANY DIRECTION**—Warms areas up to 3600 sq ft. Directional nozzle can be rotated 360° heating any desired location, high velocity discharge assures adequate distribution up to 90 ft from the unit without the use of ductwork.

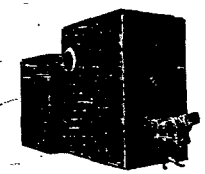
DRAVO Gas Fired Suspended Unit Heaters available for 40,000 to 184,000 Btu/hr applications.



DRAVO *Paraflo*

JACKSON & CHURCH

Division of York-Shipley, Inc., York, Pa.



J-C DIRECT-FIRED FURNACES

These new *units incorporate* a true counter-flow design. Heating surfaces are arranged for highly efficient heat transfer, allowing minimum pressure drop through the heater. Flexible application as they can be installed upright, laid on their side, or inverted. *Fully automatic controls*, installed and wired for complete programming sequences. For No. 2 oil, natural, mixed, *manufactured, L. P. gases or combination.*

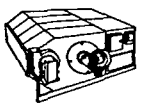
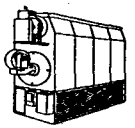
DESIGNERS — **MANUFACTURERS**

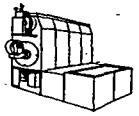
JOHNSON MODEL FA FACTORY ASSEMBLED "FYRE TUBE" HEATING UNITS



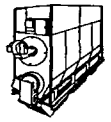
Engineered and designed for all types of commercial and industrial direct-fired heating applications, with or without duct work. Single heater output capacities from 400,000 to 4,000,000 Btu/hr. Fired by light or heavy oil, gas or combination of both. Furnished as standard with *UL* and *FM* accepted burner and control systems, chrome nickel stainless steel combustion chamber, large capacity circulating blowers and separate motor driven induced-draft fan.



Cutaway view of Johnson Model FA Unit (Type VP). Note the rugged compact construction with accessible service and maintenance features.



TYPE VN Vertical floor model with adjustable discharge heads.



TYPE HP Horizontal suspended type for duct connections.
TYPE HN Horizontal suspended type with discharge nozzles.

TYPE VP Vertical floor mounted units for duct installations.

TYPE VPO Using separate outside blower for combination heating, cooling or ventilating applications. Also furnished for horizontal mounting TYPE HPO.

TYPE IN Inverted type using adjustable discharge nozzles. Furnished without nozzles for duct installations TYPE IP.

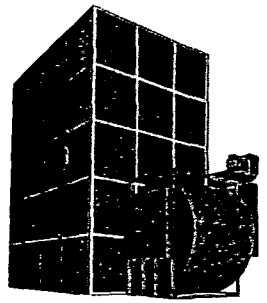
DESIGNERS — **MANUFACTURERS**

MODEL JA HEAVY DUTY COMMERCIAL AND INDUSTRIAL "AIRE TUBE" HEATERS

15 Sizes—Output Capacities from 400,000 to 5,000,000 Btu/hr. Direct-Fired by heavy or light oil, gas or a combination of both fuels

"AIR ROTATION" SPACE HEATING

One, free standing, Model JA "AIRE TUBE" Heater can uniformly heat in excess of 1,500,000 cu ft of open building space without duct work, noticeable drafts or the need to spot, throw or direct the heated air.



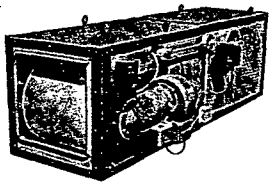
This is accomplished with our "AIR ROTATION" system of space heating in combination with our special heater design. Large volumes of the cooler and denser, low-level air from the building are rotated through the heater. This air is then heated to a low temperature and discharged at a low velocity from the heater outlets back into the area to be heated.

DUCT DISTRIBUTION SYSTEM

JA "AIRE TUBE" Heaters with low internal resistance are excellent for use with all types of duct distribution systems.

HEAVY OIL FIRING

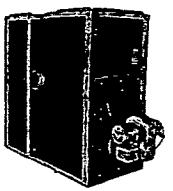
JA Heaters are especially designed for firing with the low cost #5 or #6 fuel oils in the larger sizes.



JA Heaters have approximately 90 percent direct heating surface with multiple banks of practically self-cleaning, air-heating tubes located over the fire.

MODEL JAS

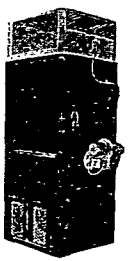
Horizontal Suspended "AIRE TUBE" Heating Units. 17 Sizes Output Capacities from 112,000 to 1,000,000 Btu/hr.



- Factory assembled
- Multiple air tube design
- Practically self cleaning
- Low draft requirements
- Chrome nickel steel combustion chamber

Available as duct heaters without blower section in range of sizes listed above.

Direct-fired by light oil, gas or a combination of both fuels



SMALL MODEL JA

(EXTENDED CASING TYPE SHOWN)
Nine sizes output capacities from 112,000-350,000 Btu/hr. Fired by light oil, gas or a combination of both.

MODEL HB

For heating small commercial-industrial and domestic buildings
Designed for use as a space heater or with duct distribution systems

(SPACE HEATER SHOWN)
Nine sizes output capacities from 112,000-350,000 Btu/hr. Fired by light oil, gas or a combination of both.

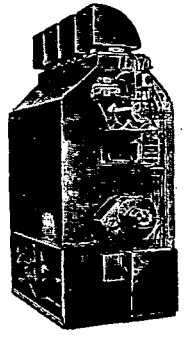
FOR | SPACE HEATING, DRYING, MAKE-UP AIR AND OVEN APPLICATIONS



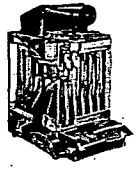
"OG" SERIES HEAVY DUTY HEATERS

Specifications—Gas, oil or combination burners with manual or automatic fuel selection. 300,000 to 500,000 Btuh output. Control system is packaged, factory-tested.

Applications—Can be used as a central furnace with ducts or as a unit heater. Installations may be horizontal, vertical, suspended or floor mounted. Listed by *U. L.* and complies with factory mutual insurance requirements.

Blower Section—Huge air volume delivered quietly from dynamically balanced blowers. Up to 2 in. external static pressure. Blower section can be used for air conditioning, will handle up to 30 tons of cooling. A wide choice of blower motors and drives satisfies all air volume requirements.

Construction—Compact, rugged, with 16 gage stainless steel heat exchanger; secondary heat surface of aluminized steel to resist corrosion. Exceptional expansion joint allows unit to "breathe." Burner enclosed in sound proof compartment. Heater uses adjustable discharge nozzles or ducts. (*Write for Bulletin OG-581-M10.*)



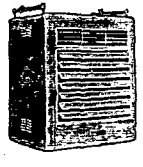
"AT" SERIES HEAVY DUTY HEATERS

Specifications—Gas, oil or combination burners with manual or automatic fuel selection. 750,000 to 2,000,000 Btuh output. One master controller eliminates non-standard, hard-to-replace system components.

Design Features—Special 4-pass counter flow design without the use of internal baffles gets the most heat from the flame. Boiler tubes, equipped with high-velocity retarders, and double casing, with metal radiation shield, contribute to operating efficiency of 80 percent or better, while holding casing heat loss to minimum.

Blower Section—Quiet, large-capacity blowers may be removed for remote applications if desired.

Applications—"AT" heaters offer wide variety of uses and applications in department stores, warehouses, manufacturing plants, process industries, truck terminals, apartment houses, office buildings. Units can be floor mounted in upright, inverted, or horizontal positions; suspended vertically or horizontally from ceiling (service platform optional). (*Write for Bulletin LDMI-G-5-58.*)



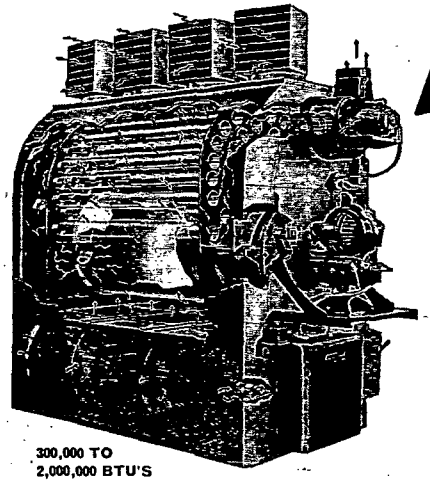
GAS DUCT HEATERS

Wide range of uses: Hotels, motels, stores, schools, service stations, factories. Btuh input ratings per unit from 120,000 to 420,000. Depth is never more than 49 in. including diverter.

Dual limit controls provide complete protection for air travel in either direction. Can be fired with all types of gaseous fuels.

Provides positive zone control with precise thermostatic action. Can be used alone or added to an existing system. (*Write for Bulletin GSD-581-M3.*)

GAS UNIT HEATERS



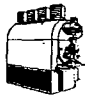
Btuh input ratings per unit from 80,000 to 250,000. Dual vertical and horizontal louvers diffuse warm air evenly over a wide area. Quick, easy installation made possible by easily balanced hangers.

Motor has overload protection, is cushion mounted and totally enclosed. Attractive cabinet design allows "exposed" installations. Controls include automatic pilot with 100 percent safety shut-off.

Heat exchanger: Aluminized steel, with 18 gage tubes and 16 gage headers. (*Write for Bulletin LDMI-G-6-58.*)

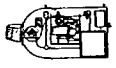
MAMMOTH FURNACE COMPANY

6425 CAMBRIDGE STREET • MINNEAPOLIS 26, MINNESOTA



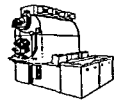
300,000 TO 2,000,000 BTU'S

Commercial-Aire



DIRECT-FIRED SPACE HEATERS

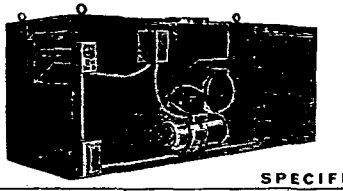
Commercial-Aire Direct-Fired Space Heaters have a high fuel-to-heat conversion efficiency. They are ruggedly built for quiet, vibrationless operation. All controls, wiring, and moving parts are accessible for service. Among the many desirable features are the central control cabinet, retractable burner tray, MH-Electronic flame control, pre-ignition draft purge timing and draft sensing, and vortex cooled motor shaft to blower wheel. A variety of controls, power supplies and burners by reputable manufacturers may be specified and integrated. Write for Bulletin C-357.



SAFETY TESTED and approved by A.G.A. Laboratories and Listed by Underwriters' Laboratories, Inc. Commercial-Aire safety control circuit is accepted by Factory Mutual Engineering Division and Factory Insurance Ass'n. Control circuit wiring meets J.I.C. Requirements.

MODEL "F" Floor mount with discharge heads for industrial plants, foundries, etc.

MODEL "H" Horizontally suspended unit for use where floor space is unavailable.



MODEL "FD" For duct distribution. For churches, schools, auditoriums, etc.

MODEL "U" Suspended inverted unit for make-up air applications in plants, foundries, etc.

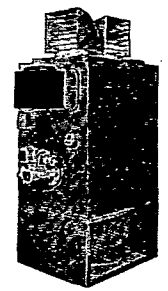
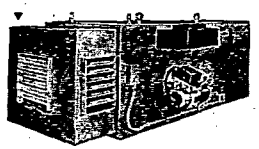
U SERIES HI-BOY and COUNTER-FLO MODELS

NATIONAL Champion WARM AIR SPACE HEATERS



T-F SERIES SUSPENDED UNITS



U Series HI-BOY and COUNTERFLO models. ▸

Research-designed for compactness plus efficiency are prime requirements. The **HI-BOY** upright units can be equipped with adjustable discharge heads or arranged for duct connections. **COUNTER-FLO** models for under floor heat distribution systems or inverted ceiling suspension. Five sizes—175,000 to 350,000 Btu output capacity for either gas or oil firing.

•

T-F Series suspended units. Heavy duty suspended units engineered for industrial and commercial heating applications where floor space is at a premium. Rugged, compact, easy to install—with four-way adjustable

discharge head or for convenient integration into a duct distribution system. Duct heaters available in identical Btu capacities. Special stainless steel and aluminized steel can be furnished for high temperature applications and corrosive conditions. Nine sizes—180,000 to 550,000 Btu output capacities—gas or oil fired.

PANELBLOC

CR-63 (62,500 Btu Input)

CR-125 (125,000 Btu Input)

PANELBLOC INFRA-RED RADIANT HEATERS BRING THE SUN INDOORS

For Commercial and Industrial Installations

Through the eons man has benefited from radiant heat. First the sun and now the gas fired Overhead PANELBLOC takes over. With the speed of light healthful infra-red heat waves pleasantly warm objects and people without air disturbance.

A few of PANELBLOC'S advantages are:

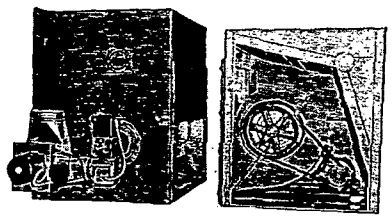
- No fan—ideal for dusty areas.
- No motor—quiet as a sun's ray.
- No power consumption—unit generates own operating current.
- No costly electrical power installation charges.
- No possibility of shutdown due to power failure.
- No heat diverted by drafts from open doors or in open pavilions.
- No fuel wasted heating unnecessary spaces in building.

MODERN INFRA-RED METHOD

(U. S. and Foreign Patents Granted)

Developed to fill the gaps in Industrial and Commercial heating, PANELBLOC turns difficult heating problems into routine installations. PANELBLOC spot-heats with no need for costly partitions or false ceilings. Infra-red heat like light goes only where directed by the polished metal louvers. As a result people, equipment and particularly floors are pleasantly warm.

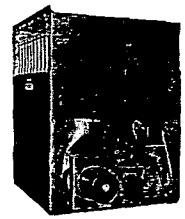
CONSTRUCTION AND OPERATION



The combustion gases, produced from any commercial gas fuel pass through a unique panel heat exchanger of special steel. To overcome corrosion and high temperatures this heat exchanger is coated inside and out with vitreous enamel. The panel is heated to a carefully controlled temperature so that the infra-red waves (10 times longer than those from a glowing fire) produced have a wave length which gives maximum penetration. Maximum penetration means comfort heating.

Underwriters Laboratories Inc. INSPECTED

TJERNLUND MANUFACTURING COMPANY

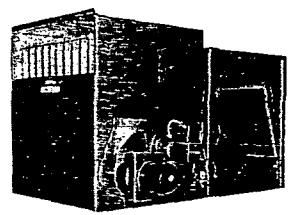


2140 KASOTA AVENUE · ST. PAUL 14, MINNESOTA

Manufacturers of Industrial and Commercial Warm Air Heating Equipment, Oil and Gas Burners, Blowers and Draft Inducers

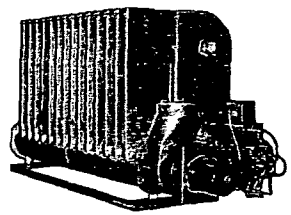
STYLE "A" LO-BOY

Heater with separate blower section for by-pass application blowers other than standard can be utilized i.e. model 150 blower can be used with model 100 furnace for additional air capacity.



STYLE "A" DUCT HEATER

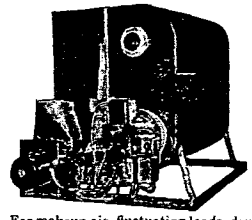
All heaters available as duct heaters in a variety of outlets and inlets for use in conjunction with air conditioning equipment.



STYLE "E" COUNTER FLOW HEATER

With jet fired power gas burner top or side inlet for return air.

STYLE "A" SUSPENDED OR LO-BOY



Heater filter inlet top or rear. Discharge top or front.

EVEN-FLOW HEAT EXCHANGER

Multiple flue arrangement. Down flow of hot gasses gives a temperature equalizing effect which distributes the generated heat uniformly over the entire flue area. Direct firing into combustion area with no restrictions to block heat transfer to air stream. Stainless steel wrapper at combustion area.

Hi-Boy, Counter Flow, Suspended, Lo-Boy Heaters in a Complete Range of Sizes—Choice of Firing Equipment.

3 STAGE OIL BURNER

For makeup air, fluctuating loads, drying systems, heating and ventilating systems. Three individual burner heads, each comprising end cone, turbulator ring, nozzle and blast tube make possible efficient air velocities and oil atomizing pressures for each firing stage. Integral draft inducing fan provides positive draft. Single motor for operation of both oil burner and draft inducer. Standard SUNDSTRAND 2 STAGE fuel unit. Delayed action solenoid valves to each burner head provides prepurge timing, control of oil for each firing stage and positive shut-off. Electronic control for fast, safe control. Standard ignition transformer.

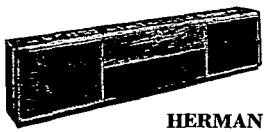
For suspended mounting. Use with steam or hot water. Copper heating element with patented stay tube prolongs unit life. Many models and sizes. *Bulletin 700.*

VERTICAL SHAFT PROPELLER-FAN TYPE UNIT HEATERS

Designed for high ceiling installations. Long life copper heating element for use with either steam or hot water. Units available in range of capacities with high or low velocity discharge. *Bulletin 700.*



CONSOLE HEATERS

Compact, quiet, economical and attractively styled. Ideal for offices, showrooms, corridors, stores, etc. May be placed on floor, wall or suspended from ceiling. 18 models and sizes. *Bulletin 787.*

CONVECTOR RADIATORS (Not Illustrated)

Range of sizes for steam or hot water. Heating elements made of non-ferrous materials. Cabinets designed for free standing or recessed installation. Also sloping top models. *Bulletin 791.*

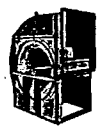
FINNED RADIATION AND COVERS (Not Illustrated)

Adaptable to any system as a primary or supplementary heating source. Range of sizes with choice of expanded metal, flat top or slant top covers. *Bulletin 790.*

HERMAN NELSON UNIT VENTILATOR SYSTEMS

Herman Nelson Draft/Stop Systems automatically heat, ventilate, natural cool (with outdoor air) and mechanically cool (with chilled water). Draft/Stop principle traps cold window drafts before they reach classroom occupants. For steam, hot water, electric heating, direct gas-firing, and hot water or chilled water for year 'round air conditioning. *Bulletin 600.*

FANS AND BLOWERS



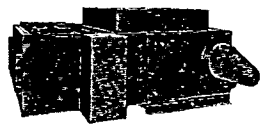
PROPELLER FANS

A complete line of belt or direct drive ventilating fans. Twenty-nine sizes with wheel diameters from 10 to 54 in. Unit capacities ranging from 655 to 36,150 cfm. *Bulletin 800.*

UNIT BLOWERS

Direct or belt drive with forwardly curved or backwardly inclined wheels. Wheel diameters from 4½ in. to 36 in. and capacities from 160 to 18,303 cfm. *Bulletin 826.*

CENTRIFUGAL FANS



Designed for systems requiring a Class I or II centrifugal fan. Slow speed or non-overloading type. Wheel diameters from 12¼ in. to 73 in., single or double width. Direct or belt drive. Any rotation or discharge. *Bulletin 851.*

American Air Filter Co. Inc.

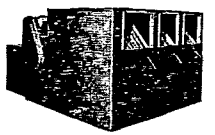
St. Louis, Mo.

AIR CONDITIONING UNITS

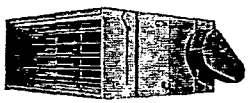


Complete Air Treatment

All basic air conditioning functions of heating, humidifying, cooling, dehumidifying, cleaning, and air movement may be combined in this one unit, providing true "year 'round" air conditioning.

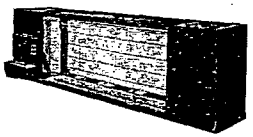
A Size for Every Application

Twelve sizes, with air handling capacities of 675 cfm to 36,000 cfm matched with proper size cooling and heating coils of all styles and capacities make this a universal unit. No application is too small, none too large for this broad line.



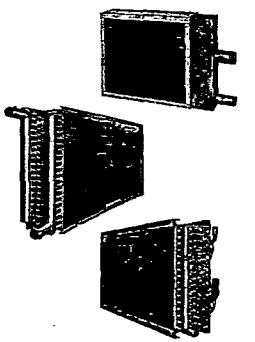
A Model to Fit

Horizontal and Vertical models are available in all sizes to meet the modern need for compact, space-saving equipment. *Bulletin 786.*



MULTI-ZONE AIR CONDITIONING UNITS

Multi-Zone Air Conditioning Units maintain design conditions, under varying loads, in ALL zones of the system. This single central station Multi-Zone Unit can handle from 2 to 8 zones. Eight sizes, with air handling capacities of 3,440 cfm to 36,000 cfm. Coils can be furnished for direct expansion, chilled water, steam or hot water. One cooling coil and one heating coil in each unit (operating in parallel) supply correctly cooled, tempered or dehumidified air for perfect comfort under year-round conditions. *Bulletin 870.*



HEATING AND VENTILATING UNITS

Feature sectionalized construction, low outlet velocities, slow fan speeds, wide selection of heating coils. Available with humidifier. Ideal for institutional, industrial and commercial use. *Bulletin 910.*

ROLL-O-VENT AUTOMATIC AIR FILTER

Offered exclusively by AAF, the Roll-O-Vent automatic air filter is available as an optional accessory with Air Conditioning Units, Multi-Zone Units, or Heating and Ventilating Units. Utilizing AAF's famous Roll-O-Matic filtering principle, Roll-O-Vent assures constant air delivery at all times, makes filter changing automatic and gives major savings in maintenance. One roll of media can do the work of a year's supply of disposable filters at about one-half the cost.

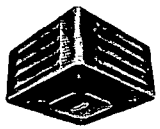
HEATING AND COOLING COILS

A. **Standard Steam Coils—Type S** (Not Illustrated) Made with ⅝ in. seamless copper tubing; spaced 8 fins per inch. Recommended for a maximum operating pressure up to 30 psi. Over 30 psi, use heavy duty coils, type HS.

B. **Steam Distributing Coils—Type SD** For use where steam supply is to be modulated and/or exposed to freezing temperatures. *Bulletin 890.*

C. **Standard Water Coils—Type W** Made with ⅝ in. seamless copper tubing, spaced on 1½ in. centers in depth and width. Fins spaced 8 per in. Coils are used for both heating and cooling. Also available with fittings to permit internal cleaning of tubes. *Bulletin 880.*

D. **Direct Expansion Coils—Type DE** Aluminum or copper fins are bonded to ⅝ in. or ¾ in. seamless copper tubing. Fins spaced 8 per in. Refrigerant circuits are of equal length and arranged for counter flow. *Bulletin 880.*



Carrier Corporation

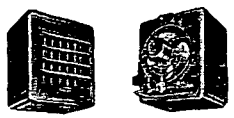
Syracuse 1, New York

UNIT HEATERS

Carrier Unit Heater Agents, jobbers and distributors are located in all principal cities. Listed in your local Classified Telephone Directory under "Heaters, Unit"

Carrier Unit Heaters are the product of more than half a century spent in the design and manufacture of temperature control equipment. For high and low pressure steam, forced hot water and gas-fired systems.

46S Four-Way Unit Heaters feature a variable "clover leaf" air discharge pattern through four separately controlled outlets. In eight sizes ranging from 55,000 to 600,000 Btu/hr.

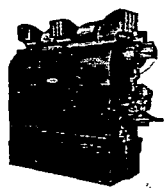


46U Horizontal Unit Heaters heat areas with a conventional horizontal discharge pattern. Feature single row, low air resistance coils; in ten sizes ranging from 13,400 to 200,000 Btu/hr.

46SD Vertical Unit Heaters mount within 2 inches of ceiling to save headroom. Available with standard or low temperature rise coils in ten capacities, from 30,000 to 576,000 Btu/hr output.

46AE Cabinet Unit Heaters include eight cabinet styles; free standing, variable semi-recessed and recessed. Mount on floor, wall or ceiling. Capacities range from 26,200 to 115,000 Btu/hr.

46T Gas-fired Unit Heaters are compact in design and use Aluminized Steel heat exchangers for long unit life. Available in eight sizes ranging in capacity from 50,000 to 230,000 Btu/hr.



46TD Gas-fired Duct Furnaces include eleven basic sizes from 50,000 to 440,000 Btu/hr capacity. Companion engineered Blower Assemblies provide from 530 to 6500 cfm capacity.

Carrier Heat Diffusers are designed to provide dependable heating and ventilating for large buildings or areas and for industrial process application. Available for steam, hot water or direct-fired installation.

46PQRV Heat Diffusers for steam and hot water systems feature floor mounted or suspended units with "building block" design of components for installation flexibility. Choice of fan-coil capacities to provide from 47,000 to 2,990,000 Btu/hr output.

46AF Heat Diffusers—Direct Fired are self-contained units for oil, gas or combination fuel. With stainless steel combustion chamber and heavy gage steel heat exchanger, they are *A.G.A.* and *UL* approved in ten sizes from 300,000 to 2,000,000 Btu/hr.

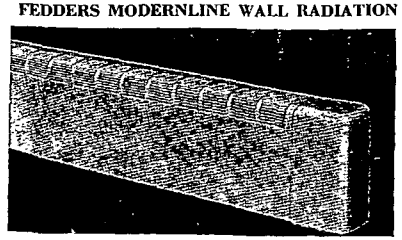
FEDAIR REMOTE TYPE AIR CONDITIONING UNITS

Made in Free Standing, Recessed, and Overhead Models

FEDAIR Units are designed for multiple room installations, in large and small buildings. They simplify planning of new and modernized buildings. No duct work and only 3 lines required—supply, return, and condensate drain. Aluminum finned copper tube coil gives quick response to controls. All models available with motors for standard and low-speed operation. Blowers are sized to deliver rated cfm at specified motor speeds. Outside and recirculated air filtered. Write for complete catalog.



FEDAIR overhead models are used where floor and wall space is limited. Outlet louvers are adjustable for directional control. Available without enclosure for concealed installations.

FEDDERS MODERNLINE WALL RADIATION

SMOOTH ROUNDED COVERS, available in 3 heights and 2 depths, combine attractive appearance with functional convected and radiated heat emission. Integral die-formed louvers direct heated air outward into room. Covers finished with baked-on ivory enamel or Quaker gray neutral prime. Can be furnished in five other colors. HEATING ELEMENTS can be used with steam or hot water systems and installed one or two rows high. ML-5 elements have 1¼ in. copper tubes with 4¼ in. square .025 in. aluminum fins in lengths from 2 ft. to 12 ft. in increments of 6 in. ML-5 steel elements available with 1¼ in. and 2 in. IPS and 4¼ in. square fins. Write for catalog.

FEDDERS BASEBOARD RADIATION

MODEL BBH Complete With Deflector Damper

FEDDERS Baseboard Radiation provides completely packaged, factory assembled units for easy handling and time saving installation. Standard lengths are 4-ft, 6-ft, and 8-ft with other lengths available for large projects. Three series—Model BBH, Model S, and Model L provide ratings and prices to fit every job. Write for catalog.

⅜ in. Tube Coil

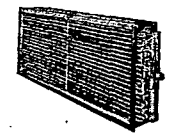
½ in. Tube Coil

⅝ in. Tube Coil

McQUAY RIPPLE-FIN COILS

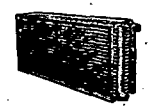
The famous McQuay Ripple-Fin coils are made in three tube diameters; ⅜ in., ½ in. and ⅝ in., in a wide variety of styles and sizes for steam, hot water, cold water, direct expansion and refrigerant condensing.

"Custom Engineered" coils are readily obtained, as McQuay's manufacturing methods provide a wide variety of fin spacings, fin heights, finned lengths, rows deep and circuiting, thereby both space and capacity requirements can be met.



Ripple-Fin coils have all tubes mechanically pressure bonded into wide smooth fin collars providing a permanent bond and a high heat transfer efficiency. McQuay coils are pneumatically tested under warm water at 315 psig.

Ripple-Fin coils have a staggered tube pattern which, combined with the ripple fin, produces a turbulent air flow and reduces air "by-pass".



In addition to the ripples across the air flow, the fins of McQuay coils have rippled edges to give strength and a pleasing appearance.

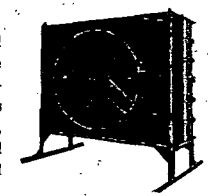
McQuay evaporators and condensers are dried with minus 40°F dew point air to assure moisture-free coils.

McQuay Ripple Fin coils have been approved by *Underwriters' Laboratories* for use as evaporators or condensers with either R-12 or R-22.

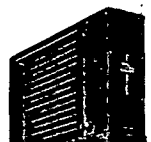
Direct Expansion Coil

Water Coil

Steam Coil



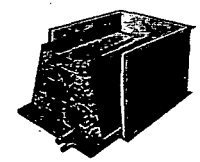
McQuay Means Quality



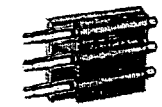
"AL" Aircon

McQUAY AIR COOLED CONDENSERS

Fifteen sizes of belt drive commercial propellers and centrifugal fan models up to 50 tons capacity in a single unit. Split circuiting systems and winter control systems are available for all models. Centrifugal fan models are available with filters, face and by-pass dampers, intake mixing boxes, discharge diverting boxes and humidifiers for combination condenser, ventilator and heating applications. Write for free bulletins.



"AB" Aircon



Vertical Air Flow Evaporator

McQUAY RESIDENTIAL EVAPORATORS

Five models of vertical residential evaporators ranging from 26,000 to 90,000 Btu/hr constructed for either up flow or down flow of air. The horizontal residential evaporators range from 25,300 to 92,100 Btu/hr in five models, and are designed for air flow in either direction. Both the vertical and horizontal circuits are for use with R-12 or R-22.

McQUAY UNIT HEATERS

Horizontal, down flow and cabinet unit heaters are available in an extremely wide range of sizes and capacities for either steam or hot water. Adjustable louvers are standard equipment on horizontal unit heaters. Down flow unit heaters are furnished with adjustable radial diffusers. There are three types of cabinet unit heaters—floor, wall and ceiling—all for exposed, semi recessed or fully recessed mounting.

SEASONMAKER

Air Conditioning Units

Individual room and large capacity air conditioners, four types—floor, hideaway, basic and ceiling. Cooling and heating medium supplied from central plant. Cools, dehumidifies and filters in summer. Heats and filters in winter. Five sizes of all models—200, 300, 400, 500 and 600 cfm. Hideaway and ceiling types also available with 800, 1200 and 2,000 cfm. The Seasonmaker's compactness, only 8½ in. deep, attractiveness, quiet operation and ease of installation make it ideal for hotels, apartment buildings, motels and other multi-room buildings.

McQuay Means Quality

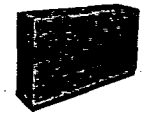
HEATING AND VENTILATING UNITS

Horizontal, vertical, wall and inverted types available. Covers the entire range to 48,000 cfm and 3,320,000 Btu. Filters, face and by-pass dampers, mixing boxes, humidifiers, discharge plenums and nozzles are available. Special units for school applications.

MULTI-ZONE

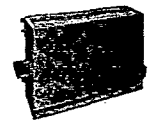
Heating and Cooling Units

One unit simultaneously heats and cools up to 22 separate zones. Eleven sizes in horizontal or vertical models with capacities from 1350 to 38,000 cfm.



SEASONMASTER

Central Station Air Conditioning



Horizontal and vertical types. Cool, dehumidify, filter and circulate air in summer. Heat, humidify, filter and circulate air in winter. Direct expansion and water cooling coils. Steam and water heating coils. Cooling capacities to 200 tons, from 640 cfm to 38,000 cfm in both suspended and floor types.

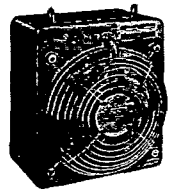
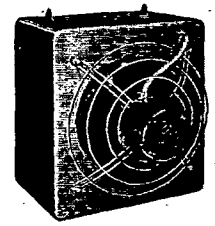
ILG ELECTRIC VENTILATING COMPANY

2880 N. Pulaski Road Chicago 41, Illinois



Offices in 57 Principal Cities

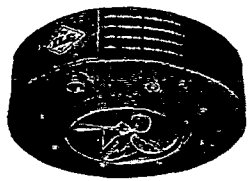
Member of *Air Moving and Conditioning Association, Inc. (AMCA)*



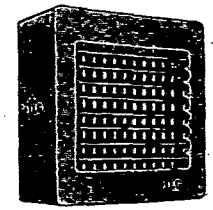
ILG UNIT HEATERS—STEAM, HOT WATER, ELECTRIC OR GAS

Tested and rated by *IUHA* and ASHVE Codes. "One-Name-Plate" guarantee.

ALL-ELECTRIC UNIT HEATERS



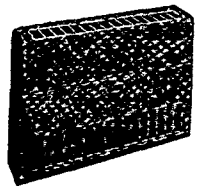
1½ to 7½ kw



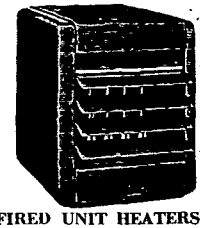
9 to 36 kw

ILG ALL-ELECTRIC UNIT HEATERS—new design for 1½ to 36 kw. features black heat type steel-sheathed elements and Ilg's quiet Type "Q" fan wheel. Built-in thermal cutout and direct-connected, totally enclosed motors. Heavy-duty construction throughout for heating *isolated areas, temporary* or auxiliary heating, stand-by freeze prevention, etc. Send for *Bulletin 808.*

STEAM AND HOT WATER UNIT HEATERS



ILG VERTICAL-TYPE UNIT HEATERS—new design. Totally enclosed ball-bearing *motors.* Heating surface features similar to horizontal type. Type "V" for standard outlet temperatures, Type "VL" for low outlet temperatures. 15 capacity sizes. Send for *Bulletin 1202.*



ILG HORIZONTAL-TYPE UNIT HEATERS—four side pipe connections for simplified piping. Suitable for hot water and steam to 150 lb pressure . . . tubes air-tested to 90 lb. Motor totally enclosed, continuous-duty type. 19 capacity sizes. Send for *Bulletin 1202.*

CABINET HEATERS

ILG SERIES "A" CABINET HEATERS—designed for maximum flexibility of arrangement and operation. Can be furnished for floor, wall, ceiling or inverted mounting. Available in seven basic unit sizes, 35 models. Blow-through type with direct fan assembly and draw-through type with belt-drive assembly. Equally suitable for steam or hot water applications. Send for *Bulletin 1506.*

GAS-FIRED UNIT HEATERS

ILG GAS-FIRED UNIT HEATERS—use natural, manufactured, mixed, butane-air mixtures; propane, or butane gas. Available in 10 basic model sizes, 2 types: Propeller Type (Series M); or Blower Type (Series MB) for use with duct work. Safety pilot, automatic control valve, electric limit switch. Motor has thermal overload protection. Send for *Bulletin 286.*

MANUFACTURERS OF GRID CAST IRON

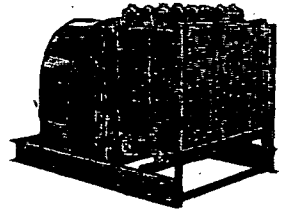
UNIT HEATERS, BLAST HEATERS, RADIATORS.

Corrosion IN HEATING EQUIPMENT Ends WHEN YOU INSTALL - - -

CAST IRON STEAM HEAT

GRID

TRANSFER SURFACE



You once and for all eliminate internal electrolytic corrosion because all metals in GRID Cast Iron Steam Heat Transfer Surface that are in contact with steam are similar . . . not 2 or 3 different metals that promote corrosion to cause leaks and breakdowns. GRID Cast Iron Steam Heat Transfer Surface also largely eliminates external corrosion because its cast iron construction resists acids or fumes in the air. When corrosion in heat transfer equipment ends, high maintenance ends . . . it's as simple as that, no mystery, no magic, no "sales" talk. Your heating problems are no longer problems . . . you do away with high maintenance costs, repair work and the nuisance of leaky heating equipment.

GRID Cast Iron construction is designed to withstand steam pressures up to 250 p.s.i. . . . 450 deg temperature eliminating the use of reducing valves where high steam pressures are used. GRID Cast Iron Steam Heat Transfer Surface largely does away with replacement costs because GRID is built to last for years . . . operating successfully without maintenance in many plants since 1929. Sounds worth looking into? Then get the complete story today . . . come the heating season, you will be glad you did.

29 YEARS MAINTENANCE-FREE SERVICE ON ALL TYPES OF GRID EQUIPMENT

Grid Blast Heaters in Fan Assembly

A rugged, strong, and economical heat transfer surface, GRID *Blast Heaters are designed for the tough job* . . . for low and high steam pressures . . . require less labor for installation, less cubical space, and being designed and made the same as GRID Unit Heaters are resistant to corrosive atmospheres . . . definitely proved for years of service and maintenance-free.

Grid Cast Iron Radiator

Can be furnished with protective grill

Designed for the tough applications in conjunction with high steam pressure systems, GRID Radiators eliminate the use of pressure reducing valves and because they are built with the same heating sections as GRID Unit Heaters, they will withstand steam pressures up to 250 psi . . . and wide fin spacing prevents collection of dust and dirt . . . particularly adaptable for factory, shop offices, store rooms, laboratories, etc. . . . any place where smaller heating capacities than required of a unit heater are needed.

98 TRANE SALES OFFICES IN UNITED STATES

REFRIGERATION

1. HERMETIC CENTRAVACS

Hermetic centrifugal refrigeration unit—a complete water-chilling system. CenTraVac features automatic capacity control. No seals or gears. Capacities range from 45-1600 tons; 32 sizes. Unit performs efficiently at operating levels down to 10 percent of rated capacity.

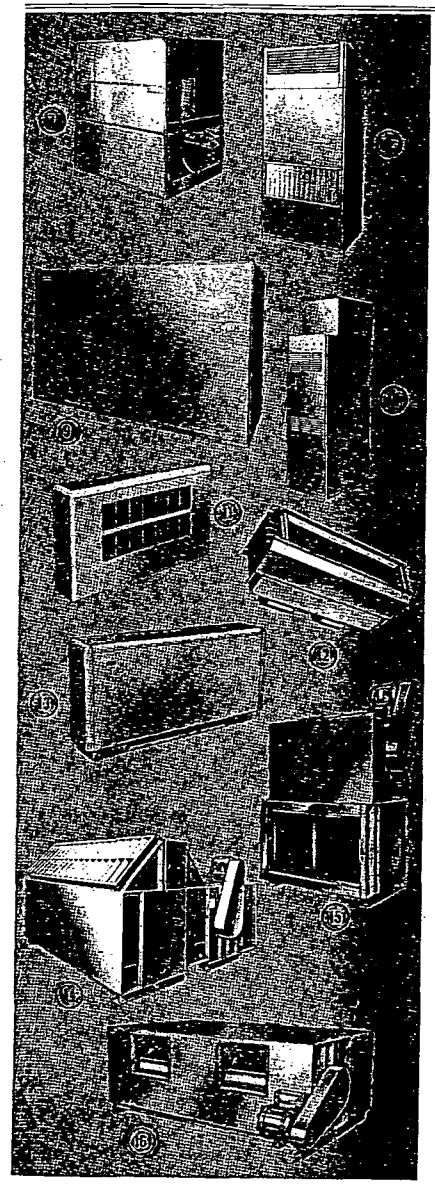
2. TURBINE CENTRAVACS

Centrifugal water chillers combining CenTraVac compressor design and steam turbine drive. Integral assembly of compressor and turbine eliminates critical field alignment problems. Sizes from 300 to 1600 tons.

3. RECIPROCATING COMPRESSORS

Two cylinder sizes in 4, 6, and 8 cylinder units. Single or duplex direct drive arrangements with capacities from 10 to 150 tons.

4. COLD GENERATORS



Complete factory-assembled packaged liquid chillers, designed to meet all normal requirements of chilled water systems. Only simple water and electrical connections are necessary for installation. No special foundations are required. Available with capacities ranging from 10 to 150 tons; using Refrigerant 12 and Refrigerant 22. Automatic chilled water temperature controls are also available.

5. CONDENSING UNITS

Trane Reciprocating Compressor complete with water cooled condensers. Capacities 10 to 150 tons; Refrigerant 12 and Refrigerant 22.

6. EVAPORATIVE CONDENSERS

For installations in localities where the use of water for condensing the refrigerant in the air conditioning system is restricted, or where disposal of large quantities of water is a problem. These units condense Refrigerant 12 and Refrigerant 22 by the evaporative process using a constantly recirculated supply of water. The only water lost is that which is evaporated to cool the water being circulated. Sizes from 3 to 100 tons.

The Trane Company

7-8-9. SELF-CONTAINED CLIMATE CHANGERS

Packaged air conditioning units for offices, shops, commercial or industrial air conditioning. Available in 8 sizes—20 models ranging from 3 to 30-ton. The 3, 5, 8, 10, and 15 sizes have deluxe cabinet design to be installed in the conditioned space and blend with any surrounding. The commercial units available in 10, 15, 20, 25, and 30-ton sizes are usually installed in a remote location, outside the conditioned area. Deluxe units available with water- or remote air-cooled condenser. 10, 15, and 20-ton commercial units available with integral evaporative condenser; 20, 25, and 30-ton sizes with either water-cooled or air-cooled condenser.

10. RESIDENTIAL CLIMATE CHANGERS

Heat, cool—or both—with this year-round unit. Cooling unit (top section) may be added later. 2, 3, and 5-ton sizes. Heating unit (lower section) comes in complete range of sizes from 77,000 to 154,000 Btu. Gas-fired. *A.G.A.* approved.

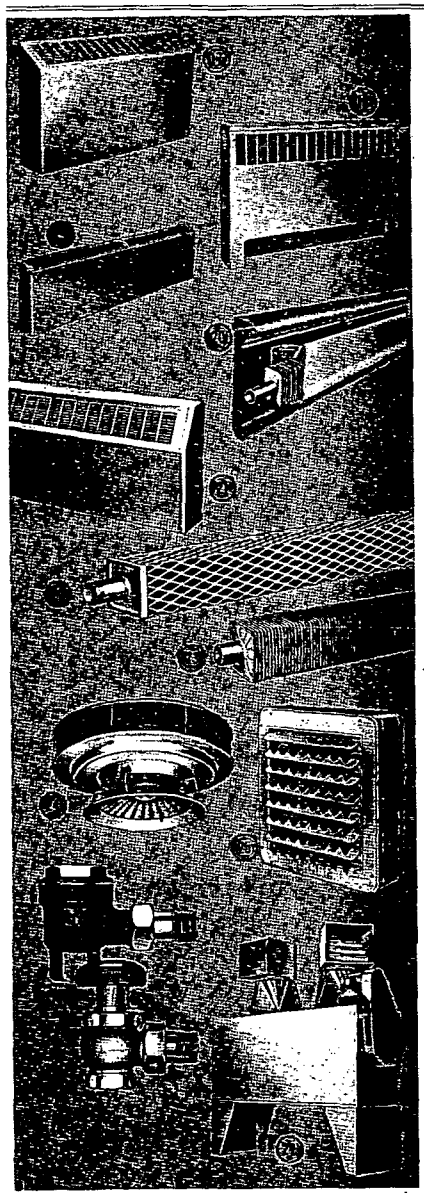
Residential Climate Changer Bonnet Cooling Unit fits atop Trane heating unit—or other modern makes. Compact 2, 3, or 5-ton capacity cooling coil.

Residential Climate Changer Fan-Coil Unit for cooling with independent heating system. Unit, with own quiet centrifugal fan, distributes cooled, dehumidified air. Built-in filter cleans air of dust and dirt. Fits anywhere. 2, 3, and 5-ton sizes.

Residential Climate Changer Duct-Cooling Unit for special applications. Same engineering, same capacity as bonnet type unit.

11-12-13. UNITRANE

UniTrane room air conditioners heat, ventilate, filter and circulate air in the winter. In summer, they cool, ventilate, filter, control moisture content and circulate air. Available in both fan-coil and induction types. Wide range of sizes and models—free standing, recessed, semi-recessed, ceiling-suspended—for exposed or concealed installation. Capacities for 100 to 600 cfm delivery. Automatic Air Flow Regulator provides permanent balancing for Trane high pressure induction air conditioning systems. Acts automatically to assure proper air delivery and performance. Factory-installed for either left-hand or right-hand air supply. System is balanced in a single initial operation; requires no periodic rebalancing thereafter.



14-15-16. CLIMATE CHANGERS

Any or all phases of air conditioning available in one unit. Two models, horizontal and vertical, each in 12 different sizes. Capacities range from 600 cfm to 39,000 cfm for any application, comfort or process. Multi-Zone Climate Changers provide a number of zones with different air conditions at the same time. Temperature in each zone is automatically controlled by separate set of dampers, making it possible to heat in one zone, while cooling in another. Humidifiers and filters, optional.

EDUCATIONAL MATERIAL

"Trane Air Conditioning Manual" ($6.50), an unbiased 380-page textbook for the engineering profession. New revised edition now available. Many tables and charts included for making computations. In general, text covers heat gains, psychrometry, calculations for the conditioned air supply, refrigeration for air conditioning, water for air conditioning, and ducts and fans.

"Trane Refrigeration Manual," a reference for servicing and installing all types of refrigeration systems. Also available from The Trane Company, La Crosse, Wis. Price $2.00.

THE TRANE COMPANY

HEATING AND VENTILATING

17-18. CONVECTORS

For all steam and hot water systems. Type C—immediately available in many standard sizes. Other units for specific application problems.

19. WALL LINE CONVECTORS

High capacity radiation designed to run continuously below window expanses. Cabinet depths 4 in. and 6 in., heights—14 in., 20 in., and 26 in. Top and front outlet. Chain-type or dial-type knob dampers, optional.

20. BASEBOARD CONVECTORS

Non-ferrous fin-and-tube heating element. Attractive steel cabinets, 8¼ in. or 12 in. height. Damper or valve controls, optional.

21-22-23. WALL-FIN

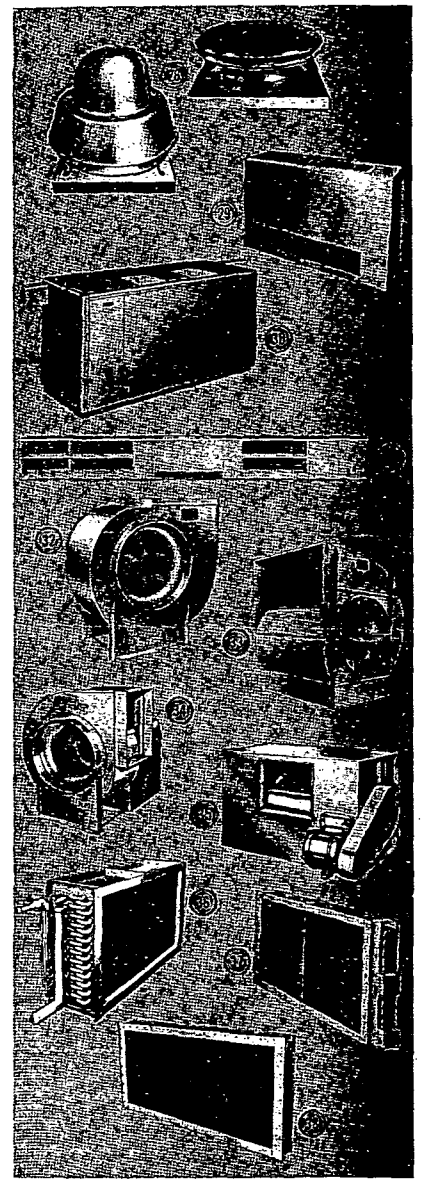
Ferrous and non-ferrous finned radiation. Lengths 2 ft to 12 ft in 6 in. increments. Cabinets and expanded metal grilles available. Grille louvers two inches in length for greater strength. Ball bearing cradled elements minimize expansion-contraction noise. Spiral damper control for positive temperature control. Enclosures phosphatized and primed after spot welding to prevent rusting.

24. PROJECTION UNIT HEATERS

Model "P" taps the reservoir of ceiling heat, solves a multitude of heating problems. Available in 24 sizes, steam or hot water. Capacities from 40,000 to 560,000 Btu. Louver Cone diffuser, optional.

25. HORIZONTAL UNIT HEATERS

Combines Trane broad blade propeller fan and extended surface coil. In 24 sizes, 22,000 to 352,000 Btu. Louver Fin diffuser, optional.



Gas-fired Unit Heaters available in six suspended type models, all *A.G.A.* approved for use with any type of gas—*natural*, manufactured, mixed or liquefied petroleum. One-piece Horizontal-Tube Heat Exchanger combines combustion chamber, heating surface, draft diverter and flue outlet in a single compact unit. Patented Louver Fin Diffuser, optional. All units carry *Underwriters' Laboratories* Seal of Approval.

26. STEAM SPECIALTIES

Complete line including thermostatic traps, valves, float traps, bucket traps, strainers, vents and temperature control valves.

27. TORRIVENT

Large capacity heating and ventilating units combining Trane Centrifugal Fans and extended surface coils for heating and ventilating large spaces and for process applications. Available in 1, 2, or 3-fan units. Choice of 3 coils. Designed for air deliveries ranging from 1150 to 36,000 cfm and for heating capacities from 50,000 to 1,900,000 Btu. Four models available in nine sizes.

THE TRANE COMPANY

28. ROOF VENTILATORS

Complete line of axial and centrifugal roof ventilators for wide variety of applications. Units for exhausting air, for supplying air—units that supply heated air for comfort conditions or process work in the winter season.

29. FORCE-FLO HEATERS

Deluxe cabinet-type unit heater with centrifugal fan. Capacities: 17,700 to 142,000 Btu.

30. UNIT VENTILATORS

Kinetic Barrier System with lateral extensions the length of the outside wall provides constant protection against window downdrafts. Conventional discharge type units with all air being delivered from the unit itself, also available. Automatic or manual temperature control. Quiet, belt-driven operation. Matched *components* and accessories.

31. SHELVING

Available for Kinetic Barrier and conventional unit ventilation in open or closed type. Three sizes with fill-in sections to make wall to wall installations.

32-33-34-35. FANS

Centrifugal fans in non-overloading backwardly inclined or slow speed forward curved types. All standard arrangements in sizes from 12 in. to 89 in. Capacities 668 to 330,048 cfm.

Utility fans, both belt-driven and direct connected, *in non-overloading* backwardly inclined or slow speed forward curved types. All standard arrangements in sizes 4½ in. to 30 in. *Capacities* 110 to 15,450 cfm. Cabinet fans in size 1-7 through 2-27. Capacities 587 to 39,499 cfm.

Propeller fans with direct or belt drive. Sizes 10 in. through 72 in. Capacities 475 to 58,560 cfm.

36-37-38. EXTENDED SURFACE COILS

Heating coils include a complete range of same and opposite end connection steam distributing tube coils, standard coils, heavy duty, high pressure steam coils, and equipment coils.

Cooling coils are manufactured for direct expansion or water cooling in thousands of sizes and types.

All extended surface coils have exclusive Delta-Flo Fin for greater heat transfer efficiency.

L. J. WING MFG. CO.

Office and Factory
LINDEN, N. J.

Canadian Factory:

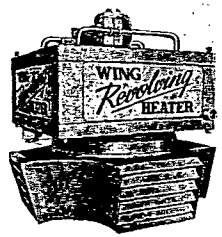
WING REVOLVING UNIT HEATERS

ONLY WING OFFERS THESE ADVANTAGES

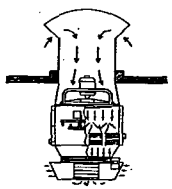
Distribution outlets slowly revolve—assuring



1—Complete distribution of heat over wide areas—around obstacles

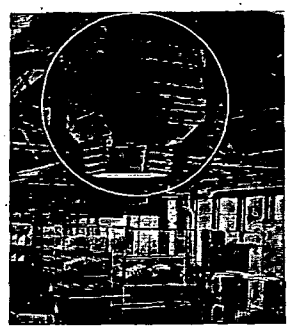
2—No uncomfortable steady blasts of heated air

3—Increased worker productivity



Multiple outlets direct heat in multi-diameter circles. Area entirely covered. Fewer heaters needed. Minimum installation, maintenance and fuel costs. For steam, hot water, electricity, gas. Summer operation gives refreshing breezes—closest approach to air conditioning.

Write for *Bulletin HR-6A*.



Four types of discharges permit mounting heights from 8 to 60 feet.

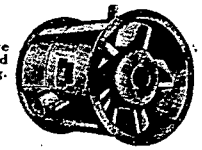
WING FRESH AIR SUPPLY HEATERS

Wing Fresh Air Supply Heaters (right and left) provide "make-up" for exhausted air and for health, comfort and efficiency of workers and for improving processes.

Illustrations show 4 way discharge for low ceilings. Other outlets for high and medium ceilings are available.

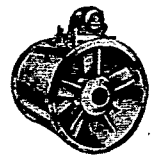
Coils cannot freeze . . . steam always at full pressure.
Temperatures automatically controlled.
For roof or window mounting . . . horizontal or vertical discharge.
Write for *Bulletin FAS-1*.

OTHER WING HEATERS

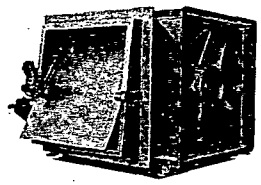


Left . . . Wing Door Heater. Blasts curtain of hot air over open doorways. Keeps cold drafts out.
Right . . . Wing Utility (Horizontal Discharge) Unit Heater. Steam, hot water, gas, electric.

Right . . . Wing Revolving Gas Fired Unit Heater—Self contained for overhead mounting and downward discharge. Output capacities to 368,000 Btu per hr.

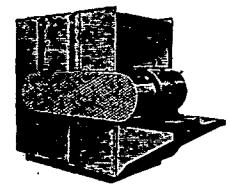


WINGFOIL VANEAXIAL FANS

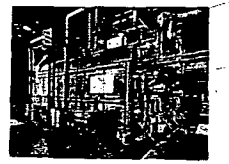


Wingfoil Direct Drive Vaneaxial Fan has sealed motor within the casing. Sizes 10 in. to 42 in.

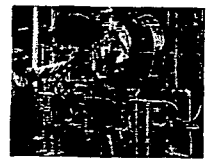
Wingfoil Elbow Fan replaces elbow in run of duct. Motor, outside the casing, remains cool and clean. All deliver large volumes of air for size of fan without vibration. Capacities to 95,000 cfm. Write for Bulletins.
Wingjet Power Roof Ventilators discharge hot or contaminated air high above building. Two types available: motor inside or outside airstream. *Bulletin PV-1*.



Wingfoil Straightline Vaneaxial Fan forms part of straight line of duct. Sizes 10 in. to 60 in.



WING BOILER DRAFT EQUIPMENT
WING DRAFT INDUCERS



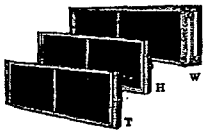
Wing Packaged Draft Inducers for Heating or Power Boilers furnish uniform, adequate draft regardless of wind or weather. Tall chimneys become obsolete. Factory assembled, easy to install in minimum space. Capacities available for all sizes of heating boilers. In power boilers up to 120,000 lb of steam per hour. Send for *Bulletin I-58*.

WING FORCED DRAFT BLOWERS

Wing Motor Driven Blowers. For volumes to 50,000 cfm. Statics to 24 in. Manual or automatic regulation through Voltrol Vanes down to 10 per cent of maximum. Static efficiencies to 80 per cent. Mountings horizontal or vertical. Send for *Bulletin FD-4*.

Wing Turbine Driven Blowers. Easily installed on burner fronts or boiler settings. Capacities to 50,000 cfm and statics to 15 in. Exhaust is oil free. *Bulletin FD-4*.

Wing Dual Drive Blowers provide both turbine and motor drive, either available at will of operator. Send for engineering data.



Wing Steam Turbines for driving pumps, fans, compressors, etc. are sturdy, dependable sources of auxiliary power. Capacities to 150 bhp. Pressures to 600 psi. Temp. to 750F. Speeds to 4000 rpm. *Bulletin T-54*.

JOHN J. NESBITT, INC.

State Road and Rhawn Street, Philadelphia 36, Pa.

SALES: HEATING AND COOLING SURFACE sold by representatives of *John J. Nesbitt, Inc.*;
SYNCRETIZERS, AUDICON, ROOMMATE, WIND-O-LINE & THERMOVENTS sold by Nesbitt and American Blower Corporation;
BASEBOARD RADIATION & GAS FIRED UNIT HEATERS sold through Wholesalers;
SILL-LINE RADIATION & UNIT HEATERS sold by *John J. Nesbitt, Inc.*

Products: Heating, Ventilating and Air Conditioning Equipment — Heat Transfer Surface (steam and water), Heating and Ventilating Units, Baseboard Radiation, Sill-line Radiation, and Unit Heaters (steam, water and gas-fired).

NESBITT HEATING AND COOLING SURFACE

Series T. Trombone shaped tubes distribute even smallest amount of steam uniformly under modulating valve control. Maximum freeze-up protection. Ideal for pre-heating outdoor air. Available with steam and condensate connections at same or opposite ends. Copper tubes. Aluminum or copper fins. *Lengths 12" to 120". Publication 305-1.*

Series H. Efficient blast-coil surface for general heating, ventilating and air conditioning, or drying in high and low pressure systems. Seven types; full range of sizes, capacities. *Publication 301-1.*

Series W. For cooling, dehumidifying or heating. Type WD has exclusive Nesbitt drain feature. Surface pitched in casting. Freeze proof. Type WB for booster heating or air cooling where drain is unnecessary. *Pub. 246.* Type WC features cleanable tube sections. *Pub. 255.*

Nesbitt Syncretizer with storage cabinet components

THE NESBITT SYNCRETIZER

The heating and ventilating unit for classrooms that provides quick, economic heat without overheating; draft-free ventilation and natural cooling when needed. A fully automatic, quiet operating unit adaptable to four cycles of control. Models to deliver from 750 to 1560 c.f.m. anemometer rating. *Publication 10-1.*

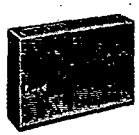
Wind-O-Line (circled) in rear channel of Nesbitt storage cabinets

NESBITT WIND-O-LINE RADIATION SYSTEMS

Finned radiation, operating in conjunction with the Syncretizer, solves special problems of cold windows and walls. May be concealed by wall hung enclosures or storage cabinets. Provides positive protection against downdraft. 450, 550 and 700 Btu ft. capacities. *SERIES WIND-O-LINE SYSTEM* combines the Syncretizer with Wind-O-Line Radiation on a hot water system to reduce mechanical costs and, at the same time, increase the efficiency and quality of the system. *Publication 10-1.*

NESBITT SERIES T THERMOVENTS

For heating and ventilating large auditoriums, gymnasiums, cafeterias, assembly halls and similar gathering places, Nesbitt Series T Thermovents are available in capacities up to 15,000 c.f.m. standard. For high- or low-pressure applications, steam or hot water. Acoustically "silenced" for *quiet* operation. *Pub. 20-1.*



THE NESBITT YEAR-ROUND SYNCRETIZER

Quietly promotes classroom learning by providing balanced heating, ventilation and natural cooling during cold weather... ventilation and mechanical cooling during hot, humid weather. Fully automatic. One-piece motor and fan assembly. Models from 500 to 1500 c.f.m. *Publication 11-1.*

THE NESBITT AUDICON

Sound engineered for large occupancy spaces such as auditoriums, libraries, cafeterias. Provides heating, ventilating and natural cooling in winter; ventilating and mechanical cooling in summer. The latter may be installed initially, or added at a later time. Available in high or low pressure models from 1,250 or 15,000 c.f.m. Cooling from 3 to 60 tons. Heating capacities from 40,000 to 1,500,000 Btu. *Publication 22-1.*

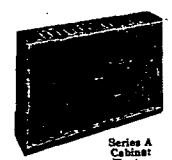
THE NESBITT ROOMMATE

A year-round cabinet conditioner for both winter heating and summer cooling. 7 Standard models. Complete range of air volumes from 200 to 1400 c.f.m.; cooling capacities 1 to 5 tons; heating capacities 25 to 100 MBH. Large variety of recessed, semi-recessed, universal and built-in arrangements possible due to versatility of intake and discharge locations. Outdoor air dampers optional. Install for heating only, if desired... add mechanical cooling in future. *Publication 600-1.*

NESBITT SILL-LINE RADIATION

High capacity finned radiation for perimeter heating in commercial and institutional buildings. Attractive 16-gauge enclosure, rigid one-piece back. Five casing styles, 8 lengths in baked enamel finish. Code ratings, 2.9 to 12.1 sq. ft. EDR. *Publication 30-1.*

NESBITT UNIT HEATERS



Propeller-Fan Unit Heater

Propeller-Fan Unit Heaters feature universal coils of continuous-tube design — perform equally well with either steam or hot water. Made for high water capacities and temperature drops. Male coil connections through casing rear provide maximum headroom. Sound rated in accordance with A.M.C.A. test code. Modern heavy gauge steel casing; green hammered-tone finish. Eight basic sizes, 24 models, 15,000 to 335,000 Btu/hr. *Publication 401.*

Little "Giant"

Little Giant Unit Heaters. Versatile, draw-through propeller fan units in 34 models from 34,000 to 684,000 Btu/hr; universal heating elements for steam or hot water; side piping for close-to-ceiling mounting; wide variety of outlets; code rated for sound and capacity. *Publication 402.*

Series A Cabinet Heater

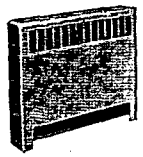
Series A Cabinet Heaters for steam or hot water. Smartly styled, compact, quiet, trouble free. Ideal for offices, lobbies, corridors. 7 Standard models, 71 to 545 sq. ft. EDR; 265 to 1880 c.f.m. Four Blow-Through types have direct drive fan assembly. Three Draw-Through types available with belt drive fan assembly. Available for recessed, semi-recessed or non-recessed mounting. Full selection of intake and outlet locations. *Publication 403.*

"Giant" Unit Heater

"Giant" Blower-Fan Unit Heaters. Economical heat for large areas. Floor-mounted, wall-mounted, ceiling suspended types in wide capacity range. Giants of efficiency and endurance. Twelve sizes, choice of 10 heating elements, steam or hot water; 1, 2, or 3 fans; for heating and/or ventilating; from 2000 to 28000 c.f.m., 83,000 to 1,735,000 Btu. *Pub. 404.*

Gas Fired Unit Heater

Gas Fired Unit Heaters. New, light, compact Series K models provide clean, economical, automatically controlled heat for commercial and industrial applications. Ten sizes from 25,000 to 250,000 Btu per hour input; approved for all types of gases. Sound rated. *Publication 400.*



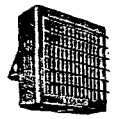
All ratings of Nesbitt Unit Heaters are based on tests made in accordance with the standard test code of the Air Moving and Conditioning Association and the American Society of Heating and Air Conditioning Engineers.

Young Radiator Company

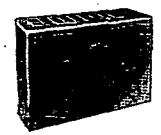
DEPT. 549, RACINE, WIS.

HEATING, COOLING, AIR CONDITIONING PRODUCTS FOR HOME AND INDUSTRY, HEAT TRANSFER PRODUCTS FOR AUTOMOTIVE, AVIATION, AGRICULTURAL, INDUSTRIAL, GAS AND DIESEL ENGINE APPLICATIONS

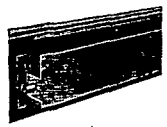
General offices: Dept. 549, Racine, Wisconsin, U.S.A.
Factories at Racine, Wisconsin and Mattoon, Illinois
Sales and Engineering Representatives in All Principal Cities



CONVECTORS & UNIT HEATERS



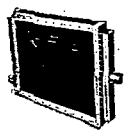
Convectors for steam or hot water systems are available in a wide range of sizes and six standard cabinet styles to fit all applications. Also available in institutional, low-level and bathroom models.



Vertiflow® Unit Heaters for use in steam or hot water systems are available in 22 models with sizes and capacities that range from 52,500 to 1,062,000 Btuh. Excellent for heating industrial buildings, garages, warehouses, and large high-ceiling airplane hangars. Outstanding Young feature is the through-stack motor ventilation which provides motor cooling. Units are fitted with Spreadaire diffusers, Anemostats, or Aerojet nozzles to meet specific air distribution requirements.

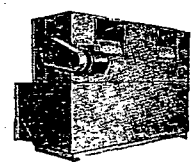
Type H Horizontal Unit Heaters are built in 15 models; with capacities from 19,000 to 325,000 Btuh; for steam or hot water systems.

Cabinet Type Unit Heaters are available in 3 sizes, with capacities from 29,900 to 117,300 Btuh, and in floor mounted, wall-hung, inverted wall-hung, and horizontally suspended models.

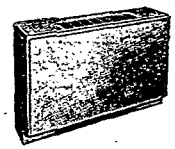


Perimaheat® Baseboard Convector for hot water service; available in 6 and 8 ft lengths; capacity with 190 deg average water 787 Btu per linear foot. Accessories include end caps, inside and outside corners, and optional splitters or dampers.

Gas-Fired Unit Heaters are available in eight sizes ranging in capacities from 50,000 to 230,000 Btuh input. Have welded corrosion-resistant aluminized steel combustion chamber and heat exchanger; other important design features.



HEATING AND COOLING COILS



Young manufactures a complete line of heating and cooling coils for central heating or cooling systems. All steam coils are pitched in casing to allow proper condensate drainage.

AIR CONDITIONING UNITS

Young Type "CS" Central Station Air Conditioning Units are available in 10 sizes with capacities from 500 to 28,000 cfm, and in three models—Type H (Horizontal), Type V (Vertical), and Type MZ (Multizone). They can be assembled in any combination, from a simple ventilation installation to a complete air-conditioning system, including heating and humidifying, cooling and dehumidifying, and filtering. Their simplified sectional design makes it possible to select a unit to exactly fit the requirements of the job.

Young "Roomaire"® Conditioner is a remote-type room air-conditioning unit that provides year-round air-conditioning of individual rooms in multi-room installations. For use with hot water and chilled water systems. Individual controls. Four sizes—handling from 200 to 600 cfm with nominal cooling capacities of ½ to 1½ tons. Four models—F and CF for free standing or concealed floor installation; H for horizontal installation; CH for concealed horizontal installation.

ELECTROMODE
Division Of
COMMERCIAL CONTROLS CORPORATION

Complete line of ELECTRIC HEATING SYSTEMS for HOME - INDUSTRY - FARM

ROCHESTER 3, NEW YORK

When you need advice in any field, you consult a specialist. Deciding on a heating system is an important matter—one that you do not undertake very often. Therefore, it is only natural and in the course of wisdom, that you will look to a specialist in this field. For more than 25 years Electromode has devoted its research engineering and manufacturing facilities predominantly to the design and production of electric space heating equipment, and is one of the oldest in the business. The Safety Grid Heating Element is an Electromode feature. All electric wires are insulated, embedded and completely sealed inside a finned aluminum casting. No exposed hot wires, no glowing coils and no danger of fire, shock, or burn. This finned aluminum casting spreads the heat rapidly, resulting in higher efficiency and greater economy. The built-in safety switch automatically prevents overheating. The Safety Grid Heating Element is guaranteed for 5 years against any defect in material or workmanship.

For HOME and OFFICE

Fig. 1

Fig. 2

WALL-TYPE HEATERS

Electromode Wall-type Heaters are made in models and capacities suitable for all size rooms, ranging from 1320 to 4000 watts, with built-in thermostat or manual control. Heat is fan-circulated at floor level. All have automatic thermal safety switch. The big room heaters have silver grey finish and can be painted to match decor. The small room or bathroom heaters are available in gleaming chrome or white enamel and are used as complete or auxiliary source of heat. See figs. 1 and 2.

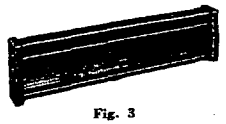


Fig. 3

BASEBOARD HEATERS

Designed so that a completely harmonious installation can be made which conforms to design and dimensions of any room. Matching blank sections, end pieces and corners for carrying out unbroken baseboard effect. The comfort of radiant warmth along outer walls, under windows and across the floor, thermostatically controlled at the comfort level you select for each room. There's no interference from Electromode Baseboard Heaters. They're so out of the way along the walls just like regular baseboard. 600, 900, 1200 watts; 120 or 240 volts. See fig. 3.

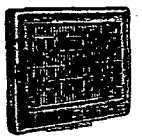

Fig. 4

Fig. 5

RADIANT HEATING PANEL

Combines radiant and convection heating. Modern design with silver grey finish. With or without built-in thermostat. Capacity 1100 watts. See fig. 4.

RADIANT CABLE HEAT

Coils of cable hidden in ceiling radiate clean heat downward. Each room temperature controlled by separate thermostat. Cables are a measured length of special insulated electric wires; waterproof; non-corrosive. Used in plaster, drywall ceilings, or concrete floors. Magic Seal coating prevents streaks on ceiling. See fig. 5.

For INDUSTRY

Fig. 6

Fig. 7

UNIT HEATERS

Unit Heaters available in Suspension-type and Combination Portable and Suspension models. Capacities from 1500 to 45,000 watts. Fine for auxiliary warmth in hard-to-heat areas and for complete heating in outlying buildings. Adjustable louvers for directing fan-circulated heat into working zone. Thermostat control available on all models. See fig. 6 for Suspension and fig. 7 for Portable and Suspension. The Electromode Commercial and Industrial heater is specifically designed for quick, comfortable, warmth in factory departments, offices, supermarkets and other areas where its quiet operation is an asset. It is easily portable, or it may be mounted on swivel-type brackets. 5KW—240 volts—single or 3 phase—17,075 Btu. See fig. 8.

Fig. 8

Fig. 9

EXPLOSION-PROOF HEATERS

Explosion-Proof heaters are specially engineered for installation in hazardous areas where heat is required and danger of explosion exists. They conform to rigid safety specifications and are fully tested and approved by *Underwriters' Laboratories* for use in areas covered in Class 1. Group D hazardous locations. Used in places where atmospheres contain gasoline, petroleum, naphtha, solvent vapors, natural gas and where flammable gases etc. are made or stored. Convection type. Three models range from 2000 to 6000 watts. See fig. 9.

BLAST COILS

Consists of a bank of Electromode cast-aluminum heating elements mounted in a 16 gauge formed steel frame having a 1½ in. wide flange with 5/16 in holes on approximately 6 in. centers for mounting to air ducts. Complete wiring diagrams for special applications furnished on request. See fig. 10.

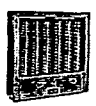

Fig. 10

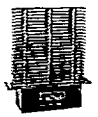

Fig. 11

Electromode Insert Duct Heater (fig. 11)

Safety and endurance is inherent in its construction. It was designed as a package unit ready for easy installation. The Safety-Grid heating element is your assurance of complete protection against fire, shock or burn. Safety switch automatically breaks the service to the heater in the event of stoppage of air flow through the heater from any cause. It is an automatic reset type.

Engineering help gladly given. For more information, see your supplier or write Dept. HVG-19, Electromode Division of Commercial Controls Corporation.

Electric Blast Coil Heaters

for Installation in Ducts
and in Package Air Conditioners
Total and Supplementary Heat

Package Units
sized to specifications

SAVE YOU Design & layout work
Field time

Commercial, industrial, institutional, residential and governmental installations are heated by these patented units. They offer the following advantages:

1. **COMPLETE UNIT,** ready for installation, eliminating design and layout work
2. **SIZED TO FIT**
3. **THERMAL CUT-OUTS,** furnished with each unit
4. **WIDE SIZE RANGE**

INDEECO UNITS FOR PACKAGE AIR CONDITIONERS. Write for *Bulletin E97P* showing 704 sizes to fit 20 manufacturers' package units.

INDEECO UNITS FOR DUCT-INSTALLATION. Write for *Bulletin E97U* showing 422 sizes.

SPECIAL UNITS in both categories furnished at no extra cost. INDEECO Blast Coil Heaters are made to suit your specifications. You are not compelled to change your plans to meet our specifications.

A FEW EXAMPLES OF USES

1. Primary source of heat
2. Booster, supplementary or standby auxiliary heating
3. ZONE temperature control
4. Industrial applications
   (Example: for major oil refinery, seven pumping stations without attendants are heated by INDEECO blast coil heater installations)

Literature describes wide range of applications in detail. More than 10,000 specifications on file.

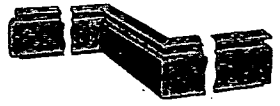
PRODUCTS: Over 15,000 types, sizes and ratings of Chromalox electric heaters for Industry and Home. All heating elements are metal or alloy sheathed in metal for strength and corrosion resistance, fully insulated for safety.

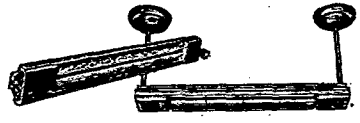


CHROMALOX ELECTRIC UNIT VENTILATOR

The Chromalox Electric Unit Ventilator has been specifically designed to meet the *requirements* for proper heating, ventilating and natural cooling of classrooms and similar rooms . . . wherever it is normal for many people to gather in a limited space. Fast response to a room's changing requirements . . . from heating and ventilating to natural cooling, give the versatility required for these applications.
Normally installed below a window sill, a louvered opening through the wall permits the introduction of fresh *outdoor* air into the Chromalox Unit for proper ventilation and natural cooling. The unit can be supplied with automatic room temperature controls.
To eliminate discomfort from window downdraft, Chromalox Electric Baseboard Heaters are recommended on both sides of the Chromalox Unit Ventilator extending the full window width.
Units are available in 500, 750, 1000 and 1250 cfm Standard Air Ratings and up to 18.0 kw (61,500 Btu/hr) capacities. *Bulletin D-52.*

CHROMALOX ELECTRIC CABINET CONVECTOR HEATERS

Chromalox Electric Cabinet Convector Heaters are completely enclosed, 18-gage metal casings, designed to give easy bottom access of air which is then heated by a bank of metal-sheathed strip heaters and convected outward and upward. Available in 6 in. deep free-standing models or semi-recessed models projecting 2¼ in. from wall surface. Heating capacities: 1, 2, 3 and 4 kw. *Bulletin 975.*

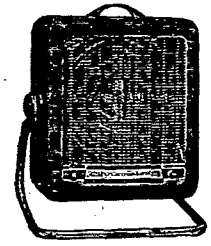


CHROMALOX ELECTRIC BASEBOARD RADIATORS

Clean, balanced radiant and convected heat supplied by rugged baseboard measuring only 8-⅞ in. high and 2-⅜ in. deep. Lengths in standards of 1 ft with 100 watts, 2 ft with 300 watts, 5 ft with 800 watts, 8 ft with 1250 watts. Extremely easy to install. Heating element is all metal fully enclosed, flat strip type which is break-proof, moisture-proof and shock-proof. Designed for maintenance-free heating in homes, offices and public buildings. *Bulletin 975.*

CHROMALOX AIR DUCT HEATERS

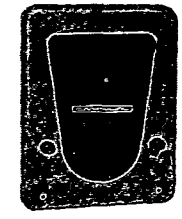
For use in square or rectangular forced air ducts. Construction allows free-flow of forced air circulation. Finned elements present maximum contact for fast heating and minimum air friction. For room heating and process work. Ratings from 6 kw to 100 kw. *Catalog 60.*



CHROMALOX ELECTRIC FAR-INFRARED COMFORT HEATERS

"Spot heating" for personal comfort without heating entire rooms or buildings. May be ceiling-, wall-, or floor-mounted as best suited for various conditions. Heater housing is aluminum extrusion. Stainless steel grill protects against accidental contact. Lengths from 24⅜ in. to 85¾ in. Individual temperature control by Chromalox thermostat, or several heaters may be controlled on automatic cycles with Chromalox input controller. *Bulletin F-1614.*

Edwin L. Wiegand Company

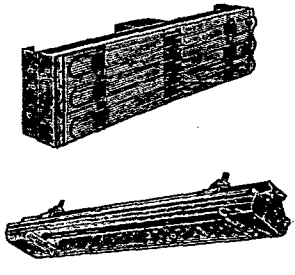


7672 Thomas Boulevard Pittsburgh 8, Pa.

Representatives in all Principal Cities

CHROMALOX ELECTRIC PORTABLE COMFORT HEATERS

Model shown is one of several available. Outputs range to 13,648 Btu's. Available with manual "on-off" switch or automatic thermostat. Swivel stand adapts for wall or ceiling mounting. *Bulletin 975.*

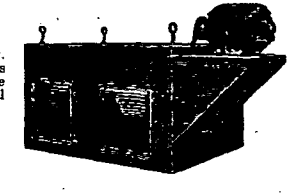


CHROMALOX ELECTRIC FORCED-AIR WALL HEATERS

Smooth molded contours of heavy-gage steel form the front grille. Recessed section contains a quiet, fully-enclosed motor and dustproof fan. Metal sheathed Fintube element and fan are controlled by manual on-off switch. Variable temperature control knob for setting built-in thermostat. 1500 to 4000 watts for 240 a-c supply for game rooms, living rooms, motels, reception rooms, etc. *Bulletin 975.*

CHROMALOX ELECTRIC CIRCULATION HEATERS

Circulation Heaters heat fluids in convection or forced heating systems; for washrooms, laundries, dishwashers, central heating systems, superheating and drying steam, preheating fuel oils and heat transfer fluids, gases. Temperature to 750F. *Catalog 60.*



CHROMALOX FAR-INFRARED UNITS

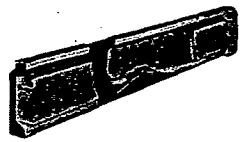
Far-Infrared Radiant Heat for heating, drying, baking, dehydrating, etc. Compact pre-engineered panels, heaters and lamps can be made into banks, tunnels, ovens. All-metal construction protects against breakage, splashing; high safety against shock hazards. *Catalog 60.*

CHROMALOX ELECTRIC HIGH VOLUME HEATERS

For heating of larger areas or as central heating system. Ratings from 15 to 40 kw. Twin centrifugal fans, driven by a 3-phase motor, draw air into unit and across Chromalox Finstrip Heaters. Air deflectors furnished for each outlet to discharge warmed air slightly downward. May be connected to ducts of conventional central system when required. Fans may also be used for summer cooling. *Catalog 60.*

4965

WESIX ELECTRIC HEATER COMPANY



390 First Street

San Francisco 5, California

CHICAGO DALLAS DENVER DETROIT HUNTSVILLE
LOS ANGELES NEW YORK PORTLAND SEATTLE

Complete Line of Electrical Air and Liquid Heating Equipment for Residential, Commercial & Industrial Applications

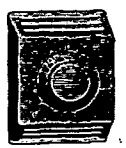
BASEBOARD PERIMETER PANELS with monofin element available in standard 32 in. and 48 in. lengths for simple, inexpensive installation without special tools or metal cutting. 250 watts (853 Btu) per linear foot. Control section (thermostat and switch), Air-conditioning Supply Section and Receptacle Section, each 6 in. long. Corner section, hood and end pieces available. Approved by *UL*.

AUTOMATIC ELECTRIC BRACKET TYPE HEATER for commercial, institutional or industrial applications, these units are available in a large range of sizes and types including explosion-proof models for use In Class I, Group C and D locations. Approved by *UL*.

AUTOMATIC ELECTRIC WALL FURNACE sizes range from one to eight kilowatts for use in domestic and commercial installations. Available in radiant-convection (model illustrated), convector or blower type (5000 watt maximum). Approved by *UL*.

DUCT HEATERS utilizing either Wesix "dust free" or conventional transverse fin elements, these units may be ordered from a wide variety of self contained, standard units, or built to order. Units available complete with sensitive integral overtemperature control.

LOAD REGULATORS control electric heating capacity automatically by switching voltage supply from 240 volts to 120 volts by means of outdoor thermostatic control. Controls heating loads up to 24 kw. Approved by *UL*.



INDUSTRIAL UNIT HEATERS—BLOWER TYPE for horizontal or vertical mounting either as suspended unit heaters or duct system use in standard sizes to 60 kw. Larger sizes or models for special applications on order. Approved by *UL*.

QUIET AUTOMATIC SWITCH, a motor operated contactor for resistance loads to 24 kw, 1ϕ or 40 kw 3ϕ, 240 volts and 33 kw 1ϕ or 55 kw 3ϕ, 480 volts. Actuated by SPDT switch or thermostat. Available with sequence action for control from single switch of two or more contactors. Approved by *UL*.

COMMERCIAL UNIT HEATERS—AXIAL FLOW sizes from 3 to 40 kw for ceiling or pedestal mount. Feature Wesix longitudinal fin, "dust free" inclosed heating elements. Approved by *UL*.

HEAVY DUTY WALL THERMOSTAT AND SWITCH for control of electric heating apparatus directly up to 25 amp, this unit includes a lockout switch double pole in the "off" position. Thermostatic action is bi-metallic, sensitive to plus or minus 1 degree F. Fits standard wall box mounted vertically. Case color: Ivory. Approved by *UL*.

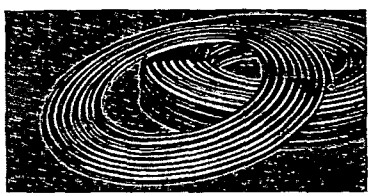
The American Brass Company

Waterbury 20, Conn.

ANACONDA
from mine to consumer

District Offices in Principal Cities

IN CANADA: ANACONDA AMERICAN BRASS LIMITED, NEW TORONTO, ONTARIO



PRODUCTS—Anaconda Phosphorized Copper Tubes and Fittings; Anaconda "85" Red Brass Pipe; Everdur Metal for storage heaters, storage tanks, ducts and air-conditioning equipment

Anaconda Types K and L Phosphorized Copper Tubes, assembled with solder-joint Fittings, offer an unusual combination of advantages for hot-water and low-pressure-steam heating systems, including radiant panels. These advantages may be summarized briefly as follows:

Low Friction Loss—Smooth, nonrusting inside surfaces of copper tubes do not become rough, and offer an unchanging low resistance to flow.

Ease of Installation—The flexibility of copper tubes simplifies connections which would be awkward and expensive with rigid pipe, and solder-joint fittings can be installed in restricted places where the use of a wrench would be impossible.

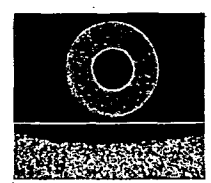
They meet the requirements for these types of tubes in Federal Specification WW-T-799a and *ASTM* Specification B88, when so specified. Type K, the heavier, is recommended for heating lines and general piping.

Anaconda Copper Tubes, in standard sizes, are furnished soft in 60- and 100-ft coils; also hard and soft in 20-ft straight lengths.

Anaconda Type M Copper Tube is furnished hard drawn in 20-ft straight lengths in nominal sizes from 1¼ in. to 12 in. for drainage lines in certain types of air-conditioning installations. This tube has a thinner wall than Types K and L and provides economies in weight and cost when used in the larger sizes. Type M tube is assembled with wrought-copper or cast-brass solder-joint fittings.

***PG's (Pre-Formed Panel Grids)** Anaconda Panel Grids are machine-formed radiant-heating coils of Type L copper tube, supplied in two standard panel sizes and two nominal diameters (⅜ in. for ceilings, ½ in. for floors). They can be contracted or expanded by hand to obtain a range of C-C spacings. *Publication C-6* describes economies of PG's, gives simplified design suggestions and short-cuts to calculating heat output.

* Trademark Reg. U. S. Pat. Off.



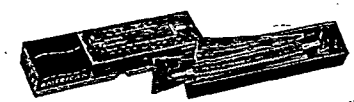
Heat for this basement game room will be provided by ½ in. PG's *imbedded* in the concrete. Troublesome hand bending and resulting sags and dips that increase friction loss are eliminated with pre-formed PG's.

CUSTOM-MADE CAPILLARY TUBES

Anaconda Custom-Made Capillary Tubes, for *restrictor* purposes, are made to specific mutually agreed-upon airflow limits. These limits alone are the basis for production.

Initial shipments contain Master Reference Sample Tubes with labels giving maximum and minimum flow capacities agreed upon. Duplicate Master Samples are kept in the mill files. Every subsequent shipment of tubes will be made to the limits of the Master Samples.

All Anaconda Restrictor Tubes are plug-drawn to finish to provide a smooth, round inside bore. Each length is chambered at both ends, thoroughly washed and dried, given a final air-flow test, and carefully paper-wrapped in a bundle.



(Top) A cross-section of an Anaconda Copper Restrictor tube, .081 in. OD x .031 in. ID, magnified 10×. Note the roundness of the bore. (Bottom) Section of a photomicrograph at 200× magnification to show smoothness of the bore.

The American Brass Company

REFRIGERATION TUBING

Anaconda Dehydrated Copper Refrigeration Tubes are manufactured in accordance with *ASTM* Specification B280 in all standard sizes up to and including ⅞ in. O.D., in 50-foot coils. The tubes are sealed immediately after annealing and dehydrating.

VIBRATION ELIMINATORS

American Vibration Eliminators—Compressor vibration and noise are muffled in a line equipped with an American Vibration Eliminator. The corrugated tin-bronze tubing is *seamless*. Copper ferrules and tube ends are *braze welded*. Each unit is pressure-tested under water, is spotlessly clean and dry, and is packed in a polyethylene envelope.

ANACONDA "85" RED BRASS PIPE

Anaconda "85" Red Brass Pipe, in standard pipe sizes, is considered the highest quality corrosion-resistant pipe commercially obtainable at a moderate price, and is the material preferred by many engineers for steam condensate return lines.

EVERDUR*

Everdur Metal is the original copper-silicon alloy group. These high-strength, highly corrosion-resistant engineering alloys are manufactured by The American Brass Company in five standard compositions and in practically all commercial forms.

In addition to their nonrusting properties and high strength, Everdur alloys possess many qualities not usually found in metals of this character. They are unusually resistant to general atmospheric conditions and other normally corrosive factors. Everdur alloys have excellent machining and working characteristics, and can be fabricated into a variety of forms and shapes. Everdur alloys are available for oxyacetylene, carbon-arc and inert-gas arc welding.

Everdur Tanks—Everdur copper-silicon alloy is an ideal material for durable, nonrusting water tanks of every description—from domestic range boilers to large storage heaters for hotels, laundries, hospitals, textile plants, schools or breweries.

Everdur is made in all commercial shapes, including annealed tank plates which have physical properties as given in *ASTM* Specification B96.

Minimum specification requirements for hot-rolled-and-annealed tank plates are: Tensile Strength, 50,000 psi.; Yield Strength (at 0.5 percent elongation under load) 18,000 psi.; Elongation, 40 percent in 2 inches.

Welds made with annealed Everdur tank plates meet the requirements for construction in the *ASME* Boiler and Pressure Vessel Code.

For additional data and names of fabricators, address our nearest District Sales Office.

EVERDUR FOR AIR-CONDITIONING EQUIPMENT

Because of its strength and welding properties, Everdur may often be substituted for steel and fabricated by substantially the same methods, with much the same equipment as steel.

Everdur metal has been used with marked success for fans, blowers, ducts, humidifiers, cast and wrought parts of other equipment items subject to corrosive influences.

EVERDUR LITERATURE

Descriptive literature containing much pertinent tabular data will be sent on request.

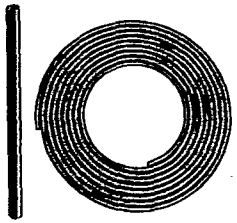
WOLVERINE ROLL-O-TUBE•

. . . copper water tube in a round carton that rolls

Wolverine Roll-O-Tube represents a new packaging concept for rolls of copper water and refrigeration tube. Roll-O-Tube for example, simplifies tube handling. It can be rolled, like a hoop, to job site or storage. A convenient center hole makes carrying easy. By holding the tube at one end and unreeling the required length, Roll-O-Tube functions as a reel. Also of importance to users is the fact that unused tube remains in the Roll-O-Tube carton protected against damage and dirt until needed again. Large easy-to-read print and color coding on the opening tape make identification fast and sure.



WOLVERINE VERSATUBE•

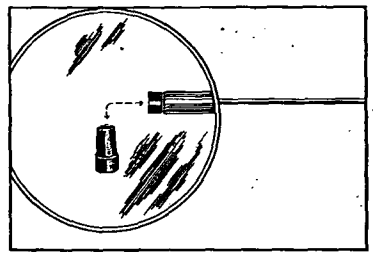
Aluminum Utility Tube used for air lines, connecting lines for pumps, stoves, oil burners, etc. Packaged in master cartons. Available in from ⅛ in. O.D. to ⅜ in. O.D.

WOLVERINE COPPER REFRIGERATION TUBE

Wolverine copper refrigeration tube is well known throughout industry. It, too, is available in straight lengths and rolls. In roll form, Wolverine copper refrigeration tube comes packaged in the convenient Roll-O-Tube carton. Wolverine refrigeration tube is dehydrated, has a clean, mirror-bright inside surface and is consistent in quality and temper. As a further service to its customers, Wolverine refrigeration tube is provided with unique plastic plugs for positive end-sealing. These plugs are removable and may be used again and again; because their O.D. is no larger than that of the tube there is no need for removing the plug when threading through partitions.

• Patent Applied For.

WOLVERINE COPPER WATER TUBE



Wolverine copper water tube is available in three types:

Type K—in straight lengths and rolls—is recommended for general plumbing where severe service conditions may be encountered as well as for heating, gas, steam, and oil lines. It is also used for underground service. It is available in nominal sizes from ¼ in. through 6 in.

Type L—in straight lengths and rolls—is recommended for general plumbing involving less severe conditions and for internal applications for heating, gas, steam and oil lines. It is available in nominal sizes from ¼ in. through 6 in.

Type M and Type DWV—available in straight lengths only—are ideally suited for DWV (drainage, waste, vent) installations and for other non-pressure applications where soldered fittings only are used. Type M is available in nominal sizes from ⅜ in. through 6 in.—Type DWV, 1¼ in. through 4 in. Wolverine also manufactures standard and extra heavy S.P.S. pipe in copper and red brass. Pipe is available in standard lengths of 12 ft and 20 ft. Sizes range from ⅛ in. through 3 in. Standard, industry-approved color coding identifies the various types of tube.

WOLVERINE CAPILATOR•

Wolverine copper Capilator tube is designed for precision control in the metering of gases, liquids or air. Tiny, plug-drawn Capilator has a smooth, mirror-bright bore held to exceptionally close limits. It is available in sizes from .026" to .090" inside diameter. Capilator is washed, deburred, flow-tested and its ends are paper wrapped to insure absolute cleanliness. For general metering or control purposes, Wolverine also manufactures rigidly quality controlled small diameter copper tubing, .062" O.D. and larger.

WOLVERINE TRUFIN•

Wolverine Trufin is an extended surface tube with fins extruded directly from the tube wall. Because of this, Trufin provides increased heat transfer surface—extracts more Btu's per foot of tube. Trufin's integral fins also resist vibration, temperature changes, and fluctuating pressures. Trufin is available in five different types in a wide range of sizes, alloys, and fin spacings—in copper, aluminum, and seamless steel. Illustrated is Trufin Type H/R—a high finned tube ideally suited for air cooled heat transfer operations.

FABRICATED TUBULAR PARTS

Through its Copper† and Aluminum‡ Spun End Processes Wolverine is able to produce one-piece, tubular-shaped parts (below) with a wide variety of contours and end treatments in one fast, economical operation. Other Wolverine fabrication techniques include finning, bending (such as the hairpin return bend at left above), coiling, flaring, expanding—to name but a few.

ALUMINUM TUBE AND SHAPES

Wolverine produces strong, lightweight aluminum tube—plain or finned—drawn or extruded—in a wide variety of sizes in popular alloys. Wolverine extruded aluminum shapes are rigidly quality controlled to meet customer specifications—can help save machining and assembly time and reduce material requirements.

FIELD ENGINEERING SERVICE

For the convenience of our customers Wolverine maintains its Field Engineering Service. Highly skilled tubing technicians are ready at all times to help you solve problems in design, corrosion or fabrication.

Soldering Joints in Copper Tube

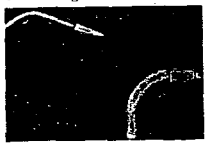
The two most common types of solder used in joining copper tube are 50-50 tin-lead solder and 95-5 tin-antimony solder. 50-50 solder is generally used for moderate pressures with temperatures up to 250° F. For all temperatures up to 250° F where higher strengths are required, the 95-5 solder should be used. In general, 95-5 solder melts at a higher temperature than does 50-50, has less of a pasty range, and is therefore somewhat more difficult to handle, particularly for a vertical joint to be filled upward.

The fluxes best suited to the 50-50 and 95-5 solders are in paste form and consist of a petrolatum-base, impregnated with zinc and ammonium chlorides. It should not be the function of the flux to clean the copper, but assuming that the copper has been cleaned the flux may be reasonably expected to remove residues of oxide, in addition to protecting the surfaces from oxidation during the heating process. The flux also floats out the remaining oxides ahead of the molten solder and promotes wetting action of the solder. In general, paste-type fluxes are recommended rather than liquid fluxes.

1. cleaning tube end

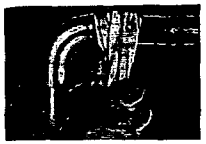
2. cleaning fitting socket

3. fluxing tube end



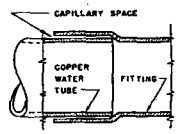
4. fluxing fitting socket

5. assembly



6. heating

7. applying solder



8. removing surplus solder and flux

It cannot be too strongly emphasized that for strong, tight, long lasting joints, thorough cleaning of the tube *surface* and the inside of the cup of the fitting is of utmost importance. Pretinning is not necessary and generally is not recommended if the metal is properly cleaned and fluxed.

Fittings that are oversize will result in a loose fit. The capillary action is dependent on a fairly tight fit although a certain amount of looseness can be tolerated. Looseness is more apt to cause difficulties in working with the larger size copper tube, especially for horizontal joints where an *oversize fitting* may allow the tube to rest directly on the socket, resulting in a double width space at the top. Wherever possible, such joints should be made up in a vertical position, before assembly. For best results always use fittings conforming to accepted standards.

Making up a joint

There are six simple steps that, when followed, will result in a well-made joint. These steps should be taken after first measuring the tube to proper length so that it will run the full length of the socket of the fitting, cutting the tube end squarely and removal of all small burrs.

1. Clean tube end and socket of fitting.
3. Apply flux to the clean areas.
3. Assemble.
4. Apply heat and solder.
5. Remove residual solder and flux.
6. Allow joint to cool.

AGITAIR AIR FILTERS

Type FM
HIGH VELOCITY
•
ALL METAL
•
PERMANENT
•
CLEANABLE

HOW IT WORKS

High turbulence of many finely divided air streams is the keynote of Type FM air filters. The media divides the air into countless fine streams and throws those streams into violent cyclonic turbulence against countless viscous-coated "wiping surfaces" which virtually scrub the air clean by catching and holding the dirt.

HIGH VELOCITY

The Agitair FM Filter is designed to perform at highest efficiency at an approach velocity of 432 fpm—or 1200 cfm through a 20 x 20 in. filter panel.

1/3 LESS SPACE REQUIRED

The ability of the FM to filter, with greater efficiency, 50 percent more air at the high velocity of 432 fpm reduces the number of filter panels required. Now TWO FM's will do the work of THREE ordinary filters . . . ⅓ less space required . . . fewer units to be installed . . . fewer units to be serviced . . . overall installation and maintenance costs reduced to a minimum.

HIGH EFFICIENCY

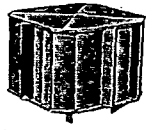
At the recommended velocities, the Agitair FM has a high dust arresting efficiency, which increases as the dust load is applied.

LOWER RESISTANCE

The sustained low resistance of the Agitair FM means sustained peak volume of air for longer periods of time . . . no loss in air volume . . . no danger of unloading . . . clean filtered air at all times.

HIGHER DUST HOLDING CAPACITY

Employing a new formula for air filtration the new Agitair FM holds more dirt, from two to six times as much as ordinary 2 in. permanent, cleanable filters. No early clogging of air passages . . . less frequent servicing . . . lower maintenance cost.



TWO TYPES OF HOLDING FRAMES

Individual type: Designed and constructed for easy handling in single unit installations, and to facilitate "on the job" assembly, into a multiple unit bank. **Pre-Fabricated Type:** Made of heavy gage steel and delivered completely knocked down. They can be quickly and easily bolted together to form a sturdy panel bank.

GREASE FILTERS

Strong Expanded Metal Media recommended for use in kitchens where grease-ladened air is a fire hazard and a maintenance problem. Prevent grease from entering exhaust ducts, eliminate frequent duct cleaning, protect fans, greatly reduce fire hazard, and help maintain good ventilation.

AGITAIR WIND-ACTUATED EXHAUSTERS

Type CNO

Provide proper ventilation regardless of wind direction, and with positive elimination of down-draft. Functions at peak efficiency at average low wind velocities. Will not restrict the exhaust of air or gases when there is no movement of outdoor air across the head.

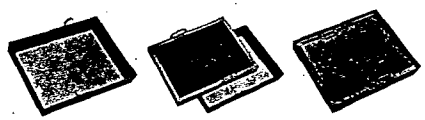
VIRO-CRIMP FILTER
(Type W)
Pat: No. 2,653,676

A specially designed high velocity filter media, viscous type. Constructed of horizontal layers of galvanized wire mesh assuring a large filter-area with no appreciable pressure drop. Designed for velocities of 300-600 fpm at minimum resistance. Viro-Crimp edges are hemmed, an important safety feature that provides a smooth media surface.

Type W, Airsan High Velocity Air Filter is of all galvanized metal construction throughout. Drain slots provided to hasten drying and aid in cleaning. Available in all standard and special sizes (2 in. and 4 in.). *Bulletin W802.*

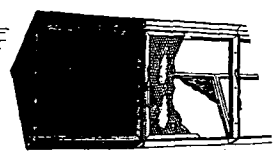


Airsan

AIR FILTERS
Low Velocity
(Type AF-1, AF-2)
Domestic Industrial Commercial

Expanded metal face plate acts as a lint arrestor to provide easier cleaning and servicing. It distributes air evenly over entire filter area providing high filtering efficiency and dust-holding capacity with low resistance. Media is viscous type, permanent, cleanable, and is constructed of multiple layers of galvanized wire mesh. Galvanized steel frames and drain slots for quicker easier cleaning. Available in standard 1 in. and 2 in. thickness. *Bulletin 302.* Also HEAVY DUTY filters (Type AD-2, AD-4) for industrial and special applications—2 in. to 4 in. thickness. *Bulletin 402.*

Airsan



FILTER RETAINER
(Holding Frames)

For Air and Grease Filters. Features include positive snap locks, fire resistant felt seals etc. Particularly flexible to any type of installation of flat or "V" banks. Easily built up to any height or width by progressive addition of Airsan Filter Retainers. Available in 2 or 4 in. sizes. *Bulletin L605.*

Airsan

GREASE FILTERS

Permanent cleanable type Airsan Grease Filters are specially designed for range canopies, galleys, and kitchens.

Removes grease at source, reduces fire hazard in exhaust ducts, and prolongs life of fans, motors. Assemblies for mounting on ceiling or wall, single or multiple units—include holding frames, supporting angles and end seals. *Bulletin L604.*

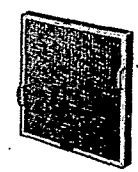
AIR-MAZE CORPORATION

25000 Miles Rd., Cleveland 28, Ohio

THE FILTER ENGINEERS

Representatives in all principal cities



Because filtering air is still an art rather than an absolute science, proven experience itself is even more important in this field than in other technical areas. We at Air-Maze have specialized entirely in the art of filtration for well over 30 years. As a result, there are few filtering problems that we have not encountered during this time. Through first hand experience, we have learned that what not to do is a highly important factor in successfully engineering a filter for a particular job.

There is a saying in the filter business that, "In most cases one never knows he has the wrong filter until it's too late". Consequently, as a buyer or specifier of filters, our years of proven experience, we believe, are invaluable to you.

The prime function of our application engineers is to guide you in selecting the right filter . . . even though it means suggesting an item we do not make, as is sometimes the case. By experience, we recognize that future business depends on your confidence in us. So we endeavor to justify your complete confidence in every recommendation that Air-Maze makes.

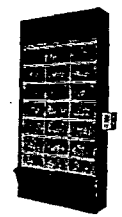
A fully staffed organization, backed by adequate plant facilities with a well-equipped testing laboratory, have helped Air-Maze become one of the largest filter manufacturers in the country.

Send for catalog sheets on specific products. General catalog also available on request.

AIR FILTER PANELS

Available in metal washable, viscous impingement types, and dry disposable types. Dry filters also available with washable strainer-type filter element.

ELECTROMAZE ELECTRONIC AIR FILTER



The Electromaze 2-stage electronic air cleaner performs an air cleaning function using the electrostatic phenomenon that no other commercial device can do.

- It is one of the two practical methods for removing particles of sub-micronic size. These particles include smoke, fumes, and carbonaceous matter which authorities agree is the principal cause of discoloration.
- The electronic air cleaner does this air cleaning job with extremely low pressure loss and high dirt-holding capacity. For all practical purposes the pressure drop is so low as to be negligible.
- Its operating costs and maintenance are unusually low.

Electromaze employs high-voltage direct current to ionize the air (and entrained dirt contaminant therein) by means of a corona discharge. Ionized particles are readily collected on plates having opposite positive and negative charges on alternate plates.

Has semi or completely automatic vertical spray washing system. Removes particles as small as 0.1 micron diameter, has rated efficiency over 95 percent, as tested by the *National Bureau of Standards'* Discoloration Method.

AUTOMAZE AUTOMATIC AIR FILTER

Where continuous operation without servicing is required, the Automaze "pulse action" automatic self-cleaning filter should be used. It combines a double filter panel curtain with a positive effective panel cleaning action to provide a better viscous impingement air filtration with a minimum of maintenance. New self contained drive mechanism and unitized control system simplifies installation. Standard Automaze filter media is satisfactory for most installations, but other media types are available for special applications.

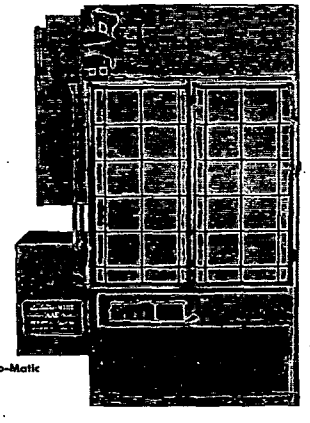
ACCESSORIES

Cleaning tanks, holding frames, complete assemblies for range canopies, viscous adhesive coatings, spray guns, etc., are available for complete installation and service requirements.

American Air Filter Company, Inc.

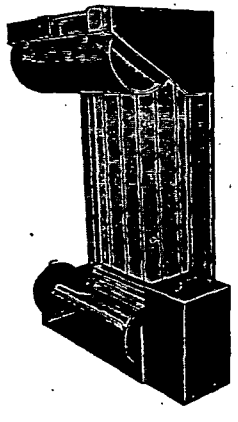
673 Central Avenue, Louisville 8, Ky.

AMERICAN AIR FILTER OF CANADA, LTD., MONTREAL, P. Q.



THE COMPANY: The American Air Filter Company, Inc., is recognized internationally as an authority on air filtration and dust control. In 30 years, its leadership and scientific "know how" have been responsible for installations of AAF equipment in every industrialized part of the world. Because its continuous research, high engineering standards and exclusive specialization have been consistently maintained, AAF equipment is used by leading companies in nearly every industry and is specified by leading architects and engineers for use in commercial and industrial air conditioning.

The American Air Filter Company, Inc., manufactures a complete line of air filtering and dust control equipment. A few representative types are shown here. AAF's years of experience and the scope of its knowledge dealing with the elimination of air-borne particles in every form insures maximum efficiency in application, design, manufacture and installation . . . with a minimum of field engineering. Write AAF on all problems of air filtration and dust control, or its Herman Nelson Division on heating or ventilating problems.



AAF AIR CLEANING PRODUCTS

Electro-Matic Self-Cleaning Electronic Precipitator—The Electro-Matic Precipitator is an automatic electronic precipitator combining advanced principles of electronic air cleaning with a special self-cleaning principle. It eliminates the necessity of shutting down the filter for manual cleaning, minimizes the need for personal attention and permits continuous high-efficiency operation. It also allows the Electro-Matic filter to be built in standardized self-contained sections, easy to install and with all exposed parts of the filter casing electrically grounded for the protection of operating personnel. Send for *Bulletin No. 250.*

ROLL-O-MATIC Renewable Media Filter—An automatic air filter featuring a low cost, renewable media filtering curtain of bonded glass fibers supplied in convenient roll form. The media, mounted at top of filter, moves down the face of the ROLL-O-MATIC and is re-rolled on a driven spool at bottom. Introduction of clean material to maintain desired operating resistance is controlled by an automatic time switch. ROLL-O-MATIC's maintenance-free operation provides continuous, high efficiency cleaning at less than half the operating cost of a disposable type filter of equal capacity. Send for *Bulletin 248.*

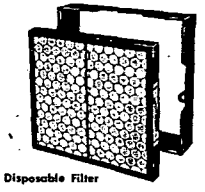
Electro-Cell Electrostatic Precipitator

Electro-PL Dry-type Electronic Filter

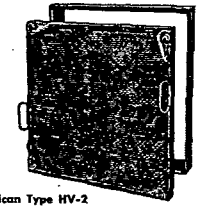
Multi-Duty Automatic Filter

The Electro-Cell is a stationary plate-type electronic precipitator available in both conventional and high-velocity designs for application on a wide range of dirt concentrations. Cell construction assures simplified installation and ease of maintenance. Collector assemblies may be removed for individual cleaning—washed in place manually—or, with the addition of Type "H" Washer, cleaned automatically by traveling water sprays. Write for *Bulletin No. 252.*



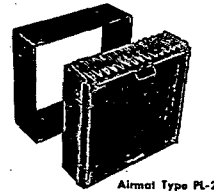
Electro-PL—A special dry-type electronic air filter with charged Airmat collector element which combines air filtration and electronic precipitation in a single unit. Gives intermediate efficiency at lower cost, when the need for superclean air is not indicated. However, it has twice the efficiency of uncharged dry-type filters. Available in Straight Bank or "V" arrangement to meet virtually any space or capacity requirement. Send for *Engineering Bulletin No. 257.*

Multi-Duty Automatic Filter provides outstanding features of performance and design and will accommodate either armored screen panels or die stamped louvre panels available in three types. Offers advantage of uniformly constant air supply, fixed operating resistance and automatic operation. Ideal for ventilation and air conditioning service. Available in any size or capacity. Send for *Bulletin No. 241-A.*



AMER-glas Replaceable Unit Filters. A new viscous impingement type for eliminating atmospheric dust from forced air heating systems. The highly efficient filtering media consists of continuous, curled and interlaced, extremely fine glass filaments, bonded with thermoplastic to form a thick resilient pad. The pad is sprayed with a special Viscosine and placed in a fiberboard casing between perforated metal grilles. The AMER-glas is nonflammable, sanitary and odorless and the Viscosine remains in a fluid-jell state for the life of the filter. Available in 15 sizes. Write for *Bulletin No. 211-A.*

Airmat Type PL-24—Airmat filters use standard Airmat medium, renewable after collecting dust load. Used both for comfort and industrial air conditioning. Available with unit frames to be set up to meet any capacity requirement or space condition. Send for *Bulletin No. 230.*



Type HV-2 Filter: A high capacity, low-resistance unit designed for velocities up to 500 fpm. Special pyramid pocket media design eliminates through-air passages and gives uniformly high efficiency over wide range of air velocities. HV-2 has large dust capacity, long life, and decided advantages where space is limited. Available in three designs. Write for *Engineering Bulletin No. 203.*

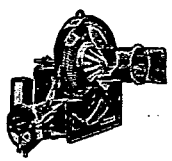
AMERICAN AIR FILTER OF CANADA, LTD., MONTREAL, P. Q.

AAF DUST CONTROL EQUIPMENT



All AAF Dust Control equipment—dynamic precipitators, hydrostatic precipitators, dry centrifugals and fabric arresters—combine the functions of exhausting, separating and storing dust in one simple, compact, self-contained unit. All have these basic design features: (1) small space requirements, (2) maintained performance over a wide range of operating conditions, (3) constant exhaust volume, and (4) high collection efficiency. Available in a wide variety of types and sizes, AAF equipment has a proven record of economy and efficiency covering thousands of production line and individual applications. Write for profusely illustrated 35-page application and *Engineering Bulletin No. 274-A.*

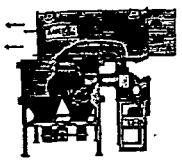
Type D ROTO-CLONE —A dynamic precipitator designed for dry collection of granular industrial process dust. Combines functions of exhauster, dust separator and storage facilities in one compact unit. High collection efficiency remains constant over entire pressure volume range. Adapted for individual unit or central system use. Capacities — from 100 to 15,000 cfm. Write for *Bulletin No. 274.*

Type D ROTO-CLONE

Type W ROTO-CLONE offers high dust separation efficiency where extreme fines and heavy dust loads are involved. Combines dynamic precipitation with integral water sprays. Delivers a constant air volume and collects dust as a sludge. Compact design makes for easy, low-cost installation. Capacities from 1,000 to 50,000 cfm. Write for *Bulletin No. 274.*

Type W ROTO-CLONE

Type N ROTO-CLONE is a hydrostatic collector, with induced water scrubber. Requires minimum space—easy to install. No moving parts, spray nozzles or pumps. Completely self-contained with dust discharged as a sludge. Capacities—from 1,000 to 50,000 cfm. Write for *Bulletin No. 277.*



Type N ROTO-CLONE

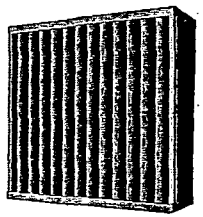
AMERjet—A reverse jet type fabric arrester offering high collection efficiency, constant pressure drop (constant air volume), compact design and continuous operation. Other features are (1) unique method for pressure air supply, (2) rugged mechanism for dislodging collected material with high pressure air jets and (3) venturi-shaped inlet for dust-laden air which extends life of cloth. Available in range of capacities. *Bulletin No. 279.*

AMERjet

AMERclone —A dry centrifugal dust collector designed to handle large exhaust volumes containing dust in high concentrations. Unit requires small space due to compact design and high cleaning capacity of the AMERclone tubes. Abrasion resistant construction featured throughout. Collection efficiency remains practically constant over wide range of exhaust volumes. Available in wide range of capacities. Write for *Bulletin No. 291.*

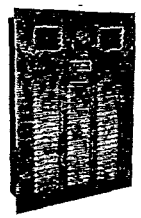
AMERclone

BARNEBEY-CHENEY



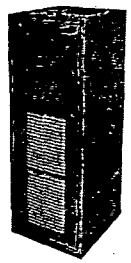
Cassady at Eighth, Columbus 19, Ohio

Los Angeles • San Antonio • St Johns, Quebec



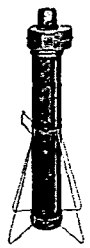
Barnebey Cheney

Activated charcoal purification equipment



Barnebey-Cheney manufactures activated charcoal and purification equipment for air, water and chemical products. Used in air purification, AC saves on heating-cooling costs by permitting recirculation of air. AC adsorbs odors, irritating vapors, smoke and smog. Completely revitalizes stale or stuffy air.

FilterFold adsorbers Pleated filter with ½ in. bed of charcoal. Installed in multiples, these cells give large air handling capacity in a small space. Each cell will handle up to 1,000 cfm at 0.2 wg. Heavy guage steel frames take rough treatment (stainless frames available). Five types available.



Wall unit Flush mounted circulator for semi-light duty use. Contains centrifugal fan, charcoal filter, and dust filter. Steel cover plate furnished with prime coat. Designed to fit between studding. Capacity: 150 cfm.

Cabinet circulators Complete units contain panel adsorbers, dust filter, centrifugal blower, and motor assembly. They are fully assembled, ready to plug in. Designed for long service and quiet operation 24 hours a day. They will purify up to 12,000 cubic feet of space.

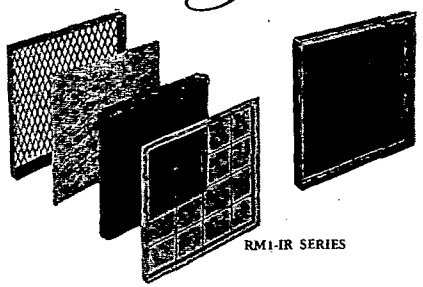
Heavy duty units are available for warehouse or industrial operation. These may be ceiling mounted or portable.

Canister circulators Complete unit contains removable canister and blower-motor assembly. Designed for small rooms and enclosed areas. Four models, with capacities from 15 to 120 cfm. Either floor stands or wall mounting available.

Panel adsorbers Flat perforated metal cell with 1 in. bed of activated charcoal. Use it when the contaminant load is heavy and you want long service life. Frame assemblies and panels are available for any air flow. Capacities up to 180 cfm at 0.3 wg. Three models.

Canister adsorbers Cylindrical perforated metal with ⅜ in. to ¾ in. bed of charcoal. Use these for small jobs and for expansion of existing installations. They are mounted in manifold plates in multiples, depending on cfm, and are interchangeable with other types of canisters. Four models.

Other products and services Disposable charcoal filters in paperboard frames are available for use in air conditioners, forced air furnaces, and ventilating systems. Breeze circulators are attractive units for homes, offices, clubs.



Barnebey-Cheney's complete line of activated charcoals is available in bulk.

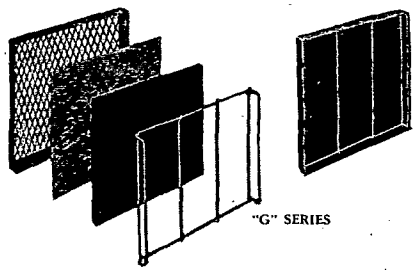
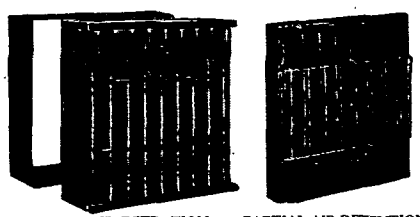
BURKE AND COMPANY

2902 Hyde Park Boulevard, Los Angeles 43, California



ROTO*Aire*® REPLACEABLE MEDIA AIR FILTERS GAS AND VAPOR ADSORBERS



RM1-IR SERIES

RM2-IR SERIES

"G" SERIES

TOTAL AIR DETENTION PARTIAL AIR DETENTION

Roto Aire RM1-IR Series Impingement-Strainer Type Replaceable Media Air Filters with Integral Retainer

The Roto Aire RM1-IR Series impingement-strainer type replaceable media air filter with integral retainer is the "advanced design" air filter which combines the filter holding device and the filter itself. It is comprised of a heavy gauge retaining frame which is faced with a sheet of 1" diamond, flattened, expanded steel and equipped with filter case centering dimples and spring loaded positive filter media case face-locking devices. The filter media case is likewise constructed of heavy gauge steel and is faced with a 4" mesh 12 gauge welded steel rod grid. The spring loaded positive filter media case face locks permit the installation of filters on any angle and press the filter case against the retainer so securely that by-pass of dirt laden air is eliminated. The filtering medium is glass fiber and consists of one filter pad that has a *bulk thickness* of 2" and one strainer mat that is .025" in thickness. Each medium *is treated with Type 201 non-inflammable* binder, and the 2" filter medium is treated with TCP (Tri-Cresyl Phosphate adhesive), the surface chemistry of which is cationic.

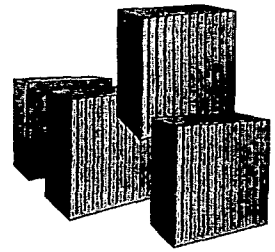
Roto Aire RM2-IR Series Impingement-Strainer Type Replaceable Media Air Filters with Integral Retainer

Roto Aire RM2-IR Series air filters differ from the RM1-IR Series to the extent that the filter media case is 2" in depth to accommodate three distinct types of filtering media namely large particle preload paper in addition to the media employed in the RM1-IR Series. These media perform the various functions of *retaining airborne* substances over the wide range from lint collection to retention of 0.5 micron particles. Greater economies in operation are to be realized because of their high dirt holding capacity and low face loading characteristics.

Roto Aire G Series Impingement-Strainer Type Replaceable Media Air Filter with Integral Retainer

The Roto Aire G Series air filter is comprised of a retainer, a gate lock grid and two types of fiber glass filter media that combine to form an integral filter cell. The *retainer consists* of an "L" *type* welded frame that is faced with flattened expanded steel to form a case for the filtering medium. Clips for hinging and locking the grid are also provided in the retainer. The grid is fabricated from steel wire and shaped so that when opened it sets off to permit easy installation *of replacement filter media.* Like the Roto Aire I.R. Filter, the G Series filter may be installed at any angle, and the grid, when locked in place, presses the filter media against the retainer so securely that by-pass of dirt laden air is eliminated. The filtering medium is glass fiber and consists of one filter pad *that has a bulk thickness of 2" and one* strainer mat that is .025" in thickness.

Roto Aire Gas and Vapor Adsorbers



ROTO AIRE GAS AND VAPOR ADSORBERS increase comfort and physical efficiency because they purify air by removing noxious gases and vapors. The air purifying agent in Roto Aire Gas and Vapor Adsorbers is granular carbon that has been processed at high temperature to expel hydrocarbonic impurities and increase its porosity. The surface of carbon granules so refined becomes super active and contains the remarkable power of arresting noxious gases and vapors from ventilation and recirculated air. This phenomenon is known as adsorption and is easily likened to flies clinging to fly paper. ROTO AIRE GAS AND VAPOR ADSORBERS make it possible to greatly reduce, or even eliminate, con*taminated outside air for ventilation purposes. Air conditioning* installation and operational expenses therefore decrease because there is no need to heat or cool this additional air. There are no anoxia concerns because unavoidable infiltration factors exceed by many times the air volume necessary for oxygen replenishment. Partial air detention type Roto Aire Adsorbers are designed to process air at high efficiency on a by-pass basis. Therefore only a part of the air passes through the carbon cartridges where up to 25% of air borne contaminants are removed. Their use is recommended to process ventilation and recirculated air when ventilation air requirements are less than 10% of the total air volume. They are also recommended for use in systems where outside air is excluded and the total quantity of supply air is recirculated.

CAMBRIDGE FILTER CORPORATION

AEROSOLVE® Filter

Cambridge ABSOLUTE® Filter
Guaranteed 99.97% Efficient on 0.3
Micron Particles

High-Efficiency Air Filters

Cambridge air filters are positive, strainer-type, high-efficiency filters which provide trouble-free air cleaning without electric, water or drain connections. They are economically installed and, except for infrequent replacement, require no maintenance. In relation to efficiency, initial pressure drops are exceptionally low.

Cambridge AEROSOLVE® Filters

Consist of permanent cadmium-plated steel frames with easily replaceable and interchangeable cartridges available in efficiencies of 35 percent, 85 percent and 95 percent efficiency (discoloration test with atmospheric dust). This test was developed by the National Bureau of Standards and is used for rating electric precipitators. Most commercial filters test 5 percent to 15 percent by this method. Changes in efficiency requirement are easily met without major change in the system simply by substituting cartridges. Cartridges slide easily into frames and are secured by quick-acting fasteners. Integral prefilters are available where desired.

Standard units are designed for face velocity of 250 fpm and can be used at higher velocities by V-ing the filter bank. High-Velocity units, face velocity 450 fpm, can be installed in the plenum in a straight bank, for even greater economies.

	High Velocity	Standard	
Face Area	24" × 24"	24" × 24"	24" × 12¾"
Rated Face Velocity	450 fpm	250 fpm	250 fpm
Rated Capacity	1800 cfm	1000 cfm	500 cfm
Area, Filter Medium	86 sq ft.	43 sq ft.	22 sq ft.

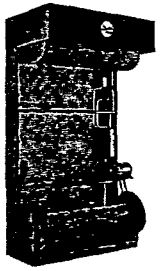
Low Pressure Drop

In relation to efficiencies, the initial static pressure drop of AEROSOLVE Filters is exceptionally low:

	AEROSOLVE 95	AEROSOLVE 85	AEROSOLVE 35
Average Discoloration Efficiency	*95 percent*	*85 percent*	*35 percent*
Initial Δp (Standard)	0.35" w.g.	0.22" w.g.	0.16" w.g.
Initial Δp (High-Vel.)	0.45" w.g.	0.32" w.g.	0.25" w.g.
Final Δp (Both Types)	0.80" w.g.	0.60" w.g.	0.60" w.g.

The great area and thickness of AEROSOLVE filter cartridges provide long life which, with low initial cost, guarantees economical owning and operating costs.

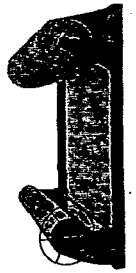
Cambridge ABSOLUTE® Filters



New *glass-asbestos filter medium* now used in ABSOLUTE Filters is an improvement both in efficiency and in air-handling capacity over the medium which Cambridge originated for removal of *radioactive particles from exhaust systems in AEC* installations. 99.97 percent removal of 0.3 micron particles is guaranteed. Essentially removes all smoke, dust, bacteria and *mold spores and is widely used by industry* in applications where the highest degree of air cleaning is required. Every filter individually tested. Maximum penetration of 0.03 percent guaranteed. Initial pressure drop *1.0 in. w.g.* at rated air flow. Each filter self-supporting—no permanent frame required. Easily installed. Standard size units from 30 cfm to 1375 cfm in stock for immediate shipment. Special sizes and shapes available on order. 1100 cfm units 24 in. × 24 in. × 11½ in.; filter area over 200 sq ft. Standard A-series withstands 220F and 85 percent RH. Other series available for extremes of temperature, humidity, fire resistance and corrosion.

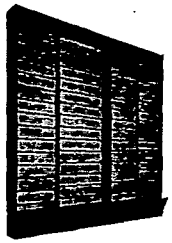
Table of Sizes

Model	Size, in.	Rated Capacity CFM at 1" wg.
1–25	8 × 8 × 3¹⁵⁄₁₆	30
1–50	8 × 8 × 5¾	50
1–600	24 × 24 × 5¾	650
1–1000	24 × 24 × 11½	1100
1–1250	24 × 30 × 11½	1375



CONTINENTAL AIR FILTERS, Inc.

P.O. BOX 1647 — LOUISVILLE, KY.



CONTINENTAL CONOMATIC Roll-Away Type Air Filters... provide maximum filter area for filter size. Automatically advances viscous coated, glass-fiber filter media as needed. **Media Saver** minimizes cost. Trouble-free direct drive saves maintenance.

Write for *Bulletin No. 802.*

CONTINENTAL CONOMANUAL ... manually operated dry-type filter similar to Conomatic, for use where low installation and maintenance cost limits preclude automatic equipment. Simple hand-wheel advances ½-inch-thick disposable synthetic media blanket which has high dust-holding capacity, is moisture-, fungus-, and fire-resistant and will not part or "shed" when handled.

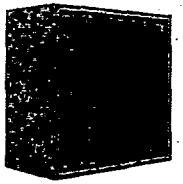
Write for *Bulletin No. 850.*

CONTINENTAL ANTOMATIC, SELF-CLEANING Air Filters ... viscous impingement type. **Features:** Patented E-Z-Wash media, "Ferris Wheel" action of continuous rotating filter curtain, and positive automatic flush-cleaning of curtain in each rotation cycle.

Ferris Wheel action passes filter sections from front to rear curtain **without reversing** them to the direction of air-flow ... thus eliminating problem of trapped dirt being blown into clean air stream.

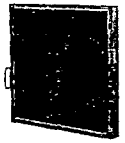
Cam action tilts and lowers each filter section while in oil reservoir so as to forcefully flush filter oil through the media **counter to air-flow.**

Write for *bulletin No. 810.*



CONTINENTAL DYCON Dry-Type Air Filters ... have excellent dust-holding capacity. Efficient media blanket of specially prepared synthetic fiber. **Low maintenance cost:** quickly and easily restored to original resistance by cold-water rinsing. No oil involved. Standard sizes. Type CA-24, 8 in. thick. Type CA-20, 4 in. thick. Type DY, 1 in. thick.

Write for *Bulletins Nos. 460 and 670.*



CONTINENTAL E-Z-WASH Unit Filters ... use same advantageous patented media as discussed above. Can be **washed easily** by brisk cold water hosing, and quickly re-oiled with E-Z-Oil spray bomb or dip tank. Standard sizes, 2 in. or 4 in. thick.

Write for *Bulletin No. 425.*

CONTINENTAL TYPE LV Air Filter... crimped galvanized hardware cloth and screen wire in highly rust-resistant, hot-dipped galvanized steel-channel frame assure long service-life for the LV viscous impingement air filter. Bale handles optional.

Write for *Bulletin No. 600.*

CLEERALL Air Filters ... to approach **totally dust-free** conditions ... provide efficiency in excess of 99.97 per cent on 0.3-micron particles as tested by DOP standard procedure required by *Atomic Energy Commission.*

Available in standard sizes ranging from 30 to 1200 cfm rated capacities at 0.9 in. WG. Size 24 in. x 24 in. x 11½ in. has 1000 cfm capacity.

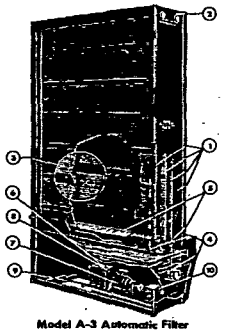
Three standard types meet operating conditions in temperatures up to 1000F or high humidities. Special filters for use up to 2300F or in highly corrosive fumes also available.

Write for *Bulletin No. 900.*

Dollinger Corporation

6 CENTRE PARK • ROCHESTER 3, N. Y.

AIR PROTECTOMOTOR — STAYNEW FILTERS



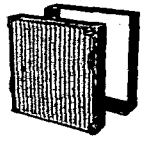
Filters for Building Ventilation, Air Conditioning, Engine Intake, Pipe Lines and Many Other Special Applications

REPRESENTATIVES IN PRINCIPAL CITIES

STAYNEW MODEL A-3 AUTOMATIC FILTER

An endless curtain type oil-bath filter for handling large volumes of heavily dust-laden air at low cost. The efficiency of Staynew Model A-3 is outstanding among mechanical self-cleaning filters.

Patented, exclusive Staynew Compressed Air Curtain Cleaners (5) are available for special conditions.



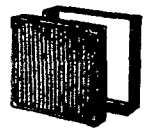
Model A-3 Automatic Filter

SPECIFICATIONS

Model A-3 Filters are sectional and may be bolted together to obtain any required capacity. Sections come in two widths, 4 ft. 3 in. and 2 ft. 9 in. Curtain drive and control mechanism (6) arranged either as an integral part of filter unit or for remote mounting, includes a ¼ hp motor (7) driving through a reduction gear and a momentary contact time switch (8) for testing and checking curtain travel and compressed air control. All are mounted on a common base plate (9) on clean air side of filter. Shear pin (10) is provided for protection of moving parts from accidental damage. Drive Motor operates for a few seconds at 15 minute intervals, and compressed air curtain cleaners can be arranged to operate simultaneously.

Write for Bulletin 500.

STAYNEW PANEL TYPE FILTERS



Model WKE Panel and Frame

Model WKE: Dry-type finned panel filter for use in ventilation and air conditioning systems. Extremely large filtering area in relation to overall size. Adaptable to wide variety of filtering media—in fact, almost any medium obtainable in sheet form that can be crimped. Steel mesh on both sides of medium prevents sagging and makes the WKE fire-resistant (models available to meet Class I Fire Underwriters approval), and cleanable without possible damage from vacuum cleaning tool or cleaning nozzle. It may also be washed or dry cleaned when and if necessary. There are no cross bars, spacer bars, or other obstructions to interfere with the cleaning operation. Unaffected by temperature changes.

Filter cells are held in rigid box-type supporting frames of heavy gage metal by spring-loaded cam-type locking latches. Two lifting handles are provided on each cell. Filtering medium supplied already crimped and cut to size. It may be inexpensively replaced in 2 to 5 minutes right at the filter bank—no special tools required.

Frames are drilled so that they can be riveted together to form a flat bank, or by the addition of angle uprights into a "V" or staggered arrangement.

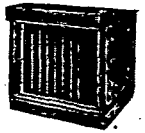
Write for Bulletin 600.

Viscous Model DPV Panel and Frame

Viscous Panel (Model DPV): A permanent type panel for air conditioning systems used in heavy duty industrial service. Filtering media consist of a series of layers of crimped galvanized screen cloth and woven mesh. These media when coated with PD-10 Pingene Filter Oil form an unusually efficient filter. Model DPV filters are cleaned easily with live steam or by washing in a suitable solvent. Spring-loaded locking latches and lifting handles are provided as in Model WKE.

Both Model WKE and DPV cells are furnished in 2 in. and 4 in. depths in various standard sizes.

Write for Bulletin 700.



ELECTRONIC FILTERS

1200 CFM Electro-Staynew Air Cleaner

Electro-Staynew Air Cleaner: Ionizer and Collector Cell built into one compact unit. Highly efficient—removes 90 percent of all air-borne dirt, including smoke, dust, pollen, oil mist. Available in single units of 1200 and 1800 cfm; any capacity in multiple units.

Write for Bulletin 400.

1500 CFM HV Electro-Staynew Air Cleaner

HV Electro-Staynew Air Cleaner: Has same features as standard model but requires less space. High velocity design permits 40% reduction in face area for any given capacity. Available in 1000 and 1500 CFM units, any capacity in multiple units.

Face dimensions:

1000 CFM unit—20" x 17"

1500 CFM unit—20" x 23"

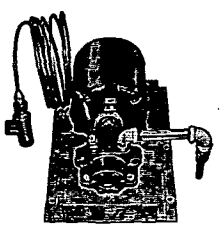
Write for data sheet.

Electro-Staynew Mist Collector

Electro-Staynew Mist Collector: Eliminates smoke and oil mist at its source. Mounted on or near high speed machine tools, an Electro-Staynew Mist Collector draws contaminated air from around grinding or cutting operations and returns clean air to shop. A completely self-contained ventilating system for machine tools.

Write for Bulletin 420.

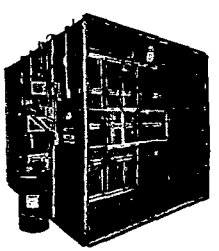
Electro-air Cleaner Company Inc.



Olivia & Sproul Sts., McKees Rocks, Pa.

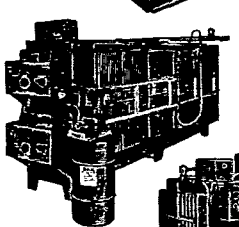
"In Greater Pittsburgh" • Representatives in Principal Cities

Electro-air Hi-C, "High Capacity" Electronic Air Cleaners have been developed for ease of installation, maintenance-free operation and high efficiency. The entire line features a self-adjusting, ballasted, single circuit and selenium rectifiers. All parts, including selenium rectifiers are guaranteed for five years.



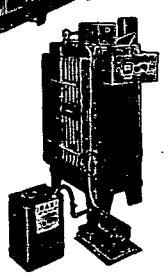
All Electro-air equipment incorporates the patented "Inside Curve" Ionizer which means higher efficiency, reduced size of equipment, increased capacity and face velocity, and service-free operation. All sizes of Electro-air units are available with either vertical traveling manifold or horizontal fixed manifold washing systems.

The latest Electro-air engineering development is the new *Detergent-Adhesive System, Type "X", with "double action" DAX solution* which is available with all sizes of Electro-air equipment. It is supplied as a "package" and is used to promote thorough washing and adhesive application. DAX solution is injected into the wash water during the last ⅓ of the washing cycle, acts as a strong detergent, then dries and leaves an adhesive coating on collecting plates and electrodes.



Electro-air Detergent-Adhesive System Type "X

"Built-up Line" equipment is manufactured in capacities from 10,350 cfm to 200,000 cfm for larger building areas. Each unit is made "to order" according to the specified height, width and cleaning capacity required, is assembled and tested at the factory, then match-marked, disassembled and shipped in well marked crates. "Built-up Line" units are also furnished with "enclosures" complete with drain pans, fore and aft ducts, windowed access doors and complete wiring.



Electro-air "Built-up Line" Enclosure Unit

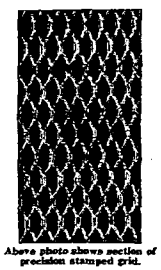
"Custom Line" units are furnished in capacities from 1,150 cfm to 21,360 cfm as complete "packages" and are designed for use in those cases where space is limited and access doors in ducts are not practical. Each unit is complete with the required number of collecting cells, drain pan, washing system and power pack. "Custom Line" Electro-airs are furnished in either horizontal or vertical (up or down) air flow, and may be floor mounted or suspended.

Electro-air "Custom Line" Unit

"Compact Line" Electro-airs are moderately priced and are designed for easy installation in homes and smaller commercial or industrial buildings which have forced air ventilation. They are available in fifteen models, both horizontal and vertical (down) flow in capacities from 800 to 9,600 cfm. Horizontal flow models may be either floor mounted or suspended. "Compact Line" units include most features of larger "made-to-order" Electro-air models.

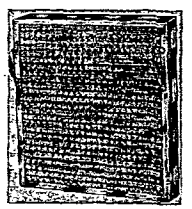
Electro-air "Compact Line" Unit

Electro-air Cleaner Company, Inc. also manufactures low cost "Tec Line" units which are true electronic air cleaners (90 percent efficient as determined by the National Bureau of Standards Dust Spot Test) for installation in small and medium size homes.



THE GEORGE EVANS CORPORATION

MOLINE, ILLINOIS



Evans

Evans Lifelong Air and Grease Filters

All Aluminum . . . Every Part Precision Made

Above photo shows section of precision stamped grid.

FILTER PACK HOLDS MORE GRAMS OF DIRT PER CUBIC INCH.

Strands and grids are scientifically sized and placed for holding *maximum dirt load. Filter pack has larger grid openings on* air inlet side progressing to smaller grid openings on air outlet side. Prevents face loading and choke-off of air stream. Accomplishes uniform depth loading all through the pack. Every grid, every strand does its part.

TURBULENCE AIR CLEANING ACTION.

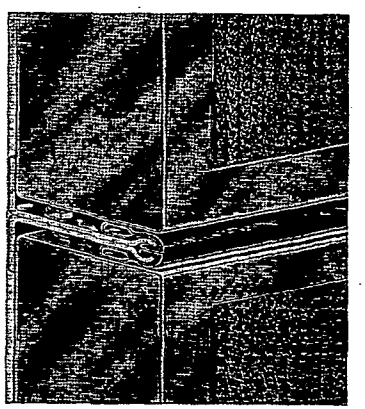
Dirt is slammed into the flat strands of mesh where it is caught and held by talon like edges of these grids. Precision stamped openings force air to travel many times filter depth from inlet to outlet side . . . for high efficiency air cleaning.

LOWER AND SLOWER STATIC PRESSURE RISE PER GRAM OF DIRT LOAD.

Filter pack catches and holds dirt without strangling air stream. Filter remains in service longer: (1) without sharp increase in resistance (2) with fewer cleanings (3) with power costs held down.

HIGH VELOCITY APPLICATION . . . UP TO 1,000 FPM.

Using turbulence air cleaning action (instead of screening or straining action) makes Evans filters particularly well suited to extremely high velocity requirements. The higher the velocity . . . the harder dirt is slammed into the mesh where it is caught and held by the talon like edges of the strands. *Filter's efficiency rises as velocities rise.*



DOUBLE ACTION ADHESIVE.

Works as adhesive while filter is in service. Becomes a detergent and helps wash filter when water is flooded on. IMPORTANT . . . When Evans filter fluid is used filters can be washed with tap water.

SEAL TIGHT HOLDING FRAME WITH PVC GASKET GIVES PERMANENT DUST TIGHT SEAL.

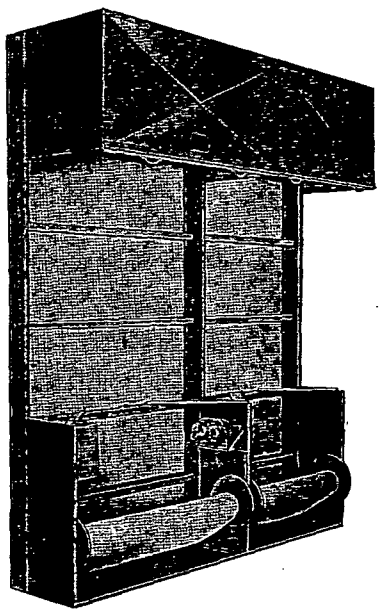
Gasket pressure locks filter into frame. No springs, latches or locking attachments. Slide filter into frame. Gasket automatically grips it securely.

Gasket is permanent (Polyvinyl Chloride). Stands up for years *against compressive stresses without breaking down.* Unaffected by oil or moisture.

HOW TO SPECIFY EVANS SEAL-TIGHT FRAMES.

Filter holding frames shall be heavy gage steel. Polyvinyl *chloride gasketed* on front of air inlet side. Gasket shall provide both positive grip for holding filter in frame and positive seal between filter and holding frame. Frames shall be double coat finished in black enamel. *Frames shall bolt together.*

HOW TO SPECIFY EVANS LIFELONG AIR FILTERS.



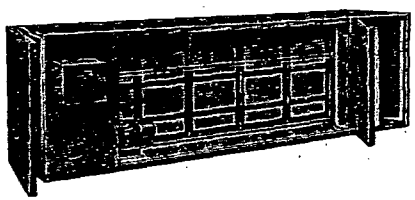
Filters shall be aluminum. Frame holding media shall be one-piece precision die-pressed heavy gage aluminum with edges rounded. *Corners machine fitted. Frame shall have drain holes* in 3 corners of frame member. Filter pack shall be made of die-cut flat and corrugated aluminum grids packed with larger openings on inlet side progressing to *smaller openings on* outlet side.

FARR COMPANY

P. O. Box 90187, Airport Station, Los Angeles, California

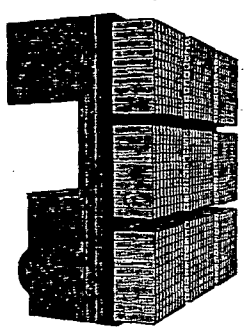
NEW YORK LOS ANGELES CHICAGO

AUTOMATIC FILTERS



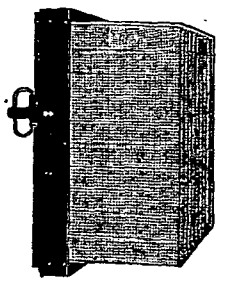
ROLL-KLEEN AUTOMATIC FILTER

A disposable media filter which automatically changes the media in the face of the filter. Designed for Roll-Kleen media, an adhesive coated, glass fiber mesh, bonded to and reinforced by a lenoweave fabric backing. Use of this reinforced media permits a simple, direct drive media movement system. Auto-Control system includes prewired control boxes, electric gear motor and signal lights. Pressure operated media control is standard. Timer or combination control systems also available. Factory assembled in Sections 3, 4, and 5 ft wide and from 5 to 15 ft high. Write for *Bulletin B-1400-2*



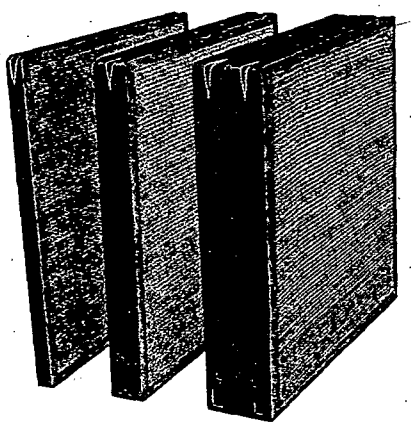
LINT KLEEN

An automatic filter similar to the Roll-Kleen in appearance and operation. Designed for textile mill applications. Uses special, extra long media rolls. Write for *Bulletin B-1400-5*.



ROLL-KLEEN TYPE H

Incorporates the basic Roll-Kleen features in a compact assembly which can be easily attached to most makes and models of air-handling units. Media moves horizontally across the air stream. The Type H uses standard Roll-Kleen media. Write for *Bulletin B-1400-3*.



HI-KLEEN

A complete, two-stage, air-filtering system combining the Far-Air Roll-Kleen and HP filters in a compact unit. Total depth is only 38¾ in. Both stages use convenient, completely disposable media. Offers exceptional efficiency, especially in the 0-5 micron range. Write for *Bulletin B-1400-4*.

Far-Air HP FILTER

A deep-pleated, flameproof, disposable filter which is preformed, then folded before shipment for convenient handling and storage. The HP is popped open at the filter bank and easily inserted into a matching metal holding frame which remains permanently in place. After use, the HP will refold trapping all collected dirt in the deep, pocket-like pleats. Filter weighs approximately one pound depending on size. Highly efficient in the small (0-5 micron) particle size range. Available in 16 x 20 in., 20 x 20 in., 20 x 25 in., and 24 x 24 in. sizes. All sizes are 8 in. deep. For use with or without prefilters at high or low velocities. Write for *Bulletin B-1500-2*.

Far-Air HIGH VELOCITY FILTER

A high velocity, low resistance, viscous coated, impingement air filter for industrial and commercial applications. Available in 1, 2 and 4 in. thickness and all standard and special sizes. One piece frame; rod-reinforced construction. Specify handles. Special materials and finishes for marine, fume and other applications. Write for *Bulletin B-100-2B*.

F/S FILTER

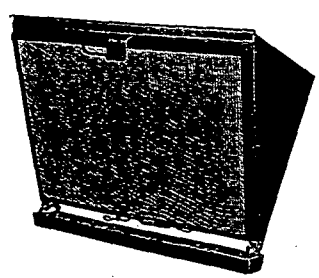
The type F/S Filter is an all metal, cleanable, viscous coated impingement type panel air filter. Performs efficiently at either low or high (350 to 520 fpm) velocity.

The F/S filter is especially effective in air containing a high percentage of lint contamination. The filter is available in ⅛ and 1-⅜ in. thicknesses, standard and special sizes. Write for *Bulletin B-1502-1*.

SELF-WASHING FILTERS

These completely automatic units wash and re-oil themselves. Washing water and contaminated oil is immediately flushed away, eliminating messy sludge and oil sumps. There is no oil entrainment. Each unit has a safety deluge valve that automatically prevents fire from passing the unit. Installation is simple and inexpensive. Write for *Bulletin B-1000-3*.

MICROLOC FILTER



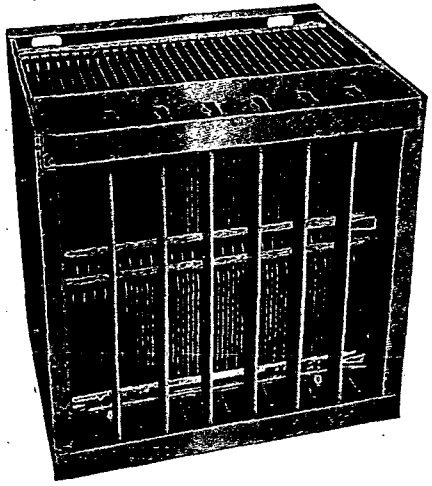
The FAR-AIR Mieroloc is a dry-type, renewable media filter which offers a selection of high efficiencies on the D.O.P. test method. Each Microloc unit consists of 5 inserts to hold the disposable media pads.

The Mieroloc filter units are interlocking and include a panel filter holding frame. A single bank of Microloc filters provides for 2 stage filtration.

Recommended for use after impingement filters where high efficiency is required. Write for *Bulletin B-1303-1*.

MAGNAMEDIA FILTER

Ultra-High Efficiency filters which meet *AEC* specifications for high efficiency and construction. Used to trap radioactive or other fine particle contamination. For laboratory and special industrial applications. Write for *Bulletin B-1304-1*.



GREASE ELIMINATORS

FAR-AIR Grease Eliminators halt the deposit of grease and lint in the air ducts. Available in one-sided and two-sided models in sizes to meet any size requirement. For restaurants and commercial kitchens. Write for *Bulletin B-201-5*.

MINNEAPOLIS-HONEYWELL REGULATOR CO.

Minneapolis, Minnesota

NEW SELECTOR SERIES OFFERS AN ELECTRONIC AIR CLEANER FOR EVERY REQUIREMENT

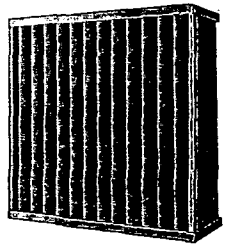
Hi Velocity Cell

Provides air cleaning efficiency of 98 percent at an air velocity of 600 fpm. A greater efficiency will result at lower speeds. Honeywell Hi Velocity cleaner should be specified when maximum cleaning is desired, or when unusually high velocities are common. ¼-in. plate interval.

AC/ME Cell

Offers advanced capacity for dirt loading and maximum cleaning efficiency at moderate air flow rates. 90 percent efficient at 600 fpm. This cell should be used in most normal air-conditioning applications. Reduced velocity will result in greater efficiency if desired. ⅝-in. plate interval.

Hi-Load Cell



Designed to provide great capacity for dirt loading. Outstanding for air-conditioning applications requiring wider plate interval to reduce frequency of plate washings. Honeywell Hi-Load cell is given rating of 90 percent cleaning efficiency at an air velocity of 400 fpm. ⅜-in. plate interval.

HONEYWELL'S Selector Series of Electronic air cleaners offers you a choice of three air-cleaning cells. The cells are identical except for the number of dirt-collecting plates per cell and the spacing between plates. Particles as small as .001 microns can be stopped by a Honeywell electronic air cleaner. After being charged positively in a powerful electrostatic field, particles are attracted by grounded plates where they are collected. Periodically, the unit is flushed and cleansed by a built-in water-washing system.

Honeywell electronic air cleaners can remove cigarette smoke, bacteria, spores, dusts and corrosive mists.

They protect large investments in machines, merchandise, fixtures and lessen cleaning and redecorating costs.

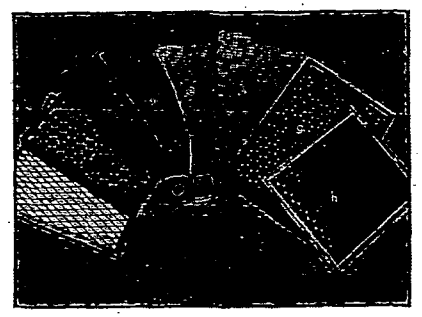
ALL HONEYWELL ELECTRONIC AIR CLEANERS ARE WARRANTED FOR ONE YEAR AGAINST FAULTY WORKMANSHIP OR DEFECTIVE MATERIAL

Honeywell Activated Charcoal Filters

Where it is necessary to remove odors as well as to clean dirt from the air, we recommend Honeywell Activated Charcoal Filters should be used with the Electronic Air Cleaners above.

In addition to removing odors, these Activated Charcoal Filters cut air conditioning costs by reducing the amount of outdoor air intake normally required to diffuse odors. Four sizes available. Capacity of the filter shown is 1000 cfm, resistance 0.2 wg.

FOR MORE INFORMATION, CALL YOUR LOCAL HONEYWELL SALES OFFICE



Owens-Corning Fiberglas Corporation

Toledo 1 — **Ohio**

OWENS-CORNING FIBERGLAS

DUST-STOP* AIR FILTERS

AN AIR FILTER PRODUCT TO FIT MOST OF YOUR COMMERCIAL NEEDS

a. Filter Adapter Frame for filter banks. b. Mat-Faced Filter for paint spray booth applications. c. Pad Media Filter for room air conditioners. d. Bonded Mat for strainer type air filtering. e. PF-115 for special high efficiency filtering applications. f. Filter wool, type TWL, for dry type specialty applications. g. Commercial and Industrial Filter for velocities of up to 500 fpm nominal. h. Dust-Stop Filter for velocities of up to 300 fpm nominal. i. Die-cut Aerocor for liquid fuel applications. j. Special molded shaped Aerocor for Jet Fuel-Water Stripper Elements.

THE FILTER

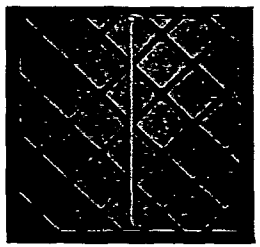
A replacement type filter that since 1931 has offered dependable air filtration, easy installation and convenient maintenance at low cost, for filter banks and other commercial or industrial filtering applications. Standard Dust-Stop Filters are designed for use in filter banks and equipment where velocities do not exceed 300 fpm. The Dust-Stop 450 series may be used with velocities up to 500 fpm. Care should be taken to see that fan capacity is adequate to overcome increased resistances. Rated capacities are 800 cfm at 300 fpm for standard 20 × 20 Dust-Stop Filters and 1000 cfm at 300 fpm for 20 × 25 filters.

DUST-STOP FILTER FRAMES

Frames are designed for the convenience of the engineer in constructing filter banks. Metal frame is universal style, suited for use in flat or "V" banks. Designed-in, self-locking device permits fast, economical assembly. Made to take 2 in. or 4 in. depth of standard 20 in. × 20 in. or 20 in. × 25 in. filters. Black painted or galvanized finish. Front, back and side-angle uprights for Y-bank assembly are also offered in 20 in. increments up to 160 in. length.

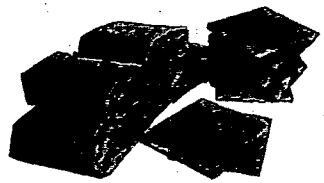
DUST-STOP RESISTANCE INDICATOR

Dust-Stop Resistance Indicator acts as a guide to economical bank maintenance. With adjustable filter-change marker set at resistance level specified by engineer as point where filters should be changed, this indicator provides a guide to when filters should be changed and insures operation at rated capacity and efficiency. Available direct from H. O. Trerice Co., 1420 W. Lafayette, Detroit, Mich. For technical data on Dust-Stop Filters and Frames, as well as Fiberglas Flexible Media, write: Owens-Corning Fiberglas Corporation, Dept. HVAC-1, P.O. Box 901, Toledo 1, Ohio.



* Fiberglas and Dust-Stop are trade-marks (Reg. U. S. Pat. Off.) of Owens-Corning Fiberglas Corporation for a variety of products made of or with fibers of glass.

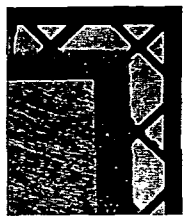
Pittsburgh Plate Glass Company



FIBER GLASS DIVISION

One Gateway Center Pittsburgh 22, Pennsylvania

Where clean air is a necessity for either residential, commercial or industrial applications specify GLASFLOSS filters. Products of the Pittsburgh Plate Glass Company, these filters are composed of long and fine glass fibers. Because of this fineness, they furnish a greater dust-collecting area and provide unusually complete filtering action. GLASFLOSS filters are available in three forms, to suit all filtering requirements:



GLASFLOSS STANDARD AIR FILTER—Millions of fine, bonded glass fibers, treated with a special fire-resistant, dust-catching adhesive, trap and hold more dirt. New **Safety-Grille** design makes filters stronger, eliminates danger of cut hands from old-type metal grilles. Excellent for home heating and air conditioning equipment.

GLASFLOSS ROLL-PAK—For bulk users of air filters who are faced with the problem of continuous replacement. The Glasfloss Roll-Pak provides substantial savings . . . as high as 30 percent. It offers quick replacement of filter media, and is available in rolls of 40 in. wide and 10 ft. long and in ½ in., 1 in. and 2 in. thicknesses, packed five rolls per carton, to suit every size commercial air filter. Also available in cut pads.

GLASFLOSS I-S FILTER—To the long, fine glass fibers used in the STANDARD Air Filter a special strainer mat has been added on the air-exit side. This means that the I-S filter is actually two filters in one. For industry, where clean air is essential, or in the meticulous home equipped with forced air heating, Glasfloss I-S provides new high performance air filtering.

	Nominal Sizes	Volume of Air Cleaned	ACTUAL DIMENSIONS Width	Height	Thickness 1" Filter	Thickness 2" Filter

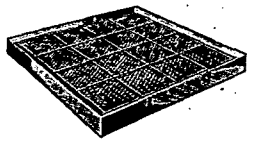
RESEARCH PRODUCTS CORP.



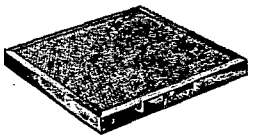
MADISON 1, WISCONSIN

Air Filters for Heating and Ventilating—Grease Filters for Kitchen Exhaust Systems—Paint Arrestors—Automatic Humidifiers

R P AIR FILTERS

Viscuous impingement, with controlled turbulence caused by scientifically staggered baffles is a feature of every R P Air Filter. In addition to high efficiency dust, dirt and pollen removal, R P washable air filters offer a bonus feature—ODOR REMOVAL—through the use of Super Filter Coat Adhesive.

E Z KLEEN AIR FILTERS

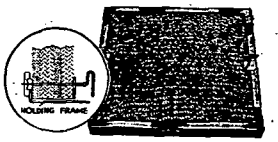


The aluminum, washable air filter that features easy cleaning and moderate cost. Available in ½ in., 1 in. and 2 in. thicknesses—all designed for velocities up to 350 fpm.

Multi-Velocity E Z Kleen Air Filters

For commercial-type installations, where a strong, yet light weight filter is required. Designed for both low and high velocities (350 to 520 fpm) and available in 1 in. and 2 in. thicknesses.

Industrial Air Filters

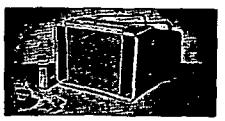


R P Industrial Air Filters are Multi-Velocity filters (250 to 600 fpm) with extremely low initial resistance, and slow build-up resistance. Outstanding where a rugged, heavy duty filter is required for industrial installations. In 1 in., 2 in., 3 in. and 4 in. thicknesses. Holding frames for filter banks, combination lift and lock handles, lift or bail handles are available.

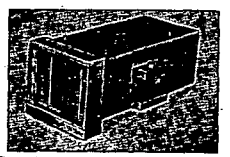
R P ADHESIVE

R P Super Filter Coat adhesive performs all the normal dust and dirt trapping functions, but also is scientifically compounded to adsorb and absorb odors—and prevent their re-circulation in the air stream. A "built-in" detergent simplifies the filter washing process. Available both as a concentrate and in ready-to-use form.

GREASE FILTERS



Efficiency in excess of 99 percent on grease vapors, gleaming appearance, ease of cleaning and light weight have made the R P Grease Filter a volume performance leader in its field. Inset illustration shows handle lock—also available with lift or bail handles. A free, comprehensive data booklet on kitchen exhaust systems is available on request.



PAINT ARRESTORS

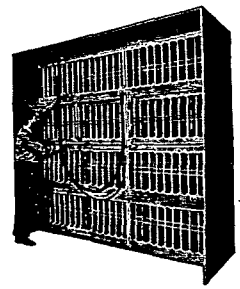
Specially designed, inexpensive, replaceable R P Paint Arrestors trap paint over-spray from spray booth exhaust air. Efficient in operation, R P Paint Arrestors are flexible and versatile—can be used in existing booths and in new installations. Easily installed (with Snap-in Grid to hold Paint Arrestor in frame), and maintained—reduce down-time and floor-space requirements.

APRILAIRE AUTOMATIC HUMIDIFIERS

Residential—3 models available . . . all featuring controlled high capacity (up to 9.2 lb of water per hour). Plenum Model illustrated; Universal Model for buildings with wet heat; Portable Model, requiring no installation.

Industrial-Capacities from 2½ to 10 gph . . . dust-free operation . . . positive control, models for all types of heating.

TRION, INC.

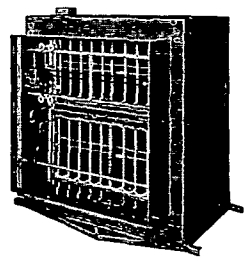


1000 Island Avenue McKees Rocks, Pa.
in Metropolitan Pittsburgh
Toronto, Canada Zurich, Switzerland
Dortmund, Germany Tokyo, Japan
Representatives in Principal Cities
Designers and manufacturers of equipment for cleaning and purifying air and other gases

TRION ELECTRONIC AIR CLEANERS

High efficiency air purification equipment. Electronically removes up to 97 per cent (*National Bureau of Standards Dust-Spot Test* method using normal atmospheric air) of dust, dirt, smoke, pollen, and germs from air. All airborne particles are electronically charged (positive) as they enter the Trion. They are then attracted to and collected upon grounded plates An integral washing system flushes the dirt to a sewer.

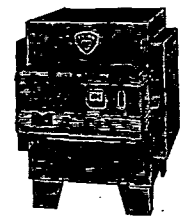
FIELD ASSEMBLED UNITS



The specific use of field assembled units is for installations requiring the cleaning of air in comparatively large volumes. An example would be multiple floors of a building. Units are sized to specifications for handling any volume of air. The unit consists of all basic components including power pack(s) for supplying the necessary current; required number of dirt collecting cells; and a built-in water spray system for removing collected dirt from cells.

Field Assembled Units

CUSTOM-BUILT *PACKAGED* UNITS



As an aid to the architect, engineer and installer, Trion will supply equipment constructed as a complete *package. Packaged* equipment is available for installation where space is limited. Units are designed for floor mounting or ceiling suspension and for horizontal or vertical air flow. Complete unit includes all basic units housed in a corrosion-resistant metal cabinet including drain pan. Sizes range from 1,300 to 10,000 cu ft of air per minute.

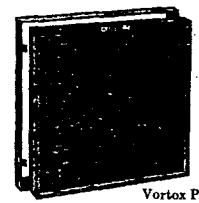
Custom Built Package Unit

PACKAGED RESIDENTIAL UNITS

The standard *packaged* units are designed primarily for residential and small commercial installations. Because of ease of installation, they are also being widely used for industrial and commercial applications where the volume of air to be cleaned is relatively small. Units are available in suspended models or for floor mounting in sizes to handle from 800 (average 5–6-room home) up to 9,600 cu ft of air per minute. Units are sized to the capacity of the furnace or air-conditioning blower.

Package Residential Unit

OIL MIST PRECIPITATOR UNITS



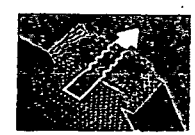
These units are specifically designed for the elimination of coolant oil mist and smoke emanating from high-speed cutting, grinding, and machine operations. Flexibility is provided in that they can be mounted on the floor, on the machine, or suspended from roof trusses. The basis components are the same as for field-assembled units. Under normal machining operations the daily oil recovery from a Trion Oil Mist Precipitator may be as much as 3 to 5 gal.

VORTOX COMPANY

Claremont, California

Panel Air Filters for all Industrial Applications

Vortox Panel Air Filters are of the cleanable, impingement, viscous-coated type with exceptionally low air flow resistance. They are made for use in air conditioning ventilation, range canopies, engine intakes, and general air filtration.



Vortox Panel Filter with Frame

Vortox Type VR Panel Air Filter illustrated above is the type used on engine intakes and in car bodies of diesel locomotives. It is constructed to withstand the *severe usage of locomotive service.* It has exceptional characteristics as in all types of Vortox Panel Air Filters.

FILTER ELEMENT. Fabricated of elastic units of fine steel wire positively interlocked to provide a permanent filter, the element offers many advantages: (1) In a 2 in. x 20 in. panel there are from 9,300 to over 15,000 feet of fine steel wire, depending upon the type. (2) Even distribution of filaments exposes innumerable viscous-coated surfaces to the air stream, thus obtaining the most effective cleaning for space occupied. (3) Proper spacing of filaments prevents clogging and assures maximum dust removal efficiency. (4) Structural strength and permanent resilience combine to withstand "packing" effect of vibration and pulsation.

EFFICIENCY. *Vortox* Panel Air Filters are efficient at both high and low air flows. Consequently to reduce costs of the original installation or to save space, fewer Vortox Filters may be used at higher air velocities. To assure a longer service life, more Vortox Filters may be used at lower velocities. In either case, Vortox Panel Air Filters provide better cleaning at lower cost.

OPERATION. Numerous changes in direction of dust laden air cause the dust particles to impinge on the adhesive viscous-coated surfaces of the filter element. Coarser particles collect near the entrance, while finer

particles penetrate to a greater depth. As the entrance becomes saturated, the cleaning action takes place deeper in the filter and the restriction is increased slightly. Increased restriction in certain sections of the filter diverts the air to cleaner sections, thus distributing the dust load for a higher over-all efficiency and a greater total dust-holding capacity. EASY TO CLEAN. All dust and lint are easily and completely flushed from the filter by water or steam sprays.

Nominal Size of Panel Inches*	Actual Outside Dimensions Inches	Capacity Range In CFM**	Outside Dimensions of Holding Frames Inches
16 x 20 x 2	15⅝ x 19½ x 1⅜	640 to 950	16¼ x 20⅛ x 2
16 x 25 x 2	15⅝ x 24⅝ x 1⅜	800 to 1200	16¼ x 25⅛ x 2
20 x 20 x 2	19¼ x 19½ x 1⅜	800 to 1200	20⅛ x 20⅛ x 2
20 x 25 x 2	19¼ x 24⅝ x 1⅜	1000 to 1550	20⅛ x 25⅛ x 2

* These filters are also made in 4-in. thickness.

** Some filter manufacturers specify very high velocities which are applied to certain internal dimensions of the filter. The range of capacities stated above are computed on the basis of average to high velocities applied to the total filter area using the actual outside dimensions of Vortox Panel Air Filters.

Westinghouse Electric Corporation

Sturtevant Division

**Heating, Ventilating, Cooling, Dehumidifying,
Electronic Air Cleaning and Mechanical Draft Equipment**

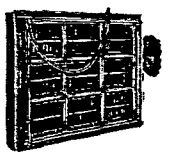
Main Office—Boston 36, Mass. Offices in Principal Cities

PRECIPITRON® ELECTRONIC AIR CLEANERS

By catching and holding dust, dirt, smoke, pollens and bacteria as small as one-tenth of a micron, the Westinghouse **PRECIPITRON** provides clean air for homes, hospitals, public buildings, commercial and mercantile establishments and industrial plants. A product of research and development by Westinghouse engineers, **PRECIPITRON** is available in unitary and field assembled models, all easily installed and with capacities to meet exacting requirements.

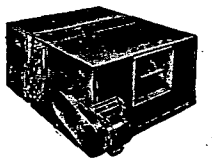
HIGH CAPACITY UNITS—available from 2500 to 120,000 cfm for use in central ventilation and air conditioning systems. Units feature automatic washing—built-in high voltage connections—simplified erection.

IN-LINE AIR CLEANER SECTIONS—match standard Air Distributing Units for Air Conditioning, Heating, Ventilation and Air Cleanliness control. Sizes from 2000 to 28,800 cfm—built-in traverse washing, in economy or automatic models.



HEAVY DUTY UNITS—especially for industrial applications where dust concentrations are greater. Available with one side or dual side automatic washing, remotely controlled in sizes and capacities from 6000 cfm up.

CABINET UNITS—available in high capacity and heavy duty models. Self-contained—built-in traverse washing—suspended or platform mounting. Capacities 2000 to 28,000 cfm in high capacity, 2000 to 12,000 in heavy duty models.



RESIDENTIAL UNITS—for home heating and air-conditioning systems. Save on household cleaning and redecoration—cost little to operate.

OIL MIST CONTROL UNITS—collect coolant oil mists generated by high speed machinery. Fan is built-in for individual machine ventilation.

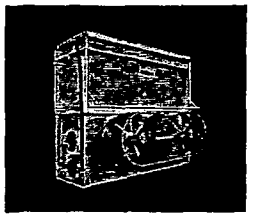
EVAPORATIVE CONDENSERS — COOLING TOWERS

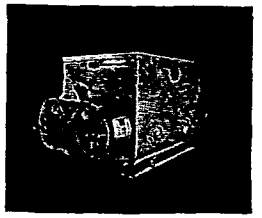
B.A.C. EVAPORATIVE CONDENSERS



10 to 350 Tons for Freon 12, 22 or Ammonia

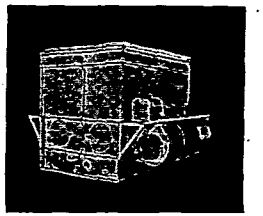
Blow-Through
Centrifugal Fans
Maximum Accessibility

Draw-Through
Centrifugal Fans
Minimum Floor Space



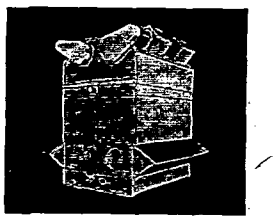
Blow-Through
Propeller Fans
For Horsepower Saving

One of the most complete lines of Evaporative Condensers offered. From 3 different models, you can select the unit that exactly suits your installation requirements.



Baltimore Aircoil Company has specialized in the manufacture of Evaporative Condensers for 20 years and is a recognized leader in this field.

B.A.C. COOLING TOWERS



Up to 400 Tons in a single, factory-assembled unit

Flexi-Tower
Propeller Fans
Adjustable Capacity

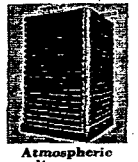
Blow-Through
Centrifugal Fans
Quiet Operating

Draw-Through
Centrifugal Fans
Ideal for Indoors

A new line of adjustable capacity Flexi-Towers is now available. Without any mechanical changes to the tower, Flexi-Tower capacities can be varied over a wide range to meet changing load requirements.

All B.A.C. units require as little as ½ the space needed for field-erected cooling towers. This, plus their quiet operation, makes them ideal for today's modern buildings where the cooling tower must be inside or otherwise hidden from view. These units are of rugged, hot-dipped galvanized construction, and even the largest sizes require only a simplified and inexpensive base.

Binks Manufacturing Company

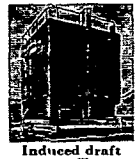


3130-36 Carroll Avenue, Chicago 12, Illinois

Representative in all principal cities

BINKS NATURAL AND MECHANICAL DRAFT COOLING TOWERS

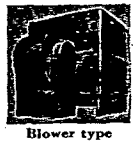
Binks atmospheric spray cooling towers



Small sizes, in a variety of standard units with capacities ranging from 10 to 125 gpm—larger units handle from 600 to 1,200 gpm. Special designs furnished in sizes of exceptionally large capacity. Standard tower capacity and temperature performance are based on nozzle pressure of 7 lbs per sq in. Ask for *Bulletin 512*.

Atmospheric cooling towers, Type "T"

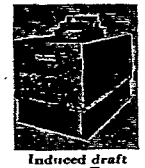
Binks steel cased induced draft cooling towers



Towers of this type are of the spray filled or deck filled type—made in 20 standard *sizes of sq ft rated* area. Larger models are engineered to specification. Air propulsion assemblies for either type can be arranged for V-belt or reduction gear drive, as required. Ask for *Bulletin 533*.

Induced draft towers, Types "2-K-S", "2-K-W"

Binks blower type mechanical draft cooling towers



The squirrel cage blower provides extremely quiet operation. Available in single or multiple types, capacity range from 9 to 800 gpm of cooling water. Ask for *Bulletin 477-A*.

Blower type towers, Type "3-B"

Binks multi-finned, plastic decked induced draft cooling towers

New POLYETHYLENE plastic decking provides efficient evaporative cooling surface in small area. No nozzles needed for initial water break-up. Decking slides out for easy cleaning maintenance. Capacities from 15 to 180 gpm. All components pre-assembled for easy installation—hot-dipped galvanized. Fan is stainless steel. V-belt drive. Ask for *Bulletin WT-501*.

Induced draft towers, Type "Watertemp"

BINKS SPRAY NOZZLES FOR EVERY PURPOSE

Binks non-clogging Rotojet spray nozzles

Non-clogging Rotojet nozzles are the heart of every Binks water cooling system. They account largely for the efficiency and satisfactory operation of Binks water cooling installations. In addition to cooling tower applications, Binks Rotojet nozzles have found a wide number of uses in brine-spray and quick-freeze refrigerating systems, air-washing equipment, metal cleaning and treating machines, chemical plants, etc. Rotojets produce a uniformly fine fluid breakup in a hollow cone pattern.

Binks small and medium capacity Rotojet nozzles

To fit ⅛ to ¾ in. pipe connections. Regularly *supplied in brass*, with male or female threads, as specified. Discharge orifices are available over a considerable range for each size. Rotojet nozzles of this type are designed on the side inlet whirl chamber principle, which produces a fine fluid breakup and a uniform spray pattern.

Binks heavy-duty Rotojet nozzles

To fit 1 to 2½ in. pipe connections. Female threads only. Discharge orifices *available in various sizes*, from $^{9}/_{16}$ to $1^{13}/_{16}$ in. The totally unobstructed involute type of whirl chamber produces a uniformly fine water breakup at low pressures (5 to 7 lbs).

Binks pneumatic atomizing nozzles

Series 50 nozzles are designed for use wherever conditions of controlled humidity must be maintained, as in the storage of perishable products, paper storage and printing plants, textile mills, greenhouses, etc. Nozzles of all brass construction deliver round or flat spray and are designed for use with automatic siphon or pressure feed installations.

Standard small and medium Rotojet nozzles are machined from brass bar stock, but can be made on special order from monel, stainless steel, or other machinable metals. Large, heavy-duty Rotojet nozzles for use in large cooling towers and spray pond installations, are cast from high quality brass with precision machined threads and orifices. These nozzles may be cast in other metals for special purposes.

Binks Spra-Rite nozzles

Produce a solid mass cone spray pattern. Small sizes for ¼ to ¾ in. connections are widely used for air washing, cooling, brine refrigeration, rapid evaporation processes, filtering systems, chemicals, etc.

Binks large capacity Spra-Rite nozzles

To fit 1 to 3 in. connections meet a variety of heavy-duty uses in blast furnace gas washers, vibrating and revolving screen coal and gravel washers and water cooling.

Free technical bulletin and engineering service

Binks 28 page *Bulletin No. 5600 contains* a wealth of useful information for anyone specifying spray nozzles for air conditioning, refrigeration, humidifying, heating and ventilating, or similar heat transfer processes. Nozzles shown above and all other nozzles in Binks line are illustrated and described. Data given include nozzle dimensions, capacities and spray angles. Cutaway drawings explain *nozzle operation* in many cases. "Blue print" drawings show installation details for heating and cooling uses where this information is required. Write for a free copy without obligation.

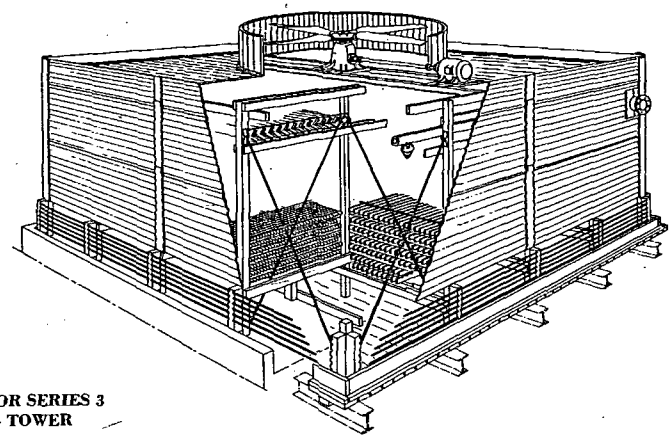
Binks engineering service in planning and installing cooling systems is available *without obligation or cost to architects*, heating and ventilating engineers and builders.

FLUOR PRODUCTS COMPANY

Fluor Products Company — Air Conditioning and Refrigeration Cooling Towers

AC & R Division: Meadows Bldg. Dallas 6, Texas

General Offices: 12000 E. Washington Blvd. Whittier, California



A Division of the Fluor Corporation, Ltd.

District Sales Offices, Agents & Representatives in:
Albuquerque, El Paso, Detroit, Philadelphia, Shreveport, Phoenix, Amarillo, Louisville, Mission, Kan., Memphis, Atlanta, Jacksonville, St. Louis, Cincinnati, Austin, Dallas, Houston, Charlotte, Minneapolis, Washington, D. C., Pittsburgh, Miami, Orlando, Daytona, Tampa, Birmingham, Richmond, New Orleans, Whittier, Corpus Christi, Denver, Salt Lake City, Oak Park, New York, San Francisco, Cleveland

SERIES 3 COOLING TOWER

Offers complete coverage for the Air Conditioning, Refrigeration System field with appeal for *architectural design*. The sheathing material is $^{5}/_{8}$ in. corrugated asbestos-cement, having the corrugations in the horizontal plane. Compact counterflow design requires minimum plan area, and fits rigid space requirements.

Supporting structure may be oriented in any direction. Perimeter anchorage and uniform column spacing simplify design of supports. Water inlets may be located on any wall. The tower is offered with either V-Belt or gear drive. Single and multiple cells cover any required capacity of 40 tons and up.

THE FLUOR SERIES 3 COOLING TOWER

Gives you these extra features . . .

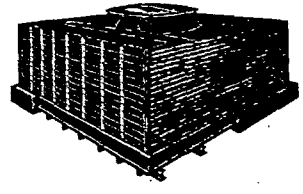
Rugged Construction The entire tower structure with its *tension type bracing* and thru bolting of all members is designed to withstand 30 lb wind load (100 mph). Wood stress values are in accordance with the *U. S. Forest Products Handbook*.

Poly-Grid Fill Fluor patented polystyrene Poly-Grid *fill* gives more cooling per cubic ft than any other fill available, reduces total operating weight by ¼ to ⅓ over conventional wood *fill* towers. *Wood Fill (illustrated in right of cutaway)* also available.

Redwood Distributing Systems Header and laterals of redwood stave construction are completely non-corrosive. Low pressure splash plate units of non-ferrous material are non-clogging and self-draining.

Standard Accessories Galvanized steel hardware, wood ladder, and redwood basin with sump, sump cleanout, overflow-drain and makeup float valve.

Optional Accessories Handrails, Fan guard, non-ferrous hardware.



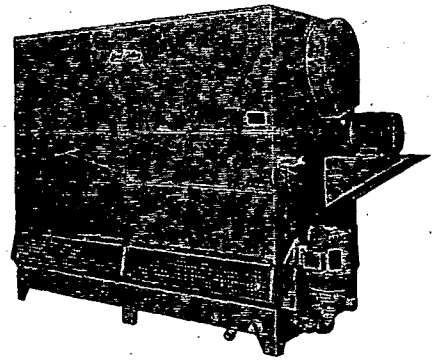
Fluor Air Conditioning and Refrigeration Cooling Towers are available thru exclusive Representatives in all major market areas. Experienced service and erection personnel are *strategically located* to render service to the owner when and where needed.

Write for additional information.

SERIES 2 COOLING TOWER

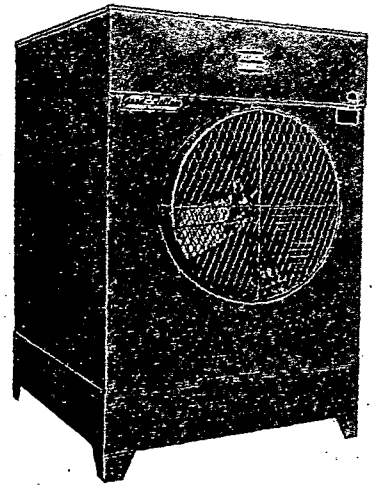
This tower is offered for installations requiring minimum height, with less critical limitation on plan area. The capacity range is similar to that of the Series 3 Cooling Tower.

Write for additional information.



E. D. Goodfellow Co., Inc.

Memphis, Tennessee



Good-Fellow COOLING TOWERS

GOOD-FELLOW CF Series: These models are produced in capacities from 2 to 100 TR. They are available with our standard corrosion resistant finishes or hot-dipped galvanized (after fabrication). Standard units have double air inlet and vertical discharge. Front or rear horizontal discharge and/or front or rear air inlet are available on order. This series is available with fan motor only, or with separate arrangement for close-coupled pump mounting. These models are leakproof. Models 15 tons and larger are constructed in three sections to facilitate erection and installation. They are normally shipped completely assembled.

We believe the CF Series is one of the most versatile types of cooling tower available.

CF Series

P Series

GOOD-FELLOW P Series: These models are manufactured in tonnage from 3 to 180 TR. All sizes of this series are designed to withstand a wind pressure of 30 lb per square foot. Large diameter slow speed fans produce efficient and quiet operation. Decibel ratings are furnished upon request.

Clear heart Redwood is used for deck filling. Inlet and discharge louvers are also of Redwood. All models P8 and larger can be completely taken apart, the largest section being the cold water basin. Motors on all models through P30 are mounted inside of tower casing. All models of this series are **HOT-DIPPED GALVANIZED** after fabrication. They can also be supplied with corrosion resistant Epon epoxy exterior and Epon Coal-tar pitch interior finishes.

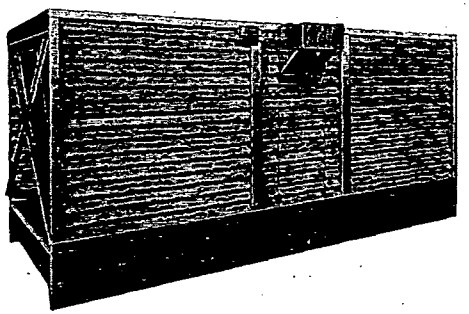
HAVENS "33 Series" 5 to 75 Tons

FEATURES



- All steel parts hot dipped galvanized after fabrication.
- Heavy Fan Screen
- Belt Guard
- Weather protected motors
- Stainless Steel Fan Shaft (our own bearing design)
- Stainless Steel Fan Blades
- Corrosion-resistant cast-iron sheaves
- Steel sheets, heavy gauge hot rolled mild steel

The "33 Series" is recommended for residential and small commercial installations. The units are shipped assembled, ready for installation. Water tray distribution system assures ample spread over all-heart, California redwood fill. All steel parts are hot dipped, double galvanized before assembly. Towers can be disassembled and reassembled with ease when necessary. Special fan bearing design assures quiet, trouble-free operation for years; it requires little maintenance.

HAVENS "V SERIES" Models 80 thru 600 Tons

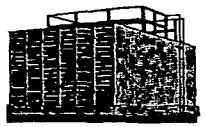
(Models above 200 tons are field erected.)

- Recommended for medium and large commercial and industrial installations.
- Low, modern silhouette for pleasing appearance.
- Transite casings (corrugated cement asbestos board)
- Unique bearing design cuts maintenance costs.
- Models 80 to 200 tons are factory-assembled units—larger tonnages are field erected.

Havens "V Series" Cooling Towers are ruggedly constructed to stand years of service under the most adverse weather conditions.

Wood fill is California clear, all-heart red wood with unique tray arrangement to gain most advantageous water distribution.

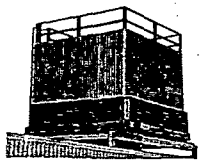
The variable pitch fan provides versatility. To minimize installation costs detachable hoisting yoke is furnished with each tower.



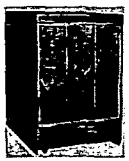
Product bulletins and specification data available on request.

Lilie-Hoffmann Cooling Towers, Inc.

Exclusive Builders of Cooling Towers Since 1898

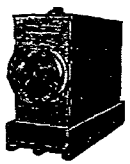


1450 So. Vandeventer Ave., St. Louis 10, Mo.

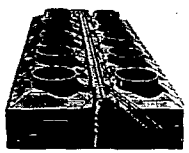


Two Modern Plants—St. Louis, Mo., and Plainview, Texas

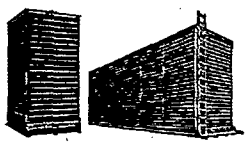
LILIE-HOFFMANN CROSS FLOW TOWERS . . . Outstanding for its "Low-Hite" and low pumping head. Ruggedly constructed to serve intermediate sized air conditioning and refrigeration installations. Appearance designed to fit and complement modern architecture. Economical in first cost as well as operational cost, yet same high standard of quality of materials and mechanical equipment are maintained. *Bulletin CM-456*



LILIE-HOFFMANN COUNTER-FLOW TOWERS . . . Highly functional with conservative, highly efficient spray distribution. Choice of casing materials will fit any architecture—may be installed inside of masonry enclosure with louvered openings. Low cost, space saving tower with very high performance record. This tower is particularly useful for high efficiency designs. Cast aluminum variable pitch multi-bladed fans are supplied. *Bulletin LM-456*



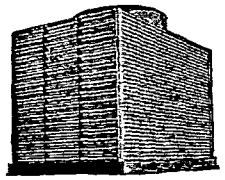
LILIE-HOFFMANN NEW WATER-MASTER COOLING TOWER . . . Steel packaged units distributed by dealers. Built to Lilie-Hoffmann high standard quality with heavy duty motor. Standard equipment includes air inlet and outlet screens. Have many years of built-in maintenance free operation with a high performance record. Size from 3 to 60 ton —shipped assembled. Large units are easily disassembled for special handling. *Bulletin WM-757*



LILIE-HOFFMANN HORIZONTAL DRAFT PACKAGE TYPE TOWER . . . Designed for 4 to 100 ton air conditioning and refrigeration installations. Side walls are of corrugated and/or flat cement asbestos with stainless steel trim. Long service life with no painting problem means conservative operation. All towers equipped with either 4 or 6 bladed, deep pitched, low speed fans for delivery of maximum air at minimum horsepower and low decibel rating. *Bulletin CU-857-5M*

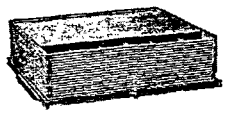
LILIE-HOFFMANN INDUSTRIAL INDUCED DRAFT TYPE . . . A very heavy duty tower providing the maximum in high efficiency for large capacities. Designed with conservative ratings. Provides independent operation of individual cell or group of cells. Cells can be arranged in-line or back to back. Pumping head design is low. Installations are world wide. *Bulletin MD-94-Z*

LILIE-HOFFMANN ATMOSPHERIC SPRAY TOWERS . . . Manufactured in two models. Smaller CS series for air conditioning and refrigeration up to 50 tons which are distributed by dealers. Larger S series for heavy duty and large capacity industrial installations. Heart quality redwood throughout. Galvanized wrought iron headers with bronze nonclogging spray nozzles supplies on both models. Completely prefabricated with simple instructions for easy erection. *Bulletins CS and S.*



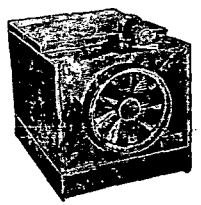
THE MARLEY COMPANY

222 W. Gregory, Kansas City 13, Missouri



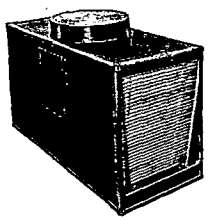
Representatives in All Principal Cities (Consult Classified Phone Directory)

Water Cooling Towers of All Types and Capacities. Spray Nozzles



MARLEY DOUBLE-FLOW AQUATOWER®

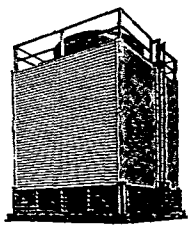
MARLEY DOUBLE-FLOW AQUATOWER . . . For performance —and professional acceptance . . . there is nothing like the Double-Flow Aquatower in the intermediate-capacity cooling field. This "low silhouette," low pumping head cooling tower is designed for air conditioning and refrigeration jobs of 50 tons or more. It has open gravity water distribution, full height louvered walls and all fittings and mechanical equipment are readily accessible. Available in wood or steel structure with asbestos cement board casing and in single or multi-cell arrangements. Write for *Bulletin DFA-58.*



MARLEY UNDERFLOW® AQUATOWER

MARLEY UNDERFLOW AQUATOWER . . . First intermediate capacity cooling tower with no louvered sides or ends. Mechanical equipment is located beneath tower which inherently baffles operating sounds and facilitates inspection and service. Structural framework of steel cold water basin acts as grillage; only corner support columns required. Hot water basins at top are covered, leaving minimum air discharge area at ends exposed from above, greatly increasing fire-safety. Casing and basin covers asbestos cement board. Write for *Bulletin UA-58.*

MARLEY AQUATOWER®

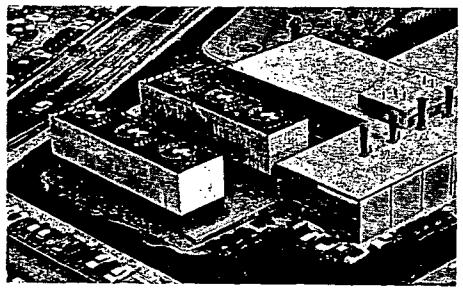


MARLEY AQUATOWER . . . Available in a complete range of 11 sizes, rated for servicing from 3 to 60 tons of air conditioning or refrigeration. Thousands of steel packaged units have proved themselves in years of maintenance-free operation. They are stocked by dealers throughout the country—are shipped completely assembled and require no field construction. Large units may be readily disassembled for easy handling. Write for *Bulletin AQ-58.*

MARLEY PERMATOWERS®

MARLEY PERMATOWERS . . . Available in 11 sizes, are the newest packaged cooling towers designed for maximum resistance to corrosion. They combine the time-proved design principle of Marley double-flow cooling with many new design features, including all-plastic water distribution piping assembly, plastic depressed sump, plastic fan cylinder, resin-impregnated-fiber surfaced laminated casing and basins. Write for *Bulletin PT-58.*

MARLEY COUNTER-FLOW SERIES, STEEL AND WOOD . . . This new series of Marley counterflow cooling towers is designed especially for heavy duty air conditioning and refrigeration service. The all-steel model (with corrugated asbestos cement board casing) is designed to meet fire codes in all metropolitan areas. Both the steel and wood models blend well with modern architecture. May be installed with any combination of louvered walls open providing unusual flexibility and maximum utilization of usable space. Write for *Bulletins CS-58 and CW-58.*

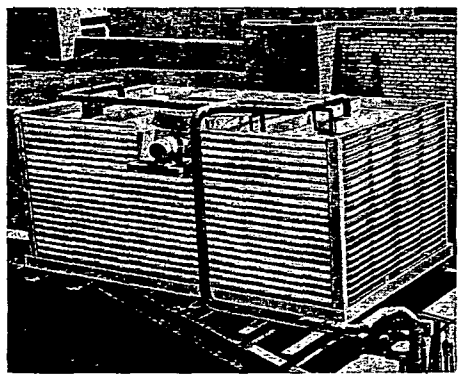


COUNTER-FLOW STEEL

MARLEY CROSS-FLOW . . . For large capacity industrial cooling, Marley offers 2 towers that utilize the patented Marley Cross-Flow principle—The Double-Flow and Single-Flow. Write for *Bulletin CF-58.*

MARLEY SPRAYTOWERS . . . Complete line of all-redwood natural draft cooling towers; capacities from 2 tons up. Write for *Bulletins ST-58 (up to 35 tons) 200-58 (above 35 tons).*

Phillips Cooling Tower Co., Inc.
220 DUPONT ST., BROOKLYN 22, N. Y.



HEADQUARTERS FOR COOLING TOWERS

(150 TONS and UP)

Tower on left is redwood framed Type WT with cement asbestos casing and louvers. Type WT towers are available from 500 tons and up.

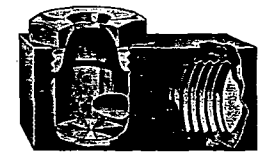
Counterflow Type Towers available with either redwood or steel framing. Steel framing members are all hot dipped galvanized after fabrication in accordance with ASTM specifications. Partitions, louvers and siding of cement asbestos board are standard on this type of tower.

Series "DA" towers are available in California redwood, or Hot Dipped Galvanized framing. Corrugated cement asbestos board casing, laid horizontally, is fastened to frame with Galvanized bolts and Neoprene washers. Slipfit louvers of flat cement asbestos board provide easy access. All hardware is Hot Dipped Galvanized.

SPECIAL FEATURES ON ALL TOWERS

Corrosion Resistant Hardware. Aluminum or Stainless Steel Fans. Nailless Redwood Filling Removable at Tower Base. Nailless Three-Pass Redwood Eliminators. Removable Louvers.

Monarch Manufacturing Works, Inc.



2509 E. Ontario St., Philadelphia 34, Pa.

SPRAY NOZZLES FOR WATER AND OIL

NON-CLOG AIR WASHER NOZZLES

Produce an exceptionally efficient, evenly distributed hollow cone spray. Single large tangential inlet to swirling chamber minimizes any possibility of clogging. Also available in ⅜ in. to 1 in. pipe sizes inclusive, and of Brass, Stainless and Monel.

AEROFIN CORPORATION

101 Greenway Avenue, Syracuse 3, N.Y.

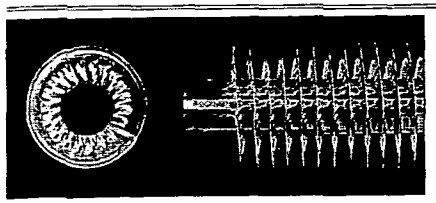
Standardized Light-Weight Heat Exchanger Surface

There is a factory-trained Aerofin application and service engineer located near you to give you prompt service. Write, wire or phone the factory.

Available in a wide range of sizes and types for heating, cooling, air conditioning and process, Aerofin is the modern standardized light-weight encased fan-system surface designed by *fan engineers* to meet present and future requirements of this highly specialized field.

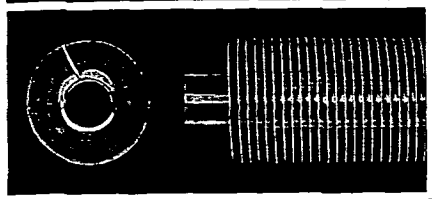
All standard Aerofin units are furnished as completely encased units, ready for pipe and duct connections. The patented casings are built of pressed steel and are exceptionally strong and rigid to protect the unit from all strains of pipe connections and expansion or contraction in service. The casings are flanged on both faces, top and bottom, and template-punched for bolting adjacent units together or for easy duct connection.

Guarantee



Aerofin is guaranteed, when properly installed and operated at pressures and temperatures not exceeding those specified, against failure or leakage due to faulty material or manufacture. The Aerofin Corporation will furnish a new unit, fob car Syracuse, N. Y., or Kingston, Ontario, for replacement of any unit found defective in either material or workmanship within one year from date of shipment of original unit, when such defective unit is returned to the factory at Syracuse, N. Y., or Kingston, Ontario.

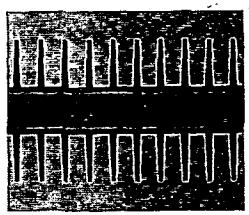
Extended Surface Exclusively



Aerofin manufactures light-weight extended-surface heat exchangers exclusively – not as a side line or accessory. Modern manufacturing, research and engineering facilities give real meaning to the Aerofin guarantee. Aerofin ratings are accurate – units may be safely installed to the full rated capacity.

Aerofin heat exchangers are rated according to accurate research laboratory test data and operate efficiently at full rated capacity.

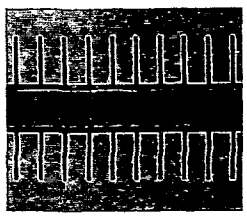
Old Type Aerofin Surface with Crimped Fins



New Patented Aerofin Surface with Smooth Fins

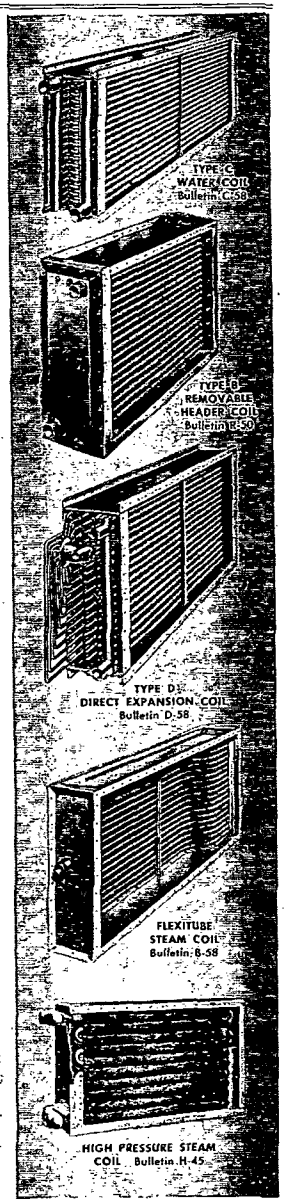
Smooth-Fin Construction Provides Greater Capacity – Less Air Resistance

With air resistance and turbulence caused by the corrugations in the old-style fins now eliminated, note how many more fins can be used per inch of tube length. Note the extremely low air friction of this new design.

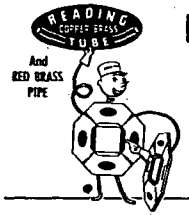


For optimum service, aluminum fins are spaced 14 fins per inch; copper, 12 fins per inch. Because of the low friction losses, high air velocities are entirely practical. This, combined with maximum heat transfer per sq ft of face area, results in extremely high heating or cooling capacity in relation to the available space.

For lower temperature differences, the tubes can be spaced on wider centers as required, or fewer rows may be used.



Aerofin Tapered Fin



The wide contact base of the new Aerofin tapered fin conducts sufficient heat between fin and tube to make the entire fin effective transfer surface. It is not necessary to crimp the fin to provide the required contact surface.

Conventional Straight Fin

The relatively small amount of heat conducted by the small contact surface means that only a portion of the fin is effective heat transfer surface. Such fins are generally crimped to provide greater contact surface.

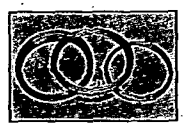
READING "LEKTROSEAL"® COPPER REFRIGERATION TUBE

Soft tempered easy forming—Dehydrated

Handy, 50 ft coil in convenient protective carton

Crimped ends seal out all moisture and dirt

Reading refrigeration tube is made to the highest standards. Composed of 99.90% pure deoxidized copper, every coil is thoroughly dehydrated and sealed at the mill before being packaged. Its immaculately clean inside surface is the result of the most modern production methods and exhaustive inspection operations.



All sizes of refrigeration tubing are regularly shipped in 50 foot lengths. Coils are individually packaged inside master shipping cartons.

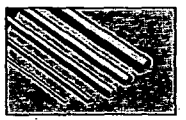
MACKENZIE WALTON SMALL SEAMLESS QUALITY PRECISION TUBING

in Copper and Copper Alloys

- Famous for Accurate and Fine Finish Tubing
- Quality Controlled from Start to Finish
- Produced to Your Exact Specifications

CAPILLARY

SHAPE



CAPILLARY—Available in coil and straight lengths from 0.031 in. OD to 0.250 in. OD and 0.009 in. to 0.055 in. in wall thickness, depending upon alloy and form specified. We guarantee uniformity of size, cleanliness and smoothness of bore, and consistency of temper. Modern methods and equipment under constant control by skilled metallurgists, assure quality from start to finish.

SHAPE—Whatever shape you specify . . . rectangular, square, oval, fluted, reeded, embossed, specialty or architectural, all Mackenzie Walton shape tubing is produced to meet the most exacting requirements. Available to your specifications within our size range in copper and copper-base alloys in random mill or exact cut lengths. Consult us on all applications.

THIN WALL—Available in Copper (DHP or OFHC), Brass (70/30, 85/15, 80/20), Bronze (95/5, 90/10) and Nickel Silver (18 percent, 15 percent, 10 percent) in size ranges from 1/32 in. to ⅜ in. OD, and wall thickness 0.007 in. and upward, depending on alloy and form specified. Noted for fine quality and cleanliness of OD and ID, our thin wall tubing is always made to close tolerance.

BRAIDED—Where armor or reinforcement of capillary tubing is an important factor, we will braid to your exacting requirements. Choice of B & S wire gage size in eye-appealing copper, tinned copper, stainless steel, galvanized steel, and aluminum with one to four layers over capillary tubing from 0.031 in. to 0.125 in. outside diameter, in wall thickness from 0.009 in. to .040 in.

BOURDON—Our Bourdon tubing assures you absolute, minimum tolerance variation for instrument accuracy. Quality controlled through rigid inspections means consistent spring properties, accurate size and constant wall thickness. We can furnish six standard size groups in random mill or exact cut lengths, in wall thicknesses from 0.0039 in. to 0.068 in., or to your specifications.

READING "READI-FIN" Type W/H IS EASILY FABRICATED

That same rugged construction and design that gives Type W/H finned tube its high performance characteristics, also readily lends itself to being coiled, bent or formed into the particular type of bundle you desire. This feature is important. Since the fins are an integral part of the tube, any bending or coiling does not affect the strength of the concentricity. The performance remains high and the durability lasting. "Readi-Fin" Type W/H is available in the "as finned" or "annealed" temper. Annealed temper is suitable for bending.

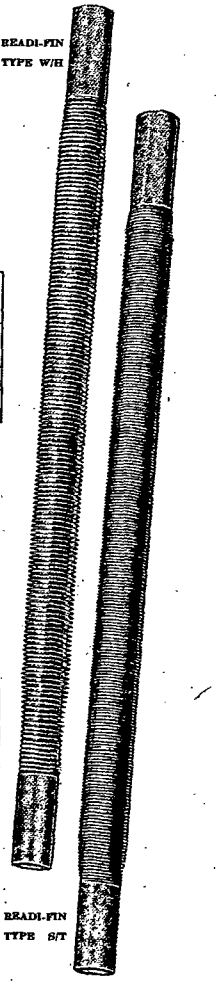
READING READI-FIN Type S/T EXTENDED SURFACE CONDENSER TUBE



"Readi-Fin" Type S/T—the extended surface condenser tube—is designed primarily for shell and tube heat exchangers. Tube ends may be finned, stripped or plain. The outside diameter of the plain end is approximately the same as the outside diameter of the fin. "Readi-Fin" Type S/T, with plain ends, is fabricated in shell and tube heat exchangers in the same manner as plain condenser tubing. "Readi-Fin" Type S/T is available in "as finned" or "annealed" tempers. The "as finned" temper has plain ends suitable for rolling-in operation. The "annealed" temper is suitable for bending.

The G & O Manufacturing Company

140 Winchester Avenue **New Haven 8, Connecticut**

G&O

INDIVIDUAL AND STRIP FIN TUBING

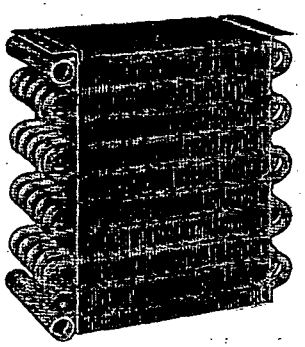
We manufacture a complete line of high efficiency heat transfer surfaces in a wide range of standard sizes with individual square, round and oblong fins.

The use of individual fins permits using fins in groups at intervals along the straight length of any tube for the manufacture of U-bends, continuous return bend, and spirally wound coils. Where space permits, the use of square or oblong fins provides proportionately greater surface than a round fin of a diameter equal to one side of the square or oblong fin.

G&O Individual Fin Tubing is available for heating coils of every description, including unit heaters and blast coils, intercoolers, aftercoolers, baseboard radiation, and convector elements.

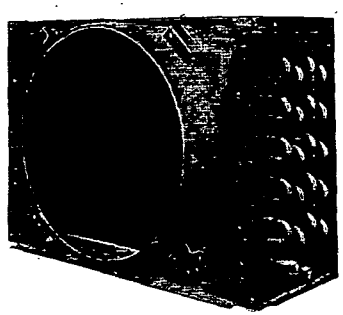
STRIP FIN TUBING

Continuous strip aluminum fin tubing is particularly suited for cooling and air conditioning coils. The lightweight all aluminum construction is of advantage in installation where weight is an important factor. Various fin spacing is available and sections can be stacked to provide any practical number of rows in direction of air flow within the limits of maximum height and width area dimensions.



G & O continuous strip fin coils are produced in two standard sizes: ⅝ in. OD tubing with ⅞ in. wide continuous strip fins, or ⅝ in. OD tubing with $1\frac{1}{16}$ in. wide continuous strip fins.

INDIVIDUAL FIN TUBING



STANDARD SIZES

OD of Tube	Fin Size	Fin Spacing per Inch	Surface per Linear Foot
⅜"	⅞" sq	6	0.80 sq ft
⅝"	1⅜" r'd	6	0.87 sq ft
¾"	1¼" r'd	6	1.55 sq ft
¾"	1⅝" sq	6	2.40 sq ft
¾"	1⅝" sq	7	2.95 sq ft
⅞"	2⅛" sq	6	4.15 sq ft
⅞"	2⅛" sq	5	3.50 sq ft
1"	2⅛" sq	6	4.00 sq ft
1⅛"	2⅛" sq	6	3.82 sq ft

RADIATING ELEMENTS FOR ALL HEAT TRANSFER PURPOSES ARE AVAILABLE IN A WIDE RANGE OF SIZES

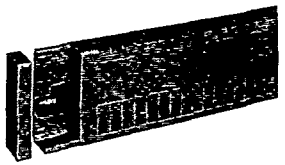
Rittling THE RITTLING CORPORATION

103 Kentucky St. Buffalo 5, N. Y.

REPRESENTATIVES IN PRINCIPAL CITIES

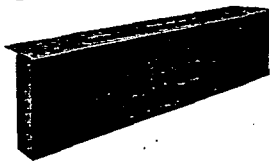


Prompt delivery from strategically located warehouses

RITTLING Heating and Ventilating equipment includes a complete line of finned tube units for residential and non-residential application; Wall and Baseboard Radiation, Convector Radiators, Unit Heaters, Back Draft Dampers, Air Cooled Condensers. Engineering and capacity data is included in catalogs mailed on request.

RITTLING FINNED TUBING

Steel tubing in 1 in., 1¼ in., and 2 in. IPS sizes. Steel tubing is supplied with steel fins. Copper tubing is available with 1 in. and 1¼ in. nominal sizes with aluminum fins. *Catalog FT55.*

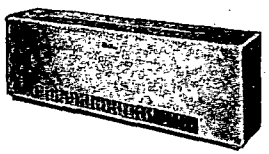


RITTLING 1200 HEAVY DUTY BASEBOARD

Heavy sheet steel cabinets with louvered inlet and outlet grilles. Designed for semi-recessing. Available with 1 or 2 heating elements for high output in short runs. *Catalog BB56A.*

RITTLING SIL-VECTOR

Attractive enclosures with rounded top, bottom, and ends. Outlet louvers located at top and front radius. Die formed louvered inlet panel at bottom provides strength, rigidity, and integral support for front panel throughout its entire length. *Catalog FT55.*



RITTLING SIL-N-WALL

Top of cabinet takes place of window sill. Front takes place of plaster finish under windows where unit is installed. Sizes fit standard window designs. Variety of heating elements in single, double, and triple height to provide needed output. Length and height as required. *Catalog FT55.*

RITTLING 485 BASEBOARD

RITTLING 485 Baseboard is only 6 1/16 in. low and projects 2 5/16 in. into the room—only 1½ in. when recessed to the depth of the plaster. Ideal for installation under picture windows. One-piece back plate has integral top and bottom cover. Covers are finished in neutral prime. Adjustable damper can be easily installed at any time. *Catalog BB-485.*

RITTLING SCHOOLMASTER UNIT VENTILATORS

Are complete heating and ventilating units with heating elements, circulating fans, air filters, and dampers to control the fresh air volume. Steel cabinets, available in five sizes, have baked-on enamel finish in a choice of colors. *Catalog UV-1157.*

MATCHING STORAGE CABINETS. Heavy steel cabinets match Schoolmaster Unit Ventilators to form an unbroken line when joined. Available with and without concealed heating element. Also furnished with locking doors.

ASK FOR YOUR COPY OF CATALOGS.

RITTLING BASEBOARD RADIATION. Rittling offers a complete line of fabricated steel baseboard radiation in five basic types to meet every requirement of residential and non-residential specifications. Wide choice of heating elements and enclosures provides sizes and designs to fit every installation condition. *Catalog BB-56.*

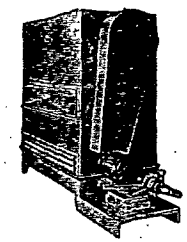
9 SOUTH CLINTON ST.

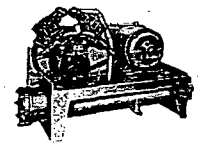
OVER 100 YEARS OF SUCCESSFUL MANUFACTURING EXPERIENCE

REFRIGERATION • AIR CONDITIONING

Complete Line of Units from ¼ to 100 hp. Unit Coolers, Air Handling Units, Evaporative Condensers and Cooling Towers.



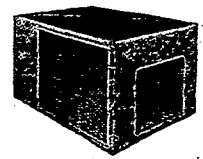
Air Conditioning Equipment, Packaged and Central Types. Complete Refrigerating Equipment for Dairies, Cold Storage Locker Systems, Walk-in Coolers, Drinking Water Systems, Commercial and Low Temperature Cooling and Processing.



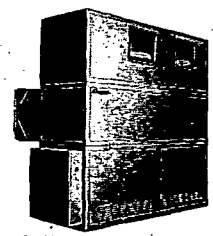
Combination air and water cooled Condensing Units. ⅓ through 3 hp.

COMMERCIAL REFRIGERATION

Air cooled condensing units from ¼ to 3 hp, inclusive, combination air and water cooled units from ⅓ to 3 hp, inclusive, and water cooled units from ½ to 100 hp, inclusive. All models charged with Freon 12 refrigerant. Mechanical advantages include Timken Bearings, Positive Pressure lubrication.

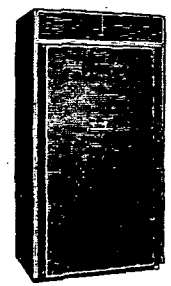


Evaporative Condensers, Cooling Towers, Air Handling Units. 3 to 100 tons.

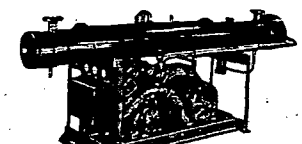


15 hp Cleanable Shell and Tube Condensing Unit. Other sizes from 7½ to 100 hp.

AIR CONDITIONING



Curtis offers complete packaged air conditioning units. Air cooled condensing units with various types of matching coils can be added to present heating system. Water cooled units can be supplied with air cooled condenser. Water cooled units adaptable for heating.



Air Cooled Type 3-5-7½ Tons

25-30-40-50 Ton Packaged Air Conditioners

3-5-7½-10-15 and 20 Ton Packaged Type Air Conditioner

MANUFACTURERS OF AIR CONDITIONING AND REFRIGERATION EQUIPMENT

ICE-CEL ACCUMULATOR UNITS
LATENT HEAT ICE STORAGE SYSTEMS FOR AIR CONDITIONING

EXTERIOR ICE-CEL TANK

ICE-CEL INTERIOR X-UNIT

APPLICATION

DOLE ICE-CELS are used wherever the air-conditioning load is high for a relatively short period of time, such as in churches, mortuaries, auditoriums, lodge halls, cafeterias, offices, theaters, motels, retail stores.

OPERATION

The ICE-CEL consists of an assembly of DOLE Vacuum Plates submerged in a tank of water. A condensing unit is connected to and refrigerates the plates, causing ice to build up on their surface. A control is available to stop the condensing unit when the ice has reached any desired thickness. When cooling is to begin, chilled water from the ICE-CEL is pumped through a water coil in the air stream. In passing over this coil, the air gives up its heat to the water which is then returned to the ICE-CEL for re-chilling and re-circulation.

COMPRESSOR REQUIREMENTS

Since the compressor capacity can be spread over the whole day, if necessary, rather than just for the duration of the actual cooling period, a much smaller condensing unit, together with a correspondingly smaller cooling tower or evaporative condenser, can be used. This eliminates the need for water economizers. Also a compressor used for other purposes and not needed full time can have its idle periods devoted to building up ice on the ICE-CEL to be used while the compressor is doing its regular job. As a result, operating costs are kept at a minimum, especially in areas where demand power rates are in effect. The existing power service to the building is usually adequate.

HOLDOVER CAPACITIES AND BUILD-UP TIME FOR STANDARD ICE-CEL UNITS

STANDARD ICE-CEL UNITS		LHS-12 or LHS 12x		LHS-21 or LHS 21x		LHS-31 or LHS 31x		LHS-51 or LHS 51x

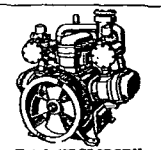
Unit Air Conditioners, 10 & 15 hp.

AIR CONDITIONING

Complete Frick systems, including original designs, in all sizes: also refrigeration for use with equipment supplied by others. Thousands of installations, the world over, attest the value of Frick air conditioning, which has 50 years experience behind it. See Frick *Bulletin 502* on hospital work; *505* on installations and systems; *522* on unit conditioners; and *146* on Frick air conditioned storages, which are revolutionising the cold storage industry. Estimates cheerfully furnished.

LOW-PRESSURE REFRIGERATION

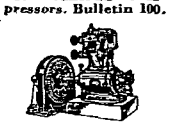


Small commercial units, "ECLIPSE" multi-cylinder compressors, and larger heavy-duty enclosed compressors, handling refrigerants 12 or 22, provide a complete and efficient line to meet your exact needs. We build unit air conditioners, central systems, plain and finned coils, water coolers, condensers, controls, valves and fittings: no job too special for Frick Engineers.

AMMONIA REFRIGERATION

Heavy-duty vertical compressors, with 2 or 4 cylinders, in sizes from 2½ to 1000 tons of refrigeration: handle refrigerant 22 equally well. Useful life of these dependable machines averages 40 years. Highly economical for cooling water on air conditioning, and for heat-pump service, in addition to regular refrigeration duty. Booster systems, developed by Frick Engineers 30 years ago, provide power savings at low temperatures. "ECLIPSE" compressors, with 3, 6, or 9 cylinders, also supplied for ammonia work.

SERVICE



We supply the most complete service, including recommendations, estimates, design, manufacture, installation, test and maintenance. One responsibility, one superior standard. Quotations cheerfully furnished through Branch Offices and worldwide Distributor organizations.

THE READY POWER CO.

DETROIT 14, MICHIGAN

NATURAL GAS PACKAGED AIR CONDITIONERS

GENERAL DESCRIPTION—Ready-Power Air Conditioning Units combine modern, Freon compressors with medium-speed industrial-type gas engines. These packaged gas air conditioning units are performance-tested under actual operating conditions to insure long, trouble-free, service.

These units operate on clean natural gas. Engine carbon deposits are nearly non-existent. These natural gas-carbureted engines last 3 to 5 times longer than similar engines operated on gasoline.

OUTSTANDING ECONOMY—Less than 13 cu ft of low-cost natural gas is required per ton hour. Fuel consumption is in direct proportion to the actual load throughout over 80 percent of the capacity range. A power take-off pulley is provided on the engine shaft to provid for belt-driven tower pumps. The economy combination of low fuel requirement, engine-powered tower circulation, and "matched to the load" fuel consumption makes Ready-Power outstanding in net refrigeration costs.

AUTOMATIC OPERATION—All Ready-Power Units are available with either Thermostat Start or Push-button Start Controls. All models are equipped with a-c electric starting motors and automatic LOAD-MATCH capacity controls.

Thermostat Start Units start and stop automatically in response to the setting of your thermostat. Push-button start units must be started and stopped manually.

AUTOMATIC CAPACITY CONTROL—Automatic Capacity Control is achieved by varying the operating speed and by unloading compressor cylinders after the unit has dropped to the minimum operating speed. This means that the pumping rate of the compressor is exactly matched with the cooling load. In this manner, maximum operating economy is realized.

This "LOADMATCH" capacity control system permits almost continuous compressor operation at a constant evaporator coil temperature, the result of which is extremely close control of humidity and temperature without the need for large re-heat systems.

COMPRESSORS—Modern precision balanced Freon 12 and 22 compressors assure a minimum of vibration. The Ready-Power control system automatically unloads compressor and permits start-up at idle speed with all cylinders unloaded. Approximately 2 to 3 minutes are required to fully load the compressor after start-up. This greatly decreases start-up impact loading on valves, bearings, etc., and substantially increases compressor life over similar equipment operating at synchronous constant speeds of 1750 rpm or higher.

COMPACT AND READY TO RUN—Complete "packaging" of auxiliary controls and accessory items with the direct driven compressor unit permits quick, easy installation in a space measuring only 3 ft × 7 ft.

MATCHED WATER CHILLERS—Ready-Power offers completely balanced and tested refrigerant systems for water-chilling applications. Matched chiller-condenser units are designed to take full advantage of the variable capacity feature of the engine compressor units. The chiller and condenser are mounted on a heavy structural steel frame assembly, completely piped and wired. A control cabinet houses the necessary related solenoids relays and switches and other controls.

LONG SERVICE LIFE—Powered by medium-speed industrial engines, these systems have achieved an outstanding reputation for dependability and long service. The compressors represent the latest developments in design, engineering, and manufacture, and are long-wearing and smooth-running. Units are equipped with automatic engine oil level controls and closed engine water cooling circuit.

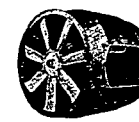
Aerovent Fan Company, Inc.

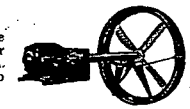


Ash and Blade Sts. Piqua, Ohio

Efficiency-engineered industrial fans and air handling equipment

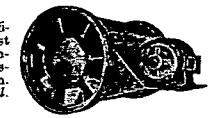
DIRECT CONNECTED

Heavy-duty units for industrial exhaust or air supply. Steel ring or panel orifice. Size 9 in. to 96 in. with 2, 4 or 6 blades. For capacities to 145,000 cfm. Also available in Extended Shaft and Pulley types. Write for *Bulletin 100.*



SEMI-PRESSURE FANS

Standard units with new 7-blade propellers move more air with less power at resistances to 4 in. S.P. Sizes 14 in. to 60 in. Five types. Shown is "Bi-Flo" Duct Fan. *Bulletin 400.*



EXTENDED SHAFT

For high temperature, moisture or corrosive conditions. Ring or panel orifices. Sizes 12 in. to 84 in. with 2, 4 or 6 blades. Capacities to 120,000 cfm. *Bulletin 100.*

VANEAXIAL

Designed for maximum efficiency and economy against resistances to 6¼ in. S.P. High-velocity, straight-line air discharge. Sizes 12 in. to 48 in. Capacities to 77,000 cfm. *Bull. 450.*

NEW "LS" FANS

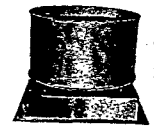
Belted and Direct Driven Ring, Panel or Duct types with new 4-blade "Macheta" Airfoil Propellers for peak performance at resistances to 1½ in. S.P. Sizes 24 in. to 48 in. for capacities to 46,000 cfm. Ask for *Bulletin 750 and 775.*

AIR MAKE-UP UNITS

Tempers and filters outside air entering working areas. Steam, hot water and gas-fired types. Sizes 24 in. to 54 in. 2, 4 or 6 blades. Capacities to 45,000 cfm. *Bulletin 850–875.*

PORTABLE UTILITY

For personnel cooling, product drying and processing and fume removal. Adjustable for 180 degree discharge. Sizes 16 in. to 36 in. for capacities to 20,450 cfm. *Bulletin 250.*



CENTRIFUGAL BLOWERS

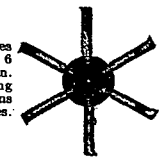
For materials-handling, dust-collecting or exhaust systems. Reversible rotation. Adjustable discharge. 19 in., 26 in., 33 in., 40 in. and 51 in. wheel diameters. *Bulletin 700.*

MANCOOLERS

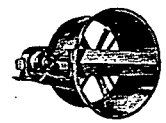
For spot cooling of men and machines, exhaust and general air circulation. Cradle, pedestal and 2 or 4-wheeled types. Portable, adjustable for 180 discharge. Sizes 24 in. to 48 in. with 2, 4 or 6 blades. Capacities to 40,000 cfm. *Bulletin 250.*

ROOF VENTILATORS

Three models, featuring rugged all-weather construction with new 'low-level' design. Sizes 12 in. to 72 in. 2, 4 or 6 blades. Capacities to 93,500 cfm. *Bulletin 600.*



DIRECT-DRIVEN DUCT



Preferred by industry for high-velocity air circulation and exhaust of non-hazardous atmospheres. Sizes 12 in. to 96 in. 2, 4 or 6 blades. Capacities to 145,000 cfm. *Bulletin 150.*

LARGE DIAMETER PROPELLERS

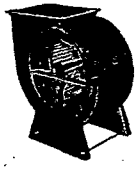
Adjustable-pitch aluminum alloy blades with cast aluminum hubs in 4 and 6 blade types and sizes 54 in. to 144 in. New AL-Metal propellers for cooling tower and heat exchanger applications in sizes 14 in. to 18 in. with 4 or 6 blades. *Bulletins 500 and 510.*

BELT-DRIVEN DUCT

Recommended for handling dusts, fumes, vapors, high temperatures and hazardous atmospheres. Sizes 12 in. to 96 in. 2, 4 or 6 blades. Capacities to 145,000 cfm. *Bulletin 160.*

PENTHOUSES

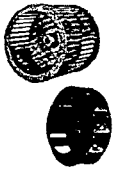
Weather-tight enclosure for exterior mounted fans. Eliminates downdrafts; provides safe exit for fumes and vapors. Sizes 16 in to 72 in. Shutters optional. *Bulletin 650.*



MEMBER *AIR MOVING AND CONDITIONING ASSOCIATION (AMCA)*

Air deliveries of Aerovent equipment are determined in accordance with established and accepted codes and each unit is guaranteed by the manufacturer to deliver rated performance.

CERTIFIED PERFORMANCE



AIRFAN ENGINEERING COMPANY

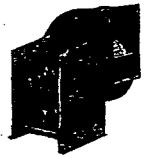
7401 Telegraph Rd.
Los Angeles 22, Calif., U. S. A.
(Telephone RAymond 3-3354)

←HEAVY DUTY BLOWERS

Forward and backward curved wheels. Single inlet single width and double inlet double width. Wheel diameters range in size from 12 in. to 60 in. Any rotation, discharge or arrangement.

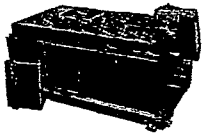
BLOWERS AND SCROLLS→

Made for original equipment manufacturers of air handling units and evaporative condensers. Heavy duty riveted construction, center or end suspension wheels. 12 sizes; 10 in. diameter to 30 in. diameter, standard or hot dipped galvanized.



←STANDARD BLOWERS

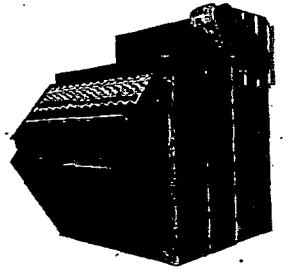
Medium duty blower assembly made in single or double width, sizes 10 in. to 30 in. wheel diameter, and features universal discharge arrangement. Motor mounting in any location.



AIR WASHER EVAPORATIVE COOLER →

With slinger spray type water distribution system as part of packaged unit, assembled ready to use. Special features of design insure high cooling efficiency and lower maintenance costs. Features such as fiber glass evaporative and eliminator filters washed continuously by efficient slinger spray.

←UTILITY FANS



For general ventilation, complete with weather-proof covers. Self contained package units ready to run, easy installation. 300 cfm to 20,000 cfm. Wheel diameters 10 in. to 30 in. Forward and backward curved wheels.

AIR HANDLING COMBINATION UNITS→

Offering a complete line of air handling and comfort-conditioning units, utilizing direct expansion, water and steam coils for cooling and heating. Wide selection, both in vertical and horizontal arrangements. Capacity range from 1600 cfm to 35,400 cfm with special emphasis on quiet operation and thermal-acoustical insulation.

MULTIZONE AIR CONDITIONERS→

With the **Heat Supplied by AGA Approved Gas Fired Furnaces** from 200M-Btu to 1,200M Btu Input. Available in horizontal and vertical arrangements—Twelve sizes with capacity from 2500 to 35,000 cfm. Cooling coils from 6 to 60 square feet. Supplies air mixtures blended for simultaneous unequal heat load demands up to 25 individual zones from single unit.

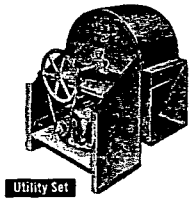
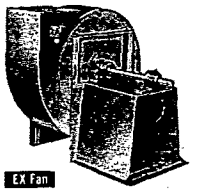
Aladdin AIR HANDLING EQUIPMENT

1111 West Avenue 137, San Leandro, California

Manufacturers of Centrifugal Blowers, Heating and Ventilating Equipment



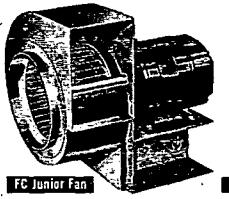
BB FANS—Backwardly inclined blade fan with non-overloading horsepower characteristic. Manufactured in 22 sizes, single and double width, all arrangements, 2 classes of construction. Request *Bulletin 605-A, 605-B.*



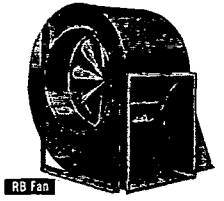
BB Fan

FC Fan

FC FANS—Forward curved fan, slow speed for quiet operation. Manufactured in 22 sizes, single and double width, all arrangements, 2 classes of construction. Request *Bulletin 605-A, 605-C.*



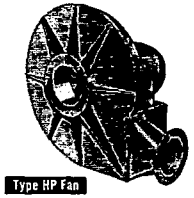
UTILITY SETS—Self contained units for a wide variety of ventilating applications. Manufactured in 14 sizes with forward curved rotors, 12 sizes with backwardly inclined blade rotors, single width only. Request *Bulletins 610-A, 611-B.*



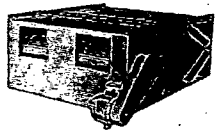
Utility Set

EX Fan

EX FANS—Radial blade fan used chiefly for conveying materials, fume exhaust, etc. Manufactured in 15 sizes, single width only, all arrangements, 5 classes of construction, 3 wheel types. Request *Bulletin 461.*



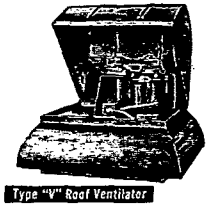
FC JUNIOR FANS—*Self contained direct connected fans with* forward curved rotors. Manufactured in 5 sizes with 13 motor speeds, single width only. Request *Bulletin 422.*



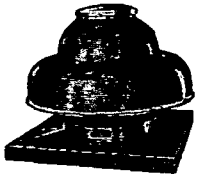
FC Junior Fan

RB Fan

RB FANS—Radial blade fan well suited for handling grease or other sticky materials. Manufactured in 13 sizes, single width only, all arrangements, 2 classes of construction. Request *Bulletin 450-C.*



HP FANS—Designed for applications requiring low air volumes at high pressures. Manufactured in a variety of combination sizes. Request *Bulletin 470.*



Type HP Fan

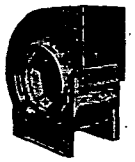
Type "M" Fan

TYPE "M" FAN UNITS—Self contained units for a wide variety of commercial and industrial requirements. Manufactured in 7 standard sizes, units are available with accessory face and by-pass dampers, filter boxes and mixing boxes. Request *Bulletin 510-A.*

TYPE "V" ROOF VENTILATORS—Backwardly inclined blade centrifugal type. Manufactured in 13 belt driven and 12 direct driven sizes with steel, aluminum, copper or stainless steel housings. Request *Bulletin 410-B.*

Type "V" Roof Ventilator

Type "S" Roof Ventilator

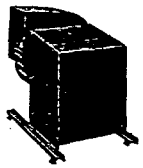


TYPE "S" ROOF VENTILATORS—Backward inclined blade centrifugal type. All units fabricated from spun aluminum. Available in both direct connected and belt driven models. Request *Bulletin 411.*

BAYLEY BLOWER COMPANY

Engineered Air-Handling Equipment

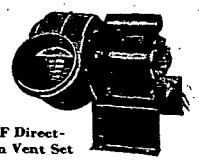
1821 S. Sixty-Sixth St. Milwaukee 14, Wis.



Representatives In Principal Cities

Type AP Ventilating Fan

GENERAL VENTILATING & AIR-CONDITIONING FANS



Bayley Type AP Fans have backward-inclined blades, non-overloading power characteristic. They are made in Classes I, II, III & IV for air-conditioning systems, plant and building ventilation, process air-handling, mechanical draft. Sizes from 12¼-in. to 132½-in. wheel diameter, capacities from 1000 to 700,000 cfm, all standard drive arrangements, single and double width. Complete line of modifications and accessories. Sizes up to 365 (36½-in. wheel diameter) have reversible housings, facilitating prompt delivery of any discharge position in popular drive arrangements. All standard housings are made with scroll seams inside-welded for strong, tight construction, smooth exterior.

Belted Vent Set

BELTED VENTILATING SETS

Compact unitary sets, complete with drive and motor, serve a wide variety of applications, such as kitchens, gymnasiums, lavatories, garages, restuarants, hospitals, laboratories, industrial plant areas. Sets may be used for supply or exhaust ventilation. They are available in wheel diameters from 9-in. to 36½-in., for capacities from 500 to 15,000 cfm. Smaller sizes have Type F forward-curved wheels, larger sizes have Type AP backward-inclined wheels, as required for most suitable drive selections. Wheels and housing are of same design and construction as regular Class I fans. Protective drive covers and automatic outlet louvres are available for outdoor installation.

Type F Direct-Driven Vent Set

DIRECT-DRIVEN VENTILATING SETS

Sets with forward-curve wheel mounted on motor shaft are particularly suited for light-duty low-capacity requirements. Wheel sizes from 4½-in. to 10½-in., capacities from 100 to 1500 cfm. Larger sizes made to order as regular arrangement 4 fans. Typical applications include small rooms, booths, cabinets, compartments, equipment cooling. Housings and wheels are designed and built for permanency under hard usage. Inlet screens and filters are available. Also can be equipped with motor cover for outdoor installation. These sets are particularly recommended for incorporation as ventilating or cooling fans in factory-built apparatus.

Type EX Industrial Exhaust Fan

INDUSTRIAL EXHAUST FANS

Type EX Fans are of the radial-blade medium speed design best suited to the wide diversity of industrial air-handling requirements. Sizes range from 5-in. to 60-in. inlet diameter, 8-¾-in. to 104¼-in. wheel diameter. 200 to 55,000 cfm capacity. Style GP open, back-plate wheels are recommended for the majority of materials handling applications. Style AH closed wheels are designed for maximum efficiency when handling clean air or gas. Many modifications and special construction features can be incorporated for unusually severe conditions of abrasion or corrosion. Temperatures up to 1450° F can be handled with appropriate bearing selections and heat flinger arrangements.

Type H Pressure Fan

PRESSURE FANS

Type H Fans are proportioned to suit high pressure/volume ratio characteristically required in certain phases of pneumatic conveying, cupola blast, burner draft, suction or blast cleaning, and the like. Usual pressure range is from 12-in. WG to 55-in. WG (2 psi). Four designs are offered: No. 1, to 21-in. SP; No. 2, over 21-in. to 28-in. SP; No. 3, over 28-in. SP to 35-in. SP; No. 4, over 35-in. SP. While basic sizes and proportions are established, the necessary flexibility of selection for the wide range of pressure volume combinations is provided by varying widths of fans as required. Wheel diameters are also variable in sufficient degree to achieve proper operation at standard direct-connected motor speeds.

BROOKSIDE CORPORATION

McCordsville, Indiana

Manufacturers of: Fans • Blowers • Ventilating Equipment

Brookside Corporation is large enough to serve you well—small enough for frequent contact between management and production supervisory personnel to insure top quality and coordination of all customer requirements. Brookside offers custom engineering free of charge—and production at competitive prices. A company-owned airplane is maintained to offer the fastest possible service and engineering assistance when it is necessary.

4-Blade with Ring

M-PEL-AIR 6-BLADE ONE-PIECE FANS; One piece fans in a wide range of sizes from 6 in. diameter 4-Blade to 14 in. diameter 6-Blade. Some models with slinger rings for room air conditioner application. Manufactured of aluminum or steel.

4-Blade without ring

6-Blade without Ring

M-PEL-AIR AUTOMOTIVE TYPE: Heavy-duty automotive type fans, both single and double spider types, in both steel and aluminum blades. A wide range of sizes from 10 in. diameter through 85 in. diameter. Available in 4, 5, 6, and 8 blade designs. Suitable for use on gasoline or diesel engines and cooling tower applications.

Offset Type

M-PEL-AIR ROOF EXHAUSTERS: Available in a wide range of models and types ranging from 250 cfm to more than 11,000 cfm. Spun aluminum construction with aerodynamic design for greater efficiency. Entire line features extremely low silhouette. Backward inclined, non-overloading centrifugal fan wheels assure quiet operation.

Slinger Type

M-PEL-AIR GRAVITY ROOF EXHAUSTERS: Engineered and designed for fresh air intake or relief of pressure within building. Lightweight, spun aluminum housing construction. 8 Models. Motor operated or spring loaded back-draft eliminators, cylindrical bird guards, bug screens optional on all models.

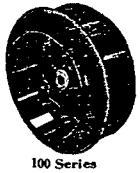
Direct Drive Exhauster

M-PEL-AIR BELT DRIVE ROOF EXHAUSTERS: Power unit is resilient-mounted for quiet operation. Fan wheel design, unrestricted air flow make for quiet operation. Rigid spun aluminum housing. All belts, pulleys, bearings and motors standard sizes. Low silhouette blends well with contemporary architecture.

4-5-6 & 8-Blade Automotive Type

M-PEL-AIR FAN BLADES: Slinger-type for air conditioning or offset spider and conventional propeller type fans for ventilating and other applications. All engineered exactly to your specifications free of charge. Slinger rings are all one-piece die drawn. Research and laboratory facilities available to solve air moving problems on your product.

Gravity Roof Exhausters



6-Blade One Piece

M-PEL-AIR SIX BLADE: One-piece or fabricated construction in a wide range of diameters, any pitch, in aluminum or steel. Gives efficient air movement against higher static pressures. Solid or resilent hub. Also available in three and four blade.

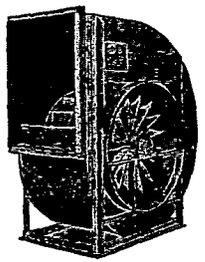
Belt-Drive Exhausters

M-PEL-AIR OFFSET TYPE: Gives maximum space-saving features by bringing blade around the motor. Brookside's advanced design blades give higher efficiency and may be made reversible.

100 Series

M-PEL-AIR SLINGER BLADE: Solid die-drawn slinger rings, with the tabs a part of the blade, operate at low sound level and high efficiency. Designed especially for air conditioning and refrigeration industry.

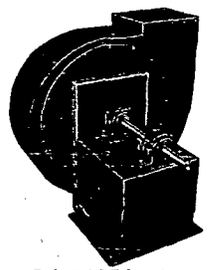
200 Series



M-PEL-AIR 100 & 200 SERIES BLOWERS: 100 series specifically designed for higher pressure applications. Rugged construction with conical shaped inlet ring welded to blades. Available from 14 to 60 inch diameter. Series 200 designed for lower pressures. Fabricated of aluminum, stainless, or steel, riveted throughout. Both series have backward inclined blades for low noise and non-overloading characteristics and are statically and dynamically balanced.

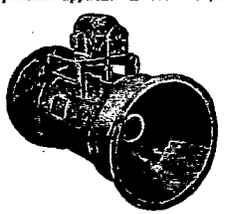
BUFFALO FORGE COMPANY

450 Broadway, Buffalo, N. Y.



Canadian Blower & Forge Co., Ltd., Kitchener, Ont.

Ventilating Fans (centrifugal, axial flow and propeller), Mechanical Draft Fans, Blowers, Exhausters, Air Washers, Drying Equipment, Air Conditioning and/or Cleaning Equipment, Unit Heaters, Air Preheaters, Packaged Power Roof Ventilators, Makeup Air Units, Spray Nozzles. "Buffalo" is ready to work with you on any air problem you may have. Call the "Buffalo" Engineering Representative in your nearest principal city, or write for *Bulletins* mentioned below.

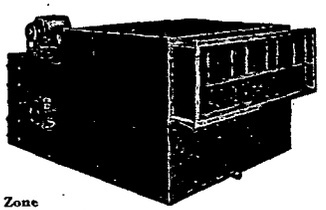


Type "BL" Fan

TYPES "BL" AND "BLH" *VENTILATING* FANS. Quiet, efficient, non-overloading fans with completely stable performance from free delivery to shut-off. Type "BL" Fans are designed for Classes I-II operation (moderate pressures). Type "BLH" Fans are designed for high pressure service covered by Classes III-IV. To provide minimum turbulence both fans have smoothly-curved inlet bell with directional guide vanes, wheel with full curvature shroud matching the inlet bell and streamlined, wheel-contoured housing. Type "BLH" Fans have divergent outlets, further minimizing turbulence. Capacities: 1,000 to 500,000 cfm. **Write for Bulletins F-104 and F-200.**

Industrial Exhauster

INDUSTRIAL EXHAUSTERS. All-welded steel plate construction is used in these heavy-duty fans. This provides smooth, rivet-free interior surfaces for minimum friction. Ease of maintenance is afforded by removable front and back plates. Available with interchangeable Air Wheels for airborne dusts, gases, fumes, or with Material Wheels for grit, sawdust grain, stringy materials. Corrosion-resistant construction can be specified. Available with heat slingers to handle gases up to 1000°F in induced draft and other high temperature applications. 600 to 37,000 cfm capacities. Write for **BULLETIN FI-110.**



Axial Flow Fan

AXIAL FLOW VENTILATING FANS. These lightweight fans fit into straight duct runs, requiring no more room than a section of round duct for ventilation, exhausting, system boosting, draft and circulation applications. Extremely efficient, quiet and non-overloading. In Vaneaxial fans, guide vanes redirect swirling air at fan outlet, converting it into increased forward thrust. Also available in Tube axial models (without directional vanes). Drives include direct connected motor-in-housing, or V-belt drive with motor out of air stream. Models for high or low temperatures, non-sparking and/or corrosion-resistant construction. Capacities: 2,000 to 65,000 cfm. **Write for BULLETIN 3720-A.**

AIR CLEANING EQUIPMENT. Air Washers for cleaning, humidity control, heating and cooling are only one of the many types of units built by "Buffalo." Also available are highly specialized units for abating nuisance effluents in the chemical and process industries. More than a half-century of experience in this field is at your service, plus our complete manufacturing facilities. Write for Bulletins on industry-proved "Buffalo" equipment to solve any air cleaning or processing problem you may have.

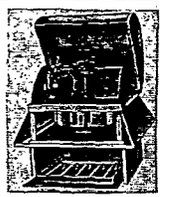
UNIT HEATERS. Widely-used for versatile, economical, efficient "spot-heating". One-piece, seamless copper coil is continuous from inlet to outlet discharge ground joint. This makes "Buffalo" Breezo-Fin Heaters desirable for high pressure steam systems because it eliminates all possibility of leakage inside the unit. Safety is insured for steam pressures up to 250 lbs. These units also operate on as little as 2 lbs steam. Adjustable louvers aim heat where needed; fins are spaced for maximum radiation; high-efficiency fans give quiet operation. Write for **BULLETIN 3137-E.** Also, a wide selection of heating and ventilating units, with or without filtered intake and by-pass dampers, suspended and floor models for large areas.

Zone Control Cabinet

ZONE CONTROL CABINETS. These quiet, compact, efficient units are designed for installations where it is most feasible to use a single unit to provide varying degrees of conditioned air for several zones. Temperature is controlled by mixing cooled and heated air in correct proportions to suit each conditioned space. No need for separate reheat coils and their controls! Sectionalized for easy handling and installation. Convenient to service, with handy access doors, removable panels and outside-located bearings. Space-saving design with floor or ceiling clips. Can be adapted to any combination of heating, cooling and/or dehumidifying. **Write for BULLETIN AC-220.**

CENTURY FAN & VENTILATOR COMPANY, Inc.

45 Cedar St., Stamford, Conn.

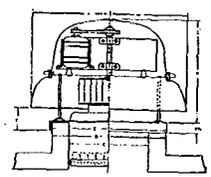


Plant #2 Torrington—Burrville, Conn.

Member of Air Moving Conditioning Association

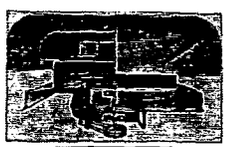
Over 25 years experience and engineering development behind its time-proven performance

CERTIFIED RATINGS — ASTORCERTIFIED BY AMCA



CENTURY CYCLONE ROOF FAN

A heavy duty centrifugal roof fan—compact, *symmetrical* and weatherproof design. High efficiency, large volume capacity, slow operating speed and quiet performance *makes the cyclone roof* fan excellent for schools and institutional type buildings.
Housings supplied in galvanized steel, aluminum, copper or stainless steel. Basic frame work constructed of heavy steel that guarantees long life and vibrationless operation.
Motors belt or direct driven in separate compartment—out of air stream.
Fan wheels are statically, dynamically and electronically balanced. Heavy plate construction, backwardly curved non-overloading type also furnished in non-sparking aluminum construction.
Motor and fan assembly suspended on rubber vibration eliminators.



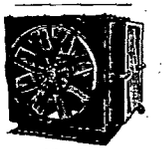
CENTURY SPUNAIR ROOF FAN

Designed to meet the modern architectural detail of low, one story buildings—streamlined gleaming appearance, low contour and simplicity of design.
Housing is of heavy gage spun aluminum—completely weatherproof. Designed to permit straight flow exhaust with venturi *inlet to minimize* turbulence.
The fan wheel is of heavy gage rugged construction—backwardly inclined, non-overloading type, statically and dynamically balanced, and quiet in operation.
Motor and fan are resiliently mounted out of air stream in ventilated compartment.
Spunair fans are made in direct and belt drive. Also furnished less motor and fan for intake hood.
Self-acting or electric operated damper.

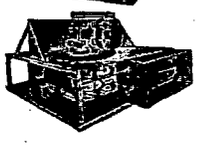
TYPE MVF ROOF FAN

Meets the requirements of extra large exhaust volume, incorporating low contour design and rugged construction.
Housing made of galvanized steel, aluminum, copper or stainless steel.
Heavy duty propeller—four blade—for low static pressure up to ⅜ in., and eight blades for static pressure up to ¾ in. W.G.
Direct and belt drive—hinged hood for accessibility. Supplied with self-acting or motor operated damper.

CENTURY BLOWER



Utility Blowers FC and BC—forward curved and backward curved non-overloading type wheels made in sizes 6 in. to 36 in. wheel diameter.



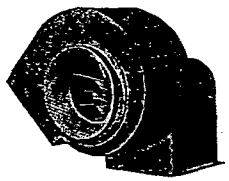
Sizes 12 in. to 90 in. wheel diameter

Class 1 Blowers	up to 3¾ in. S.P.
Class 2 Blowers	3¾ in. to 6¾ in. S.P.
Class 3 Blowers	6¾ in. to 9¾ in. S.P.

Heavy construction, manufactured in accordance with *AMCA* code of standardized arrangement, and testing procedure.
Newly designed high efficiency blower wheels are statically and dynamically balanced on the latest electronic balancing equipment.

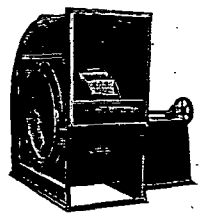
CENTURY DRAFT INDUCERS

Induced Draft Fans provide the proper draft without the use of high chimneys.
TYPE MID Inducer is an axial flow, non-overloading type fan, which is easily installed on the boiler breaching.
Bearings and shaft are protected from heat by a double shell shaft tube with impeller blade to keep a steady flow of cool air over the shaft and bearings.
Adjustable barometric damper with self contained explosion relief valve.
Motor is standard single or two speed belt driven, and protected with ventilated aluminum heat shield.
THE AUTOMIC INDUCER is a backward curved, non-overloading centrifugal type blower for heavy duty service, and used when high static pressure is encountered, such as old flues of undetermined resistance.
Motor may be single or two speed, and with adjustable sheaves. When used with sequence controls, the draft will be constant regardless of conditions encountered.



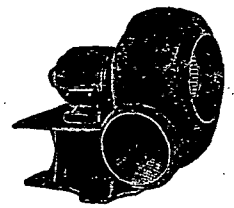
CHAMPION BLOWER & FORGE CO.

LANCASTER, PA.

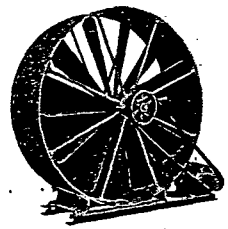


Address Correspondence to Div. 9

Manufacturers of Blowers, Ventilating Fans and Exhaust Fans for handling air, material and fumes



Representatives in Principal Cities



Champion Type D vent sets for general ventilation of all types equipped with backward curved non-overloading wheels up to 30 in. diameter, furnished complete with electric motor, adjustable drive and weather proof covers if required.

Champion Forward and Backward Curve Ventilating Fans and Exhaust Blowers manufactured in sizes up to 60 in. diameter. Fans also furnished in all standard arrangements with Ball, Babitted or Water Cooled Bearings as required.

Champion Cast Iron Housed Fans of various types for fume hood exhaust and for handling corrosive gases. Can be equipped with either plain steel or non-ferrous blast wheels, interior of housing and wheel can be covered with special corrosive resisting coating.

Champion Ventilating Fan for moving large volumes of air in either direction by reversing the rotation of the fan wheel. Develops pressures over 1½ in. w.g. Built in sizes from 18 in. to 84 in. diameter. Equipped with double Ball Bearings.

CHICAGO BLOWER CORP.

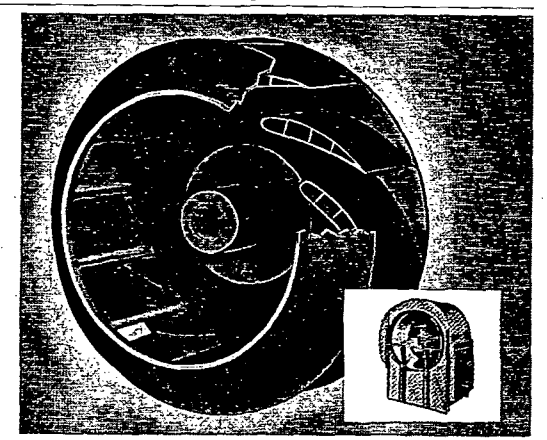
9871 Pacific Avenue, Franklin Park, Illinois

Blowers, Fans and Exhausters for Every Air Movement Requirement

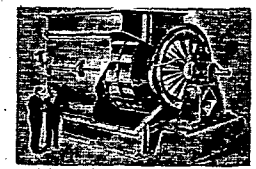
AIRFOIL BLADED CENTRIFUGAL FANS.

for heating, ventilating, air conditioning systems

Aerodynamically-shaped blades move more air with less turbulence, thereby achieving higher efficiencies with reductions in noise and current consumption.



efficiencies up to 92 percent

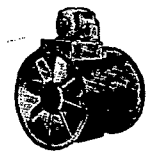


noise reduction up to 40 percent

horsepower savings up to 20 percent

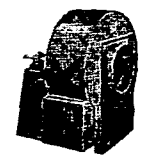
Capacities: 440 to 561,680 cfm up to 32 in. S.P. **Sizes:** 12¼ to 80¾. Class I to V arrangements for heavy and standard service. Direct or belt drive. Single or double inlets and widths. Adjustable and fixed housings for all discharge positions. Specified since 1951 for:

- high pressure and couventional ventilation.
- air supply and exhaust.
- industrial processing.
- mechanical draft.



AIRFOIL MECHANICAL DRAFT

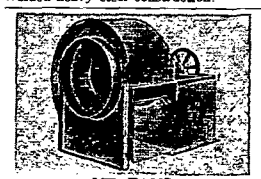
for power stations, heavy industry



All performance advantages of Airfoil Fan. **Capacities:** up to 1,097,940 cfm for temperatures to 900F; ¼ to 32 in. S.P. **Sizes:** 24½ to 80¾. Single or double width, with or without inlet boxes. Welded heavy steel construction.

AXIAL AIRFOIL FANS

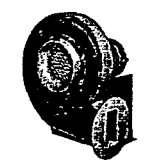
for exhausting fumes, hot gases; ventilation



Welded airfoil type blades provide higher pressure characteristics, less noise and greater strength. **Capacities:** 1100 to 105,000 cfm up to 5 in. S.P. **Sizes:** 12 to 72. Orifice ring, duct, cradle, pedestal.

STEEL PLATE EXHAUSTERS

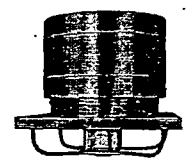
for material and dust handling



Separate wheels handle wood shavings, grinding dust, paper, fibrous and heavy materials. **Capacities:** 200 to 50,000 cfm up to 15 in. S.P. for temperatures to 1200° F. **Sizes:** 15 to 100. Arrangements for belt and direct drive. Adjustable.

MD FANS

for ventilating industrial, commercial, public buildings



Large volume and low pressure types housed in cast iron or heavy steel. Welded backward or forward curved wheels. **Capacities:** 300 to 17,000 cfm up to 1½ in. S.P. **Sizes:** 62 to 300. Belt or direct drive, adjustable discharge.

TURBO PRESSURE BLOWERS

for combustion, air, forging, pneumatic systems

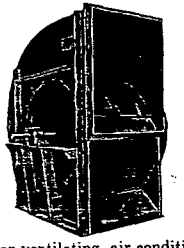
Supplies steady, high speed air pressure or suction. **Capacities:** 125 to 5250 cfm at pressures from 4 to 28 oz up to 750° F. Universal discharge adjustments. Direct or belt drive.

POWER ROOF VENTILATORS

for industrial, commercial ventilation

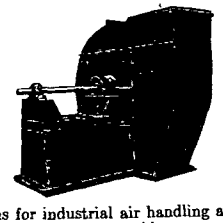
Packaged high velocity type. Welded axial airfoil wheel. Automatic butterfly damper—has emergency opener. **Capacities:** 6640 to 53,700 cfm up to ¼ in. S.P. **Sizes:** 24 to 60. Steel, aluminum or stainless housings—flat or pitched bases. Weatherproof motor. Others on request.

Technical Data Bulletins Available Upon Request



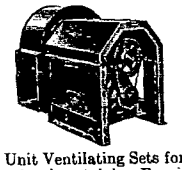
CLARAGE FAN COMPANY

Kalamazoo, Michigan

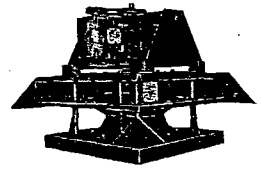


Air Handling and Conditioning Equipment

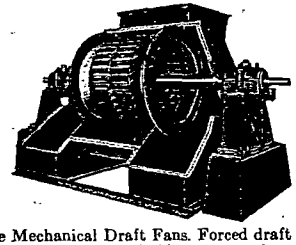
Sales Engineering Offices in All Principal Cities



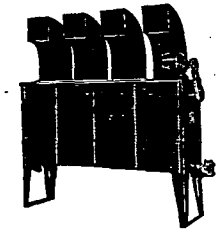
Since 1913 Clarage has been a leading manufacturer of air handling and conditioning equipment. By specializing—building a *complete* line of this equipment exclusively—Clarage has a concentrated "know how" that means important dividends to the user. (See "Air Conditioning—Central Systems" for other Clarage products.)



Clarage Fans for ventilating, air conditioning, and industrial applications—where clean air is handled at low pressures—are offered in many different designs, arrangements, and wheel types. Capacities range from 140 to 725,000 cfm.



Clarage Fans for industrial air handling and material conveying are available in a wide range of types and sizes. This broad line includes cast iron fans, fans for pressures to 50 in. sp, and fans for temperatures to 1000 F.

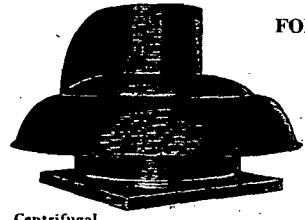


Clarage Ready Unit Ventilating Sets for smaller ventilating supply and exhaust jobs. Furnished complete, ready-to-run for both direct drive and V-belt drive. Capacities 150 to 14,000 cfm.

Clarage Centrilator Power Roof Ventilators (shown without cover) are V-belt driven. Capacities 1,500 to 26,500 cfm. Directilators are direct drive units. Capacities 100 to 3,500 cfm.

Clarage Mechanical Draft Fans. Forced draft and induced draft fans are available to meet virtually any capacity, pressure, and speed requirement. Unit shown has sections of housing and inlet boxes removed.

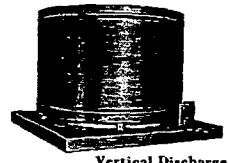
Clarage Unit Heaters. Unitherms (shown) are equipped with centrifugal multiblade fans. Clarcos, for smaller space heating assignments, have propeller fans.



DeBOTHEZAT FANS DIVISION

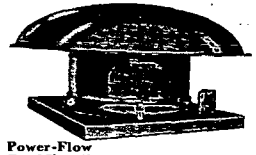
American Machine and Metals, Inc. Main Office and Factory—East Moline, Illinois

Sales Engineering Offices In All Principal Cities



Consult Your Telephone Directory Under "Fans" or "Ventilating Equipment"

FOR CONTROLLED VENTILATION

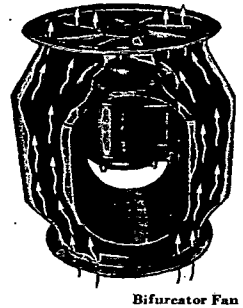


Centrifugal Roof Ventilator

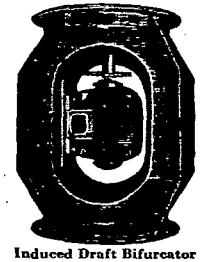
Centrifugal Roof Ventilator—low-contoured, distinctively profiled—operates at very low noise levels. It is highly efficient against static pressures. Its large unit exhaust capacity is accomplished at low fan tip speeds by a backwardly curved non-overloading fan wheel. Capacities up to 32,980 cfm. *Write for Bulletin.*

Vertical Discharge Roof Ventilator

Vertical Discharge Roof Ventilators are designed for foundries, machine shops and other buildings where much oil or dust is in suspension in the air. This unit is economical in first cost and is convenient to install and maintain. Exhaust airstream disperses dust particles into atmosphere. Capacities up to 48,925 cfm. *Write for Bulletin.*



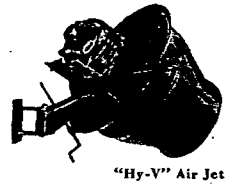
Power-Flow Roof Ventilator



Power-Flow Roof Ventilators provide controlled ventilation at all times, regardless of weather. This unit is a motor-driven fan in weather-proof housing, designed to provide positive controlled ventilation. Works efficiently with or without a duct system. Capacities up to 43,070 cfm. All three DeBothezat roof ventilators are low in silhouette and distinctly profiled . . . blend well with modern architecture. *Write for Bulletin.*

FOR FUME REMOVAL

Bifurcator® Fans are excellent for exhausting air that is abnormally hot, corrosive, flammable or explosive. Motor is mounted in separate chamber and destructive fumes are by-passed (bifurcated) around it. Installs as a part of the duct horizontally or vertically. Fan wheels 12 in. through 48 in. in diameter, with capacities up to 54,200 cfm. *Write for Bulletin.*



Bifurcator Fan

Induced Draft Bifurcator

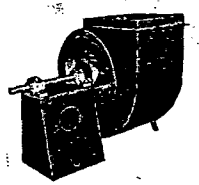
Induced Draft Bifurcators provide controlled draft for boilers and furnaces, minimizing the need for large costly stacks. Built with fan wheels 12 in. through 36 in. diameter for high pressure boilers delivering up to 60,000 pounds of steam per hour—low pressure boilers delivering up to 190,000 EDR. *Write for Bulletin.*

"Hy-V"® Air Jet is used for air quenching and solving production cooling problems. Effective for reducing fatigue of workmen exposed to radiant heat from ovens, furnaces, forges or molten metal. Two styles—for stationary mounting or mounted on 2-wheel stand for easy mobility. Available with fan wheels 18 in. through 30 in. in diameter. *Write for Bulletin.* Additional bulletins are also offered on Axial-Flow Vent Sets and Panel Vent Sets.

"Hy-V" Air Jet

BONDED RATINGS Published DeBothezat ratings are backed by a $250,000 Performance Bond on deposit with New York Trust Co. Ratings are the output of the completely assembled unit, obtained under wind tunnel tests as per Standard Test Code for the particular product classification and conform to U. S. Department of Commerce Standard 178-51.

Garden City Fan Company

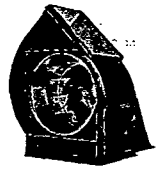


801 North 8th Street

Niles, Michigan

Representatives in principal industrial cities

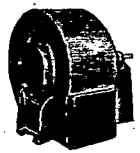
Manufacturers of Design "B" Multiblade—Non-Overloading—Hi-Static and HSH Cycloidal—Radial Blade Industrial and C. I. Small Exhaust Fans. Wheels designed in forward curved, backward curved, and radial blade types for various commercial and industrial applications. Suitable for high temperature air circulation to 1850° F, air conditioning and ventilating, dust and fume removal, heavy materials conveying, and special applications requiring "Custom-built" features. High temperature fans are equipped with a special "air-cooled" shaft which eliminates bearing failures caused by excessive temperatures.



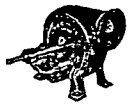
Design "B" Multiblade Fans—Compact, low speed air and gas handling fans with forward curved blades. Made for temperatures to 1650 F in uninsulated and insulated double housing construction. Well suited for systems with space limitations or low noise level requirements.

Design "B" Multiblade Fans

Non-Overloading Fans—High speed air and gas handling fans with backward curved blades. Non-overloading power characteristics. Made for temperatures to 725 F. Well suited for systems with fluctuating system resistance.

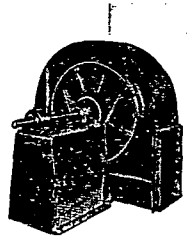


Radial Blade Industrial Fans—Heavy duty air, gas, and material handling fans. Made for temperatures to 1850 F in uninsulated and insulated double housing construction. Used for many material conveying applications, for all high temperature applications, and for exhausting against high pressures.



Non-Overloading Fans

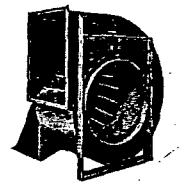
C. I. Small Exhaust Fans—Durable air, gas, and material handling fans with heavy cast housing. Made for temperatures to 1650 F. Particularly suitable for applications requiring small volumes at moderate static pressures. Further information and literature available upon request.



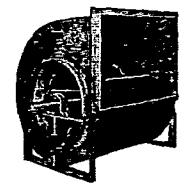
Hi-Static and HSH Cycloidal Fans—Rugged material handling and conveying fans. Two classes of construction designed to handle a wide range of materials. Specially designed "non-clogging" Cycloidal wheel reduces power requirements while offering efficient performance at low speeds.

Hi-Static and HSH Cycloidal Fans

C. I. Small Exhaust Fans

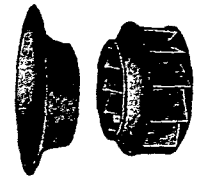


Radial Blade Industrial Fans

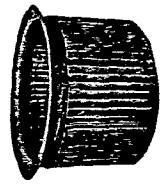


General Blower Company

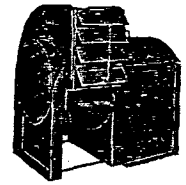
8602 Ferris Ave. MORTON GROVE, ILLINOIS



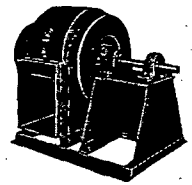
Sales Offices in Principal Cities



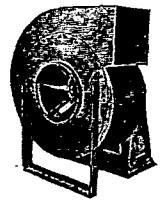
General Backward Blade Centrifugal Fans for heating, ventilating and air conditioning are non-overloading, quiet and efficient. Selection ranges through nineteen fan wheel diameters from 12¼ inch to 73 inch. **Bulletin BB-105** bears the *AMCA* seal of certification.



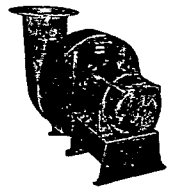
General Forward Curved Centrifugal Fans are offered in a complete range of sizes for low speed, quiet operation. **Bulletin FC-101R** bears the *AMCA* seal of certification.



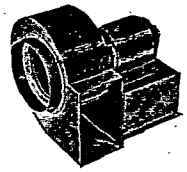
General Backward Blade wheel and inlet cone are assembled of spun parts for smooth, quiet air movement. Wheels can be manufactured of alloy materials, aluminum or hot-dipped galvanized. Ask for **Bulletin BB-105.**



General Forward Curved fan wheel and inlet cone are assembled of spun parts for smooth quiet air movement. Wheel and cone can be manufactured of alloy materials, aluminum or hot-dipped galvanized. Ask for **Bulletin FC-101R.**



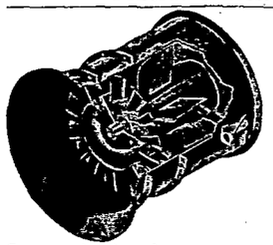
General Util-A-Vents with BB wheels are recommended for low cost air handling requirements. Belted and direct drives from 12 inch to 36 inch wheel diameters. **Bulletin UVS-104** bears the *AMCA* seal of certification.



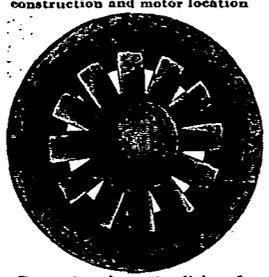
"DURA-TEMP" Heat Fans—Forward Curved and Radial Bladed Fans from 350°F to 1650°F. Heat resistant alloy and 8-in. insulated construction. Backward Blade Non-overloading Heat Fans to 350°F. **Bulletins HF-100 and HF-100A.**

General Industrial Fans for conveying dust and air borne materials. Four types of fan wheels available for air, fumes and materials handling. Modified construction for high temperature and corrosive conditions. **Bulletin IF-100.**

Turbo Blowers in two basic types: Type S single stage, and type M multi-stage. Both types used for gas and oil burners or gas boosters. 4 oz pressure—90 cfm, to 48 oz pressure—6000 cfm. **Bulletin TB-109.**

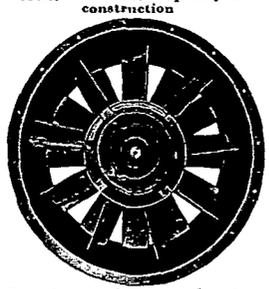


General Util-A-Vent Jr. with FC wheels are recommended for low cost air handling requirements. Belted and direct drives from 5 inch to 12 inch wheel diameters. **Bulletin FP-101.**



ALL GENERAL FANS TESTED ACCORDING TO AMCA STANDARD TEST CODE

JOY MANUFACTURING CO.



General Offices: Henry W. Oliver Building, Pittsburg 22, Pa.

Cut out drawing shows compact construction and motor location

Front view shows simplicity of construction

Rear view shows vanes and motor

Joy Axivane® FANS SERIES 1000

Joy AXIVANE® Fans, Series 1000, are available in 136 sizes to a volume capacity of 200,000 cmf and pressures up to 11 inches. Diameters range from 18 inches to 84 inches. Outstanding characteristics of Joy AXIVANE design are: straight air flow, blades adjustable on the job for volume or pressure change and simplified installation.

COMPACT

Joy AXIVANE Fans are built around the motor which permits the fan housing to become an integral part of the duct system. This inline installation frequently produces up to 70 percent more useable space than is available with conventional belt-driven centrifugal fans. Fan rooms can be eliminated in many instances.

EFFICIENT

Joy AXIVANE Fans utilize an aerodynamically efficient moving blade and stationary vane design that partially recovers the energy output of the rotor. Air is rotated by the blades, straightened by the vanes and passes through the duct in an axial flow with little pressure loss or turbulence. The natural result is increased efficiency.

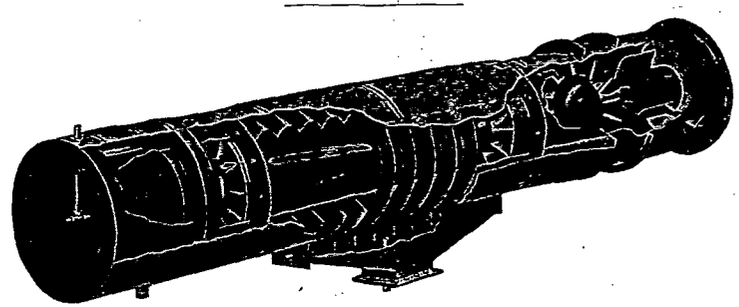
EASY TO INSTALL

Because **Joy AXIVANE** Series 1000 Fans develop greater pressures and volumes per pound of unit, lighter units than equal centrifugal fans can be used. In addition, the induct installation eliminates complex duct offsets and elbows, drives, guards and foundations.

Joy AXIVANE Fans are shipped ready to install, and, in most cases, can be placed in service quickly and easily by relatively inexperienced or unskilled labor.

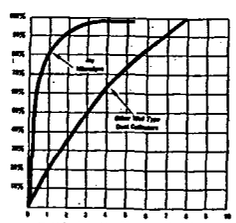
ADJUSTABLE BLADES

Joy AXIVANE Industrial Fans have the extra performance flexibility of adjustable blades. Adjustable blades are standard equipment on all Series 1000 fans. The factory blade setting can be quickly changed to provide either a wide pressure range for any particular volume or a change in a volume simply by loosening a lock nut with a wrench, setting the blades uniformly with the indicator, and retightening the lock nut. A permanent stop prevents setting blades in a position likely to overload the motor. Minimum blade settings are limited by the fan housing.



Blades are adjustable on the job by loosening each lock nut. Settings are permanently stamped on hub. This feature permits change of air pressure or volume.

Added advantage of the **Joy AXIVANE** design is that fan noise usually occurs at frequencies which are responsive to acoustical correction.



MATCHED ACCESSORIES

Inlet bells, screens, and fan supports are accessories designed to fit all AXIVANE fan housings. In ordering, it is only necessary to state the fan model number, with or without the accessories, as desired. If required with accessories, these will be furnished to fit the fan model ordered.

NOTE: An incorrect inlet bell will reduce fan efficiency by increasing intake turbulence which, in turn, increases noise level. When a fan takes its air directly from the weather, plenum, fan room, or duct system larger in circumference than the fan housing, a bell should be used.

The **Joy Microdyne Dust Collector** is a compact, wet inertial unit, 1/10 to 1/20 the size of any other collector. It collects over 99 percent of all dust particles 5 microns and larger, 92 percent of 2-micron dust, and substantial amounts of smaller dust. Cylindrically-shaped, it installs directly into the duct system—often at the point of use. It is available in ratings from 2500 to 64,000 cfm, constructed of mild steel, or Type 304 or 316 stainless steel for various corrosive and erosive conditions.

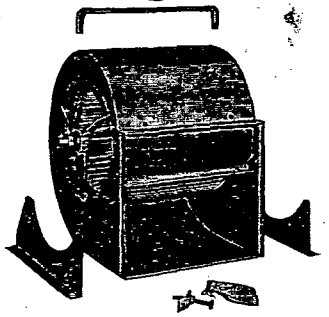
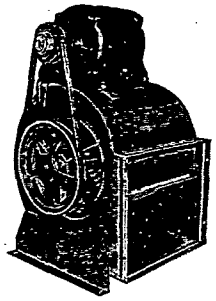
AND MORE THAN 500 DISTRIBUTORS THROUGHOUT THE WORLD

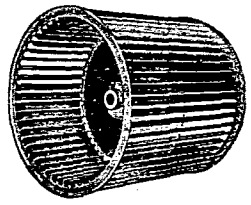


THE LAU BLOWER COMPANY

2027 Home Avenue, Dept. J, Dayton 7, Ohio



Other plants in Kitchener, Ontario, Canada and Irwindale, California

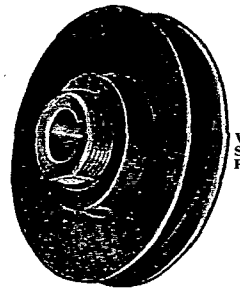


LAU all new *ELECTRO-WHEEL BLOWER: Two unobstructed air inlets on wheel sides plus compact motor design gives more air delivery with less power load. Stationary shaft with rubber mountings reduces vibration to a minimum. Rugged tripod mountings give extreme shipping strength without impeding air flow. Air deliveries from 500 to 1500 cfm, static pressure from 0.5 to 1.25 in. (water gage), ¼ and ⅓ hp motor, 9 in. and 10 in. wheels. Available in 115 and 230 volt a-c. Housing supports optional. Pre-punched holes in housing unit make any discharge angle possible.

LAU Econo-Pak Blowers cover most applications for residential air-moving equipment; effect savings up to 10 percent by eliminating special blowers for each application; reduce blower inventories by simplified order procedures, quick handling of model changes, lower handling costs, up to 26½ percent reduction in warehouse space. **Four Basic Sizes** each in 2 widths, with all features of Standard Series A Blowers. **Package Includes** blower wheel, housing with cut-off, housing supports, motor mount (not attached), all hardware; wheel, housing, bearings and shaft assembled. **Exclusive Lau-Pak Bearings** without oil cups require no lubrication. **Adjustable Discharge,** any one of 5 positions.

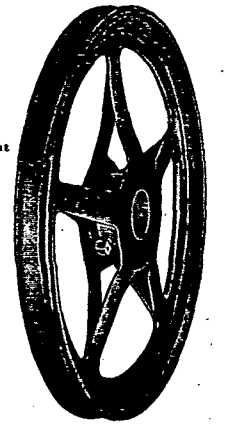
LAU Standard Blower Assemblies (Series A), heavy-gage steel housing assemblies, entire unit die-formed. Capacity range 350-22,000 cfm. **Motor Mounting** adjustable for any motor location. **Housing Base** heavy gage steel, rigid. **Discharge Outlet** improved design, construction. **Custom-built Belt** special composition for blower operation. **Shafting** 2-stage centerless ground, burnished. **Bearing Bracket** 3-point suspension; same bracket used for all discharge angles. **Lausteel Pulleys** employed; V.S. motor pulley allows speed variations up to 30 percent. **Center Suspended Wheel. Embossing of Scroll Sides** reinforces venturi inlet and discharge. Bearings highest grade self-aligning porous bronze sleeve type. **Plastic Thrust Washer** absorbs shocks.

LAU Preslok* Wheels, Center Suspended Riveted Wheels, S.I. and D.I. Weld Wheels, a complete wheel line. **Preslok Wheels,** sizes 9 in. through 18 in. center disc construction; baked enamel, Ruspruf, or hot-dip galvanized finish; standard steel or Power Lock hubs. **Riveted Center Suspended Wheels,** blades double-riveted to end rings, arc welded to center disc, diameters 22 in.-30 in.; standard steel or Power Lock hubs. **S.I. and D.I. Weld Wheels,** individual blades of correct length, width, pitch; baked enamel, Ruspruf, or plated; diameters 4½ in.-9 in.; widths 2¼ in.-9 in.



* T. M. Reg. U. S. Pat. Off.

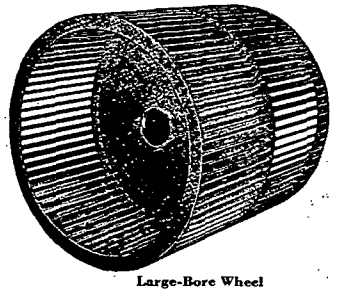
THE LAU BLOWER COMPANY



2027 Home Avenue, Dept. J, Dayton 7, Ohio

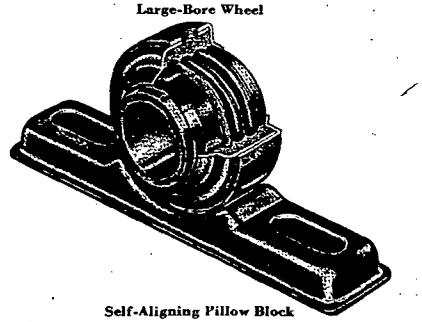
Other plants in Kitchener, Ontario, Canada and Irwindale, California

Lausteel Variable and Constant Speed Pulleys are in balance and true-running. **Lausteel Variable Speed Pulleys** available in three standard bores: ½, ⅝, and ¾ in. Diameter 3¼ in. OD. Allow speed variations up to 30 percent for many drive combinations. **Lausteel Constant Speed Pulleys** available in diameters of 6, 7, 8, 9 and 10 in., inclusive. Suitable for both "A" and "O" section belts. Lau also offers cast iron pulleys in diameters of 10 in. to 14 in.



Variable Speed Pulley

Constant Speed Pulley



Write for LAU Blower Catalog LSO-463. Mention all Blower items of interest.

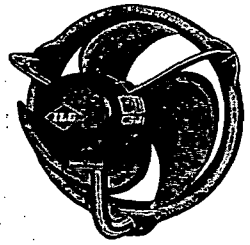
LAU Large-Bore Wheels, made to traditional LAU rigid performance standards, are now available. Bores for 3 in., 4 in. and 4½ in. shafting, with other bore diameters up to 5 in., are offered on Spun wheel sizes 9 in. through 18 in. and on Riveted wheel sizes 22 in. through 30 in. Variety of finishes (contact factory for details). NO set screws—no need for flats or keyways. New design eliminates excess weight of hub.

Large-Bore Wheel

LAU Self-Aligning Pillow Blocks are low-cost, light-weight, oil-tight steel housings with porous bronze bearings. Hold much more oil than cast iron types. Durex bushing feeds oil to shaft by capillary action. Spring keeps spherical surface of bearing and ring in close contact. Long bolt slots permit interchanging with other makes of pillow blocks. Bore sizes available are ⅝, ¾, 15/16, 1, and 1-3/16 in.

Self-Aligning Pillow Block

LAU Blower Catalog LSO-463 contains full information on Pillow Blocks and Pulleys.



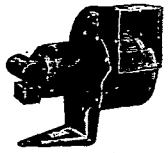
ILG ELECTRIC VENTILATING COMPANY

2880 North Pulaski Road, Chicago 41, Illinois

Offices in 57 Principal Cities • Member of *Air Moving and Conditioning Association, Inc. (AMCA)*

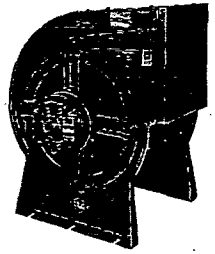
ILG PROPELLER FANS, CENTRIFUGAL FANS, ROOF VENTILATORS

Tested and rated by *AMCA, PFMA* and ASHVE code. Capacity guaranteed

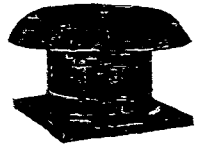


TYPE "LQ" DIRECT-CONNECTED, SELF-COOLED MOTOR PROPELLER FANS—Ilg's self-cooled motor features ventilated enclosure which keeps motor clean and cool. Permanently lubricated bearings and direct drive eliminate periodic maintenance attention. Non-ferrous Type "Q," dynamically balanced fan wheel. Exceptionally quiet operation. Wide range of sizes. Send for *Bulletin S-317.*

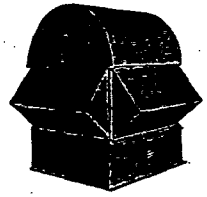
TYPE "XQ" Explosion-Proof Fan Motors carry UL certification of suitability for all Class 1, Group D hazardous applications. Send for *Bulletin S-317.*



TYPE "TAQ" Tubeaxial Duct Fans for pressures up to 1.5 in. Easily installed duct section for vertical or horizontal use. Nine sizes, 2 types. Type TAQ is equipped with 3-bladed propeller; Type TA features the new 5-blade design. Capacity, range at free air 1040 to 21,300 cfm. Send for *Bulletin S-317.*



VOLUME BLOWER TYPE "B"—Small volume, low pressure, quiet running. Direct-connected motor. Universal discharge positions. 14 capacity models. Send for *Bulletin 257-28.*



VOLUME BLOWER TYPE "P"—For exhausting dust, fumes, vapors. Cast iron housing and aluminum wheel. Direct-connected motor. 9 capacity models. Send for *Bulletin 258-26.*

NEW AIRFOIL TYPE BC DIRECT-CONNECTED CENTRIFUGAL FANS Non-overloading type. Airfoil blade design with high efficiency. Suitable for *AMCA Class I, II and III operation up* to 9-in. static pressure. Direct-drive design with motor partially recessed. 12 *sizes.* Single- and double-width models. Also belt-driven models. Send for *Catalog 257.*

ILG L-LSQ (*Exhaust*) and L-SRQ (*Supply*) **POWER ROOF VENTILATORS**—Direct-connected propeller fan type featuring low silhouette, high capacity. 11 sizes up to 21,100 cfm at free air and 13,800 at ⅛ in. static pressure. Send for *Bulletin 2302.*

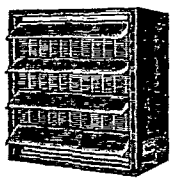
ILG PRV POWER ROOF VENTILATORS—Centrifugal fan type. Direct-drive, self-cooled motor. Non-overloading, backward-curved wheel. 10 sizes. Send for *Bulletin 1907.*

ILG L-CRF CENTRIFUGAL POWER ROOF VENTILATORS—Suitable for all duct systems. Large capacity and pressure range—from 155 cfm up. Low silhouette. Sizes 67 to 182 are all aluminum. Sizes 200 and larger complete housings are constructed of spun steel. Backward-curved airfoil fan blades of patented design for quiet, high-capacity performance. Direct-connected, self-cooled motor. Send for *Bulletin 2701.*

THE NEW YORK BLOWER COMPANY

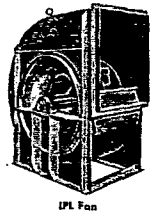
Sales Offices: 3171 South Shields Avenue, Chicago 16, Illinois

MAKE-UP AIR UNIT



M-15 Unit 15,000 CFM

A unit that delivers warmed, filtered, outside air to industrial spaces *to replace* exhausted air and balance minus pressure. Corrects drafty conditions and uncontrolled infiltration. In 4 sizes from 5000 to 20,000 CFM. *Bulletin 568.*

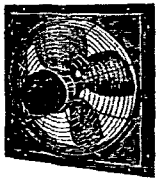


UNIT HEATERS

Ceiling suspension type with heavy duty, welded steel, fin-and-tube heating element. Suitable for continuous heating service on steam pressures up to 150 pounds or more. 10 basic sizes, capacities from 31 to 300 Mbh. *Bulletin 552.*

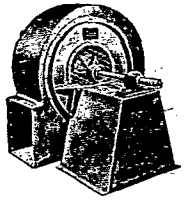
Unit Heater

STANDARD DUTY IPL FAN



IPL Fan

A complete line of NAFM arrangements in both *forward* and backward curved wheels. Class I, II, and II construction. Capacities from 1,000 to *175,000* CFM. Quiet operating with non-overloading horsepower characteristics for all heating, ventilating and air conditioning applications. *Bulletins 561 and 572.*

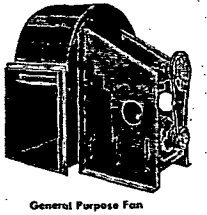


PROPELLER FANS

Propeller type ventilating fans deliver large volumes of air at low resistance and low current consumption. All wheels are machine balanced for smooth, vibrationless operation. Made in two types and ten basic sizes to cover a wide range of industrial applications. Square steel panels simplify installation. Wheel diameters from 10 inch to 48 inch. Direct or belted drive. Capacities from 610 to 24,200 CFM. *Bulletin 564.*

Propeller Fan

TYPE GI INDUSTRIAL AND HEAT FANS



GI Heat Fan

For dust and gas *removal,* conveying of materials and the handling of hot gases in industrial processes. Housings, drives, both pulley and direct, and discharge arrangements to meet any requirement. With wheel diameters from 10 inch to 66 inch. Capacities ranging from 450 to 60,500 CFM. *Bulletin 585.*

GENERAL PURPOSE FANS

Portable, self-contained units for Class 1 industrial and ventilating applications. Recommended for their ease of installation, low maintenance and space saving features. Made in four types and twelve basic sizes to meet a wide range of industrial application. Both direct *connected* and belt driven. Capacities from 160 to 19,070 CFM. *Bulletin 563.*

General Purpose Fan

ROOF VENTILATORS

Bell-Ex (above) exhausts from hoods and duct work; VP-Ex (right) for lower resistances.

These "Twins" are completely weatherproof and corrosion-resistant, and of modern design. *Bulletin 582.*

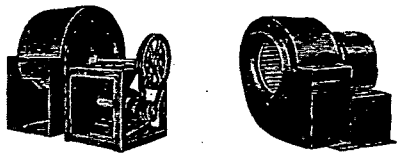
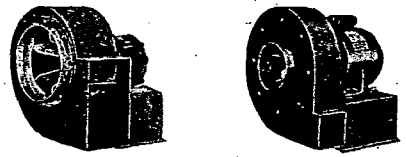
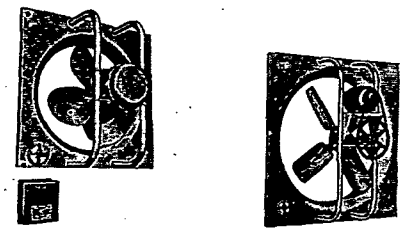
Industrial and Commercial Ventilating Equipment



BACKWARD CURVE CLASS I BLOWERS—In sizes from 12-¼ in. to 36 in.; self-limiting hp characteristics; *AMCA* standards and ratings; dynamically balanced wheel; heavy hub; nothing in air stream; quiet entry; job-matched motor; convertible discharge; belt drive or direct drive.



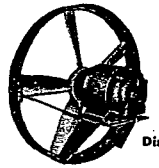
ARRANGEMENT 2 or 3, CLASS I or II—9 in. through 73-in. wheels; single width—single inlet or double width—double inlet; forward curve or backward curve type; all types of motors available; vibration bases, drives, inlet vane control and other optional features available; ball or sleeve bearing construction.



POWER ROOF VENTILATORS—CENTRIFUGAL OR PROPELLER TYPE—Direct or belt drive; 12 in. to 48 in.; 600 to 25,000 cfm; complete with disconnect switch; single phase or three phase motors; automatic shutters; inside insulation; 16 gage housing; baked enamel finish.

UTILITY BLOWERS—Belt or direct drive forward curve wheels with clockwise or counterclockwise rotation; ⅙ through 7-½ hp; motors in all current characteristics; convertible discharge; arc-welded housing; sleeve or ball-bearing construction; weatherproof drive covers optional.

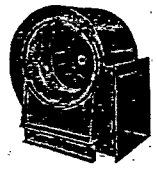
RADIAL BLADE BLOWERS—⅛ to 5 hp; slow and high-speed units; self-cleaning wheel; ball-bearing motors; discharge as specified; base and housing of heavy-gage steel.



INDUSTRIAL EXHAUST FANS—Direct or belt drive; vertical or horizontal mounting; totally enclosed motors; adjustable motor base; continuous duty; ball-bearing construction; cfm rating from 470 to 29,350; shutters, inlet guards and other optional features available.

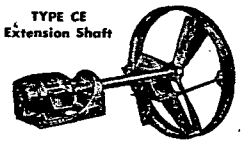
PROPELLAIR® DIVISION

ROBBINS & MYERS, INC. • 1359 STONE BLVD. • SPRINGFIELD, OHIO



Industrial and Commercial Ventilating Equipment

Certified Ratings



TYPE CD
Direct Connected

Type CD direct connected fans are designed for applications where the motor may operate within the airstream. They may be installed in any position in walls, roof ventilators, hoods or ducts. They are suitable for operation over a wide pressure range from free air to relatively high resistance. Available in sizes from 7¼ to 60 inches. Capacities range from 300 to 103,200 cfm. *Request Bulletin 690.*

TYPE IC
TYPE GU
Centrifugal

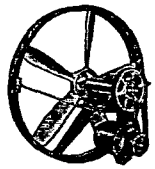
Designed for general ventilation, high temperatures, high pressures, fumes, gases and materials handling. Available with forward curved, backward inclined or radial blade wheels. All bearings are isolated from the fan housing. Available with clockwise and counterclockwise rotation in all standard positions. Sizes: 7½ to 33 inch wheel diameters. Capacities: 270 to 19,070 cfm. *Request Bulletins 750 and 760.*

TYPE CE
Extension Shaft

For use in hoods, ovens, spray booths or wherever the motor must be kept out of the airstream. Designed for use at relatively high static pressures. Oversize bearing assembly has sealed, prelubricated ball bearings which may be relubricated. Corrosion resistant coatings available. Nine shaft lengths from 16 to 66 inches. Sizes: 12 to 60 inches. Capacities: 1020 to 79,000 cfm. *Request Bulletin 640.*

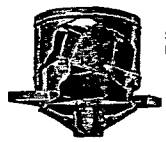
TYPE QD
Quiet Operating

Designed for use in offices, schools, stores or wherever quiet operation is needed. Special cast aluminum-magnesium alloy airfoil propeller eliminates the sounding board effect of thin sheet metal blades. Steel venturi entrance ring prevents air recirculation at propeller tips, thus further reducing noise and increasing efficiency. Sizes: 12 to 36 inches. Capacities: 1235 to 12,000 cfm. *Request Bulletin 695.*



PROPELLERS

Propellair fans are equipped with airfoil propellers of a cast aluminum-magnesium alloy that provides strength, dimensional stability and balance, and greater corrosion resistance. Airfoil design assures maximum efficiency and horsepower savings impossible to attain with overloading sheet metal blades. Two-blade designs are for use at, or near, free air. Multi-blade types are for use against resistance pressure.



TYPE BT
Tubeaxial

For handling damaging or dangerous exhaust requiring isolation of the motor from the airstream. Integrally rolled mounting flanges eliminate fume or condensate leakage. Choice of totally-enclosed, ventilated or corrosion resistant bearing assembly. Factory-applied coatings are available for severe corrosive applications. Sizes: 16 to 60 inches. Capacities: 2755 to 85,000 cfm. *Request Bulletin 620.*

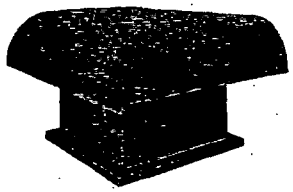
TYPE CB
Belt-Driven

Designed for large volume air delivery at relatively low noise levels and moderate pressures. For use in power plants, stores, auditoriums and factories, Type CB fans may be wall-mounted or used in the Sky-Blast power roof ventilator described below. Heavy duty bearing assembly is equipped with extra-wide prelubricated ball bearings. Sizes: 42 to 72 inches. Capacities: 14,200 to 58,100 cfm. *Request Bulletin 740.*

TYPE SB
SKY-BLAST® Power Roof Ventilator

A low-silhouette roof ventilator that blasts heat, moisture, dust and fumes high into the air away from roofs and windows. Free-swinging butterfly dampers open instantly at minimum air flow, close weathertight when fan is off. All-steel construction, hot-dip galvanized after fabrication. Rain shed and condensate drain assure weatherproof service. Sizes: 16 to 60 inches. Capacities to 78,800 cfm. *Request Bulletin 680.*

TYPE BV
Vaneaxial

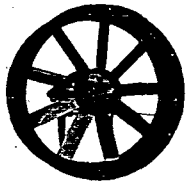


A highly efficient pressure fan that combines airfoil propeller and guide vanes. Fan bearings and motor are completely isolated from the airstream, thus making these fans suitable for handling dangerous or damaging exhaust. Rolled steel drum and belt tube are welded airtight for complete protection. Also available in direct drive. Sizes: 16 to 30 inches. Capacities: 1260 to 20,000 cfm. *Request Bulletin 795.*

Reed Unit-Fans, Inc.

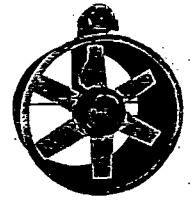
501 N. St. Patrick St., New Orleans 19, La.

Manufacturers of Axial Flow Air Moving Equipment for Industrial, Commercial and Residential Use



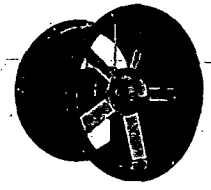
ROOF VENTILATORS

COMMERCIAL RATING: Blade Diam—12 in. to 36 in.—sheet metal blades. Air deliveries to 12,000 cfm, static pressure to ⅛ in.



INDUSTRIAL RATING: Blade Diam—12 in. to 60 in.—cast aluminum blades. Air deliveries to 75,000 cfm, static pressures to 4½ in. wg.

Available direct and belt driven, heavy gage used throughout, fan section insulated from housing, hood easily raised from either end.



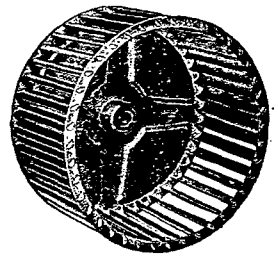
EXHAUST FANS

Blade Diam—12 in. to 60 in. Air Deliveries to 100,000 cfm. Static Pressures to 3 in. wg.
Sturdily constructed for heavy duty performance.

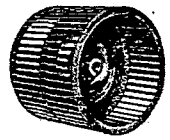
BELT DRIVE TUBEAXIAL FANS

Blade Diam—12 in. to 60 in. Air Deliveries to 75,000 cfm. Static Pressures to 4½ in. wg.
Cast aluminum alloy air foil blades, all welded construction, special finishes available.

DIRECT DRIVE TUBEAXIAL FANS



Blade Diam—12 in. to 60 in. Air Deliveries to 75,000 cfm. Static Pressures to 6 in. wg.
Cast aluminum alloy air foil blades, all welded construction, special finishes available.



Fan Housings are of heavy gage steel, all welded construction. Impellers are of cast aluminum, Air Foil section of an unusual design which permits variation in both number of paddles and angle of attack. This unique feature makes it possible to tailor the fan to any exact air moving requirement within the ranges indicated. It also enables the manufacture of a truly reversible fan to give equal performance in either direction of air flow.

Revcor, Inc.

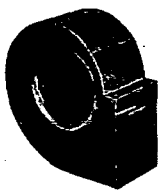
251 Edwards Street Carpentersville, Illinois Phone: HAzel 6-4819

ENGINEERS AND MANUFACTURERS OF SINGLE AND DOUBLE INLET BLOWER WHEELS, PROPELLER FANS, HOUSINGS AND INLET RINGS

Revcor Blower Wheels are available in a very large selection of sizes. 20 diameters of Single and Double Inlet Wheels from 3 in. to 12⅝ in. Single inlet widths from 1 in. to 6 in. Double inlet widths from 2 in. to 12 in. Individually attached, thin gage, full width blades eliminate air obstructions at the ends. Blades are attached to end rings by Revcor's time proven, tab locked method.

BLASTAIRE DESIGN

Engineered to provide outstanding performance. Ruggedly made for all appliance applications. Available in steel and aluminum. Unique *Blastaire* production methods result in lower costs while maintaining high standards of rigidity, strength, balance and performance!



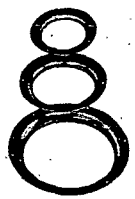
Individual Blades of correct curvature, number, depth and blade angle to deliver the greatest amount of air, efficiently and quietly.

Full Width Blades with a blade tip diameter substantially the same as the outside diameter of the wheel deliver the maximum air and pressure for the space dimensions required.

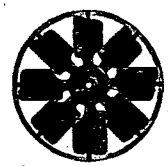
Blade tips are securely locked to the back plate and ring. Embossed back plate provides rigid support for blades and hub. Hubs can be mounted either inside or outside the wheel.

NEW DOUBLE INLET BLASTAIRE DESIGN

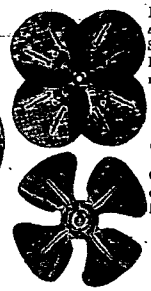
Features single center disk construction. Blades extend through slots in the center disk and are locked tight to the center disk by a unique patented method. Provides more air and pressure in less space.



HOUSINGS



Sheet metal housings die formed to insure custom-made uniformity at mass production prices. Readily permit adaptation of larger size wheels when required by space limitations.



INLET RINGS

Scientific Bell Mouth Venturi design assures least resistance to air flow. Die formed for consistency. Sizes for all Revcor Blower Wheels. Also available in special sheet metal shapes.

PROPELLER FANS—SIZES RANGING FROM 6 IN. TO 48 IN.

Revcor's expanded fan line offers you a broad range of fan types for almost any air moving application. Fill your fan needs from the following types: Static Pressure Series, Price Saver (All Purpose) Series, Space Saver Series, Hurricane Series, Multi-Blade Pressure Series, Hi-Static Series, One Piece Series, Attic Fan Series. Slinger rings are available for most types.

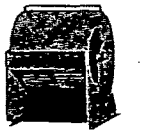
THE TORRINGTON MANUFACTURING COMPANY

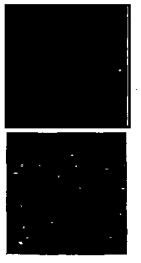
TORRINGTON, CONNECTICUT • VAN NUYS, CALIFORNIA • OAKVILLE, ONTARIO

TOTAL COVERAGE



Torrington offers the most complete line of fans in the United States. Applications range from small precision fans for electronic cooling to the largest heavy-duty requirements of industrial and residential air moving—in diameters from 1½" to 52".

Torrington blower wheels are available in diameters from 1½" to 16". A full range of designs includes standard single and double inlet Airotors, in both continuous and individually-bladed construction.



In complete blower units, Torrington offers proved-out performance ratings on three full lines, the Vari-Basic line of belt driven and direct drive units, plus the revolutionary new mixed flow Radiax blower.

The result is TOTAL COVERAGE—the best "problem insurance" you could have. For complete data:

TRADE-WIND MOTORFANS, INC.

Division Of Robbins & Myers, Inc.

7755 Paramount Place, Pico Rivera, California

TRADE-WIND VENTILATORS
EXHAUST VENTILATION FOR HOME KITCHEN, LAUNDRY, BATH, DEN AND OTHER SMALL ROOMS

SPACE SAVER KITCHEN VENTILATING HOODS

Cambridge, hammered antique copper

Sheffield, stainless steel

Concord, antique copper

New high style hoods with built-in under hood ventilator. Takes up no cabinet space. Touch-Bar controls dual lights and 3-speed ventilator. Two oversize cleanable filters. Built-in back draft damper. 3¼ in. x 10 in. duct size. 30 in., 36 in., 42 in. and 48 in. hood lengths.

PRE-WIRED HOODS

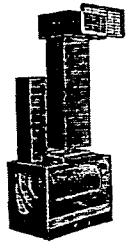
Salem, antique copper
Montecito, brushed copper
Newport, stainless steel

Beautifully designed. For use with models 3501, 2501 or 1501 ventilators shown at right. Hoods are pre-wired with cut outs for ventilators at right, left or center. Touch-Bar controls dual lights and 3-speeds. 30 in., 36 in., 39 in., 42 in. and 48 in. lengths.

PATRICIAN VENTILATING HOOD

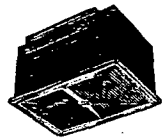
Coppertone
Satin Chrome

Complete pre-wired package with axial flow fan, light, switch and filter. 30 in., 36 in., 39 in., 42 in. and 48 in. lengths.



OVEN VENTILATING HOOD

Ventilator only available; also 3 hood styles—
Newport, stainless steel
Montecito, brushed copper
Salem, antique copper

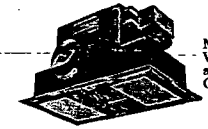


For built-in gas and electric ovens. Pre-wired with switch and automatic thermostat control. Snap-in filter; built-in back draft damper. 24 in., 27 in., 33 in. and 45 in. hood lengths. 3¼ in. x 10 in. duct size.

VENTILATORS

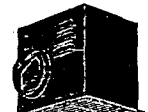
Model 3501 Ventilator

For cabinet installation only. Two inlets, one over stove, second at ceiling level, each with washable filters. Twin centrifugal blowers. Built-in back draft damper. Duct size 4 in. x 13 in.



Model 2501/1501 Ventilators

For use with Trade-Wind hoods or for ceiling installation. Handsome new style grille. Built-in back draft damper. Model 2501 for rooms up to 2000 cu ft. Model 1501 for 1000 cu ft. Duct size 3¼ in. x 10 in. Drawer-type filter available



Model AF-7M Axial Flow Ventilator

Full 300 cfm. High-style grille. Installs in ceiling or cabinet. *Duct size 7 in. round.* 50 watt motor.

Model 1701 Ventilator—and Light Combination

For bathrooms, 2-75 watt lamps, 100 cfm ventilator. Built-in back draft damper. *Duct size 4 in. round.* 50 watt motor.

Model 1201

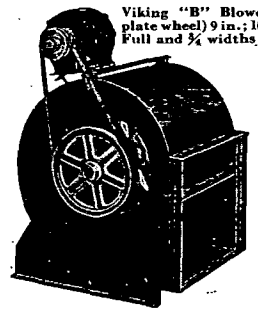
100 cfm, specially built for bathrooms. Duct size 4 in. round. 50 watt motor. Built-in back draft damper.

Viking® Air Products

5601 Walworth Ave. · Cleveland 2, Ohio

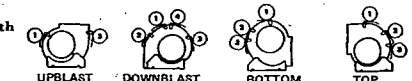
Viking Blowers Solve These Design Problems

Interchangeable Parts . . .



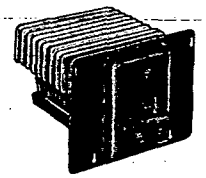
many of the important features of Viking Blower Assemblies available in these component parts: New Mark III Bearing is factory-packed but designed to permit the addition of oil; New Quadruped Bracket reduces noise possibilities and strengthens blower housing; New Center-Disc Non-Flexing "B" Wheel is engineered for strength; and Universal Lock-on Feet designed to require a *minimum* of *assembly time.*

- **Lighter loading, longer life**
- **Machined journal cuts shaft cost**
- **Interchangeable with conventional Bearings**
- **Factory-packed, but may be re-oiled**



Interchangeable Blowers . . .

in performance, dimensions, belts, pulleys and air patterns. Viking's "B" Blowers meet *A.G.A.* requirements as acceptable substitutes for "A" Series Blowers without *A.G.A.* retesting and without design or specification changes by manufacturers. Also has Universal Blower quick-assembly features.

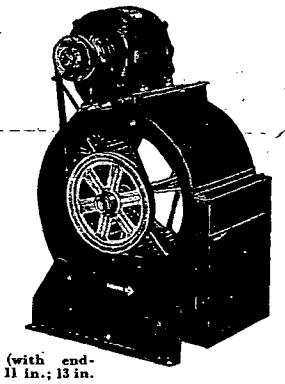


Viking "B" Blower (with center-plate wheel) 9 in.; 10 in.; 12 in.; 15 in. Full and ¾ widths.

Possible Positions with Lock-on Feet

Cost Reduction . . .

the Lock-on Feet and multiple motor positions of the Viking Universal Blower Assembly reduce inventory, eliminate dead blower stock, cut lead-time needed in ordering and reduce initial cost. Parts designed to permit quick assembly.

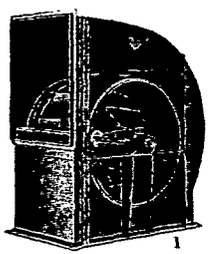


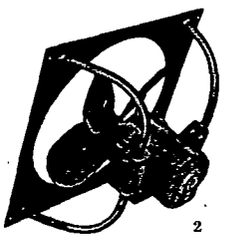
6000 Leak-Proof Humidifier . . .

New ovenware glass pan eliminates leaks, corrosion and rust common in old-fashioned humidifiers. Completely automatic unit.

Space Restrictions . . .

New Viking Direct Drive Blowers are available for application where *space is at a premium.*





Viking "U" Blower (with end-supported wheel) 9 in.; 11 in.; 13 in. Full and ¾ widths

AIR HANDLING PRODUCTS

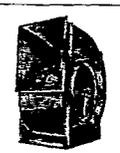
Centrifugal Fans with Airfoil Blading—Standardized General Purpose and Heavy Duty Fans for both commercial and industrial applications. Capacities up to 700,000 cfm, all pressures up to 45 in. wg. *AMCA* pressure classes I, II, III, IV.

Axial Flow Fans—V-belt driven or direct connected: Designed to provide low cost fume and vapor exhaust and air supply with new high efficiencies. Easily installed in ductwork. Vaneaxial, Tube-axial and Spray-booth types available for wide range of applications in all industrial fields.

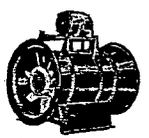
Ventilating Sets—Direct connected units for maximum efficiency at popular motor speeds. Manufactured in six sizes up to 3200 cfm. Compact V-Belt driven units for large capacity and quiet operation. Fourteen sizes up to 21,000 cfm.

Air Distributing Units—Air Conditioning, Sprayed Coil and Multizone; Heating and Ventilating, and Ventilating Fan Units. Factory built, unitary assemblies. Horizontal and Vertical. Coils available for Chilled Water and Refrigerant; steam and hot water. All units available with "In-Line" PRECIPITRON Electronic Air Cleaners. Capacities up to 48,000 cfm.

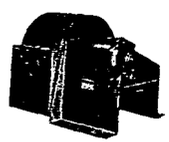
Cooling and Heating Coils—coils are available for direct expansion refrigerants chilled or hot water and steam. Water Coils in continuous tube or removable header type. Steam coils in standard, heavy duty, and steam-distributing types. Coils feature Air-Activating Plate Fins.



Surface Dehumidifiers—For central plant air conditioning. Sprayed coil units are available with chilled water or direct expansion refrigerant coils. Available with water spray and recirculating system, eliminators. Capacities to 250 tons of refrigeration and 62,500 cfm.



Industrial Heaters—For heating of manufacturing areas, warehouses, garages and similar industrial and commercial buildings. Also for continuous duty heating in industrial processes with heavy duty wrought iron coils. Capacities to 4,500,000 Btuh, 32,000 cfm.



Cabinet and Propeller Fan Heaters—Available for steam, hot water. In horizontal and downblast models. Capacities range from 15,000 to 684,000 Btuh, 240 to 11,000 cfm.

Gas-Fired Unit Heaters—Propeller and blower type. Used with Natural, Mixed, Manufactured, L. P. Gases and L. P. Gas-Air mixtures. 25,000 to 250,000 Btuh. 400 to 3,600 cfm.

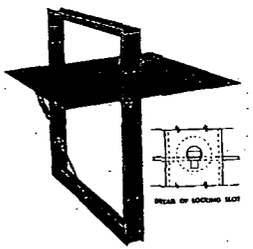
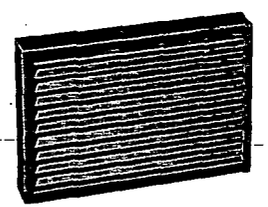
"Quality Air Control Equipment"



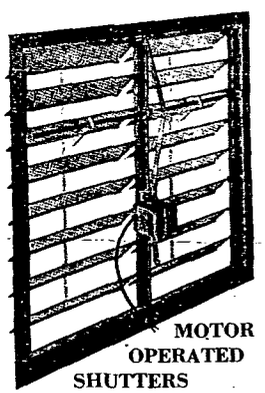
LOUVER

Architectural type louvers having an unbroken line regardless of the length of the run compliments today's contemporary design. A new principle of blade supports make the unit possible.



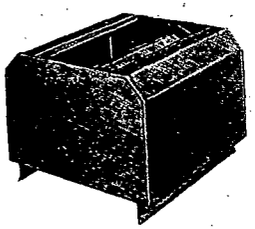
AIR CONTROL DAMPER

A new development, center pivot balanced linkage takes unnecessary torque from the operation of air control dampers. This new linkage is located out of the air stream thereby eliminating unnecessary turbulence.



FIRE DAMPER

A new key slot locking device now insures tight and positive closing of fire dampers.



DOOR LOUVER

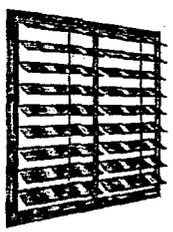
An entirely new engineering development makes possible door louvers of exceptional strength and blade alignment yet keeping cost to a minimum.

MOTOR OPERATED SHUTTERS

A recently perfected rotary leverage principle, for motor and manual operated, shutters makes possible free and easy opening yet when closed the shutter blades seal tightly against one another to repel weather.

LP-SERIES ROOF VENTILATOR

This new quality roof ventilator eliminates the necessity of many types, for its design encompasses universal application and functions either for air exhaust by gravity or power, air intake by power. One style unit now does every job.



Elgo SHUTTER & MANUFACTURING COMPANY

Elgo Ventilating Specialties

New! Extruded Aluminum Shutters with Completely Concealed Pivot Pins

Lightweight—Strong—Durable

AUTOMATIC WALL SHUTTERS

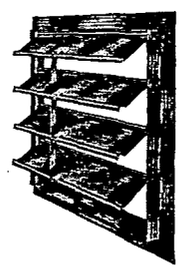
STATIONARY SHUTTERS

BACK-DRAFT DAMPERS

The new Elgo Extruded Aluminum Shutters give you shutters of modern design. They meet the demand of your customers who insist upon attractive, lightweight, strong and durable shutters.

The distinctive appearance of Elgo Aluminum Shutters blends with aluminum doors and windows. Your customers will also like the rust proof and non-corrosion qualities of Elgo Aluminum Shutters and, the fact that Elgo Shutters do not need paint to protect them from the elements.

The weather strip and extruded frame are one piece unit construction. All pivot pins are completely concealed. This gives you positive pivot pin action and prevents rusting, which means—no rust stains to mar the beauty of the frames. The full weather strip gives you ample protection from back-drafts, rain, snow, dust and other hazards of the elements.



ELGO shutters give you all these advantages . . .

- Light Weight
- Full Weather Strip
- Low Freight Cost
- Easier Installation
- Concealed Pivot Pins
- Rust Proof and Corrosion Proof Aluminum
- Natural aluminum finish with fluted frames.

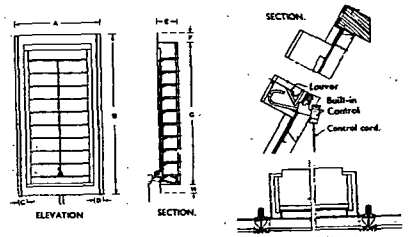
The Colt System of Customized Natural Ventilation

Colt Clear-Opening Ventilators for roof or wall—completely weather-proof



STANDARD AG/CO VENTILATOR manufactured in various sizes. Width can be varied to fit non-standard width of glazing. **COLT AG/CO/2046** comes complete with built-in control, endless control cord. Heavy gage anti-corrosive hardened aluminum, weight 23 lb. **COLT AG/CO/2446** same as 2046 except dimensions (see chart), weight 27 lb. **GIANT CLEAR-OPENING VENTILATORS (AG/CO/4060, 4460, 4080, 4480)** designed for use where large quantities of heat or smoke must be removed from a small "hot spot." Can be fitted into roof for extraction or at low level for air inlet. All ventilators can be operated individually or alternately in batteries from one control point.

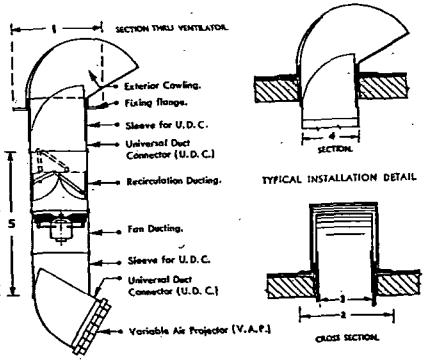
TYPICAL DIMENSIONS OF COLT CLEAR-OPENING VENTILATORS

Type	A	B	C	D	E	F	G	H
AG/CO/2046	2'0"	4'6"	1"	1"	6¾"	3"	4'0"	3"
AG/CO/2446	2'4"	4'6"	3"	3"	6¾"	3"	4'0"	3"
AG/CO/4060*	4'0"	6'0"	1"	1"	8¾"	4½"	5'3¾"	4½"
AG/CO/4460*	4'4"	6'0"	3"	3"	8¾"	4½"	5'3¾"	4½"
AG/CO/4080*	4'0"	8'0"	1"	1"	8¾"	4½"	7'3¾"	4½"
AG/CO/4480*	4'4"	8'0"	3"	3"	8¾"	4½"	7'3¾"	4½"

* These Ventilators are designed on the same principle but have manual control bar only. Can be supplied with manual or power-operated gearing.

PATENT & APPLICATIONS: 650372, 19577/55, 10630/55, 114569, 16504/54. Other U.S.A., Canadian and Foreign Patents Pending.

Colt Inflow Units . . . Supply and Recirculation

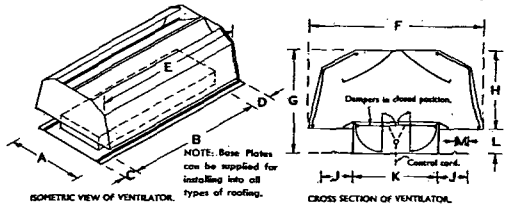


Powered ventilators for air intake. Fitted with Recirculating Dampers for recirculating heat within the premises. Can be fitted with filter unit to remove dust and dirt.

PRINCIPAL DIMENSIONS

Type	1	2	3	4	5
AG/RIU 15" Roof Inflow	2'2"	2'0"	1'4½"	1'4½"	3'4"
AG/RIU 18" Roof Inflow	2'6"	2'0"	1'8½"	1'8½"	4'0"

PATENTS: 718740, 845813, 861775, 506552, 2626556. Other U.S.A., Canadian and Foreign Patents Pending.



All ventilators available from stock

The Colt AG/SR Ventilators for Hot Industries

Positive, all year 'round, all-weather controllable ventilation, guaranteed regardless of wind conditions. No back draft from adverse winds provided inlet is balanced to extracts. With or without controls.

Designed on aero-dynamic principles embodying aerofoil curves which harness and control the free power of wind and roof eddies. Combined with power of convection currents within building, ventilators create a suction resulting in power of extraction equal to that of mechanical means without disadvantage of noise, wearing parts or operating or maintenance costs. Design effectively prevents rain from entering building.

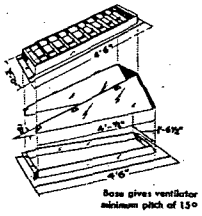
Colt Dual Purpose* Smoke and Heat Exhaust Ventilator



COLT AG/COF/2046 Ventilator in open position, for automatic escape of super-heated air and smoke

COLT AG/COF/2046, 4060, 4080. Each ventilator fitted with automatic release in event of fire. Immediately removes smoke and heat, conforming with requirements of International Fire Services who state that "proper fire venting is the key to the prevention of spread of fire once it has started in an industrial building." Fusible link can be designed to trigger ventilator open at any predetermined temperature.

* Also a day-to-day usable ventilator with manual controls as described under AG/CO Series on opposite page. Specifications same as AG/CO Series.

Typical arrangement of COLT AG/COF/2046 DUAL PURPOSE FIRE VENTILATORS

COLT AG/COF/2046 Dual Purpose Fire Ventilators for flat or shallow pitch roofs

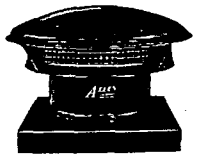
ALLEN ENGINEERED VENTILATION

Write to factory for catalog

Representatives in principal cities

"I-LINE" LOW SILHOUETTE ROOF FAN

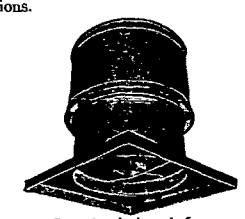
Allen "I-LINE" Roof Fan is designed to meet the architect's demand for an attractive silhouette and the engineer's demand for high efficiency. This is accomplished by use of a circular spun steel hood, and venturi, with baffle so arranged in relation to the propeller as to provide maximum efficiency with minimum over-all height. Its appearance and quiet performance recommend it for new or old construction, such as schools and offices as well as industrial plants. It is easy to install (no extra base required) and it is easy to lubricate and clean. Available with *Direct Drive* (420 to 45,000 cfm) or with *Belt Drive* (4,000 to 31,000 cfm). Special units available to 70,000 cfm.



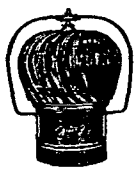
ALLEN STAXAUSTER for Conversions or New Construction

Allen Staxauster is a simple, compact, sturdy unit that can be used to convert all types of roof ventilators into powerful exhaust or air supply units. It is available in a wide range of sizes and capacities to solve almost any ventilating problem, with either *Direct Drive* or *Remote Drive*, as shown below.

REMOTE DRIVE STAXAUSTER for Corrosive Fumes



Allen Remote Drive Staxauster is specially designed for applications handling fumes, and/or high temperature air. Motor and belt drive are completely isolated from the air stream.



"T-TYPE" LOW VELOCITY ROOF FAN

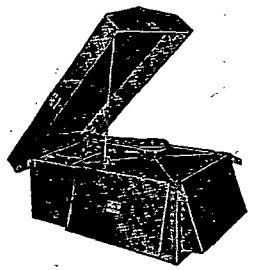
Allen "T-TYPE" Ventilator is designed for low, one-story, flat-roof, modern buildings. It blends well with modern exteriors and its design and construction assure high efficiency, easy installation and low maintenance. Model T-9 has capacity of 420 cfm at 0 in. SP; Model T-16, a capacity of 600 cfm at 0 in. SP. Low height enables these units to be used for both roof and wall installations.

HIGH VELOCITY VERTICAL DISCHARGE FAN

Allen Type "VD" Roof Fan is designed for use where extremely high discharge velocity prevents the tendency of fumes to short circuit back through building openings. Fabricated of prime zinc-coated iron sheet, welded construction throughout. Automatic wing dampers open with air blast, close weathertight when not operating. Available with *Direct Drive*, with motor readily accessible, or *Remote Drive*, with motor in outside housing and enclosed V-belt drive. Capacities available to 90,000 cfm.

ALLEN TYPE C TURBINE VENTILATOR

Allen Type "C" Turbine Ventilator is wind driven and economically removes heated air, fumes and dust. Other Allen turbine-type ventilators include power-driven models for ventilating in calm air conditions.

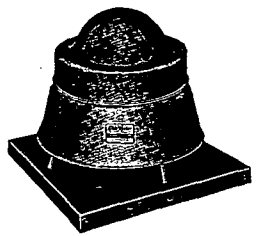


AirXpeler EXHAUSTERS

Ammerman Co., Inc.

Stillwater, Minnesota

Exhausters Powered or Gravity
Underfloor and Overhead Exhaust Systems



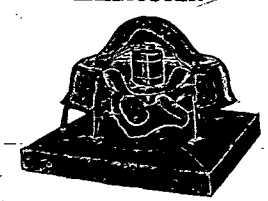
BELTED ROOF EXHAUSTER

"BCB" Lo-Boy Non-Overloading Centrifugal Wheel. Capacity table offers a selection of 16 wheel sizes—204 constant speed combinations with tip-speeds as low as 2000 fpm. Unit is exceptionally low in height. Standard construction consists of welded structural frame.

Write for special engineers bulletin

BACKWARD CURVE DIRECT CONNECTED

"BCD" Non-Overloading Roof or Wall Exhauster. Designed for optimum performance at lowest possible velocities, reduces noise level to an absolute minimum. Motor directly connected to dynamically balanced wheel eliminates costly maintenance.

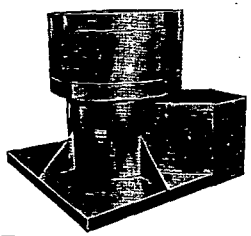


See Sweet's file for further details

ROOF RELIEF EXHAUSTERS

"RC" is regular Airxpeler design—but spun from one piece of metal. Throats may be round up to 42 in., square or rectangular up to 34 in. Constructed to accommodate any size roof opening. May be used as gravity vents. **Write for Bulletin.**

POWER ROOF EXHAUSTER



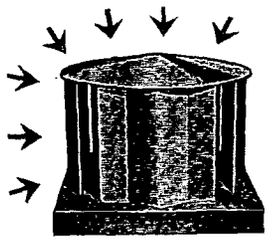
"PB" or "PFAS" Lo-Boy Wall or Roof Units. Efficient and quiet operation for low static pressures up to ½ inch. Rubber grommets are installed around all points where metal contacts metal. Powdered fresh air supply units on "PB" exhauster with reversed pressure blade to bring fresh air in under power.

DISAPPEARING EXHAUST SYSTEMS

Under the Floor and Overhead exhaust systems for all makes and models of cars and trucks. Will accommodate flexible metal hose up to six inches in diameter. Write for **Bulletin No. 650H.**

UPBLAST ROOF EXHAUSTERS

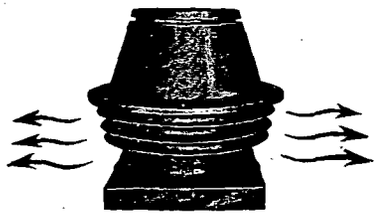
Designed for immediate heat, smoke and fume expulsion. Split disc damper that automatically opens when fan is turned on provides weather proofed units. Direct drive units equipped with totally enclosed ball bearing motors. Belt driven units furnished with motors out of line of airflow in separate weather proof compartment.



Write for Special Bulletin

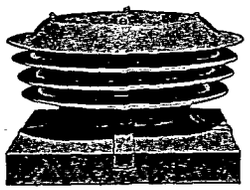
THE G. C. BREIDERT CO.

P.O. BOX 1190, San Fernando, Calif.



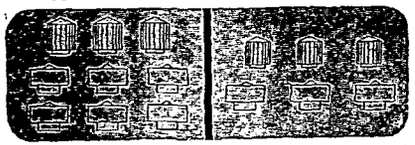
Representatives in All Principal Cities

POSITIVE VENTILATION GUARANTEED... NO MATTER WHICH WAY THE WIND BLOWS!



Breidert AIR-X-HAUSTER ... famous gravity-flow ventilator developed from principles of aerodynamics; proven by years of use in all types of application. Transforms winds from *straight-downward to 90 degrees upward* into positive suction—without a single moving part! Trouble-free, maintenance-free, weather-proof. Guaranteed backdraft-proof, barring internal negative pressures.

HORIZONTAL DISCHARGE ELIMINATES DOWN-DRAFTS!



Breidert POWAIR-X-HAUSTER ... Unique power unit provides pleasing, unobtrusive appearance on top of any roof. Discharges air on a straight horizontal plane—preventing conventional back pressures and roof deterioration caused by *downward* discharge of ordinary power ventilators. Downdraft-proof against winds from any direction when fan is off (barring internal negative pressure). Operates as a gravity ventilator when power is off!

NEW! SPECIAL VENTILATORS FOR FORCED-AIR SYSTEMS!

Breidert "AIR-OUT" ... now available to meet the special requirements of forced-air duct systems. It's the same low-silhouette Powair-X-Hauster head (at left) without motor and fan assembly. Specially designed to provide an internal static resistance much lower than that of ordinary discharge heads. Like the Powair-X-Hauster, the new Air-Out discharges fumes horizontally—and boasts an architecturally-pleasing appearance to enhance any roof top!

MORE VENTILATION PER DOLLAR!

It takes fewer Breidert ventilators to do the job than conventional ventilators of the same size... **OR** *use the same number of smaller-size Breiderts to do the job of conventional ventilators.*

INSIST ON CERTIFIED CAPACITY RATINGS BASED ON VARIABLE WIND CONDITIONS—This is your assurance that the ventilators you specify will perform efficiently in actual use. Capacity ratings of Breidert ventilators are certified by *Pittsburgh Testing Laboratory*. Breidert POWAIR-X-HAUSTERS carry the Certified Rating Seal of the *Air Moving and Conditioning Association*. Breidert single-phase power roof ventilators also carry *Underwriters' Laboratory* approval.

WRITE FOR ENGINEERING DATA BOOK—44 pages of installation photos, certified capacity ratings, complete specifications.

Manufactuers of all types of Power and Gravity Roof Ventilators

New Low Profile Electric Ventilator Type "CK"

The Type "CK" LOW PROFILE STATICK Power ventilator shown has been designed in response to the demand for the ABSOLUTE MINIMUM IN OVERALL HEIGHT for a ventilator using backward *curved blade centrifugal* fan, and is available in a wide range of capacities either direct or belt driven, with or without dampers or other extras as needed. The same LOW PROFILE type of housing is available using a propeller fan, or for gravity, pressure relief or intake. The latter is available in oblong shapes or sizes as may be needed, with or without our Insulated Double Shell steel curb of one of the several standard types. Any or all of these ventilators subject to modification to meet the need of any building project.

• Type LAC STATICK Power Roof Ventilator

This model features the damper housing as an integral part of the ventilator where the damper is accessible for cleaning. It shows the electric damper control mounted in the motor chamber where it is also readily accessible because of the hinged cowl.

Our Type "LAC" STATICK Power ventilator designed for efficient exhaust at either low or high static pressure, using non-overloading backward curved blade centrifugal fan, available in many sizes for almost any required capacity.

The Type "LC" STATICK Power ventilator (not shown) uses a similar construction minus the damper housing.

Capacity ratings for belt driven sizes of the Types "LC" and "LAC" STATICK Power ventilators have been formally approved by *Air Moving Conditioning Association*, and carry their CERTIFIED RATING SEAL.

See Sweet's Architectural, Engineering, or Industrial Construction Files.
Complete data on any or all types gladly furnished on request.

Roof Exhauster Equipment for Public, Commercial and Industrial Buildings

QUIET-TESTED! Jenn-Air Quiet-Tested Roof Exhausters are pre-proved under simulated field conditions. Each unit must pass rigid inspection by the critical *Vibronic Eye* . . . is "screened" in Jenn-Air's Sound-Elec Test Chamber to detect noise, vibration.

Direct Drive Power Roof Exhauster

Dependable U-Spring Suspension virtually eliminates noise caused by vibration. U-Springs suspend the power assembly, isolate it from the base. Motor and wheel are balanced together, eliminating vibration and noise. Heavy gage all aluminum construction.

Belt Drive Power Roof Exhauster

In this Quiet-Tested Belt Drive Power Roof Exhauster, Positive Weather-Proof Engineering is combined *with trim Low* Contour Design. Full Ball Bearing Drive and Motor are mounted out of the air stream. Heavy Gage All Aluminum Construction gives strength without weight. Exhauster can be quickly, easily, disassembled for re-assembly on the roof. Non-Overloading Blade, dynamically and statically balanced, also assures long life, smooth, quiet operation.

Hi-D Centrifugal and Axial Power Roof Exhauster

This exhauster fills the need for general area ventilation . . . has a clean engineering design that features compactness and serviceability. The wheel (centrifugal) or blade (axial) is located at the top, providing a high point of discharge which allows low curb construction. Housing is made of heavy gage aluminum which provides strength without weight. Bird guard of heavy gage stainless steel construction comes as an integral part of every unit. Unit opens easily for ready access to the drive assembly. Special vibration absorbers reduce noise to a minimum. Totally enclosed, full ball bearing, permanently lubricated motor assures smooth, uninterrupted service. Tubular drive assembly has permanently sealed, pre-lubricated ball bearings. Motor and drive can be serviced from interior of building, if desired.

Axial Roof Exhauster

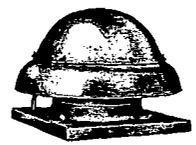
The Axial type Jenn-Air Roof Exhauster is recommended for general ventilation work and for duct-type applications where static pressures do not exceed one-half inch. Special Non-Overloading Design protects against motor failures. Dependable U-Spring Suspension eliminates noise caused by vibration. U-Springs suspend the power assembly; isolate it from the base.

Centrifugal Wall Exhauster

Jenn-Air Centrifugal Wall Exhausters eliminate most duct work . . . provide a means of ventilation through the wall when roof exhausters would prove unsuitable or more costly, as in multi-story construction. Constructed of heavy gage aluminum, exhausters are completely weather-proof, unusually quiet. Dependable U-Spring Suspension eliminates noise caused by vibration. U-Springs suspend the power assembly; isolate it from the wall.

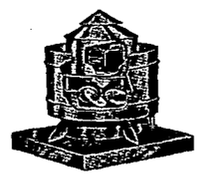
Relief Vent.

Jenn-Air Relief Vents eliminate goose necks or hoods used for air outlets or intakes. Weather resistant spun aluminum construction.



Member *Air Moving & Conditioning Association*

Jenn-Air Exhausters are tested and rated in accordance with standard test code *AMCA* Plate V-A (centrifugal) and VI-A (axial) as adopted by *AMCA* and *ASHAE*

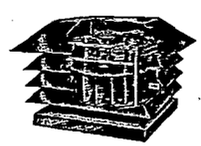


Muckle Manufacturing Co.

666 Belford Road Owatonna, Minn.

Sales Engineering Representatives in Principal Cities

MUCKLE SPUN ALUMINUM—Rating free air delivery starting at 460 cfm on larger units up to 1 in. static. Units may be had in backward curved wheels and propeller type blade. Heavy gage alloy aluminum .064 Motors are standard brands. Quiet, Sturdy, Low silhouette, Resilient mounted motors.



MUCKLE VENTS—are excellent for moisture laden applications or corrosive conditions. Motor is located out of the air stream, and housing is hot dipped galvanized after fabrication for lasting protection. Capacities 254 to 10280 cfm. Units very efficient at low static pressures. Constructed from heavy gage steel, electrically welded.

MUCKLE LO-SIL—designed for low silhouette appearance. Largest unit only 25½ in. high. Capacities from 225 to 17,600 cfm. Automatic back draft dampers built in on all models. Vibration separators are provided to eliminate vibration and hum. Totally enclosed, ball bearing motors are directly connected to propeller.

MUCKLE BC VENT—Centrifugal backward curved wheel is fine for operation where static pressures are encountered. Non-overloading, dynamically balanced wheel, directly connected to totally enclosed motor. No maintenance of belts, pulleys, or bearings. Motor is out of air stream for protection. Capacities from 280 to 7650 cfm. Heavy gage construction.

MUCKLE BELTED VENT—offers over 100 different capacities for any specific requirement. High exhaust capacity utilizes low fan tip speed to make unit very quiet in operation. Low in height, compact and symmetrical design, blends well with modern architecture. Heavy duty, ball bearing motors and non-overloading backwardly curved wheels used on all units.

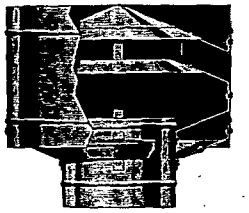
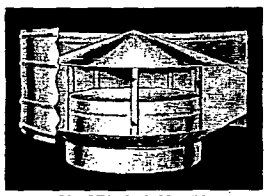
HIGH EFFICIENCY ROOF VENTILATORS



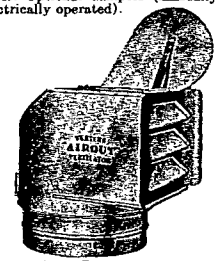
WESTERN ROTARY® VENTILATOR

Mechanical ventilation without power cost. Certified capacity ratings. Will not back-draft. Stormproof. Permanently sealed ball bearing assembly with lubricant reservoir. Rubber ISO-mounting. Baked enamel finish.



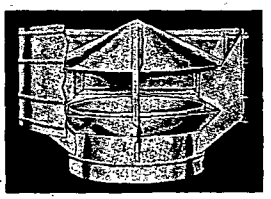
WESTERN CONTINUOUS RIDGE VENTILATOR

High volume exhaust. Architecturally desirable. Fabricated in any length in 12 throat sizes to fit any roof. Stormproof. Optional dampers (manually or electrically operated).



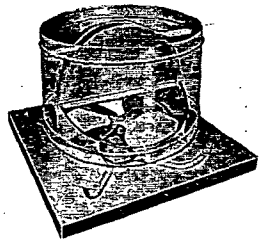
FORBES SYPHONAIRE VENTILATOR

A stationary ventilator providing high exhaust certified capacity regardless of wind direction. Rugged construction. Rainproof and stormproof. Low silhouette.



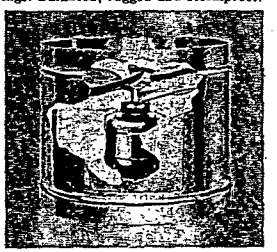
FORBES ECONOVENT VENTILATOR

Rugged design. Engineered construction at a low price. Certified capacity ratings. Low silhouette.



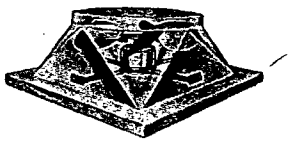
WESTERN AIROUT VENTILATOR

Directional type ventilator. Moves in the direction of airstream for maximum exhaust power. Certified capacity ratings. Balanced, rugged and stormproof.



FORBES AMVENT VENTILATOR

Government specification ventilator. Meets Corps of Engineers Guide Specifications CE 220.09, October 5, 1951. Removable top plate. Optional bird or insect screen or damper.



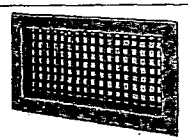
WESTERNAIRE® VERTICAL EXHAUST VENTILATOR

High capacity industrial "blow open" exhauster. Stormproof. Low silhouette. Prevents roof damage or re-entry of air in building. Fourteen gauge construction.

WESTERNAIRE® BOOSTER FAN

Duct mounted fan installs between ventilator and base. For new or existing construction. Permits ventilator exhaust when fan off.

WESTERNAIRE® CURB MOUNTED FAN



Provides fan diameter same size as throat diameter for maximum exhaust. Available in 40 models. Capacities based on NAFM ratings.

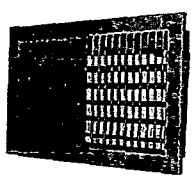
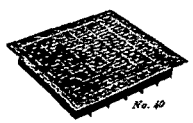
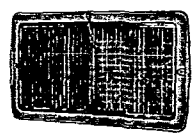
Air Conditioning Registers, Grilles, Diffusers—Ceiling and Baseboard Diffusers—Commercial Registers and Grilles



MULTI-TROL REGISTERS: Commercial type with special butterfly "Shallo-Valve", so shallow it can be used with standard 3¼ in. fittings. Fully-adjustable face bars, with rolled pivots that can't pull out of frame. Single or double deflection types. Beige prime coat finish. Full range of types and sizes. Matching grilles, all sizes.



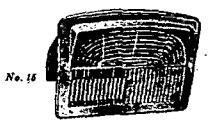
No. 76 BIG CAPACITY CEILING DIFFUSER: Up to 50 percent more capacity than ordinary round diffusers. Plenty of free area for use on ducts of same listed size. New "Air Flow" rings deliver air at lowest resistance. Contoured anti-smudge outer ring. Sponge rubber gasket. Flush, Step-Down and Adjustable types—6, 8, 10, 12 and 14 inch sizes. Beige prime coat.



No. 90 BIG CAPACITY CEILING DIFFUSER: Up to 40 percent more capacity than ordinary square diffusers. Same engineering, performance and appearance advances as No. 76. In Step-Down style only—6, 8, 10, 12, 14 and 18 in. sizes.
NEW "STA-SET" DAMPERS in both round and square models have butterfly valve, nylon friction bearing and operator rod with Adjusto-Stop collar.

No. 120 SERIES MULTI-LOUVER REGISTERS: Commercial type with one-piece face, stamped fins ½ in. wide. Great strength, large free area. Fins adjust for horizontal control of air pattern. Multi-Louver valve for 45 deg downward deflection—any upward deflection. Removable operator handle. Adjusto-Stop. Beige prime coat finish. Matching grilles, all sizes.

No. 40 FLOOR REGISTER: Features the famous Rigid-Lock type construction with each fret locked to each crossing ing fret and to margin. Dial-operator valves run the short way of the face. Medium mesh (3/16 in.) between frets. Finished in Oak or Metalescent—all standard sizes. **No. 41 FLOOR RETURN AIR GRILLES** have same construction features.



No. 20 SERIES AIR CONDITIONING REGISTERS: Positive control of air stream with vertical front fins, horizontal back fins—both readily adjustable from face. Damper opens to full 90 deg. Adjust-Stop for balancing system at face. Models for sidewall, baseboard and inverted installation. 8 × 6, 10 × 6, 12 × 6, 14 × 6 duct sizes. Matching grills, all sizes, plus 24 × 6 and 30 × 6. Two-tone beige finish.

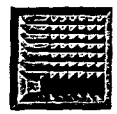
No. 188 BASEBOARD PERIMETER DIFFUSER: With built-in rotary damper to insure uniform velocity at face at any setting. 2-ft and 4-ft lengths with Adjusto-Bottom base strips. Both diffusers and matching grilles can be installed before or after plastering, on subfloor or finish floor. Also **No. 170 BASEBOARD DIFFUSER** and matching grille for low-budget installations.

No. 42 PERIMETER FLOOR DIFFUSER: Blankets outside wall with warm air, prevents drafts. Has one-piece face, extra-wide margins, smoothly-curved vanes and wafer-thin valve. Set vanes for any deflection without shearing off at ends. Opening sizes 14 × 6, 12 × 6, 14 × 4, 12 × 4, 10 × 6, 10 × 4, 10 × 2¼, 14 × 2½ and 12 × 2¼. Also **No. 150 ECONOMY FLOOR DIFFUSER** for low-budget installations.

No. 15 SIDEWALL PERIMETER DIFFUSER: Rapidly diffuses warm air over outside wall without "scrubbing". Easily balanced at face. Sponge rubber gasket. Sizes 10 × 6, and 12 × 6. Beige prime coat or Metalescent finish. **"E" FRAME** for baseboard installation. Also *No. 16* **OUT-OF-WALL DIFFUSER** for use where stackhead and duct cannot be put in wall.

WRITE FOR AIR CONTROL CATALOG FOR COMPLETE DESCRIPTIONS, ENGINEERING DATA, SIZES

ADP AIR DISTRIBUTION PRODUCTS



116 S. La Brea Avenue
Los Angeles 36, California

S-3 — Three-Way Throw True 3-way distribution, no spillage

S-4 — Four-Way Throw 360 deg distribution High Induction

SC-2 — Two-Way Corner Complete 90 deg distribution

S-2 — Two-Way Throw Side throw balanced to area served

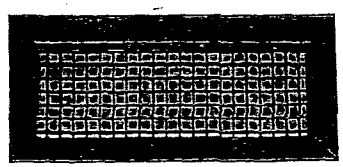
S-1 — One-Way Throw Side throw balanced to area served

ADP diffusers are designed and engineered for better air distribution. Greater free areas permit greater efficiency. The unique but simple construction combined with high induction characteristics result in top performance.

The inner core assures a balanced air delivery over the collar and face of the diffuser. No blank-offs or baffles are required to meet special pattern or delivery requirements. *ADP diffusers* provide rapid temperature equalization with quiet, draftless efficiency.

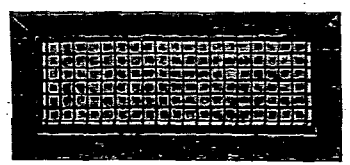
The greater efficiency of ADP diffusers permit the use of smaller ducts and a material saving on installation costs.

ADP diffusers are made in a complete range of sizes and face patterns. The air to be delivered may be proportioned in any required direction. The Type S frame, as shown, is standard, however, *ADP diffusers* are available with flat frames, tile replacement frames and with removable cores.



ADP diffusers are fabricated of cold rolled steel and welded throughout. Large diffusers are made of aluminum. The standard finish is baked on silver-tone enamel. Special finishes are available.

The TOB volume control has true-opposed blades. The blades are pivoted at edge and orifices remain constant. No contrasting velocities. Fine adjustment with fast action.



ADP diffusers and volume controls have been thoroughly field tested. Thousands of ADP diffusers are now performing with satisfaction in all types of industrial, commercial, residential and special applications.

All ADP diffusers have a smart trim appearance to blend with the decor of todays modern construction.

Sales engineering offices are located throughout the United States. They will welcome an opportunity to discuss your diffuser requirements.

K-310

K-130

ADP manufactures a complete line of adjustable bar grilles, registers and volume controls.

The *"K" series shown above is* available as a grille or register and in *single or double deflection with or without* attached dampers.

The new frame design gives an improved and attractive appearance and will add to any architectural treatment.

The "K" series is fabricated of extruded aluminum and the frame is of welded construction.

The solid section adjustable bars are of extruded aluminum and are spaced on ¾-in. centers and give top performance at a minimum noise level.

A complete line of volume controls is available.

Opposed blade dampers are adjustable through face of register with a removable key.

Dampers with individually adjusted blades are available.

Extractors are manufactured for permanent setting or with key operation.

We suggest you contact your ADP representative or write for catalog.

THERMOTANK AGITAIR

registers and grilles • high velocity units • punkah louvers air diffusers • filters • exhausters

Representatives in Principal Cities

AGITAIR DIFFUSERS

Type EC

CUSTOM MADE DIFFUSERS

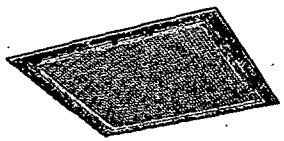
AGITAIR square and rectangular air diffusers incorporate built-in diffusing vanes, scientifically arranged in unlimited louver patterns to provide draftless, noiseless air distribution in 1, 2, 3 or 4 directions from any ceiling or side wall location.

These AGITAIR diffusers are custom made to suit each job condition and are available in three distinct types, "RC" with separate mounting frame and interchangeable diffuser cores; "R" and "RV" series, one piece units. *Catalog R-107* contains dependable, accurate performance data.

MR series matching return units (without diffusing vanes) are available in unlimited pattern designs, square and rectangular in shape to harmonize with AGITAIR supply diffusers. MR units are recommended only for return or exhaust applications.

CIRCULAR DIFFUSERS

AGITAIR circular air diffusers are made in two types—"O"—non-adjustable and—"OA"—adjustable. The graceful lines of the spinnings are identical for both types.



The "OA" adjustable units control the air direction at four different angles of discharge simultaneously. Air adjustment of these units is accomplished after installation and without changing the position of the spinnings. For normal ceiling distribution, Type "O" is recommended. *Catalog C-101* contains all dependable performance data.

STRIPLINE

STRIPLINE slot type diffusers are slenderly designed, inconspicuous, practical and versatile.

STRIPLINE combines the best features of both slots and efficient air diffusers to insure equalized air flow throughout the entire length of the diffuser, with . . . high rate of temperature equalization . . . gentle secondary air movement . . . even temperature in area served . . . quiet operation. STRIPLINE is available in various widths (some only 2 in. wide) and standard 4 ft lengths which can be butted together for unlimited runs. STRIPLINE can be located almost anywhere to suit interior design—in walls, ceilings, coves, moulds, window reveals or stools. *Catalog S-104* contains complete dependable engineering data.

PERFAIR
Perforated Air Diffusers

AGITAIR PERFAIR square and rectangular diffusers incorporate interchangeable cores available in unlimited air pattern arrangements for 1-, 2-, 3- or 4-way blows. These units also include built-in air controllers for positive adjustment of air deflection after unit is installed. The perforated face plate of PERFAIR blends in naturally with acoustical ceilings. Matching returns or exhaust units harmonize to enhance the architectural design. Separate mounting frames allow quick and easy installation of supply or return units. *Catalog P-200* contains dependable performance data.

THERMOTANK-AGITAIR PRODUCTS

The AGITAIR diffusers illustrated on this page and the THERMOTANK products shown on page 242 are sold exclusively by representatives for Air Devices Inc.

Complete engineering data, sizing and selection of these THERMOTANK-AGITAIR products are available from Air Devices Inc., 185 Madison Ave., New York 16, N. Y.

See THERMOTANK INC. ad on page 242.

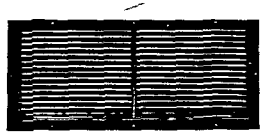
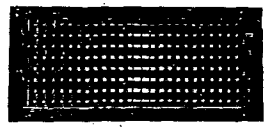
A complete line of Registers, Grilles and Scoops for all types of Industrial and Commercial air conditioning applications

185 Madison Ave.
New York 16, N. Y.

AGITAIR

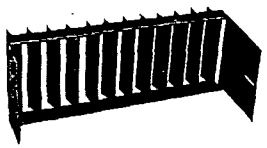


Agents in All Principal Cities.

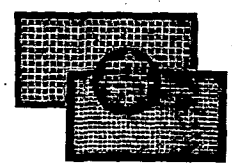


DDV A double deflection grille affording four way diffusion—individually adjustable streamlined fins ¾ in. C.-C. heavy gage metal and sturdy construction.

DDVO A double deflection grille with opposed action valves. The valve consists of a series of hollow, internally reinforced air-foil sections. Through a unique actuating mechanism each air-foil section turns in a 90 deg arc toward a similarly turning section.



DG An exhaust grille with non-adjustable fins. Fins are normally factory set at 45 deg down angle to restrict vision. Also available with fins set at 0 deg vertical or horizontal.



DVL A directional-type register employing 1 in. wide, parallel-acting valves. Face fins are individually adjustable right and left.

The 1 in. wide, parallel-acting valve mechanism is available with any/all STEWART face patterns.

SCOOPTROL A device designed to deflect and control the air from a supply duct into a collar, and installed at the junction of the duct and collar. Scooptrol is a double-blade functional product, easily adjusted, positioned and then fastened by sheet metal screws; it cannot move or fall.

PLAIN LATTICE GRILLES Available in satin bronze, brass and aluminum. Also plated finishes on steel.

FINISH DIRECTIONAL TYPE OUTLETS ARE PROTECTED BY A PRIME COAT AND A FINISHING COAT OF *SILVAIR* ENAMEL BAKED ON. *SILVAIR* FINISH IS A MODERN, ATTRACTIVE COATING CONTAINING ALUMINUM PIGMENT, AND IS SILVER-BLUE IN TONE. NO ADDITIONAL PAINTING IS REQUIRED.

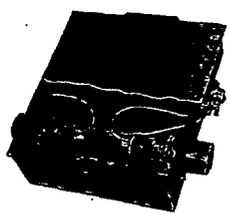
THERMO-REG UNITS

Thermo-Reg mixing and sound attenuating chambers for high-velocity air conditioning systems, single or dual duct, are available as (1) ceiling type or (2) under-window-type.



CEILING UNIT

Thermo-Reg ceiling units for rooms or corridors serve one direct connected AGITAIR diffuser or several remote diffusers. They offer considerable flexibility to accommodate room modifications or changes in internal loads after installation.

PERIMETER UNITS

Thermo-Reg perimeter units, operating at a low sound level, supply conditioned air through the AGITAIR Stripline diffuser in the top or front of each unit. In single duct systems, room conditioners are controlled by a zone thermostat. In dual duct systems, they are individually controlled by a thermostat in the space served. Ask for *Catalog TA-101*.

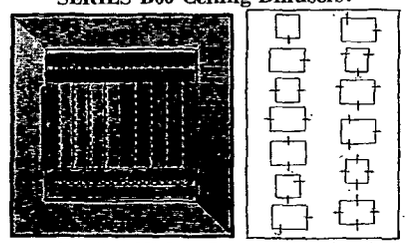
CON-VOL Equipped High Velocity Mixing Units

CON-VOL, a unique device now available in all Thermo-Reg Constant Volume perimeter and ceiling units assures precision control of air volume and temperature to meet all requirements regardless of inlet static pressure variations. *CON-VOL utilizes flow* regulators and standard pneumatic motors mounted on a sliding base. The entire system eliminates *the need of complicated linkages.*

DRUM PUNKAH LOUVRES

These units are specially designed for those heating or ventilating applications requiring extremely long throw. These units are suited for installations where large spaces must be served with a minimum of duct work. DRUM *PUNKAH LOUVRES* with directional air control and long throw are particularly adapted to large spaces in industrial plants, auditoriums and commercial establishments. Engineering data available.

ROUND PUNKAH LOUVRES

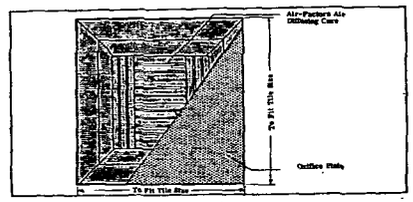


PUNKAH LOUVERS are nozzle-type outlets incorporating principles of high velocity air delivery with individual directional control *for spot* heating or cooling applications. These units are widely used in applications for air conditioning, heating and *ventilating* in ships, industrial plants, aircrafts, telephone exchanges and a variety of other applications. For complete data ask for *Catalog*.

THERMOTANK-AGITAIR Products illustrated on this page are sold exclusively by representatives for Air Devices Inc., 185 Madison Avenue, New York 16, N. Y. See Air Devices Inc. ad on pages 240-241.

AIR-FACTORS INC

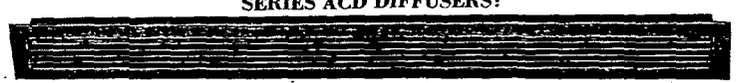
1624 South Raymond Ave. **Monrovia, California**
Air Distribution **Air Control**



SERIES B60 Ceiling Diffusers:

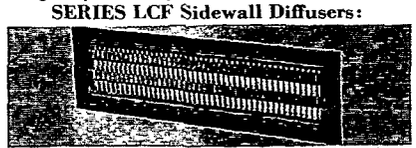
MODEL LCF-RC (Removable Core)

Air-Factors' Series B60 Ceiling Diffusers for mounting on ceilings through patented construction provide proportionately balanced air distribution with controlled air motion through laminar counter-flow cores. Square or rectangular air diffusing outlets with full range sizes and capacities allow maximum mixing of primary and secondary air with distribution of supply air in direct ratio to floor area.



MODEL MO-MJ (Series T)

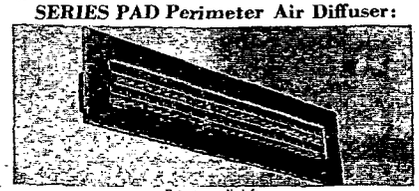
Patents applied for.



Air-Factors' Model MO-MJ recessed, square and rectangular induction type ceiling air diffusers are designed to comply with modern architectural tile ceilings and can be attached and fitted to any standard ceiling structure. The diffuser discharges supply air substantially parallel to the surface upon which it is mounted, inducing a large percentage of room air into the hooded section to mix with the supply air being discharged. On-the-job adjustment to the discharge angle is provided. One, two, three or four-way unbalanced or balanced air patterns are available.

SERIES ACD DIFFUSERS:

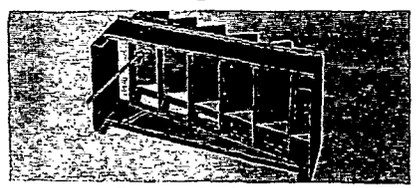
Air-Factors' Series ACD Air Curtain Diffusers are designed for ceiling installations where it is desirable to blanket a single or perimeter exposed wall with a curtain of air. It may be used to curtain any area bordering a conditioned space. Special butt ends are provided for continuous strip installations from 1 in. to 4 in. in width.



SERIES LCF Sidewall Diffusers:

MODEL LCF-RC (Removable Core)

Factory set outlets distributing air in laminar counter-flow layers mix supply with room air reaching design conditions in minimum time and space. LCF outlets can be equipped with secondary flexible horizontal vanes which may be reset on job, giving maximum, vertical control with varying length of blow.



SERIES PAD Perimeter Air Diffuser:

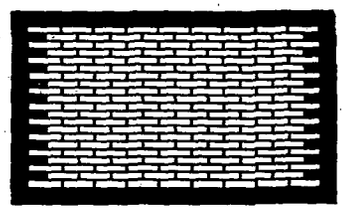
Patents applied for.

Air-Factors' PAD Perimeter Air Diffuser provides for the perimeter system of air distribution. A register with built-in diffusing core. The core is factory set to distribute the air to reach comfort conditions in a minimum of time and space. The laminar counter-flow air deflecting vanes provide a maximum divergence angle to blanket a greater area of perimeter surfaces. The perimeter diffuser is provided with a dial operated volume control valve.

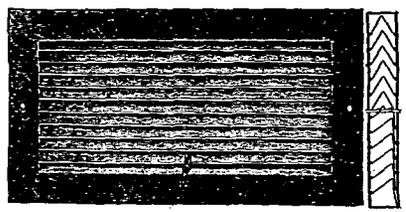
SERIES AVP-QO Adjustable Air Proportioning Vanes:

Balances air distribution for given supply outlet. Quick opening feature extracts air with a 2½ in. maximum entrance into main duct, reducing velocity evenly over outlet face. Full shutoff. Manufactured separately or attached to sidewall ceiling outlet or diffuser. Key or rod operated.

SERIES OBD-KO Air Volume Control:

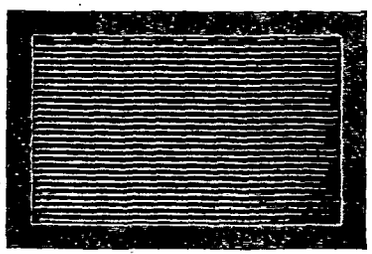


Opposed acting blades; center pivoted. Operate from full open to full closed position. Used directly attached to grille, diffuser or installed as separate unit. Key operated. Friction linkage maintains blades in position when set.

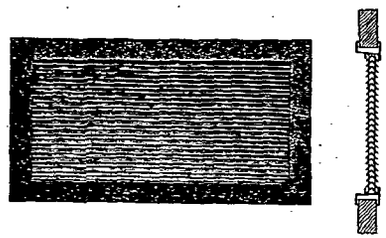


A-J Manufacturing Co.

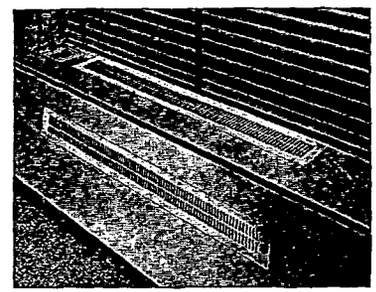
3601 East 18th St. Dept. Y Kansas City 27, Missouri



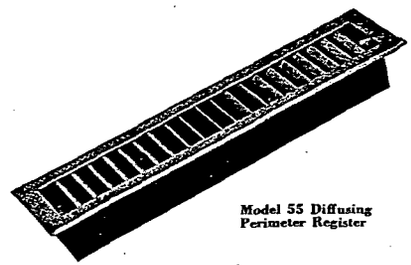
REGISTERS GRILLES DIFFUSERS



A-J Architectural Grilles are available in slotted designs B, C, and D, and square meshes of ½, ⅝, ¾, and ⅞ in. The grilles can be made to your exact order from steel, aluminum, bronze, monel or stainless. There is practically no size limitation. See A-J illustrated catalog for specifications.

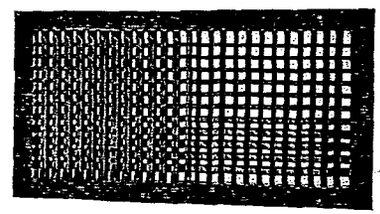


A-J A-76 No-Vision Grille, shut-off type. It has extruded aluminum V-bars and flange frame. Efficient in free area. Depth is 5/8 in. As in other styles of A-J no-vision grilles, the auxiliary frame telescopes over core from opposing side for fast, simple and neat installation. Spans 1¼ in. to 2⅛ in. depth. Cutaway view shows open and closed positions.

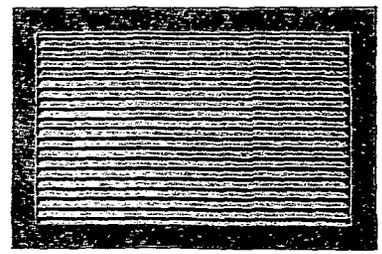


A-J A-7000-B Grille. This extruded all-aluminum no-vision grille blends attractively with contemporary interiors. Extruded aluminum V-bars-(3 to the in.) and flange frame. Resists corrosion, rust. Lightweight, approximately 70 percent free area. Mitered corners. Auxiliary frame telescopes over core from opposing side for neat, finished appearance in doors or partitions. Span from 1¼ in. to 2⅛ in. Grille 5/8 in. deep.

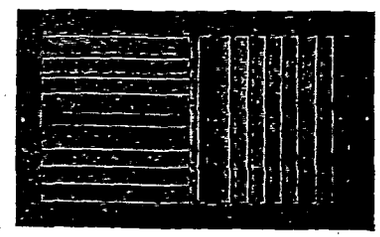
A-J No. 77 Series Thin Core Grilles are only ½ in. thick, yet are completely sight proof. Approximately 80 per cent free area. With auxiliary frame, the No. 77 series can be installed in panels or partitions from ¼ to ¾ in. thick. Illustration above shows grille and cut-away view of grille and auxiliary frame. No. 77-A is all steel with channel frame. Also available without framing—No. 77-C.



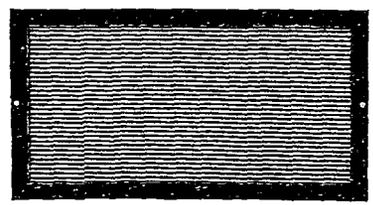
A-J Convector Grille and Register. These are custom-made to your specifications. Architectural grille of aluminum, munts, stainless or cold-rolled steel covers adjustable bar-type louvers, single or double bank, to direct air flow in desired pattern. Setting frame minimizes installation time. Construction eliminates tampering after installation.



Model 55 Diffusing Perimeter Register



A-J No. 55 Diffusing Perimeter Floor Registers. Heavy gage curved vanes are factory set to deliver a fan-shaped air pattern. Ideal for installation in stair risers, under kitchen cabinets, in picture window sills, or as side wall outlets with high velocity systems. Valve louvers may be set with special lock screw after system is balanced.



A-J No. 400 Series Air Conditioning Grilles and Registers. Extruded aluminum bar-type grille, steel frame. Single or double bank adjustable; in horizontal, vertical deflection or combination of either. No. 440 styles have opposed blade damper. The No. 430 register has single bank of bars with multiple valve body, removable handle. All-aluminum faces on styles A-400 and A-440.

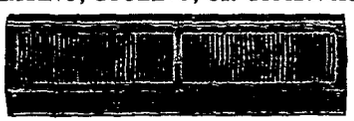
A-J No. 42 Series Return Air Grilles. Available with either horizontal (42-H) or vertical (42-V) face bars on ½ in. centers. 45 degree deflection for minimized see-through. Overall, 1¾ in. beyond duct size; depth 5/8 in. All steel, gray prime finish. No. 432 has multiple valve body, removable handle; with opposed blade damper, No. 442.

A-J No. 200 Series Ceiling and Side Wall Diffuser. Available in a wide range of deflection patterns. Standard construction is steel frame with extruded aluminum, adjustable, curved face bars which are 1¼ in. wide on ¾ in. centers. Overall size is 1¾ in. greater than duct size. Approximately 75 percent free area. Aluminum enamel finish. No. 230 has register body, multiple valves, removable handle. No. 240 is the opposed blade damper style.

A-J No. 75 Grille. For dark room or other application which requires ventilation without light or sight. Steel construction throughout. Free area approximately 60 percent. With flange frame, No. 75-B; with channel frame, No. 75-A. Depth of No. 75-B grille, 1¾ in. Spans 3¼ in. with standard auxiliary frame. Non-specular black only.

FOR COMPLETE SPECIFICATIONS AND PRICES ON ALL A-J PRODUCTS, WRITE FOR ILLUSTRATED CATALOG

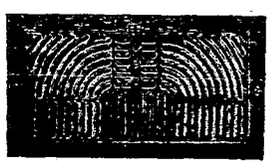
THE AUER REGISTER COMPANY



REGISTERS AND GRILLES FOR EVERY HEATING AND COOLING NEED

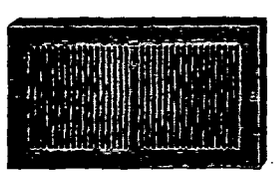
6610 CLEMENT AVENUE • CLEVELAND 5, OHIO

In Canada: Superway Products, Tilbury, Ontario



Auer features a complete line to meet every heating, cooling, or combination system requirement. The Auer line exemplifies correction of design and construction—decorator styling—easy installation.

PERIMETER HEATING, COOLING, OR COMBINATION SYSTEMS

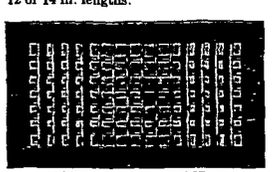


"PERFUSAIRE"

"PERFUSAIRE" . . . fits 2¼ in. x 12 in. and 2¼ in. x 14 in. openings. Only 18 in. long and 4¼ in. high, the "Perfusaire" has spread and capacity of 4 to 8 ft. units. "Limit-Lock" permits perfect balancing of system. No. 100.

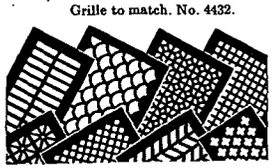
"FANAIRE"

"FANAIRE" . . . for high or low sidewall installation. Efficient, low-resistant, perimeter air diffusion. Sizes 10 x 6, 12 x 4, 12 x 6 and 14 x 6.



"AIR-FLEX" SERIES

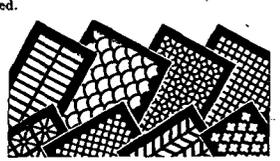
"AIR-FLEX" SERIES . . . Wall register, Grille bars and multi-louvers adjustable to direct air flow in all directions. Grille to match. No. 4432.



AUER "DRP" FLOOR PERIMETER REGISTER

AUER "DRP" FLOOR PERIMETER REGISTER . . . for intricate, "narrow-type" installations. Available with built-in Damper in 2¼, 4 and 6 in. widths; 10, 12 or 14 in. lengths.

"STREAMLINER" SERIES



"STREAMLINER" SERIES . . . For high velocity air-conditioning systems. Obtain maximum diffusion, silent operation. SINGLE BAR MODEL: "Streamliner" Bars vertical in front, with horizontal multiple louvers in rear. Louvers operated by lever on face. DOUBLE BAR: No. 1205 VH-OB—double deflection grille with 2 banks of "Streamliner" bars. Front bars vertical, rear horizontal. Opposed blade damper louvres easily adjusted.

ORNAMENTAL GRILLES

ORNAMENTAL GRILLES . . . Complete line available in steel, stainless steel, brass, bronze or aluminum. Large variety of decorator designs and finishes.

WRITE FOR COMPLETE DESCRIPTIVE LITERATURE

BARBER-COLMAN COMPANY

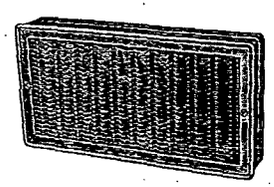
1300 Rock Street, Rockford, Illinois

Field Offices in 95 Cities Throughout the United States and Canada—consult local phone book

A Complete Line of Engineered Air Distribution Products

Barber-Colman air distribution products are engineered "to make air behave," to eliminate complaints: "Too hot—too cold—too drafty." They provide uniform, properly controlled rate of flow and diffusion of air being introduced into the room. Their performance is guaranteed.

Barber-Colman offers you years of combined experience in both air distribution products and automatic controls and will help you develop the correct relationship between room temperature, velocity of air being introduced to the room, and temperature of moving air in relationship to average air temperature in the room to provide expected human comfort conditions.



(See Barber-Colman page in Controls and Instruments Section.)

Complete descriptive literature and selection data available upon request.

Grilles & Registers

Model MA sidewall diffuser (has removable core)

Model FA sidewall diffuser (has removable core)

Model ST continuous line diffusing grille for under-window and sidewall installations.

Uni-Flo grilles and registers provide rapid diffusion, a high rate of aspiration with resultant high air entrainment ratio, low pressure drop, low noise level, simple adjustment in the air pattern, and a pleasing appearance. A variety of frame styles is available to meet sidewall, panel, or exposed duct installation requirements. The removable core feature makes it unnecessary to break the paint or plaster seal for cleaning or decorating purposes.

Barber-Colman also manufactures a complete line of return, exhaust, and transfer grilles, including the Sight-Tite core for use in doors to provide adequate ventilation without unsightly "see-through."

Accessories

Barber-Colman accessories include opposed-blade volume controls—Voladjusters, for remote manual adjustment of air volume—Airturns and Deflectrols, for efficient flow of air around turns and into take-offs.

Ceiling Diffusers

Venturi-flo ceiling diffusers

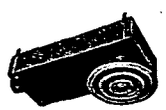
Venturi-flo ceiling diffusers feature quiet operation, rigid construction, wide range of sizes, efficient diffusion, adjustable deflection volume control, and attractive appearance. They are available for supply and return service in both recessed and flush mounting styles, as well as in combination with lighting units. A complete line of accessories includes volume controls, dampers, and Deflectrols.

Uni-Flo square and rectangular diffusers with perforated diffuser plate

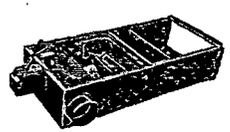
Square and rectangular ceiling diffusers are available with attractively designed faceplates, both recessed and surface type. Air pattern modification and volume control are provided without altering the outward appearance of the diffusers.

Uni-Flo square and rectangular diffusers with louver face design

Square and rectangular diffusers are also available with a louver face design to meet specific architectural requirements. These are available with a variety of vane assemblies to provide 4-way, 3-way, 2-way, or 1-way air patterns.



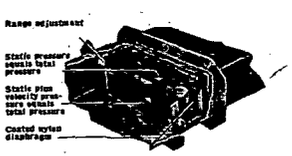
PARAFLO combination air distribution and lighting unit



This new troffer provides precision-engineered air diffusion and high comfort illumination in a single attractive unit. Adjustment can be made from below. Air distribution assembly by Barber-Colman, lighting by Day-Brite Lighting, Inc.

High Velocity Units

High velocity air distribution, pioneered by Barber-Colman, requires technically designed units which will reduce the high velocity air to conventional velocities and correctly distribute it to the occupancy zones at minimum noise levels. Barber-Colman offers a complete line of single- and double-duct control equipment including constant volume control.



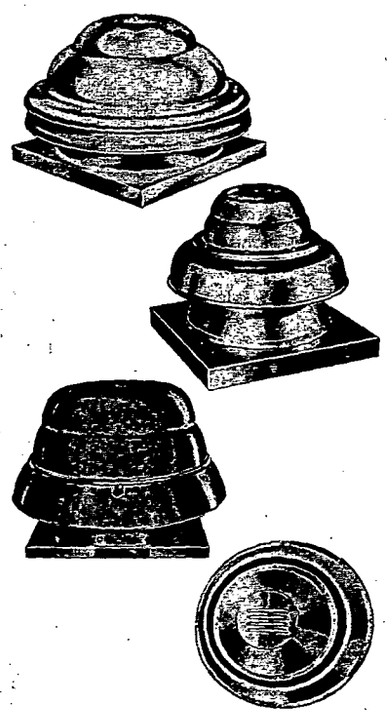
Barber-Colman high velocity control unit with Venturi-flo diffuser

Uni-Flo double-duct constant volume control

The new Uni-Flo double-duct control unit with self-contained constant volume control simplifies stabilization of high velocity systems. It mixes hot and cold air and reduces it to conventional velocity at minimum noise levels. It is self-operated, requiring no power source or motor operator. Cfm delivery and air mixture temperatures are held within very close limits.

Model SCR constant volume regulator

The Model SCR constant volume regulator illustrated above is applicable anywhere in a duct system where there are changes in static pressure. No motor operator or other power source is required. It provides extremely accurate constant volume control, reducing high velocities to conventional velocities for branch ducts.



CARNES CORPORATION

VERONA, WISCONSIN

Roof and Sidewall Ventilators—Air Diffusers—Registers and Grilles—Baseboard

ONE OF THE MOST COMPLETE LINES OF VENTILATORS

The Carnes line of ventilators includes a wide range of models and a complete selection of sizes and capacities—to fulfill every requirement. Features include—quick, easy installation; aluminum housings and curb bases; heavy duty sealed ball bearing motors, installed out of air stream; motors and fan assemblies mounted on high quality isolators, and guaranteed performance.

MODEL DI

Extremely low silhouette, especially designed for low parapet buildings. Has a backwardly inclined, non-overloading fan wheel which is direct drive. Housing is heavy gage, corrosion resistant aluminum. Available in a wide range of sizes and capacities.

MODEL AX

Heavy gage aluminum housing and aluminum, non-sparking propeller fan direct motor drive with motor and fan assembly mounted on resilient mounts to eliminate vibration and noise. Square curb base is standard and is furnished attached when ordered with the ventilator. Several sizes in a wide range of capacities.

MODEL BE

Low contour for low parapet buildings. Housing is heavy gage, corrosion resistant aluminum. Backwardly-inclined fan wheels, statically and dynamically balanced to provide years of smooth, quiet operation. Large selection of sizes and capacities.

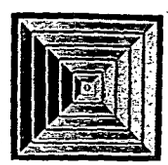
MODEL WD

Modern streamlined, centrifugal side-wall exhauster. Quickly and easily installed. Can be used with duct work, or as a straight exhaust. Each motor and fan unit is mounted on full-floating rubber vibration isolators to reduce vibration and noise to an absolute minimum. Available in capacities from 120 cfm to 2295 cfm.

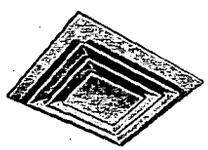
CARNES CORPORATION

VERONA, WISCONSIN

Air Diffusers—Registers and Grilles—Roof and Sidewall Ventilators—Baseboard

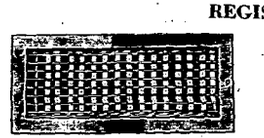


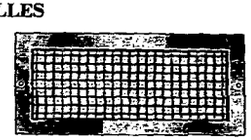
AIR DIFFUSERS



MODEL EJ is a completely adjustable diffuser for an infinite number of air patterns. Pattern adjustment is easily made by turning center cone. Ideal for installation where cooling, heating or ventilating uses the same duct.

MODEL EH is half-round diffuser—adjustable for use on ceiling or sidewall. Can be set for either throw at the factory, or easily changed after installation.

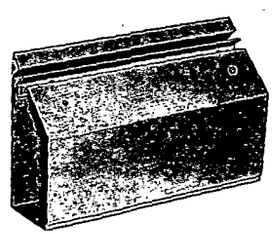




MODEL K available in one-way, two-way, three-way and four-way blow in square or rectangular models—for surface or recessed installations. Corner air scoops for an even 360 deg pattern. Inner vane removable for easy installation.

MODEL RC AND RCD Convertible Diffuser for heating and cooling. Simply adjusted without tools or disassembly for a two-way, three-way or four-way air distribution pattern. Available with opposed blade damper as an integral part of unit.

REGISTERS and GRILLES

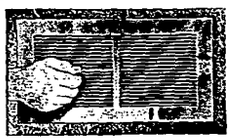


MODEL 100 Single Deflection Supply Register with opposed blade damper provides air deflection in two directions and positive volume control. Face bars individually adjustable. 18 gage steel frames. Also available with vertical front bars. 26 standard sizes.

MODEL 250 Double Deflection Supply Grille. Available with horizontal or vertical front bars. Adjustable rear blades. 18 gage steel frames –rounded edges—sponge rubber gaskets. In 26 standard sizes.

A complete line of registers and grilles available—write for catalog.

BASEBOARDS

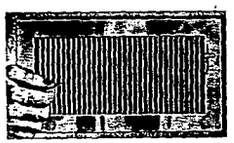


For continuous, even air diffusion, Carnes-Brandes is designed to meet the needs of architects and engineers for exacting requirements. There are standard models for all residential and commercial applications—and a complete selection of varied types. Write for *Catalog No. C-B108*

HART & COOLEY MANUFACTURING CO.,

HOLLAND, MICHIGAN

Air Conditioning Registers, Grilles & Diffusers—Warm Air Registers—Damper Regulators—Furnace Regulators—Pulleys—Chain

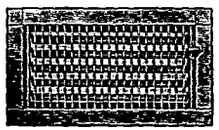


No. 74 DESIGN
ECONOMY TYPE AIR CONDITIONING REGISTER

Flexible-fin face permits any up or down deflection of air-flow. Positive valve with volume control for accurately balancing system. Gasket prevents streaking. Sidewall and Baseboard Registers in sizes 8 x 4 through 14 x 8. Grilles 8 x 4 through 30 x 8.

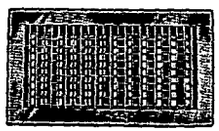
No. 76 DESIGN
IDEAL REGISTER FOR SHALLOW OR HORIZONTAL DUCTS

Multi-shutter valve (depth 1⅝ in. from wall) and flexible-fin face provide for all deflections desired. Any up or down deflection can be maintained with adjusting screw. Sealed to prevent streaking. Sidewall and Baseboard type Registers in sizes 6 x 4 through 30 x 8.



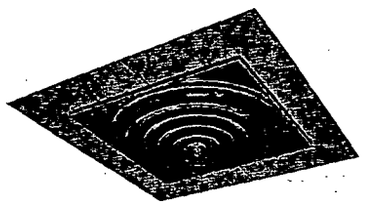
No. 88 DESIGN
SHALLOW DUCTS, LARGE INSTALLATIONS

Similar to No. 76 except that face bars are adjustable in 2½ in. sections (one moves all in section). Exceptionally good for large installations. Removable handle available to avoid tampering. Sidewall Registers or Grilles 6 x 4 through 30 x 24.



FIXT-AIRE® RETURN AIR GRILLES AND REGISTERS

Similar in construction and perfect complement to TRIPL-AIRE line. Same louver, but face bars (single bank) are fixed in either horizontal or vertical position. Grilles may be had with horizontal face bars set at 22 degree angle for up or down deflection.



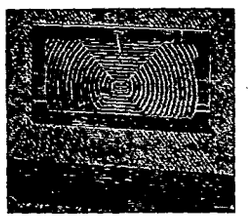
No. 821 DESIGN
COMMERCIAL-RESIDENTIAL A.C. REGISTER

Multiple deflection provided by parallel action louvers, adjustable to any upward angle and downward to 45 deg, and pivoted face bars. Vertical or horizontal louvers and face bars, snap-in valve positioning handle removable to prevent tampering with setting, shallow depth (1⅝ in. - valve open). Face bars pivoted at front to leave appearance of face uniform regardless of position. No. 831, not shown, has vertical louvers, horizontal face bars. Many standard sizes. Costs less than TRIPL-AIRE line. Ideal for year around air conditioning, particularly where low sidewall registers are presently installed.

TRIPL-AIRE® SIDEWALL REGISTERS
EXCELLENT FOR COMMERCIAL TYPE INSTALLATIONS

Provide any deflection or combination of deflections desired. Opposed louvers afford absolute volume control. 26 standard sizes up to 36 x 12 ... each available in 10 combinations of horizontal and vertical front and secondary face bars and louvers. All key adjusted from front.

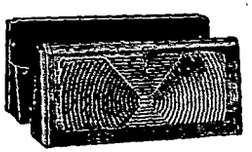
No. 16 CEILING DIFFUSAIRE®
IN No. 18 ADAPTER SQUARE



Both this diffuser and the No. 15 on the opposite page are designed to take full advantage of pipe sizes thus providing highly efficient cfm delivery at a minimum resistance. Butterfly damper is available with both. Adjustable from below it allows thorough balancing at the diffuser face. The No. 18 ADAPTER SQUARE, for use with either No. 15 or No. 16 diffuser, harmonizes nicely with acoustical ceilings solving the "round or square" problem with just one diffuser. Gasket prevents streaking. Designed for cooling as well as heating. 5 sizes.

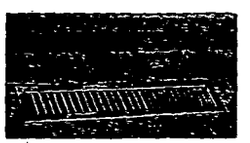
GAS VENT PIPE AND FITTINGS

The H&C line of Type B gas vent pipe and fittings is complete. Provides everything necessary for venting gas water heaters and all types of gas-fired heating equipment.



No. 401 DIFFUSAIRE®—For Perimeter Heating or Cooling.

Installed above the baseboard on outside walls, provides an excellent means of blanketing outside wall and window areas with a curtain of warm or cool air. This diffuser disperses air in full 180 degrees spread upward in addition to directing a small portion downward over floor. Adjustable stop on handle permits balancing system at the face. Sizes: 10 x 6, 12 x 6, 14 x 6.



No. 405 DIFFUSAIRE®—For Perimeter Installations.

Particularly good for use in established homes. Out-of-wall Baseboard type. No stackhead required. Provides same air pattern as our No. 401 Sidewall DIFFUSAIRE.

No. 411 DIFFUSAIRE®—For Perimeter Heating or Cooling.

Floor type. Counteracts downdrafts from windows and cold walls. Opposed louver valves and set-screw adjustment permits accurate volume control for easy balancing of system. Design of louver blades provides even spread of air in fan shaped pattern with minimum resistance. Sizes 2¼ x 10, 12, 14; 4 x 10, 12, 14; 6 x 10, 12, 14.

No. 46 DIFFUSAIRE®—For Perimeter Systems.

Continuous baseboard type. Furnished in 2 ft and 4 ft units for installations of any length desired. Airfoil valve assures minimum resistance. This diffuser maintains air pattern regardless of volume, permits balancing system at diffuser face. Flexo-flange, furnished at no extra cost, provides a tight, quick connection between diffuser and boot. Matching RETURN AIR INTAKE is No. 47.

No. 15 CEILING DIFFUSAIRE®

This diffuser and its companion diffuser, No. 16, shown opposite, provide full 360 deg., draftless air distribution. The difference in the two is this: The rings of the No. 15 are flush, while in the No. 16 the rings step down at a 10 deg angle. Dependable for residential and small commercial installations. 5 popular sizes.

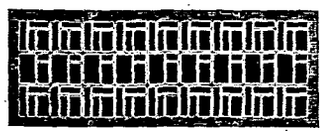
Hendrick Bulators; Hendrick Perforated Metal Grilles; Hendrick Mitco Open Steel Flooring, Armorgrids, Shur-Site Treads

HENDRICK BULATOR ....

THE *DUAL-UNIT* COMBINATION



A Deflecting Vane Grille

+ An Ornamental Grille

Now you can secure in a single installation all the advantages of an adjustable vane grille—*to direct air flow*—and an ornamental grille—*to harmonize with the decorative scheme*—by specifying the new dual-unit Hendrick BULATOR*. It is a practicable combination that meets both the engineer's specifications for air throw and spread, and the decorative requirements of the architect.

In this dual-unit, the deflecting vanes are not noticeable, although they are mounted just behind the ornamental grille. The vanes are adjustable so that the air flow can be deflected to right or left, up or down, or in a combination of both directions.

For the imposed ornamental grille section of the dual-unit Bulator, Hendrick offers a wide selection of attractive designs, with the essential open area.

Photograph taken with deflecting vanes less than an inch behind grille, shows that vanes are not noticeable

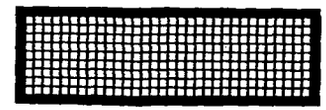
Tested at Case Institute

To determine the efficiency of the dual-unit, tests were made at the Case Institute of Technology, Cleveland, under the direction of Professor G. L. Tuve, as a result of which, "it was found that at a given air volume, the presence or absence of the 'Mosaic' (design) grille made very little differences on either the air stream pattern or the throw."

A copy of the detailed report on these tests will be mailed on request.

Vertical deflecting vanes, showing how the vanes may be set to produce any desired air stream pattern

How to specify or order Hendrick Bulators

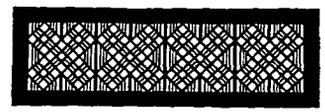


In specifying or requesting quotations on the Hendrick dual-unit Bulator, the following information is required:

1. The name or description of the desired ornamental grille, as given in the Hendrick Grilles catalog.
2. The metal, gage and finish of the ornamental grille, that is required.
3. The dimensions of the air duct opening.
4. The type of deflection desired in the deflecting vane section; whether right and left, up and down, or a combination of both.

* Beauty + Ventilator.

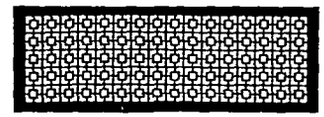
HENDRICK PERFORATED METAL GRILLES



Hendrick decorative grilles are furnished in over a hundred patterns, and in a wide variety of overall dimensions, bar sizes, and number and size of perforations.

Argive—51 percent Open Area

Arglin—63 percent Open Area



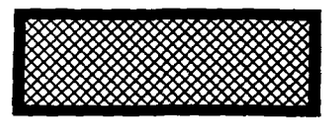
La Crosse—55 percent Open Area

Many exclusive Hendrick designs, originally produced to meet an architect's specifications for some particular project, are now available as standard numbers, and facilities for making special designs to specifications make the Hendrick service even more complete. The wide range of patterns permits the choice of a grille that will harmonize with any style of architectural design or period construction.

Grilles are fabricated in heavy-gage aluminum, bronze, copper, Monel, steel, stainless steel, and other commercially rolled metals. With ample open areas and accurate sizes, Hendrick grilles are characterized by clean-cut perforations, fine finish, and freedom from burrs and other imperfections.

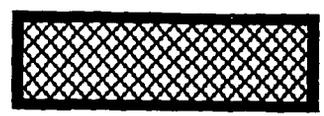
They are easy to install, and always lie flat because of a special flattening operation in their manufacture.

If among the Hendrick special and standard designs you do not find something which meets your requirements, we shall be glad to submit suggestions or to work with you in the development of a special design.

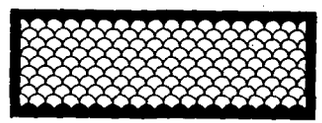


2" Link—52 percent Open Area

Air Conditioning Grilles and Registers



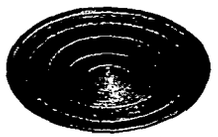
Hendrick air conditioning grilles and registers for directed air flow are made in various meshes, the standard having ½ in. or ⅝ in. opening between face bars. All types furnished with either horizontal or vertical directional bars either permanently set or so that they may be individually adjusted on the job to direct air flow to any desired degree. Grille and register faces are made regularly of steel with prime coat finish. They can be furnished in a lacquered finish to match any color sample.



M-No. 2—57 percent Open Area

⅞" Diamond—60 percent Open Area

M-No. 9—67 percent Open Area



1¾" Shell—72 percent Open Area

Demuth Draftless Air Distributors

Representatives in Principal Cities

New-Type (D-3) available now

Designed and Patented by Demuth

Illustration showing curved equalizing deflecting air vanes and method of installation

Type (S)

The DEMUTH DRAFTLESS AIR DISTRIBUTOR

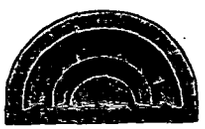
Consists of a series of curved vanes, mounted on a deflecting cone, to insure 360 deg distribution without the aid of secondary equalizing devices. A second hollow deflecting cone is arranged at a tangent to the primary cone, forming an injection nozzle.

The curved vanes discharge the supply air in turbulent streams, mixing room air with conditioned air, thereby providing constant air motion, uniform temperature and draftless distribution throughout the room.

Secondary air currents, which are created by the turbulence of the discharge air, are drawn into the diffuser by the bottom or secondary cone, mixed with the supply air, resulting in positive aspiration.

Type (SQ) square and rectangular Air Diffusers are made to any size with removable core assembly. Air distribution is from one, two, three or four sides of the diffuser. Made to any air pattern.

Accessories



Combined lighting is available with the circular type. Volume and Splitter Dampers are available for all types.

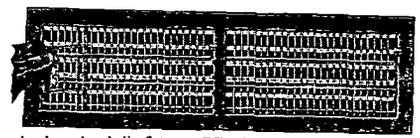
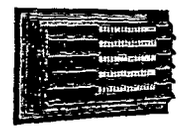
The Independent Register Company

3747 East 93rd Street • Cleveland 5, Ohio



Independent "Fabrikated"® Registers and Grilles

For Sidewall

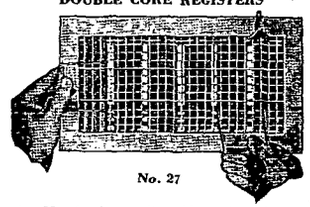


No. 321A-HMV

Every Grille Bar Adjustable Individually—Before or After Installation

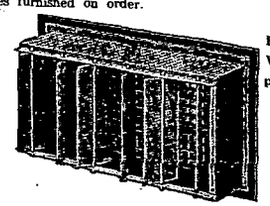
No. 321A-HMV Tandem

Rear View Showing "HMV" Valves



The valves swing from their edges and, when closed, lie flat against the flanges on the back of register face. With valves closed, register depth is 1¼ inches, except on the side, or end, of the operating lever, which is 1¾ inches. With valves open the complete depth is 2 inches.

If the valve length exceeds 24 inches, face and valves are made in tandem and valves are operated by two or more levers, as may be required.



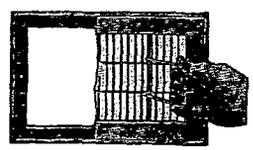
RIM WIDTHS: on sizes 12 inches vertical or less standard rim width is $1\frac{1}{16}$ inch all four sides beyond the stackhead or catalog sizes. Sizes over 12 inches vertical, $1\frac{5}{32}$ inches wide all four sides beyond wall opening sizes. Wider or narrower rims can be furnished at moderate additional cost.

These registers are available in 114 standard sizes to fit practically any opening from 8 in. x 6 in. to 48 in. x 48 in. Special sizes furnished on order.

INDEPENDENT ADJUSTABLE BAR DOUBLE CORE REGISTERS

No. 27

Rear View—Valves partly open



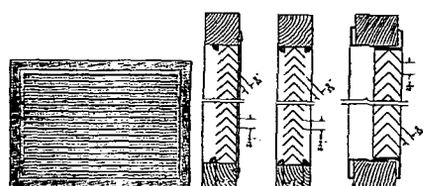
These units, No. 27, have adjustable vertical front bars and adjustable horizontal rear bars. Opposed blade, volume control dampers are key operated. Style No. 28 has adjustable horizontal front bars and adjustable vertical rear bars. Made to fit wall openings from 8 in. x 4 in. up to 48 in. x 24 in. in 90 different sizes.

No. 311D-WC—Bars Faced Down

These grilles are designed for commercial installations. Style No. 311-D-WG illustrated has grille bars set permanently at approximately 35 deg down. Other models available have grille bars set for straight flow.

"WT" WALL FRAME

Can be separately installed before plastering. Duct openings must be made approximately ⅛ in. oversize. Frames must be fitted and attached to grilles or registers at our factory. Made in sizes to accommodate sizes of No. 27 and No. 28 Double Core Registers.

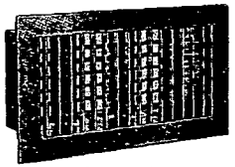


"Fabrikated" Floor Registers for Perimeter Heating

No. 60A

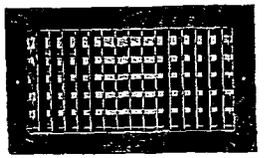
Faces are famous "Fabrikated" construction, excelling in rigidity, open area and fine appearance. Adjusting screw permits directed air flow toward outside wall when valves are set into proper position. Sizes comply with code requirements of *NWAH & ACA*. Fabrikated floor faces for return air are also available.

NO-VISION GRILLES, DOORS, WALLS AND PARTITIONS



No. 1312R No. 1312R No. 1312C No. 1312RR

The grille bars are V-shaped; it is impossible to see through the grille from any viewpoint

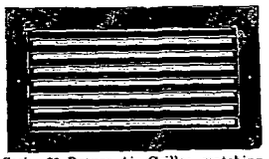


KRUEGER AIR CONDITIONING CORP.

19 East RILLITO **KRUEGER** TUCSON, ARIZONA

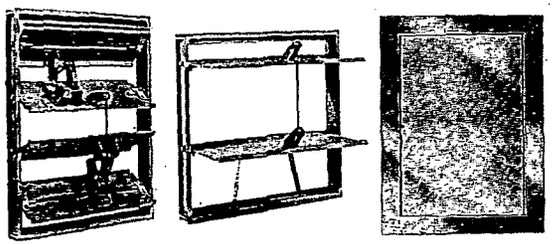
SUPPLY REGISTERS AND GRILLES

Series 880 O.B.D. Registers combine double deflection grilles and opposed blade damper units to give complete control of air in both planes plus equal distribution over entire face of register. Volume control valve is easily adjusted from face.



Series 800 Multi-Shutter Registers provide adjustable front fins for any desired deflection and rear louvers are gang operated. Models have either vertical or horizontal streamlined fins ⅝ in. deep set on ¾ in. centers.

MULTI-SHUTTER REGISTERS



A fine low-cost register for combination heating and cooling. Vertical fins diffuse air in two directions. Adjustable multi-louver has positive shut-off control. Front fins are spaced ½ in. for greater free area.

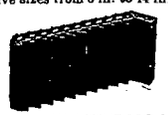
RETURN AIR GRILLES

Series 80 Return Air Grilles, matching units for air supply registers, combine rugged construction and fine appearance. Fins spaced on ¾ in. centers are set at 35 deg angles. Available in horizontal and vertical models.

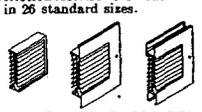
DAMPERS AND ACCESS DOORS

MIXING DAMPERS (left) Manufactured in Opposed-Blade, Multi-Louver, Face and By-pass, and Right Angle designs. Construction of heavy channel frame rigidly welded with brass pivots. Louver bearings are bronze sleeve type. Built for manual or motor operation.

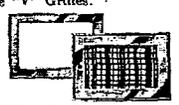
FIRE DAMPERS (center) Manufactured to N.B.F.U. specifications. Construction of welded heavy channel with 12 gauge damper blades pivoted off-center to assure positive closing. Bronze sleeve bearings. Fusible Link furnished at 165 deg or specified temperature. Closing spring is standard part of damper assembly.



ACCESS DOORS (right) Manufactured to any desired size and offset edge or flat frame types. Construction of 16 or 18 gauge cold rolled. Continuous type hinge located on long dimension. Metal screw locks door to frame. Special locking devices available.



PERIMETER REGISTERS: Series 900 Baseboard Registers offer easy installation in both new and old construction. Register housing can be installed at time of "rough in." Grille facing and damper installed later. Features rubber-tipped lever operated damper and attractive appearance. 18, 24, 30 in. lengths.



ROUND CEILING DIFFUSER has 360 deg air diffusion pattern. Friction controlled butterfly damper has full 90 deg control operated from center shaft. Step-down design does not require increase in duct size at neck for installation. Five sizes from 6 in. to 14 in. diam.

AIR & VOLUME CONTROLS designed to balance air volume and distribute flow equally over grille face. Curved blades, adjustable from full open to full closed, stabilize pressure and minimize friction loss. EX-8 Extractors available in 26 standard sizes.

NON-VISION DOOR GRILLES provide constant passage of air with complete obstruction to vision. "V" shaped fins are spaced on ½ in. centers for greater free area. Series 600 Non-Vision Grilles are available in three styles, 88 sizes. Also available are light-tight Double "V" Grilles.

PLASTER FRAMES provide a neater installation for registers and grilles by protecting plastered or panelled walls. **FILTER FRAMES** provide easy access to filter pads installed in Frame directly behind return air grilles.

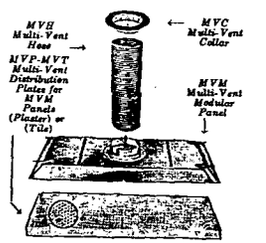
MULTI-VENT® AIR DIFFUSERS

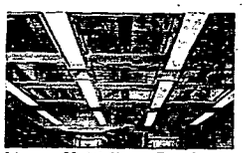
Low velocity, draft free air diffusers that permit complete concealment in ceiling and complete freedom in placement regardless of the proximity of partitions (movable or stationary). Multi-Vent low velocity, air diffusing panels are available in various models, styles and sizes to suit all types of ceiling construction. The more popular, standard types are briefly described below.

In addition, Multi-Vent panels can be custom built in almost any shape or size, material or finish, to suit unusual needs. Your inquiries for additional information on the selection and application of Multi-Vent panels will be given every consideration by our experienced engineering staff. Our extensive laboratory testing facilities are also at your disposal.



Modular Multi-Vent Panel in Standard Acoustical Metal Pan Ceiling.

TYPE MVM MODULAR MULTI-VENT PANELS

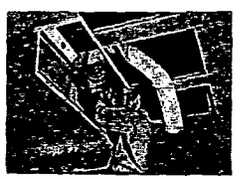


For acoustical metal pan ceilings.
For radiant pan ceilings.
For plaster and acoustical tile ceilings.
For exposed duct applications.

BASIC MULTI-VENT COMPONENTS

Modular Multi-Vent diffusers consist of four basic parts: Duct collar, tubing, panel, and perforated distribution plate. (The distribution plate is not required when standard perforated acoustical ceiling pans are used.)

Type MVM Multi-Vent Modular Panel



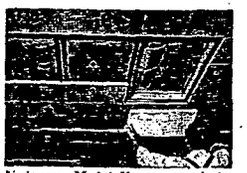
Linear Multi-Vent Panels in Acousti-Line Ceiling.

TYPE MVL MULTI-VENT PANELS ESPECIALLY SIZED AND ADAPTED FOR USE IN THE FOLLOWING CEILINGS:

Acousti-Line Mineral Tile Ceilings
Acousti-Luminous Ceilings
Alumi-Coustic Ceilings
Simplex Ceilings
Wakefield Ceilings

MVL Multi-Vent Linear Panel

Multi-Vent Troffer in acoustical Mineral Tile Ceiling.

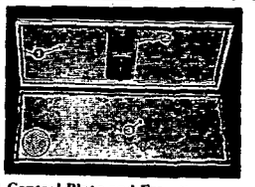


TYPE MVB MULTI-VENT TROFFER®

Patent Number 2,845,854 and 2,845,855

Combination Air Diffuser and Troffer Light.
Air diffuser by the Pyle-National Company, lighting by Benjamin Electric Manufacturing Company.
For use in any type of drop ceiling. Takes flexible hose and duct collar.

MVB Multi-Vent Troffer Valve

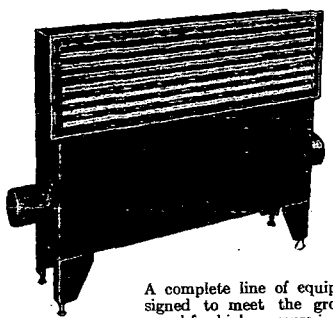


Unitary Multi-Vent panel in acoustical metal pan ceiling.

TYPE MVAC TYPE MVAR UNITARY MULTI-VENT PANELS*

For acoustical metal pan ceilings.
For plaster and acoustical tile ceilings.
For exposed duct applications.

* For special applications available with built-in secondary filters; built-in germicidal lamps; built-in radiant heating, radiant cooling coils.



1-Control Plate and Frame.
2-Pressure Displacement Air Valve.
3-Perforated Plate (not required when standard acoustical ceiling pans are used).

TUTTLE & BAILEY

Engineered Products for Residential, Commercial and Institutional Air Conditioning, Heating, Ventilating

NEW BRITAIN, CONNECTICUT

HIGH PRESSURE AIR DISTRIBUTION UNITS

TYPE MPW

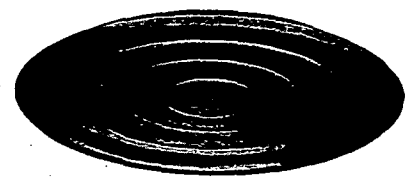
A complete line of equipment designed to meet the growing demand for high pressure installations in multi-story office buildings, schools, hospitals, hotels and institutions.

TYPE MPW

Medium Pressure Periphery Wall Mixing Plenum Unit for individual room control on heating or cooling cycle, or zone control. Handles static pressure in system up to 3.5 in. w.g.

TYPE MPD

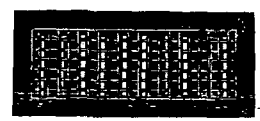
Medium Pressure Ceiling Diffuser Double Duct Mixing Plenum Unit for individual unit or zone control. Single duct units also available. Handles static pressure in system up to 3.5 in. w.g.



TYPE MP

Medium Pressure Sub-Central Station Unit for distribution of air to one or more diffusers by means of rigid or flexible ductwork. Handles static pressure in system up to 3.5 in. w.g.

TYPE PRV

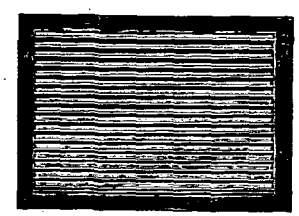


Pressure Reducing Valve for use in medium pressure systems, temperature mixing units and sound attenuation boxes. Manual or automatic operation.

AEROFUSE CEILING DIFFUSERS

A wide selection of diffuser types and sizes, styled and engineered to meet the most rigid requirements of appearance and performance at the point of air delivery.

TRI-FLEX SUPPLY AIR GRILLES AND REGISTERS



Available as single and double deflection grilles; single and double deflection registers with opposed blade dampers. Blades are regulated by means of a key operator and may be set in any position from fully open to fully closed. Face bars are individually adjustable. Stocked in 26 standard sizes.

26 STANDARD SIZES

8 x 4	14 x 4	20 x 6	30 x 6
10 x 4	14 x 5	20 x 8	30 x 8

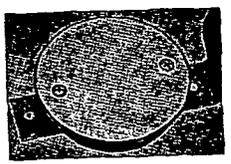
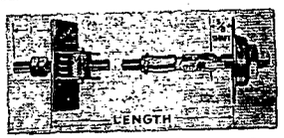
YOUNG REGULATOR COMPANY

20910 MILES AVENUE, CLEVELAND 28, OHIO



SURFACE - CONCEALED - SPLITTER - SQUEEZE - REMOTE CONTROL DAMPER REGULATORS

Young Regulator Company offers a complete line of manually controlled damper regulators for every type of heating, ventilating and air conditioning installation in office buildings, factories, hospitals, ships, schools, churches and residences. Young Regulators are used by many leading companies in nearly every industry and are specified by leading architects and engineers.

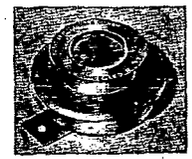


No. 1 Surface Mounted, Direct Connection Regulator

The original Young Damper Regulator, of which thousands have given satisfactory service for years, has been modernized and streamlined. It is used to regulate a damper, controlling the air flow through a duct. It is readily set and locked into position by a key.

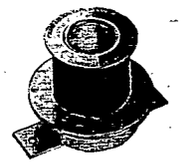
No. 301 Concealed Damper Regulator

This regulator is installed in ceilings or walls. The box is embedded in the finished ceiling or wall material so that the flange is flush with the finished surface. Cover plate is 3¾ in. in diameter and covers the joint between the box and plaster. Operation is by key or a socket wrench that fits the end of the damper rod.



No. 900 Series Air-Split Damper Regulators

No. 900, illustrated above, is one of six Young Regulators used for operating splitter or squeese dampers. The operating heads may be placed in any accessible location. Operation is by crank.



No. 700CP Remote Control Damper Regulator

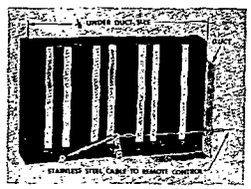
This regulator is for manual operation of dampers and registers to give individual room temperature by remote control. With No. 704 Corner Pulleys, Remote Control Regulators operate Young Dampers at a distance of 250 feet or more. Two registers or dampers can be operated by a single unit.

No. 315 Adjustable Cover Concealed Regulator

This regulator is for use in acoustical ceilings. It is similar to the No. 301 Concealed Type, except the cover plate is adjustable for height by screwing down the cover plate in order to meet the various thicknesses of acoustical or plastered ceilings. The adjustment or locking of the regulator is by a key or socket wrench.

No. 330 Floor Line Adjustable Cover Regulator

This new Young Regulator is set flush with the floor in a branch duct near a grille and is used for perimeter heating and air conditioning installations. It gives accurate volume control of air in branch ducts and makes possible the use of grilles in place of expensive registers and eliminates the necessity of separate ducts running to the heating and air conditioning room.



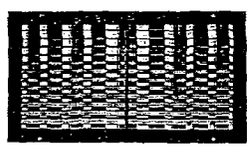
FOR COMPLETE DETAILS SEE OUR CATALOG IN SWEET'S ARCHITECTURAL FILE 30F/YO

YOUNG REGULATOR COMPANY

20910 MILES AVENUE, CLEVELAND 28, OHIO

DAMPERS - REGISTERS - GRILLES

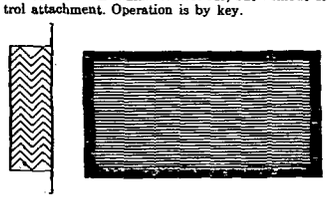
Young Regulator Company offers a complete line of dampers, registers and grilles for air conditioning and heating installations.



No. 830 Opposed Blade Damper

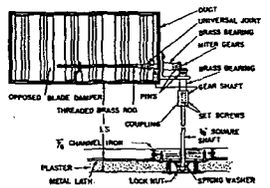
No. 830 Opposed Blade Damper distributes the air evenly over the entire face of the grille. It is easy to install in the duct behind the grille and is operated by a Remote Control Regulator placed in a convenient location. Tubing to the Remote Control Regulator is attached to the duct by a Compression Fitting.

No. 830 Damper is furnished as part of No. 840 Series Air Conditioning Register or separately.



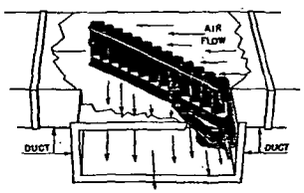
No. 831 is the same as No. 830, but without the Remote Control attachment. Operation is by key.

No. 840 Series Adjustable Bar Registers



Young No. 840 Series Registers combine the various No. 800 Series Young Grilles and a vertically Opposed Blade Damper. These registers give individual room control when operated by No. 700 Remote Control.

No. 841 Series is similar to No. 840, but without Remote Control attachment. Operation is by key.



No. 875 Series, No Sight, No Light Grilles

These grilles are for dark room installations or where light must be excluded but where ventilation is required. Finish is of non-specular black, assuring no light reflection.

No. 817A Volume Control Damper

No. 817A is an Opposed Blade Damper similar to No. 830. It is installed in a branch duct to control the volume of air and is operated from a suspended ceiling by No. 301 Regulator. The unit is operated by a crank, and can be locked in position by key.

No. 890 Air Extractor

No. 890 Air Extractor has blades that operate in unison and are controlled by a key through the grille. The adjustable extractor scoops the required amount of air from the main duct into the branch duct.

No. 882 Perimeter Baseboard Diffuser

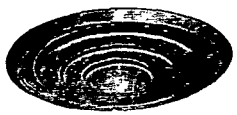
This Young Diffuser provides proper distribution of warm or cool air to all parts of the room and is engineered to induce continuous aspiration of air throughout the room. Using connectors furnished, the lengths can be combined to furnish continuous runs to fit any length of wall.

No. 800 Series Air Conditioning Grilles

Grille bars are made of extruded aluminum secured in a frame and dividing mullions. They must be adjusted with a hand tool. No. 800-VH has double banks of blades, one vertical, the other horizontal, both banks adjustable.

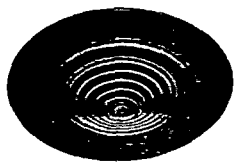
No. 845 Series Return Air Grilles

These grilles, for intake, have been designed to match the No. 800 Series for supply.



FOR COMPLETE DETAILS SEE OUR CATALOG IN SWEET'S ARCHITECTURAL FILE 30F/YO

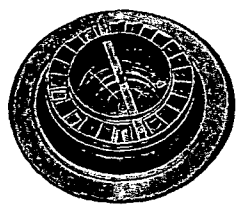
UNIVERSAL DIFFUSER CORP.



38 Marbledale Road, Tuckahoe, N. Y.
AIR DIFFUSERS · REGISTERS · GRILLES

ADJUSTABLE DIFFUSERS

Provide an infinitely variable means of controlling air volume. Control mechanism moves all blades up or down simultaneously.



TYPE QP—A circular 4-cone adjustable pattern diffuser. Rotating lower blade moves core up or down, changing air delivery pattern from horizontal through any angle to vertically down; for cooling, ventilating or heating.

TYPE R—Circular constant pattern with volume control; air travels parallel to ceiling; for cooling purposes.

TYPE V—Circular variable diffusion pattern from horizontal to vertical with simple adjustment; for heating, ventilating, cooling or for high ceilings.

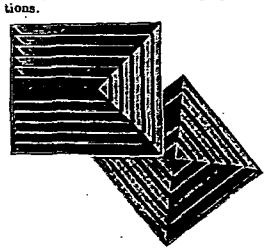
TYPE CH—Circular supply and return diffuser with both "R" and "V" characteristics. Eliminates return grilles.

TYPE H—Square diffusers with round necks, made in 3 models:

HAR—constant pattern with control of air volume through cone adjustment.

HAV—variable pattern by moving cones up and down.

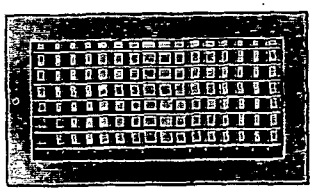
H-F—fixed pattern with 4 different face patterns.



LINE-AIR—Long slot diffuser of any desired length for side wall and ceiling: Counter-current vanes provide means to deliver air at 90° to wall face without the use of auxiliary straightening vanes.

NON-ADJUSTABLE

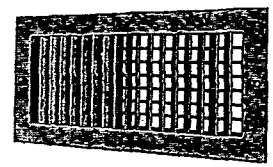
Made with fixed blades; volume control is obtained by the use of face operated volume dampers.



TYPE B—Circular, non-adjustable diffuser for cooling and heating; attractively styled for small commercial, industrial and residential ceiling applications.

TYPE MP—Rectangular and square, multi-pattern diffuser: 1-way, 2-way, 3-way and 4-way; made in 18 styles and 64 sizes for any type and shape of interior. Air diffusion pattern is determined by the style, without use of baffles.

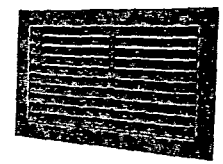
UNIVERSAL GRILLES AND REGISTERS



Available in steel and aluminum; stocked in 20 standard sizes

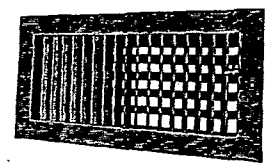
1—Double Deflection Grilles
2—Double Deflection Registers
3—Opposed Blade Dampers
4—Return Grilles and Registers
5—Door and Partition Grilles
6—Air Extractors
7—"Grilline" Long Slot Grilles
8—Volume Controllers
9—Plaster Frames

WATERLOO REGISTER COMPANY, INC.



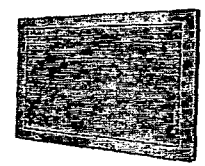
"Since 1902"
P. O. Box 72 Waterloo, Iowa

WATERLOO offers a complete line of Air Diffusion Equipment designed particularly for commercial and industrial heating, ventilating and air conditioning



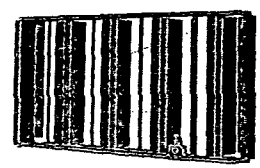
2V Supply Grille

Two sets of extruded aluminum louvers, each individually adjustable for four-way deflection at degree desired.



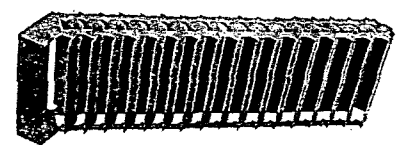
3H Return Air Grille

Fixed fins at 45 degrees of 0 degree deflection, in heavy gage frame, strengthened with adequately spaced support bars.



1VMH Supply Register

One set of adjustable louvers for easy control of air, right or left, with multi-shutter damper, horizontal blades. Ideally suited for residential installations because of narrow stack depth.



DV Door Ventilator

Inverted V-Shaped fins are permanently affixed to channel frame providing rigidity and complete sight proofing. Provides 72 percent free area. Available flange both sides, one side or channel frame only.

OB Damper

Opposed Blade Volume Controller may be purchased as a separate unit or can be incorporated as integral part of all Waterloo grilles.

DUCTROL Air Volume Extractor

Volume controller and extractor adjusts from full open to full closed, to provide even distribution to entire grille surface. Completely assembled at the factory—ready to install on job.

Airline Grille

This product of all extruded aluminum construction features solid ¼ in. face bars on ½ in. spacing. Available with or without dampers. Ideally suited for wall, sill or floor applications.

The complete Waterloo catalog is available upon request containing illustrations and engineering data on all products.

DURO DYNE Corporation

Route 110, Farmingdale, New York

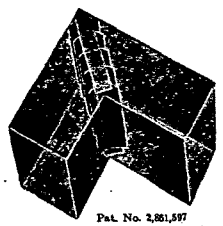
Manufacturers of Specialties for the Sheet Metal, Heating, Air-Conditioning and Ventilating Fields

NEVA BIND DURO-BLADE KIT

Pat. No. 2,863,374

Multi-Blade Louver Damper Hardware

The Neva-Bind Duro-Blade Kit (multi-blade louver damper hardware) assures absolutely smooth damper operation, despite the fact that little care is required in assembly, with no alignment necessary after assembly.



The kit's unique 4-way adjustability automatically compensates for slight errors in blade dimensions or formation; minor misplacement of bearing holes, or other possible inaccuracies which cause bending stress of connecting rod—the main cause of binding.

The Neva-Bind feature allows the rod to remain straight regardless of any of these inaccuracies of damper construction.

In addition, a damper made with the Neva-Bind Duro-Blade Kit can be fully closed without the bracket hitting the duct. The damper can be fully opened without interference from the connecting rod.

VANE RAIL* FOR MAKING AIR TURNING VANES

Pat. No. 2,861,597

The savings in installed costs of air turning vanes run from 50 percent to 70 percent when vanes are assembled with Duro-Dyne Vane-Rail.

Vanes are sheared from simple scrap. Tab cutting on vanes is completely eliminated.

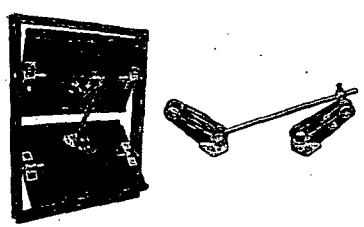
Vanes are simply inserted into concaved notches of Vane Rail. To lock assembly, place chisel (supplied with each bundle of Duro Vane Rail) on portion of vane protruding through notch . . . one sharp blow on chisel securely locks vane to rail.

P-K* REGULATORS AND QUADRANTS

A—UNXLD* DAMPER QUADRANT SET—⅜ in. size used for dampers up to 20 in.; ½ in. size for dampers up to 30 in. Provides positive control. Sturdily constructed, easily installed and adjusted.

B—HEAVY DUTY QUADRANTS—Regulate larger size dampers up to 60 in. The ball bearing quadrants are fine manually operated heavy duty units. The plain bearing quadrant for larger regulators up to 52 in. has the same rugged construction except for the ball bearing feature. Size ⅜ in. to 1 in.

C—JIFFY* REGULATOR SET—Installs more quickly since it does not have to be attached to the duct.

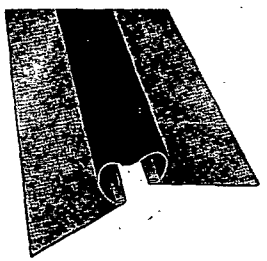


D—DIAL DAMPER REGULATION SET—¼ in. size for dampers up to 10 in.; ⅜ in. size for dampers up to 20 in. Special construction prevents air leakage and damper rattle. Made of heavy gage steel, cadmium plated.

"OPAX"* OPPOSED ACTION DAMPER LINKAGE SET

Opposed action dampers are preferred by engineers to the usual parallel assembly because turbulence is minimized and control of air more linear. "OPAX" Linkage Set includes two brackets and pre-assembled linkage rod which will provide efficient opposed action of damper blades 5 inches and wider.

The 4 way self adjustability automatically compensates for construction inaccuracies to assure smooth bind-free operation. Rugged construction permits use of the "OPAX" Linkage Set for the largest commercial and industrial damper installations.



Duro-Dyne's "OPAX" Linkage Sets are boxed in complete units with installation instructions supplied.

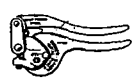
FLEXIBLE DUCT CONNECTOR PRODUCTS

Coils of Pre-assembled Metal-to-Fabric-To-Metal for Eliminating Vibration Travel



*DURO-METAL-FAB** ECON-O-FAB* and "JUNIOR"* are pre-assembled rolls of metal and fabric. They eliminate the annoying, expensive, time-consuming job of attaching metal to fabric in the shop. Featuring an unusual "Double-Loc Seam," the metal cannot pull away from the fabric when the finished connector vibrates; nor can the metal cut the fabric. For industrial applications or heavy gage duct work use DURO-METAL-FAB. Consists of 24 or 26 gage galvanized iron attached to *UL* Approved Canvas, Asbestos or Neoprened Fiberglas. Dimensions: Metal 4 in.; Fabric 3 in.; Metal 3 in. For residential and lighter gage duct work, use ECON-O-FAB. Identical to DURO-METAL-FAB except for lighter gage of metal. For lowest cost residential application, "JUNIOR" flexible duct connector is available in narrower dimensions: Metal 2 in., Fabric 1¾ in., Metal 2 in. All three sizes are packed in 50 ft or 100 ft coils in handy Dispens-o-Flat Cartons.

Special DUCT FABRIC* is available where fabric is required without metal. Packed in 100 ft rolls. Canvas comes in 6 in. and 10 in. widths; asbestos and neoprene 6 in. wide.

Duro-Dyne Portable Spot Welder

"OX" Metal Punch

DURO-DYNE INSULATION ADHESIVE IA-22*

A specific use adhesive designed for a quick, strong, permanent bond of insulation to sheet metal.

Created for bonding insulation to metal; insulation to insulation (at joints); sealing joints; "Buttering" insulation edges. Designed for glass-fiber, asbestos, cork insulation, etc.

Tack Time is only 10 seconds. Bond is immediate and positive. Long "open time" range permits bond one hour after application of adhesive. Permits rapid coating of duct surfaces and provides positive bond of heavy insulating materials without auxiliary holding devices.

Brake-forming of metal and insulation is possible immediately after bonding without separation of insulation from metal.

Coverage of Duro-Dyne Adhesive IA-22:
Brush Application: 230 + sq ft per gallon
Roller Application: 270 + sq ft per gallon
Temperature Range:
−30 F to 325 + F (Blanket)
−30 F to 250 + F (Board)

Duro-Dyne Adhesive IA-22 is waterproof, clear in color, solvent in petroleum-naphtha or white gas. Requires no thinning. Packing: 5 gal and 1 gal cans.

DURO-DYNE DUCT TAPE*

For use in sealing air duct installations and as vapor barrier sealer on insulation.

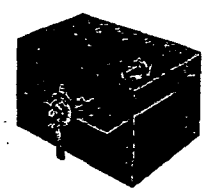
Two types available—cloth and reinforced fiber. Both have excellent characteristics. High strength, waterproof, temperature range. Aluminum color—popular widths available.

HIGH VELOCITY DAMPER REGULATOR AND QUADRANT SETS

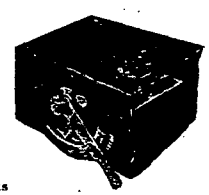
A complete line of damper controls designed specifically to meet the requirements of increased velocities and pressures found in modern air distribution systems.

Damper rattle is virtually eliminated by the positive locking device between the damper shaft and the regulator or quadrant. A new close tolerance tail piece bushing is used to support the damper in smooth rattle-free operation.

Air leakage is overcome by the use of sealing washers clamped into position by locking nuts at control end as well as tail end of damper.



Hi-V Dial Regulator Sets are available in two sizes:
¼ in. for small dampers—HV-145
⅜ in. for larger dampers—HV-195



Hi-V Quadrant Sets are available in the ⅜ in. size:
⅜ in. for heavier applications—HV-385

More detailed information is available on request

Specialists in Low Loss Components For High Velocity Systems

Manufacturers of Prefabricated Metal Spiral "Lockseam" Duct, Die-Stamped, Two-Piece "Laminar-Flo" 90 deg Elbows, Matched Low Loss Fittings, and Sound Absorbers—For High Velocity Systems

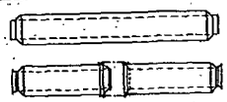
SPIRAL "Lockseam" Duct

For High Velocity Systems. Furnished in any lengths up to 20 ft as continuous duct. 12 ft lengths are standard.

Cross section showing 4 ply seam, external formed rib, internal smooth area.

REDUCES FRICTION LOSS

At 4000 fpm the friction loss averages of spiral duct as compared with clean, round, galvanized, metal duct having approximately 40 joints per 100 feet are as follows:



DIAM.	SPIRAL DUCT FRICTION LOSS AVERAGES
20"	5% less
12"	8% less
3"	15% less

Specifications of Spiral "Lockseam" Duct

DIAMETER NOMINAL SIZE	EXACT I.D.	WEIGHT LBS. PER FT.	METAL GAGE

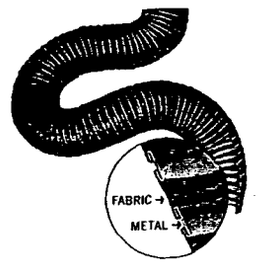
MATCHED LOW LOSS FITTINGS

20 ga. galvanized steel. Continuous weld. Available for every diameter of spiral duct. Portion of types available shown below.



The Wiremold Company

Hartford 10, Connecticut

WIREMOLD®
FLEXIBLE AIR DUCT

Sales representatives in principal cities throughout the United States and Canada

FLEXIBILITY MAKES AIR DUCT VERSATILE

Wiremold Flexible Air Duct provides an efficient, economical means for conducting hot or cold air, gases, fumes, dust, or air-borne particles at high or low velocity. Completely different from any other duct, Wiremold is made by a process that *mechanically locks* the fabric and the supporting metal spiral. There is no glue to dry out and fail with age.

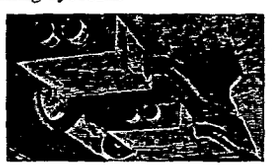
Its principal advantages are these: makes any bend easily, without kinking ... dampens mechanical vibrations ... saves hours of drafting time, because there is no need to work out exact positioning details on installation layouts.... eliminates the need for expensive, special elbows ... one man can easily install even the largest size, without needing any special tools ... no air leakage within recommended operating pressures ... minimum friction loss.

Wiremold Air Duct is made in many types and sizes to meet varying requirements and provide the longest possible service life. Write for full details.

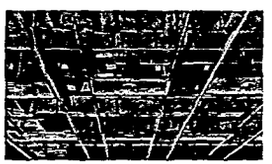
FOR AIR CONDITIONING...

After three years of development, including over 25,000 hours of accelerated aging tests, Wiremold offers three types of air duct specifically for air conditioning applications. Manufacturers of air distribution equipment recommend the use of such flexible connectors on the high pressure side of the attenuation box, as well as for runouts to air distribution units. Because the duct is flexible, diffusers can easily be relocated to meet the changing needs of tenants.

5 major uses in air-conditioning systems



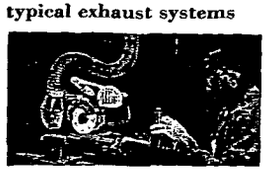
1—To connect underwindow units with vertical risers.



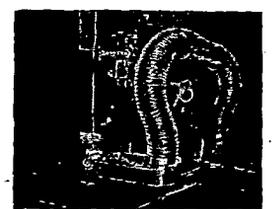
2—To connect branch duct to single ceiling outlet. The duct and diffuser can easily be relocated at any time.

3—From attenuation box to outlets in modular ceiling.

4—Flexible connection from supply duct to attenuation box, on the high pressure side.



5—Vertical takeoff from branch runout to ceiling pan-type outlet. Note compensation for misalignment.



FOR VENTILATING...

Two types of flexible ducts—one to handle dust and abrasive particles, the other to handle corrosive fumes and gases—are available for industrial exhaust systems. They can be hooked up to central or portable collection systems without costly duct work, elbows, fittings and connections.

typical exhaust systems

On surface grinding machine, duct moves back and forth with grinding wheel, to exhaust with maximum efficiency.

Glass dust and particles are removed from glass cutting machine. Height and length of cut are easy to adjust because of flexible duct.

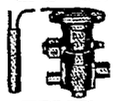
THE COMPLETE LINE OF REFRIGERANT CONTROLS

THERMO® EXPANSION VALVES



For automatic control of liquid refrigerant on all types of refrigeration and air conditioning systems. Capacities: From fractional tonnage to 200 tons Refrigerant 12 and "Freon-22"; selective charges. Low temperature valves for −40F to −100F.

TYPE 402 with pressure limiting feature

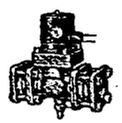
TYPE PO Pilot operated—maintains sensitive control over wide ranges in load

TYPE TCL With either angle or straight-thru connections

TYPE TR Multi-Outlet

SOLENOID VALVES

For all types of service. Liquid, up to 75 tons Refrigerant 12, 110 tons Refrigerant 22. Suction, up to 10 tons Refrigerant 12, 15 tons Refrigerant 22. For discharge gas, brine, water, steam, air or oil service.

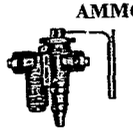


TYPE S1

TYPE S2

TYPE M3

TYPE R2



AMMONIA CONTROLS

TYPE M91F

TYPE TG

TYPE UG

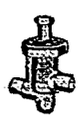
TYPE TX

TYPE E with strainer

Solenoid Liquid Valves—up to 172 tons. **Solenoid Suction Valves**—up to 28 ton. **Thermo® Expansion Valves**—from fractional tonnage to 125 ton. **Automatic Expansion Valves**—from fractional tonnage to 60 ton.

VENTURI-FLO DISTRIBUTORS

Wide application range. One piece; replace distributors requiring as many as 6 or 7 nozzles.



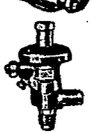
FLOAT VALVES AND SWITCHES

TYPE J56 electric floatswitch. For Refrigerant 12, 22, Methyl Chloride, Ammonia and other non-corrosive liquids having a specific gravity of 0.6 or more. Up to 230 Volts, A.C or D.C.

TYPE HK HIGH PRESSURE FLOAT VALVE. Up to 5 ton Refrigerant 12, 3 ton Refrigerant 22 and 20 ton Ammonia.

908 LECTRO-LEVEL electronic remote control of liquid level. Accurate control for full-flooded evaporators. Adjustable to a wide range of level changes. Easy-to-set control dials conveniently mounted in remote box.

SUCTION LINE CONTROLS



TYPE 771–772 SUCTION PRESSURE REGULATORS

(Hold-Back Valves) Prevent motor overload. Refrigerant 12 and 22.

TYPE EPR EVAPORATOR PRESSURE REGULATOR

For all refrigerants, with connection sizes up to 6 in.

TYPE 760 "EVAPOTROL"

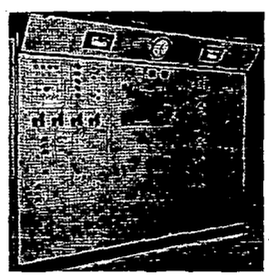
Pressure regulator—½ ton, Refrigerant 12—¼ ton, Methyl Chloride.

BARBER-COLMAN COMPANY

1300 Rock Street, Rockford, Illinois

Field Offices in 95 Cities Throughout the United States and Canada—consult local phone book

A Complete Line of Electric and Electronic Controls

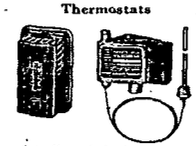


Barber-Colman manufactures a complete *line of automatic controls* and control systems for heating, ventilating, and air conditioning applications for all types of buildings, large or small. Typical product lines are pictured on this page.

A nationwide sales and service organization offers experienced engineering assistance, qualified supervision of installation, and prompt, competent field maintenance assistance.

Only Barber-Colman offers you years of combined experience in both automatic *controls* and air distribution and assumes undivided responsibility for delivering desirable indoor weather. (See Barber-Colman page in the Air System Equipment Section.)

Product literature and application diagrams available. Please state your specific interest.

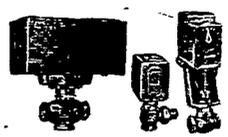


Complete "Electronic" Control Centers

The "Electronic" control center provides visual supervision of the entire heating and air conditioning systems and other mechanical or electrical functions, provides automatic control, and reduces installation and operation costs. It includes remote temperature indication, adjustment, and recording. Schematically diagramed, the control center provides "visual" supervision of the entire *building*.

Ask for new booklet, "Electronic" Control Centers.

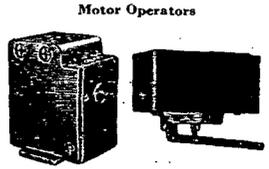
Thermostats



A complete line of single- and two-stage room and remote bulb thermostats for on-off control or proportional control.

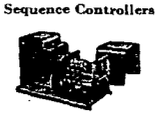
Humidity Controls

Hair element or electronic type for two-position (on-off) or proportional control of motor-operated valves, solenoid valves, compressors, relays, etc.



Motor-Operated Valves

Single- or double-seated valves for on-off or modulating control of steam, air, and water, and three-way valves for bypass or mixing applications.

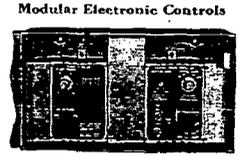


A complete line of compact motor operators is available for two-position and proportional control.

Motor Operators

Spring return, unidirectional, reversible, multi-position, and proportional-type motor operators are available for operation of all types of dampers. Heavy-duty models are oil-submerged type. Adjustable speed is optional.

Sequence Controllers



Sequence controllers, consisting of a reversible oil-submerged driving motor to operate from two to six snap-acting switches, are available for multi-step control of compressors, pumps, valves, or relays in refrigeration, air conditioning, or industrial processing applications.

Unit Ventilator Controls

A complete line of controls for all types of unit ventilators, including face and bypass, valve-controlled, electrically heated, and direct gas-fired classroom or auditorium types. "Package" sets are featured, designed for mounting entirely within the unit ventilator enclosure. These sets utilize a dual-element thermostat combined with a motor operator for extremely accurate control of room and discharge air temperatures without the need for wall-mounted room thermostats.

Modular Electronic Controls

These controls translate temperature or humidity changes into voltage outputs *which* are amplified to operate relays. *The relays, in turn, operate valves,* motor operators, or other control *devices.*

Complete custom control panels to meet any requirement are built up of one or more standard bridge circuit modules and one or more standard amplifier modules.

Temperature bridges provide for use of one, two, or three standard sensing elements. Auxiliary bridge circuit modules are available to operate as many as three amplifiers in sequence.

Either two-position or proportional amplifiers are available.

Dual compensator units, used with an amplifier module or combination of amplifier and bridge components, provide control for such applications as: outdoor reset of main element, stabilization of discharge temperature, differential thermostat action, and lag element control.

Accessories

The Barber-Colman accessory line includes power boxes, *transformers,* color-coded thermostat cable, relays, switches, electric time switches, manual rheostats, polarized microrelays, and *other items* which go to make up a complete control system.

GENERAL CONTROLS

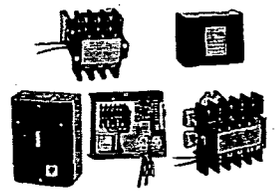
MANUFACTURERS OF AUTOMATIC CONTROLS FOR HOME, INDUSTRY AND THE MILITARY

Glendale 1, California

FACTORY BRANCH OFFICES SERVING ALL PRINCIPAL CITIES OF THE UNITED STATES AND CANADA

SIX PLANTS: IRON MOUNTAIN, MICHIGAN · GLENDALE, CALIFORNIA · BURBANK, CALIFORNIA · SKOKIE, ILLINOIS · GUELPH, CANADA · WARWICK, RHODE ISLAND

T-270 T-90H110 T-190



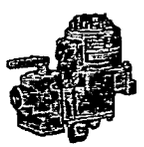
THERMOSTATS

New matched line of thermostats for heating and air conditioning—horizontal and vertical models. Distinguished by compactness and beauty of appearance—for use in all space heating remote control systems. Provide rapid response to radiant as well as convected heat. New mercury switch type. Heat Anticipator optional. Millivolt, 24-v and line voltage types to 13 amperes are available for heating and cooling.

AIR CONDITIONING CONTROLS

Complete control systems for residential, commercial and industrial air conditioning. Thermostats for cooling and heating-cooling combination, system-coordinating Master Control Panels, and a line of refrigeration controls including thermal expansion valves, solenoid valves and refrigerant distributors.

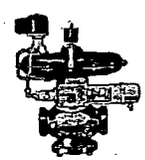
ELECTRICAL CONTROLS



New Master Control Panels are packaged control systems combining all electrical components required for complete automatic control of refrigeration or air conditioning equipment. Electrical components such as relays, contactors, magnetic starters and transformers are also available individually.

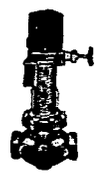
K-3A ¼" K-3A 1½" K-3E 2½"

MAGNETIC GAS VALVES



Magnetic, current failure, quiet, two-wire. Opens and closes fuel line supply at demand of room thermostat, limit control or similar device. Widely used for controlling gas to warm air furnaces, gas fired boilers, industrial furnaces, conversion burners, etc. Compact; low current consumption; humless ⅜ in. to 6 in. IPS for pressures up to 5 lb; a-c or d-c. Also available in explosion-proof model.

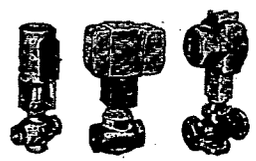
B-63



COMBINATION GAS VALVES

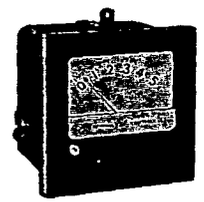
For ultimate space economy, an electric diaphragm gas valve combined with pilot valve, gas cock and low pressure regulator. B-53 models for 24-v systems have provision for optional plug-in thermopilot relay for safety shut-off in event of pilot failure. B-63 self-powered millivolt models inherently fail safe upon pilot failure, since operating power is generated from pilot flame heat.

SLOW-OPENING GAS VALVES



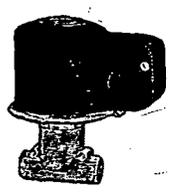
New combustion control afforded by these diaphragm-controlled gas valves. Governor regulates fuel supply to burner in direct ratio to steam pressure, eliminating hunting aspect common to most pilot throttling valves. Low fire adjustment prevents main valve or gas flow from reducing below adjustable set minimum, affording fullest advantage of gas burner installed. Type B-55G-1 pictured, available 1 in. to 6 in. in IPS.

V-110-1



MANUAL RESET VALVES

Equipped with manually-reset electromagnetically-held valve operator for safety shutoff of fuel supply to boilers. Valve can be opened only when current is applied and is closed by spring force on interruption of current in response to high limit or safety switches. ½ in. to 6 in.; normally closed; screwed or flanged body; explosion-proof or weatherproof. *Factory Mutual* and *Underwriters* approved.

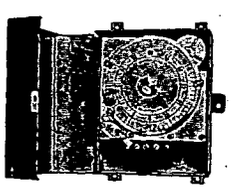


HYDRAMOTOR VALVES

Hydramotor valves, composed of electro-hydraulic actuators and valve bodies, are available in a wide range of types and sizes. Spring return for two-wire, current failure operation. Valve bodies and actuators are offered in combination as complete self-contained units. Bodies available in steel, brass, iron and alloy in sizes from ⅜ in. to 12 in., two-way and three-way bodies. Hydramotor valves are particularly suited to safety shutoff applications and control of steam, hot and/or chilled water systems.

BOILER COMBUSTION CONTROL SYSTEMS

For improved efficiency and better operational maintenance, General Controls offers an outstanding line of combustion controls and instruments suitable for use with oil, gas or stoker-fired boiler room installations in industrial and commercial installations. Included in the line are Flue Gas Temperature Indicator, Draft Gage, Steam Pressure Controller/Indicator, Draft Program Control, Air Pressure Gage. All are flush or surface mounted.



REFRIGERATION AND INDUSTRIAL SOLENOID VALVES

Available in a range of sizes from ⅛ in. pipe size midget valves to 6 in. pipe size. Pressure range to 1000 psi. Body construction in cast iron, forged brass, carbon steel, stainless steel and special alloys. Available in two-way, three-way, four-way, normally open, normally closed and manually reset models. Direct acting types, also pilot operated, diaphragm type, lever acting types. Available in a variety of coils for special applications such as mobile applications.

HAMMEL-DAHL AUTOMATIC CONTROL VALVES

Pneumatic and hydraulic actuators for fluid control from a Micro-Flo basis up to the largest type. Pneumatic diaphragm motors feature removable actuators, reversible superstructures, and a wide variety of material for body, lining and diaphragm. Body assemblies include globe, angle, Saunders, three-way and butterfly designs. Particularly suited for high temperature hot water systems.

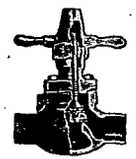
TIME SWITCHES

For commercial and industrial systems or processes for automatic on-off control. Available in 7-day models and also 24, 12, 8, 4, 2, 1 hour rotations. Electric or spring-wound models. Snap switch or mercury switch.

HENRY VALVE COMPANY

3215 NORTH AVENUE, MELROSE PARK, ILLINOIS (Chicago Suburb) CABLE: HEVALCO, MELROSE PARK, ILLINOIS

Manufacturers of Valves, Driers, Strainers, Fittings and Accessories for Refrigeration, Air Conditioning and Industrial Applications.



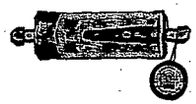
"GOLDEN BANTAM" PACKLESS VALVE—TYPE 516

A small packless line shut-off valve with ¼ in. through ⅝ in. flare, ODS or extended end solder connections. Also "Blue Bantam" and "Standard" Balanced-Action packless line shut-off valves with ¼ in. through ⅝ in. Fl. and ¼ in. through 1⅛ in. ODS size connections.

CROSS-VU® HERMETIC SEAL LIQUID INDICATOR—TYPE LI-16

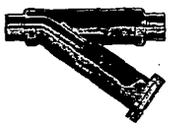
Brass indicator with glass fused directly to metal body. Maximum working pressure 500 PSI Connection sizes: ¼ in. through ⅝ in. M.Fl., M.Fl. x F.Fl. or with extended ends and solder connections.

WING CAP PACKED VALVES—TYPE 203



The standard of the industry. Bronze alloy with ODS connections in sizes ⅞ in. through 4⅛ in. (Globe) and ⅞ in. through 3⅛ in. (Angle). Also semi-steel with ½ in. through 2½ in. F.P.T. connections and semi-steel flanged type globe and angle valves with brass ODS or steel butt-weld adapters, and one piece socket weld or F.P.T. flanges in a wide range of sizes from 1 in. to 5⅛ in.

ANGLE RELIEF VALVE—TYPE 52



UV *ASME—NB—National Board Certified*

Forged brass automatic pressure relief valve. Pressure setting range 50 to 450 PSI Size connections: (MPT Inlet x Flare Outlet) ¼ in. x ⅜ in., ⅜ in. x ⅜ in., ⅜ in. x ½ in. and ½ in. x ⅝ in. Also ⅝ in. ODS x ⅝ in. ODS.

"DRI-COR" FILTER-DRIER—TYPE V800

Ceramic fired desiccant filter-core in bed of granular desiccant—a blend of molecular sieves and activated alumina. Provides high capacity drying even at relatively high temperatures, micronic filtration, efficient acid removal and low pressure drop. Pressure sealed. Wide range of sizes with ¼ in. through ⅝ in. Fl. connections. "DRI-COR" Filter-Drier Cartridges also available for Henry Cartridge Type Angle Driers.

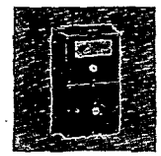
"Y" STRAINER—TYPE 895

Flanged design permits cleaning without removing strainer from line. Screen cylinders securely located by spring tension prevents by-passing of refrigerant. Forged brass end caps with integral end connections. Screen area: 10 through 150 sq in. Size connections: ⅝ in. through 4⅛ in. ODS. Angle and straight-through type strainers also available.

Write for catalogs describing the complete line.

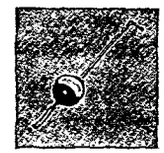
Catalog 103 Valves, Driers, Strainers and Accessories.

Catalog 202 Ammonia: Valves and Accessories.



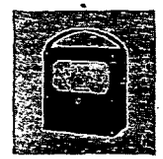
Catalog FF *Forged* Carbon Steel Fittings.

Illinois Testing Laboratories, Inc.



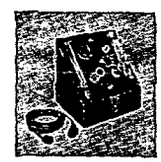
Room 516, 420 N. La Salle St., Chicago 10, Illinois

Alnor® FOR PRECISE MEASUREMENT OF TEMPERATURE... AIR VELOCITY... DEW POINT...



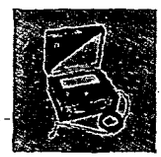
PYROMETERS

A complete line of single or multiple-point pyrometers—portable or mounted—for temperature measurement in all types of service. *Particularly adapted to exhaust, cooling water and lubricating oil temperature measurements on diesel and gas engines.* For furnaces, kilns, ovens, vats, pots, heat exchangers, kettles, reactors, autoclaves, pipe lines and any similar equipment where accurate temperatures are desired.



PYROCON

A self-contained, hand-held portable contact pyrometer. Takes any surface temperature. Widely used in plastic molding, chemical processing, electrical, rubber and paper manufacturing industries. Available with fixed or flexible arm.



VELOMETERS

An instantaneous air velocity meter giving direct readings in feet per minute without necessity of timing, calculation, or reference to tables or charts. A compact, self-contained, portable unit. For low range readings, Velometer is held in air stream. For high range readings, tube-connected special jets provide convenient use in any location. Standard ranges from 20 f.p.m. to 24,000 f.p.m

DEWPOINTERS

An improved instrument for simple, rapid dew point reading of any gas. Indication takes place in an enclosed observation chamber under accurately controlled conditions. Dew or fog suspended in air—not on mirrored surface—makes it easy for two or more observers to get the same accurate results. The Alnor Dewpointer is a complete, self-contained unit—no external coolants or other apparatus are required.

SURFACE PYROMETER

The Alnor type 2300 Pyrometer sets a new high in precision measurement of low surface temperatures. Special design, from Alnico magnet to quick reacting thermocouple, for accuracy...speed and dependability. This is a self-contained, sturdy unit—easily carried and used anywhere on a wide variety of applications. Direct reading, six-inch mirrored scale is easily read...quickly understood. The instrument is available in five Fahrenheit scale ranges with a span as small as 150°.

PORTABLE PYROMETER

The Alnor type 1500 is designed for work with electrically heated mantles. This lightweight, magnetically shielded pyrometer gives fast, precise temperature reading to production men in all industries. Choice of *ten scale ranges*, 0-400° to 0-3000°F. Automatic cold end compensator is standard equipment.

PRECISION INSTRUMENTS FOR EVERY INDUSTRY

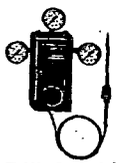
JOHNSON SERVICE COMPANY

AUTOMATIC TEMPERATURE AND AIR CONDITIONING CONTROL

General Office & Factory 507 E. Michigan St. Milwaukee 1, Wis.

Direct Branch Offices in Principal Cities

Johnson Controls Ltd., 120 Bermondsey Rd., Toronto 16, Ont.



MANUFACTURERS, ENGINEERS and CONTRACTORS—A complete line of automatic temperature and humidity controls for heating, cooling, ventilating, air conditioning, industrial processing, military installations and special temperature and humidity control applications.

SPACE CONTROL—Automatic room temperature and humidity control for convectors, radiators, radiant heating, unit ventilators, unit heaters, and heating and cooling air delivery equipment.

INDUSTRIAL PROCESSING—Automatic temperature and humidity control for every requirement in manufacturing and industrial processing. Thermostats, valves, dampers for tanks, dryers, vats, kettles, curing rooms, coolers, kilns, and other special equipment in textile, rubber, paper, petroleum, meat, dairy, baking, sugar, brewing, distilling, tanning, candy, foods, pharmaceutical, and other industries.

SERVICE ORGANIZATION—JOHNSON sales engineers and trained installation experts at all branches in United States and Canada. No agents, jobbers, or part-time representatives! All Johnson salaried personnel for exclusive service of Johnson Service Company customers.

JOHNSON LITERATURE: Available at your nearest JOHNSON branch office or write to address above.

T-901 Liquid-filled Remote Bulb Submaster Thermostat

JOHNSON THERMOSTATS

Room Thermostats—single and dual temperature (Day-Night, Heating and Cooling). Proportional or two-position action. Maintain temperatures within one degree above or below setting. Wide selection of adjusting features, guards, and mounting. Furnished with or without thermometers.

Insertion and Immersion Thermostats—Liquid-filled temperature measuring elements. Stem type for direct measurement. Remote bulb types for applications requiring location of thermostat at a distance from the point of temperature measurement. Various bulb styles available. Standard capillary length is 8 ft. Lengths of 15, 25, 35, 50, 65, 75, and 85 ft available on special order.

Submaster Thermostats—The set point of these Johnson controllers is changed from a remote location by the action of another (master) controller. Available with liquid-filled stem and remote bulb measuring elements.

Johnson "Duo-Stats," weather compensated primary controllers, control heating system temperatures in accordance with the outdoor temperature. Duo-Stats are available for any heating system, all types of buildings, and furnished in pneumatic, electric or electronic models.

Series T-400 Room Thermostat

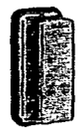
T-804 Liquid-filled Immersion Thermostat

PRESSURE CONTROLLERS

Pressure Regulators with ranges of 30 inches of water to 300 psi. Static pressure regulators measure variations in pressure from 0.009 inches to 3 inches of water. Used also as differential regulators measuring difference in pressure between two chambers. Pressure switches and governors also available.

R-316 Air Flow Controller

The Johnson Air Flow Controller is applied to mixing boxes of high velocity, high pressure, dual duct air conditioning systems. Provides positive constant volume air discharge through each mixing box. Operates at any pressure difference from approximately 0 to 1 inch wg and will produce a 1 psi air pressure change on pressure difference changes of less than 0.005 inch wg.



R-1051 Static Pressure Indicator-Controller

JOHNSON HUMIDITY CONTROL

Humidostats—Room and insertion types with humidity measuring elements of wood or animal membrane, the most sensitive of which controls within 1 percent at relative humidities as high as 95 percent, at temperatures of 200 F. Submaster models also available which are adjustable from a remote point by another controller (master) or may be manually readjusted from a remote point by means of a Johnson Gradual Switch.

Humidifiers—Steam grid (perforated pipe supplied with low pressure steam) or pan type with copper evaporating pan, brass or copper heating coils and float control.

T-1210 Room Temperature Transmitter

PNEUMATIC TRANSMISSION

Johnson pneumatic transmission systems provide a greatly simplified and superior means of centralized indication and control for modern air conditioning, heating and ventilating systems. Control centers are custom designed to fit the requirements of the individual building. Johnson offers a complete line of pneumatic transmission and control center instrumentation, including room transmitters, remote bulb transmitters, indicators, receiver-controllers, recorders and related apparatus.

T-1270 Receiver Controller

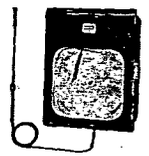
SPECIAL CONTROLLERS

Aspirating Cabinets—Several models with many combinations of controlling and auxiliary devices required to provide control of temperature and humidity. Cabinets equipped with blowers for positive air circulation and air gauges for checking function of controllers at all times.

12 Point Model Pneumatic Step Controller

Pilot Positioners—for dependable and accurate repositioning power. Applied to valves and damper operators. Respond to smallest changes in air pressure. New Precision Pilot acts 6 times faster than ordinary pilots.

Pneumatic Step Controllers—for capacity control of reciprocating refrigeration equipment or any application where sequence of pressure switches is used.



Record-O-Stat—Combination capillary temperature controller and recorder. Available in single-pen, two-pen, and submaster models. Indicating controllers and recorder-controllers also available.

V-530 Precision Pilot Positioner Applied to Valve

Liquid Level Regulators—(Float Type) control within extremely close limits. Mounted through wall of containing vessel by stem with 1-inch pipe thread. Floats of copper, stainless steel or special alloys.

Thermometers—Insertion and immersion types for air and liquids. Stem and remote bulb temperature measuring models with vapor tension or liquid filled elements. Variety of styles, mountings and finishes.

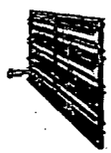
T-1000 Single Pen-O-Stat Record-O-Stat

JOHNSON VALVES

Johnson Diaphragm Valves—Simple, rugged. Diaphragms of special molded rubber, resistant to age and oxidation, operate valve stems against spring pressure. Available also with "Sylphon" seamless metal bellows. In standard sizes and patterns including compact valves for convectors and unit conditioners. Normally open or normally closed. Three-way mixing and by-pass valves, for water, brine and other liquids.

V-153 "Sylphon" Convector Valve

Johnson "Streamline" Diaphragm Valves—With modulating plugs and special internal construction. Smooth proportional control. Where greater power is required for repositioning at slightest demand of controlling instruments, the larger molded rubber diaphragm valves are fitted with pilot positioners.



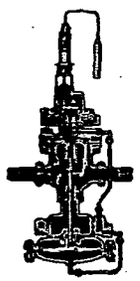
Series V-210 and V-214 Three-Way Valves—for mixing and by-pass applications. 100 percent tight closing. Can be serviced without removal from the line. Sizes 2½ to 6 in. 125 and 250 lb standard construction.

V-210 Three-Way By-Pass Valve

JOHNSON DAMPERS AND SWITCHES

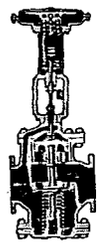
Standard Johnson Dampers—Galvanized 16-gauge steel blades in flat steel frames with adequate bracing to form rigid assembly. Black lacquer or special corrosion-resisting finishes. Angle iron frames optional.

D-225 Proportioning Louver Damper

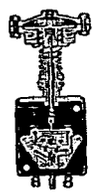


Special Dampers—Galvanized iron frames and monel metal, aluminum, copper or rust-resisting steel blades on special order. Frames of same material as blades, if desired. Brass pins in steel bearings or ball bearings.

Johnson Damper Operators—Similar in operating principle to valves. Specially molded rubber diaphragm or seamless metal bellows operates damper through suitable linkage. Johnson "piston" damper operators afford long travel at full power. With or without pilot mechanism, as described for "Valves."



D-251 Piston Damper Operator



Johnson Pneumatic Switches—For direct operation of dampers and to switch controllers in and out of service from remote locations. Standard switchboard panels are Masonite. Ebony, asbestos, steel, polished oak and genuine or imitation marble panels on special order. Special switchboards including all types of control equipment available on special order.

LESLIE CO.,
237 Grant Avenue, Lyndhurst, New Jersey

TRADE LESLIE MARK

REGULATORS and CONTROLLERS

for the Regulation and Control of Pressure, Temperature, Flow and Liquid Level • • •

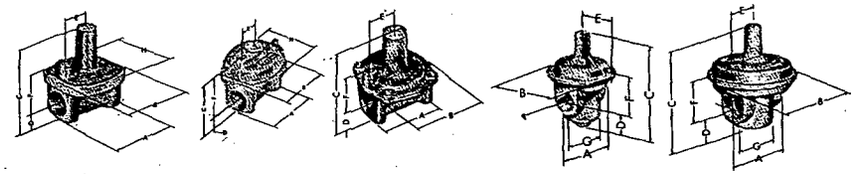
LESLIE COAST-TO-COAST SERVICE—In all principal industrial centers LESLIE factory-trained engineers are available to help with any control problem involving steam, liquid, air or gas. Look for LESLIE REGULATORS under "Valves" or "Regulators" in your classified telephone directory.

INTERCHANGEABILITY—*All internal parts of* LESLIE Regulators are dimensionally interchangeable and have maximum interchangeability in all sizes and classes.

LESLIE SPECIAL FEATURES—*at no extra cost!*

- ★ *Stellited Seat Rings*
- ★ *Hardened Stainless Steel Main Valves, 500 Brinell*
- ★ *Corrosion Resistant Springs*
- ★ *Hardened Stainless Steel Cylinder Liners, 500 Brinell*

Supplied as standard equipment.



LESLIE PRESSURE REDUCING VALVES, PUMP GOVERNORS, and TEMPERATURE REGULATORS — Self-contained, spring *loaded, internal pilot piston* or diaphragm operated with stellited seat rings, hardened stainless steel trim, bronze, iron, or steel construction. ALL LESLIE Regulators feature:

- ★ *High accuracy of regulation*
- ★ *Single-seated construction for positive dead-end shutoff*
- ★ *Quick valve action for sudden load changes*
- ★ *Maximum resistance to corrosion and wear*
- ★ *Maximum spring range — from minimum to maximum of the range without change of spring or diaphragm*

* These models also available A.G.A. certified for main burner and pilot load applications (minimum capacity 120 btu/hr).
** To convert to Btu/hr—0.6 sp gr Gas, multiply by .675.

PRESSURE SETTINGS:

Standard outlet pressure settings for the various models are as follows:

RV-10	3.0 in. w.c.
RV-30, RV-30A and RV-31	3.5 in. w.c.
RV-41¾ in., RV-41A¾ in., RV-41A½ in.	4.0 in. w.c.
RV-41½ in., RV-42, RV-50, RV-51, RV-60, RV-81, RV-91	3.5 in. w.c.
RV-110	4.0 in. w.c.

Upon Request, any Maxitrol gas regulator will be adjusted to any other pressure within the range of the standard spring at no extra charge.

INLET PRESSURES:

All Maxitrol gas regulators can be satisfactorily operated at inlet pressures up to one psi. Under certain circumstances even higher inlet pressures are permissible. Consult factory.

MULTI-POISE MOUNTING:

"Straight-Thru-Flow" series regulators should not be installed in a vertical pipe run if the gas is flowing upward. Otherwise, all Maxitrol gas regulators may be installed in any plane at any angle.

VENTS:

Position—Models RV-42, RV-50, RV-51, and RV-60 are manufactured with horizontal vent outlets. Various vent positions are available. Consult *catalog 57*. The vent boss on all other regulators is located vertically over the outlet end of the regulator.

Boss Size—All models except RV-10, and RV-110 are tapped with ⅛ in. NPT. RV-10, no tapped boss. RV-110, boss tapped ¼ in. NPT.

THE MERCOID CORPORATION

Main Office and Factory, 4201 Belmont Ave., Chicago 41, Ill.

NEW YORK 17, N. Y.

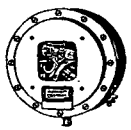
PHILADELPHIA 32, PA.
3137 E. Broad Street

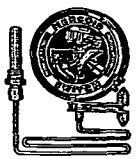


Automatic Controls for Heating, Air Conditioning, Refrigeration and Industrial Applications

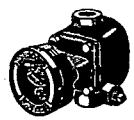
Complete line of Mercoid Controls and mercury switches shown in Catalog No. 858A

SERIES "D" PRESSURE CONTROLS

General Purpose Type (Nema 1): For indoor service and other general purpose applications. Equipped with outside adjustments, visible calibrated dial, visible on-off hermetically sealed mercury contact. Available in 23 pressure ranges from 0-30 in. vac. to 300-2500 psi with differential varying from 2 oz to 150 psi depending upon range selected.



Weather Resistant Type (Nema 1A, 2, 3, 4): For outdoor service and other applications. Has external adjustments, visible dial, hermetically sealed mercury contact. Available with same operating ranges as noted under general purpose types.



Explosion-Proof, Class 1, Group C (Nema 7), Class 2, Group E, F, & G (Nema 9, 9A): For hazardous locations. A new light weight control (8¼ lbs) equipped with external adjustments, visible calibrated dial and visible on-off hermetically sealed mercury contacts. Available with same operating ranges as noted under general purpose pressure controls.

SERIES "D" TEMPERATURE CONTROLS

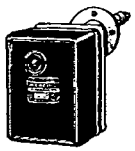
For liquids or gases, such as air, oil, water, paraffin or distillate vapors and other industrial applications. Equipped with outside adjustments, visible dial and visible on-off hermetically sealed mercury contact. Operating ranges from 30 to plus 60°F., up to 370-530°F. Available with Weather-Proof or Explosion-Proof enclosures.

LIQUID LEVEL CONTROLS

Various types available such as for boiler feed water pump control, combination pressure and low water control or for use where low specific gravity liquids are used. Can be furnished with explosion-proof case for hazardous locations.

If you have a control problem involving the automatic control of pressure, temperature, liquid level, mechanical operations, etc., it will pay you to consult Mercoid's engineering staff—always at your service.

TRANSFORMER-RELAYS

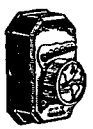


Type V, a reliable low voltage mercury contact relay which also acts as a transformer, inducing low voltage (24 volts) on the pilot circuit. Used for all types of automatic equipment. Available in various voltages, cycles and circuit arrangements.

VISAFLAME CONTROL

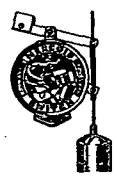
For direct burning mounting. Operates direct from the light of the flame instead of from the heat in the stack. Used with a Mercoid panel unit for either intermittent or constant ignition burners. Provides full protection against flame, ignition and power failure.

OIL BURNER SAFETY AND IGNITION CONTROLS



Type JMI, a stack safety control, for positive protection against flame or ignition. Also provides complete protection against low line voltage or power failure. Type JM, available for constant ignition burners.

LOW VOLTAGE THERMOSTAT

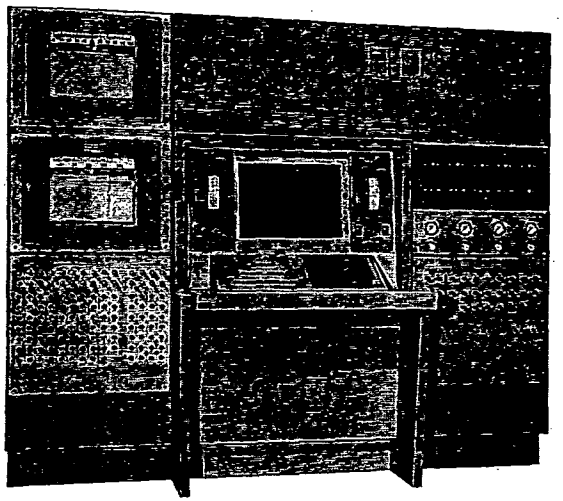


The Mercoid Sensatherm is a very sensitive room thermostat, operating on a differential of ½°F. No internal heater coils or other means of artificial acceleration are used to maintain an even room temperature.

LINE VOLTAGE THERMOSTATS

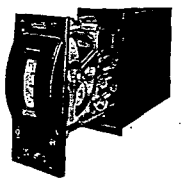
For direct control of motors operating automatic equipment. No relay required. These thermostats incorporate a liquid charged bellows. Expansion and contraction of the bellows tilts a Mercoid mercury to mercury contact to open or close the electric circuit. Standard ranges: 56-80°, 65-90°, 38-70°, and 25-60°F. Available with manual on-off switch for use with industrial unit heaters. Can be furnished with explosion-proof housing for hazardous locations.

LEVER ARM CONTROLS



Mercoid lever arm controls have a variety of applications where it is desired to mechanically open and close electric circuits. Mercoid float controls are used for maintaining fluid levels in tanks, or for control of sump pumps, etc.

MINNEAPOLIS-HONEYWELL REGULATOR CO.

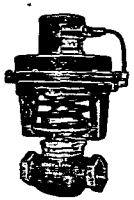


Minneapolis, Minnesota

A COMPLETE LINE OF PNEUMATIC, ELECTRIC, ELECTRONIC CONTROLS AND INSTRUMENTS

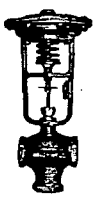
Supervisory DataCenter* allows one man to supervise and control all the mechanical systems of a building from a central location; remotely check and adjust temperatures, start and stop compressors, pumps and fans.

A new Selectrafic* panel clearly displays the desired mechanical system on a single small screen, while the multipurpose control board is automatically switched to that system. This new feature permits all graphic layouts to be shown, yet requires less wiring, is smaller and standardized. Panel location and space requirements can be determined early in the building's design. Additional functions can be incorporated by adding modular units.



Electronik* temperature indicator gives an unlimited number of remote temperature readings on one instrument. Accurate to ±1/5 of a degree. Remote readings can be taken of any point in the air-conditioning system simply by pressing a button. Requires less than a square foot of panel space.

You can look to Honeywell for all your control needs—centralized panels, instruments, valves—because Honeywell has a complete line available. You'll get quick service from 112 offices across the nation, each staffed with control specialists who will assist and advise you. Contact Honeywell even before blueprints are started to insure efficiency, saving, satisfaction.



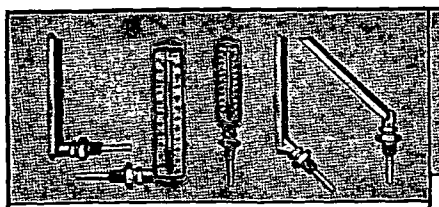
Shown below are three typical control valves in Honeywell's complete line of electric and pneumatic valves for commercial and industrial applications.

Three way electric valve controls liquids in either mixing service or in systems requiring flow be directed from either of two inlets to a common outlet. Constant total flow throughout full plug travel. Strain release mechanism insures tight close-off without motor strain. Sizes: screwed—½ in. to 2 in.; flanged—2½ in. to 4 in.

Single seated pneumatic valve used for normally closed modulating control of steam, hot water, or cold water on heating or air-conditioning coils. Also for general purpose —zone systems, booster coils, cooling units using water, etc. Equal percentage, high lift plug. Sizes: screwed—½ in. to 3 in.; flanged —2½ in. to 6 in.

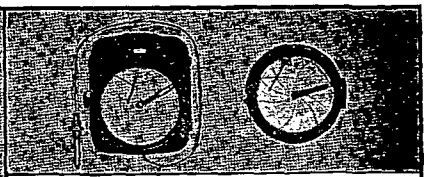
Industrial diaphragm-control valve. Three-way valve used for mixing service with two inlets, one outlet, or for diverting service. Normally open to bottom port. Linear flow characteristic. Rangeability: 30 to 1 for each port. Maximum operating air pressure 35 psi. Sizes: screwed—½ in. to 2 in.

*Trademark



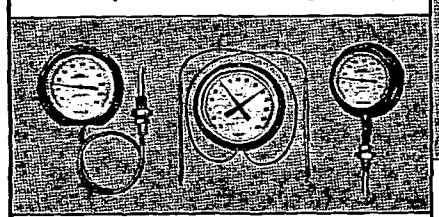
FOR COMPLETE INFORMATION CALL YOUR NEAREST HONEYWELL SALES OFFICE

MOELLER INSTRUMENT COMPANY

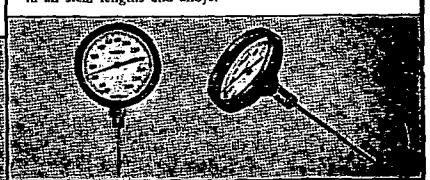


SINCE 1867

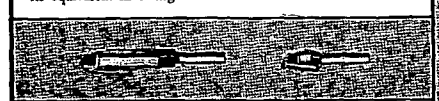
132nd STREET & 89th AVENUE, RICHMOND HILL, NEW YORK, N.Y., U.S.A



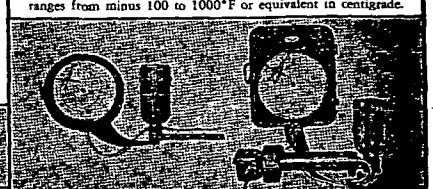
Representatives in Principal Cities



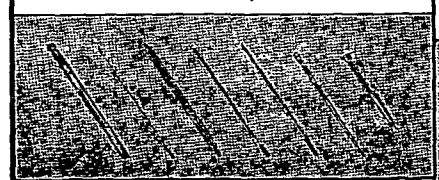
MOELLER INDUSTRIAL THERMOMETERS made in all forms, Straight, Angle, Right Side Angle, Left Side Angle, Reclined and Inclined Angles, in scale ranges from minus 120 to plus 1125°F. or its equivalent in centigrade. Available in 5", 7", 9" and 12" scale sizes with plain stems, union connection stems and separable sockets in all stem lengths and alloys.



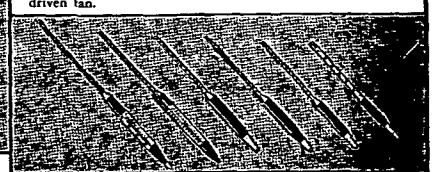
RECORDING THERMOMETERS, Mercury Actuated, made in the round or rectangular cases. Charts 10" or 12", 1 hour, 12 hour, 24 hour or 7 day. Ranges from minus 40 to plus 1000°F. or its equivalent in centigrade. Made in remote reading, direct reading, portable and self contained styles. Plain stems, union connection stems and separable sockets in all stem lengths and alloys.



DIAL INDICATING THERMOMETERS, Mercury Actuated, made in 4½", 6" and 8½" sizes with flexible extension tubing. Adjustable rigid stems, single or two pointers, plain bulb, union connection bulb or separable sockets in all lengths and alloys. Scale ranges from minus 40 to plus 1000°F. or its equivalent in centigrade.



MOELLER BIMET THERMOMETERS are actuated by a powerful, specially processed bi-metal helix. Made in 5" and 3" diameter case size. Rigid stainless steel stem, can be furnished with union connection stem and separable socket in all alloys. Scale ranges from minus 100 to 1000°F or equivalent in centigrade.



THERMOMETER TEST WELLS, THERMOCOUPLE PROTECTING TUBES and WELLS, made up in all sizes and alloys.

RECORDING PSYCHROMETERS, Mercury Actuated. Round and Rectangular Case, 12 hour, 24 hour or 7 day charts, self contained or remote reading, with or without motor driven fan.

ENGRAVED STEM and PORCELAIN and PAPER SCALE THERMOMETERS made in ranges from minus 150 to plus 1125°F. or its equivalent in centigrade. Available in standard and extreme precision grade. Made to meet specifications of the Government, A.S.T.M. and other authoritative bodies.

HYDROMETERS PLAIN FORM or COMBINED with THERMOMETER. Made in all scales specific Gravity or Baume for heavy and light liquids. Brix, Twaddle, Ballings Scales, etc. available for all liquids. Standard and commercial grades.

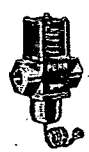
AIR CONDITIONING AND COMMERCIAL COOLING CONTROLS

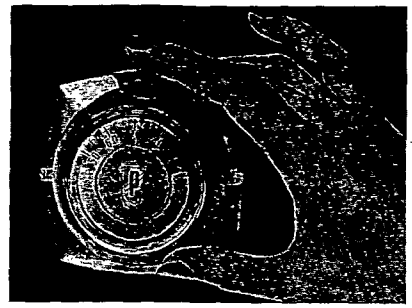
Fan Center to control the fan coil unit on residential air conditioning with remote cooling equipment. Compact ... only 4½ in. wide and 6 in. high ... it combines a transformer with fan relay, reset relay and heating relay ... *one or all.*



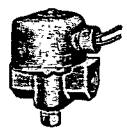
Cooling Center for control of remote condensing unit or water chiller. Only 7 in. high and 8 in. wide, it combines pressure controls, contactor, auxiliary relay for (a) water chiller pump, (b) tower pump or fan relay or both, (c) condenser fan relay.

Series 275 Oil Protection Control for pressure-lubricated compressors. Stops operation of refrigerating equipment before a failure in oil pressure system can damage the unit. Features a 90-second time-delay switch with manual reset to re-start compressor.

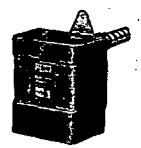
Series 273 Dual Pressure, 2-pole, refrigeration control handles polyphase motors without use of magnetic starter. With its 2 separate circuits, each unit is really 2 switches in 1. Available in single function control, also temperature models in single and dual function.



Series 246 Water Valve for pressure or temperature application on water-cooled refrigeration compressors and condensers. All range design handles both R-12 and R-22. Threaded and flange models. Also 2-piece valves for hermetic systems.



3-Way Water Valve designed for atmospheric or forced draft cooling towers. For use on single or multiple condenser hook-ups to provide the most economical and efficient use of the tower regardless of surrounding air temperature or humidity. Available in ½ in., ¾ in., 1 in. and 1¼ in. sizes.



DOMESTIC HEATING CONTROLS

Series 888 Rimset Thermostat designed for close control of room temperatures in heating, cooling or combination year. 'round air-conditioning systems. Thermostat unit is interchangeable with various subbases to handle 12 different heating and cooling jobs. All wiring is on sub-base ... you simply "plug in" the thermostat.

Series 926 Gas Valve features straight-through flow and vertical self-cleaning seat. Designed for ½ lb pressure on all types of gas. Pressure regulators and pilots are also available.

Series 680 Stack Switch for continuous or intermittent ignition oil burners. Available in either single or two-unit models. Features low-voltage protection and automatic recycling on power interruption.

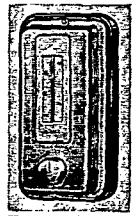
Type 520 Fan, Limit Control for warm air furnaces. Liquid expansion type in either combination fan and limit or separate models for fan and limit control. Safety limit controls for hot water jobs also available.

AUTOMATIC CONTROLS FOR HEATING, REFRIGERATION, AIR CONDITIONING, APPLIANCES, PUMPS, AIR COMPRESSORS, ENGINES

THE POWERS REGULATOR COMPANY

Specialists in Thermostatic Control Since 1891

Factory and General Offices, Skokie 84, Ill.

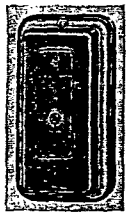


OFFICES THROUGHOUT UNITED STATES AND CANADA

New York 17, N. Y.: 231 East 46th St. • Chicago 26, Ill.: 6655 Ridge Blvd. • Los Angeles 26, Calif.: 3200 W. Temple St. • Toronto, Ont.: 15 Torbarrie Rd.

CONTROL SYSTEMS FOR HEATING, VENTILATING, AIR CONDITIONING and Processes, also Hot Water Supply Controls

Room Thermostat



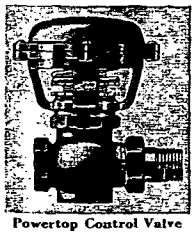
Heating-Cooling Thermostat

When you specify or install a Powers System of Temperature Control you can rely on Powers complete responsibility for a correctly engineered control system, proper installation, continuous successful operation and SERVICE when required from offices in 85 cities.

Some of the many controls employed in a Powers pneumatic system are shown here. A few hot water supply controls are shown at bottom of opposite page. For engineering assistance or bulletins contact your nearest Powers office or write nearest office listed above.

Pneumatic Room Thermostats, Hygrostats, Damper Motors

Hygrostat

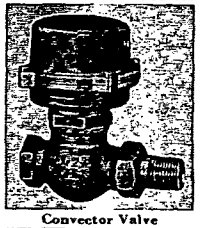


Powers Thermostats provide true gradual action for precise automatic control of room temperatures. They are available for single temperature control with direct or reverse action; two temperature or day-night control with direct action only; heating-cooling for air-conditioning control is also available with remote bulb; and submaster type with control point readjustable by a remote master instrument.

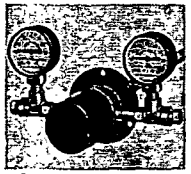
Powers Hygrostats are designed for pneumatic control of valves, dampers and similar devices used with various types of humidifying equipment. They are available for single point control for room or duct installations, direct or reverse action; also for submaster control with reverse action and with direct or reverse adjustment.

POWERSTROKE Damper Motors are piston type for gradual control of dampers or other final control elements. Available in three sizes: 3 in. (2 in. stroke) for limited space applications, 4 in. (3 in. stroke) and 6 in. (4 in. stroke) for smooth gradual control of automatic dampers up to 32 sq. ft. or for other applications.

Powerstroke Motor



Powertop Control Valve



Powers PACKLESS Control Valves eliminate packing maintenance and damage from water leakage.

POWERTOP Valves are designed for smooth proportional control of steam or water flow. With 10 sq. in. effective diaphragm area, it is a compact unit for limited space applications such as unit ventilators, radiant panels, reheat coils, etc. Sizes: ½ in., ¾ in. and 1 in. with angle union or globe union bodies.

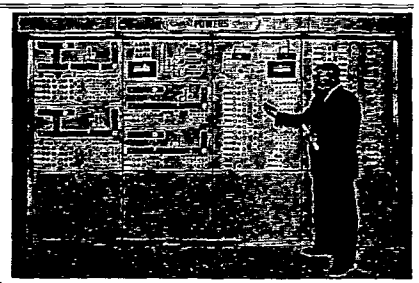
Convector Valves are extremely compact and especially adapted to very limited space applications. Available in three body types: angle union, globe union and reverse flow union. Angle and globe type sizes are ½ in. and ¾ in., reverse flow ¾ in.

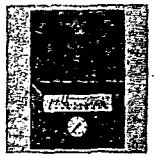
Convector Valve

Limitem Thermostat

Powers LIMITEM Thermostat is a precision instrument for: (1) low limit control of unit ventilators (2) return air, mixed air and fan discharge temperature control with central fan systems and (3) pipe line insertion when used with a well. It provides convenient adjustment for any control point between 35 F and 185 F. Various mounting arrangements can be supplied.

Series 200 SUBMASTER Indicating Regulator has a control point that is pneumatically readjusted by a master instrument. It is available with sensitivity adjustment, direct or reverse action, and with direct or reverse reset adjustment.



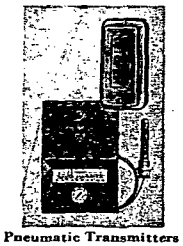


Series 200 Submaster

POWERS GRAPH-O-MATIC PANELS

Powers central control panels combine precise instrumentation with simplicity of operation. They can be equipped to take care of a variety of functions such as remote readjustment of controllers, continuous temperature indicators, remote positioning of dampers and valves. Simplicity of pneumatic controls insures continuous and reliable service.

Graph-O-Matic Panels are also available in console models. All types are custom designed and built to meet the requirements of any comfort or process control system.



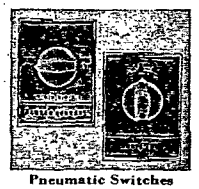
No. 200 Receiver Controller

Transmitters, Receiver Controllers, Gages

The Type HT Transmitter is available for room and duct installation. Ranges are 35 F to 65 F, 55 F to 85 F, 75 F to 105 F, and 95 F to 125 F. The Series 200 Remote Bulb Transmitter is available with bulbs for duct or pipe line insertion and with 15 ft. of capillary tubing. Standard ranges: −25 F to 135 F and 25 F to 250 F.

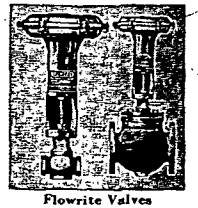
Series 200 Receiver-Controller receives pneumatic signals from a remotely located transmitter. It indicates the temperature at the remote location and also controls a valve or damper to maintain operation at the selected control point. It is furnished with adjustable sensitivity and with direct or reverse action. Standard indicating scales are −25 to +135 F and 25 F to 250 F.

Pneumatic Transmitters
Type HT above, Series 200 below



Temperature and Indicator Gages

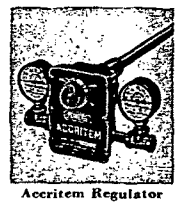
Temperature Gages continuously show the temperature of important phases of an air-conditioning or process system. They are designed for central panel mounting remote from the transmitter. Diameters are 2½ in. and 3½ in.



Powers Indicator Gages are used to show the reset range of a controller, the operation of electrical equipment or the position of a valve or damper motor.

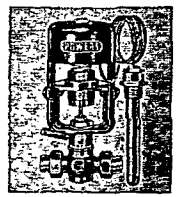
Powers Pneumatic Switches and FLOWRITE Valves

Pneumatic Positioning Switches are designed for manual operation of actuators requiring smooth gradual control and also for readjustment of remotely located submaster instruments. They are 2⅜ in. wide by 3⅜ in. high and are compactly designed for panel board use. Powers Selector Switches are designed to deliver or stop or divert a flow of compressed air to selected control devices remotely located.



Pneumatic Switches

Flowrite Valves

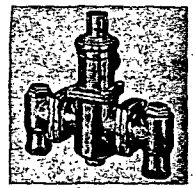


Powers FLOWRITE Valves are used to control the flow of water or steam. These valves are furnished with Powers #590 Teflon Graphited-Asbestos Packing. They are available in single or double seat and V-port types, direct or reverse acting — also in a three-way water mix type.

Accritem Regulator

Hot Water Supply Temperature Controls

Shown here are a few of Powers complete line of self operating and air operated controls for water heaters, heat exchangers, hot water line control, various types of baths and processes. All are described in POWERS WC CATALOG.



No. 11 Regulator

No. 11 Self Operating Regulator controls temperature of liquids or air; operating temperatures from 60 to 260°F; sizes ½ thru 4"; various types of valve bodies; available with 4" dial thermometer. Is widely used for water storage heaters; heat exchangers and processes.

ACCRITEM Regulator is air operated; controls temperature of liquids or air; temperature ranges 50 to 250°F and 150 to 350°F. Used for water storage heaters, instantaneous heaters, heat exchangers, submerged indirect heaters and processes.

HYDROGUARD Thermostatic Water Mixers automatically blend hot and cold water to deliver a mixture at exact temperature desired. Used for hot water line control, various types of baths, and processes. Models available for various capacities and temperature ranges.

Type N Hydroguard

Robertshaw-Fulton CONTROLS COMPANY

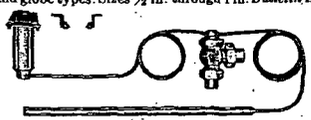
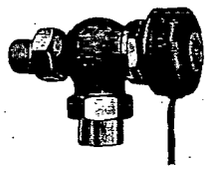
SPACE HEATING CONTROLS



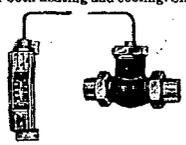
Automatic Radiator Valves #885 & #886

For exposed radiators and other heating units, either steam or hot water. Self-contained—no wiring, piping or auxiliary equipment. Self-operated—continuously positions valve to maintain desired temperature. Packless, non-leaking valve. Quickly installed—simply insert in place of regular radiator valve. Adjustable. Self-powered valves also available for concealed radiation units. Sizes ½ in. through 1 in. *Bulletin HVG-E.*

Automatic Radiator Valve For steam, #895



For any 2-pipe steam heating system of 15 lbs pressure or less. Suitable for convectors and enclosed radiators . . . only dial and adjustment knob are visible. Packless design. Two bulbs provide throttling action that assures very close temperature control. Minimum setting above freezing point. Control will lock at any adjustment to prevent tampering. Available in angle and globe types. Sizes ½ in. through 1 in. *Bulletin HVG-E.*



Radiator Valve #522-A1

For hot water heating systems. Positive, accurate and reliable control of the flow of hot water. Used primarily on radiators or convectors to control room temperature in heating. Can be applied to heating surfaces of induction units in some year-round air conditioning systems to control room temperature for both heating and cooling. Sizes ½ in. only. *Bulletin HVG-E.*

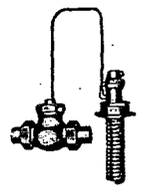
Radiator Valves for Steam, #890 & #891

An electrically operated valve for steam only. Suitable for pressures up to 15 lb. Used mainly for two-pipe steam heating systems . . . for exposed or concealed radiators and unit heaters . . . for control of individual rooms, zones, or entire buildings. A complete controlling unit includes one or more #890 (angle type) or #891 (globe type) valves, a wall thermostat and a simple transformer. Local or remote thermostatic control. Packless, no-leak valve. No wearing parts . . . nothing to lubricate. Sizes ½ in. through 1½ in. *Bulletin HVG-E.*

Temperature Regulator #7

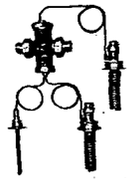
For unit heaters, wall or ceiling type radiators, steam-heated duct systems. Self-powered through filled bellows thermostat system. Packless valve continuously regulates steam supply according to setting on ultra-modern wall thermostat. 20°F ranges up to 170°F. Pressures to 75 psig. Sizes ½ in. through 4 in. *Bulletin HVG-E.*

PACKLESS EXPANSION JOINTS



Sylphon® Packless Expansion Joints simplify building plans, save on the height of buildings, reduce cost of material and labor, and improve exterior and interior appearance. Successfully used in thousands of prominent buildings. Easy installation . . . no repacking. They are made possible by the Sylphon Bellows, which makes these joints as permanent as other structural parts of the building.

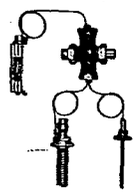
Low Pressure Type PACKLESS EXPANSION JOINT #1290



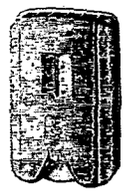
For steam or hot water lines. Simple, compact means of absorbing expansion of "baseboard" radiation, finned convectors, supply lines, etc. Emergency packing feature gives extra protection and lengthens life should bellows ever leak. Comes completely assembled. Traverse: ¾ in. Maximum working pressure: 70 psig. Sizes ¾ in. through 2 in. *Bulletin HVG-E.*

HEATING AND AIR CONDITIONING CONTROLS

Compensated Temperature Regulators #928 H1, -J1, -K1, -L1



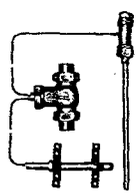
Low-cost single valve regulators that provide modulating control of heating and ventilating systems. Packless valve modulates steam flow according to dial setting on bulb. Control bulb automatically adjusts to prevent "droop" when constant discharge temperature is wanted. Self-operated. Steam pressures up to 75 psig. Temperature ranges of 60°F between 35°F and 170°F. Sizes ½ in. through 2 in. *Bulletin HVG-E.*



Regulators #889-D & #889-E

Actually two self-powered regulators in one, providing highly advanced modulating action for duct systems. One bulb serves to regulate room temperature . . . the other the low-limit discharge air temperature. A third bulb "compensates" for changes in demand, raising the *"low-limit" setting if outside* air temperature falls. Dial-type adjustment for ranges between 35°F and 170°F. *Bulletin HVG-E.*

Regulators #889-F and #889-G

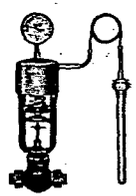


These regulators provide the same multiple control actions as #889-D and #889-E. However, room temperature is maintained through an adjustable wall thermostat instead of a thermostatic bulb. Steam pressures to 15 psig. Adjustable temperature ranges between 35°F and 170°F. *Bulletin HVG-E*

Room Thermostats #801 & 802

For heating, cooling or combination heating and cooling. Compact, attractive design. Available in Super Sensitive (#801) or Sensitive (#802) models. Suitable for direct control of many types of electric heating units, and for direct line voltage control of stokers, burners, motors, pumps, air conditioners, fans, etc. *Bulletin HVG-E*

INDOOR-OUTDOOR CONTROL FOR STEAM CONVERTORS



Regulator, #928-P1

This self-operated regulator varies hot water temperature as desired by regulating steam supply to steam-liquid convertors. Outdoor bulb automatically resets control bulb, and increases water temperature as outdoor temperature falls. For steam pressure to 15 psig. Dial-type control bulb adjustable over any specified 60°F range between 35°F and 170°F. *Bulletin HVG-E*

CONTROL FOR MISCELLANEOUS USES

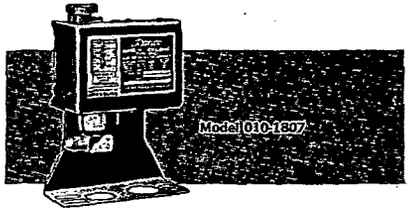
Regulators #1003 Series

Completely self-powered, these sturdy units maintain hot water temperature by regulating flow of steam, to water heating units. Powerful, seamless Sylphon® Bellows actuates valve. Available with direct-or reverse-acting valve or 3-way valve. Adjustable temperature ranges between minus 35°F and plus 455°F. *Bulletin HVG-E*

PACKLESS EXPANSION JOINTS

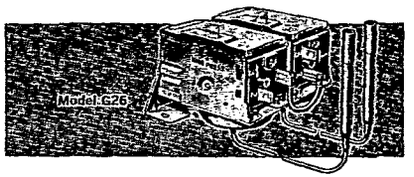
High Pressure Type PACKLESS EXPANSION JOINT #1291

For steam or water lines—vertical or horizontal. *Internally* guided stainless steel multi-ply Sylphon Bellows. Completely assembled ready for easy installation. Traverse: 2 in. (also available to give 4 in. traverse). Maximum working pressure: steam 125 psig; water 150 psig. Sizes ¾ in. through 3 in. *Bulletin HVG-E.*



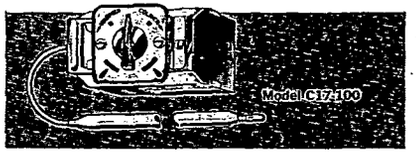
PACKLESS EXPANSION JOINTS #110-M and #111-M

These simple, rugged units absorb up to 1-¼ in. movement in horizontal or vertical lines. Two-ply Monel bellows will not corrode or leak at pressures up to 100 psig. No. 110-M, shown on opposite page, is for steam lines; No. 111-M is for water service. Sizes from ¾ in. through 3 in. *Bulletin HVG-E.*

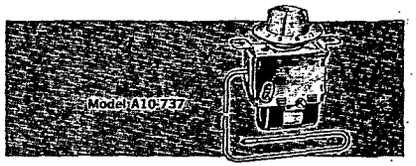


Ranco® INCORPORATED

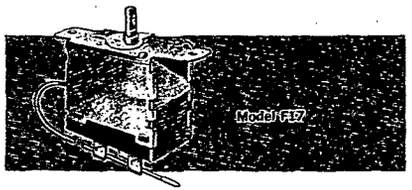
COLUMBUS 1, OHIO



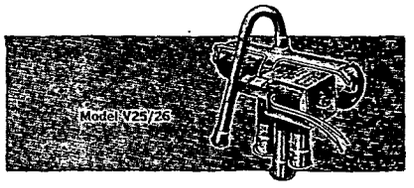
REFRIGERATION AND AIR CONDITIONING CONTROLS



"O" type Commercial Refrigeration Controls, in Single or Dual Types adaptable to temperature or pressure operation; automatic cycle or manual reset. Single pole, single throw or single pole, double throw switches with front access terminals. Temperature range adjustment: −37°F to 110°F. Adjustable differential: 5° to 20°. Pressure range adjustment: 20 in. vac. to 450 psi. Adjustable differential: 5 to 25 psi and 30 to 100 psi.



"G" type Commercial Air Conditioning and Refrigeration Controls for low and high pressure application, non-adjustable in the field. Small in size, readily adaptable to panels. Screw or quick-connect type terminals. With or without manual reset on either single or dual pressures in combinations. Electrical Ratings from Pilot Duty through 18 amp., full load.



"C17" Air Conditioning Control for automatic changeover on heat pumps or two-stage cooling or heating operation that features two electrically separate switches operated by one temperature-sensitive power element. Liquid filled power element controls from the bulb. Switches are single pole, double throw with quick-connect type terminals.

"A10" type Refrigeration Controls for use on household refrigerators, freezers, beverage coolers, water coolers, window air conditioners, etc. Single pole, single throw switch. 15° to 35° dial range from −37°F to 95°F. Differential: 5° to 24°.

"F17" Air Conditioning Control is a cycling temperature type plus an auxiliary switch built-in for fan operation. Dial knob operates and controls both fan and unit. Switches are single pole, single throw. Maximum range of 25°F. Control differential: 4°F.

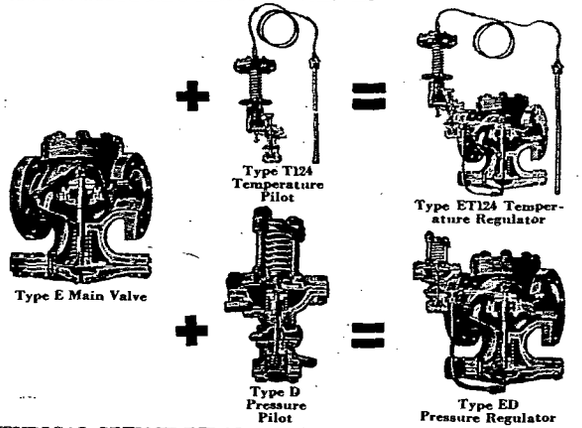
"V25/26" Instant Reversing Solenoid Valves for unit air conditioning heat pump systems to reverse the flow of refrigerant for either cooling or heating or both without an "off" period. Capacity of V25 is 2½ through 7½ tons; of V26 is 1 through 2 tons using Refrigerant 22.

Ranco Also Manufactures Motor Relays, De-Icing Controls, Clothes Dryer Controls, Automatic Defrost Timer Controls, Sequence Timers and Automobile Water Heater Modulating Valves. Write for descriptive literature.

SPENCE ENGINEERING COMPANY, INC.

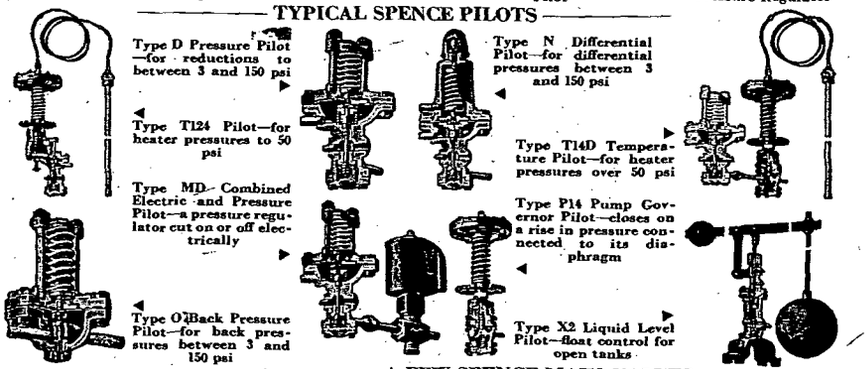
Owners of Rider-Ericsson Engine Co., Founded by Capt. John Ericsson 1842
31 Grant St., Walden, N. Y.
Automatic Regulating Valves, Desuperheaters and Strainers
Offices in all Principal Cities

SPENCE AUTOMATIC REGULATING VALVES



One or more separate, sensitive pilots control the main valve in Spence Regulators. These pilots are connected to the main valve by means of unions. This Spence feature offers the following advantages:

(1) **It's easier** to inspect and maintain Spence Regulators.



(2) **It's simple** to change the control function of a Spence Regulator by changing the pilot. All main valves, regardless of size, can be controlled by a wide variety of Spence pilots.

(3) **It assures** that you get the most effective and economical regulator for your needs because of the many possible combinations of main valves and pilots.

The illustration at right shows how a single main valve is combined with two pilots to form two different regulators.

TYPICAL SPENCE PILOTS

A FEW SPENCE MAIN VALVES

For accurate water pressure regulation—Type D24 Direct Acting Water Pressure Reducing Valve

Type E2 Main Valve for low initial pressures and low differentials

Type E3 Main Valve for high initial pressures and low differentials

Type C20 Main Valve same as Type E but double seated

HYDRAULIC-ACTION CONTROLS

The complete line of White-Rodgers controls includes:

- Warm Air Controls
- Low Voltage Thermostats
- Line Voltage Thermostats
- Hot Water and Steam Controls
- Relays
- Gas Valves
- Oil Burner Controls
- Refrigeration and Air-Conditioning Controls

Hydraulic-Action temperature controls operate on the principle of expansion and contraction of a solid liquid charge against a diaphragm.
This system, developed and perfected by White-Rodgers provides accuracy comparable to that of a fine thermometer . . . and other outstanding features guaranteeing excellent performance.

ADVANTAGES OF HYDRAULIC-ACTION

Hydraulic-Action controls provide maximum sensitivity—positive dial settings—full range accuracy—consistent differentials—eliminates temperature drift—simplified installation—extra sturdy switch mechanism—and other qualities that assure long satisfactory operation.

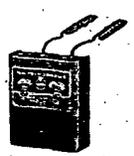
"Fashion" Thermostat, low voltage, shown with hinged cover partly open. Pleasing shape blends with any room decor. Adobe Beige finish. Bi-metal operation.

Push Button subbase using "Fashion" thermostat to give finger-touch selection of heating, air-conditioning or off.

HOT WATER ZONE CONTROL PACKAGE

Low cost system which uses no flow valves and after first zone no additional relays or circulators are necessary. Low voltage wiring. Uses common return to save on piping, fittings etc.

Line voltage thermostat for unit heaters or air conditioning installations.



Zone Valve. Quite automatic water valve for inexpensive zoning of Motels, Hotels, Split-Level Homes, Ranch-type homes.

PRIMARY CONTROLS

In addition to Hydraulic-Action Controls, White-Rodgers manufactures Oil Burner primary controls, Gas Valves (both diaphragm and solenoid types) and automatic pilots for gas installations.

***Dual Hot Water* Controls. Limit and Circulator, High and Low Limit combinations. Also made in single controls.**

Fan and Limit controls in single case. Note the flexible elements. Also in single units.

Remote bulb heavy-duty thermostat, also available with self-contained bulbs.

Oil Burner primary control (stack switch). Intermittent or Constant Ignition types.

"Cushioned Power" Solenoid Gas Valves. Quiet, soft seat, spring loaded. for ALL gases.

Contact your nearest White-Rodgers office for complete information. Catalog and Engineering data furnished quickly.

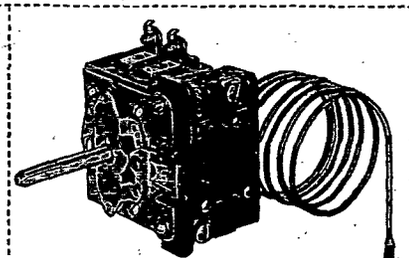
THE Wilcolator COMPANY

TYPE G2-E

New Effective-Temperature Control

The Wilcolator G2-E Effective-Temperature Control is a thermostat designed to sense both dry bulb and wet bulb temperatures and to combine these signals in such a way that the thermostat controls at any selected effective temperature. In application, a wick or sleeve surrounding the wet bulb cools it by evaporation of the water supplied from the evaporator. As humidity increases, evaporative cooling decreases, and temperature of the wet bulb rises. Hence an increase in humidity appears to the thermostat as an increase in temperature, just as it does to the human body. Volume of the wet bulb is so proportioned to volume of the dry bulb that the thermostat automatically corrects the controlled temperature to compensate for changes in humidity.



TYPE G

Thermostat with Positive "Off" or "Constant Cool"

The Wilcolator Type G liquid expansion electric thermostat features an improved, snap-action, vibration-proof control mechanism permitting much higher ratings than previously available in such a compact unit (2¾ x 1⅝ x 1⅞ in.). Suggested applications include room coolers, space heaters, and air conditioners. Ratings are the same as for Type GA. Standard temperature range for both G and GA controls is 0°F minimum; 585°F maximum. Special temperature ranges to customer's requirements.

TYPE GA

Thermostat with Multiple-Circuit Switch

The Wilcolator GA is a versatile new thermostat for both cooling and heating applications. Higher rated for new heavy duty appliances, it consists of a standard Type G thermostat, plus a special switch—cam operated by the dial shaft—permitting control of several circuits with a single dial. Contact rating, heater load (Type G1-A): 30 amp, 125 and 250 v a-c noninductive load. Cooler ratings (Type G2-A): 120, 208 and 240 v a-c; running current—14 amp; locked rotor—60 amp.

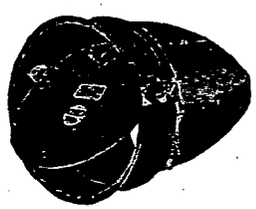
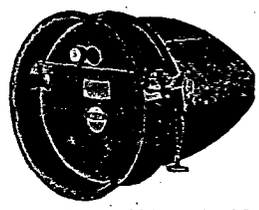
Field Barometric Draft Controls

Field M+MG2: A Three-Fuel Control, in Sizes 10 in. through 32 in., for Oil, Oil-Gas, Gas, and Coal Fired Furnaces and Boilers.



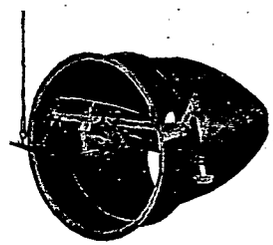
The **M+MG2** will serve gas, oil or coal with equal efficiency, and requires only minor, in-the-field changes to adjust from one fuel to another. A plant might convert from coal, to oil, to gas, then to oil-gas, without obsoleting this control. With coal it serves as a combination barometric draft control and check damper. With oil it serves as a single-acting barometric control. With gas it becomes a double-acting control, opening inward to regulate up-drafts, opening outward to relieve down-drafts. Where gas-oil is used interchangeably, the control change takes less than a minute.

The Field M+MG2 is a specialized, precision-made, three-fuel control. Because it is a control of extreme sensitivity, it is, of necessity, a control of extreme structural strength. For example, accuracy is increased when the clearance between a ring and gate is held to a minimum. To permit this, in the M+MG2, without risk of binding, Field developed a die-formed, heavy gage ring. Its deflection strength exceeds many fold the normal requirements of shipping, installation or use. The gate is also very heavy—39 pounds for a 32-inch control. Such weight obviously provides extreme rigidity. Heavy weight is also, paradoxically, a requirement of the virtually friction-free gate mounting that gives the M+MG2 its extreme sensitivity. Only a heavy gate could be so delicately balanced. The same weight factor also prevents the spurious responses to which so sensitive a gate might normally be subject.



The M+MG2 gate is mounted on a long, thin, stainless steel knife edge, which in turn rests on self-aligning bearings. The bearings are self-cleaning. Soot or dirt cannot accumulate to cause binding or friction. They are also self-leveling—assuring that the knife edge is always in contact across the full width of the bearing, for an even distribution of weight. When the gate moves, only the sharp corner of the knife edge rests on the bearings—an area of contact so minute that friction is virtually non-existant. The result is extreme and instantaneous sensitivity to draft change. The gate is deeply recessed in the ring, to direct the flow of air over the gate and avoid response to random, variable air conditions outside the control.

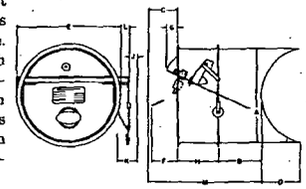
The M+MG2 permits an unusually wide range of draft settings. The 18 in. control, for example, will maintain a draft setting as low as 0.002 in. The same control will maintain a draft as high as 0.3 in., a requirement where there is a very high draft loss through the appliance. Compensation for differences between horizontal and vertical installation is fully provided, by the simplest means available on any Field control. Where a safety switch must be specified, to meet gas code requirements, attachment is easily, effectively, and compactly made. Compactness is a characteristic of the M+MG2. There are no protruding parts. Even the stainless steel bead chain is short, holding setting weights neatly against the side of the control.



Unless otherwise specified the M+MG2 control is shipped as a single-acting control, with patterned collar. For gas, the installer will set control for double-action. If solid fuel is involved, order the M+MG2 Barochek. If control is to be shipped less collar, so specify.

M + MG2 Double Acting for Gas, opens inward to regulate up drafts, and opens outward to relieve internal pressures

M + MG2 Single Acting for Oil



M + MG2 Barochek for Solid Fuels

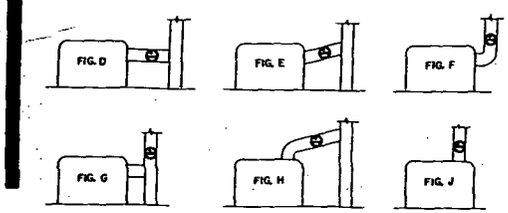
*No Points On These Collars



SWITCHES: A draft hood provides relief for down draft pressures, but gives no visual sign of spillage. The double-acting M+MG2 gate opens outward to relieve such pressures, and by its position signals any spillage. In addition, the M+MG2 can be equipped with an automatic switch where the engineer finds conditions which could create frequent and prolonged down drafts. A time delay switch is usually recommended for an atmospheric burner; a thermal switch for a power burner. These switches provide an obvious means to measure the extent of a down draft problem so that an engineer can judge if and when some remedial action is indicated.

BEST LOCATIONS FOR GAS

BEST LOCATIONS FOR OIL OR SOLID FUELS

FIELD TYPE M: For automatic heating equipment, designed to assure finer performance, greater fuel economy, through highly accurate control of drafts. Available in sizes from 6 in. through 9 in. for pipe diameters of 5 in. through 10 in. Features "Rocking Chair" gate action, off-center gate mounting, sidewings, extended housing. Widely used in the heating industry.

FIELD TYPE RC: Calibrated draft control in sizes 6 in. through 9 in. for 5 in. through 10 in. flues. Features extreme capacity, and reversible wing flap on gate for more precise adaption to either vertical, horizontal or sloping flues. Friction-free gate mounting, single strap attaching, easily leveled on a sloping flue.

FIELD MG1: Double-acting control for lower-input gas-fired furnaces and boilers; widely used in conversion burner installations. Opens outward to relieve down-drafts; opens inward to regulate up-drafts. Sizes 7 and 8 in. for 6 through 8 in. flues.

FIREYE SAFETY INTERLOCK SYSTEMS FOR SEMIAUTOMATICALLY AND MANUALLY-LIGHTED BURNERS.

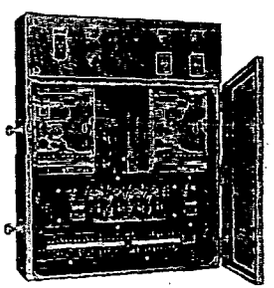
Complete safeguard systems for up to four burners per boiler—oil, gas, or combination oil-gas. Assures safe light-off and firing. Includes System FP-4 electronic control in pre-wired cabinet assembly; plus all external valves, switches, and alarms.

FIREYE ELECTRONIC SAFEGUARDS AND PRIMARY CONTROLS.

System FP-2. Flame failure protection and programming for automatic industrial oil, gas, and combination oil-gas burners. *UL-FM* approved.

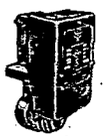
System FJ-2. Flame failure protection and programming for automatic commercial light oil, gas, and combination light oil-gas burners. *UL-FM* approved.

System FP-4. Flame failure protection for semiautomatically and manually-lighted oil, gas, and combination oil-gas burners. *UL-FM* approved.



FIREYE VALVES AND INTERLOCKS.

Oil Valves. Manual reset or solenoid operated safety shutoff valves for all oil burner applications.



Gas Valves. Automatic or manual reset types, 1 in. to 6 in. IPS. Solenoid operated pilot gas valves, ¼ in. and ½ in. IPS. Supervisory *FM* Cock, manually operated, lubricated plug cock. Untamperable position indicating switch.

FIREYE PHOTOELECTRIC SMOKE DENSITY INDICATOR.

System FE-3. Provides low cost, *easy-to-install* smoke density indication with assured accurate readings. Helps keep smoke within legal limits. Saves fuel dollars. Chart recorders also available.

SIMPLEX MANUFACTURING COMPANY

198-206 North Main Street **Fond du Lac, Wisconsin**

SIM-TROL Barometric Draft Controls—Types "A" "C" "F" "H-HG"

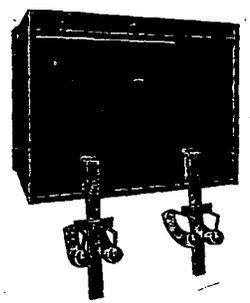
Breechings and stacks must provide sufficient draft under adverse atmospheric conditions. During normal and high barometric periods, cold months, and windy days, excessive draft intensities are generated with resulting inefficiency and fuel waste.

ADVANTAGES

SIM-TROLS automatically maintain the predetermined minimum draft required for good combustion, fuel economy, increased heat transfer, by reduction of gas velocity through the boiler or furnace bonnet, minimizing cold air infiltration and inrush causing sudden shrinkage of boiler parts. They eliminate local hot spots, floating and pulsating flame and sucking out of pilots. They improve feed water regulation, super-heater results, boiler-life and boiler-room ventilation.

SIM-TROLS aid materially in smoke abatement and boiler cleanliness by reduction of unburned combustibles and air dilution of stack gases. Lowered stack temperatures prolong liner life and reduce fire hazards.

CONSTRUCTION



SIM-TROLS, properly sised, adjust easily to any desired draft intensity.

The races of the Type A SIM-TROL adjust laterally, the race assembly vertically, and the arm angle may be varied in relation to the plane of the gate.

The races of the Type C SIM-TROL adjust laterally, the assembly vertically, but the angle *in* relation to the gate is not variable.

Gates of Type A and Type C SIM-TROLS rotate on cold rolled arbors and prelubricated dust proof ball bearings. Curved tubular counter-balances contain metal balls which constantly change position to compensate for varying rotation angles of the gate, maintaining overfire draft within 0.01 in. water, plus or minus.

Gates of Type F SIM-TROLS rotate on cold rolled arbors and dust proof ball bearings in sizes from 12 in. x 12 in. upward. Adjustable weights hung on slide loops permit regulation along the curved slide arms.

Type "A" SIM-TROL

Gates of Type H-HG SIM-TROLS rotate on heavy gage black oil tempered wire extending into drilled holes in the metal frame of the control at an off-center horizontal point. Counterbalance members are similar to that of the Type F, except as to angle of application.

SIM-TROLS are protected by hard, heat resisting boiler room enamels. All counterbalance members are outside, free from corrosion and encrustment by products of combustion.

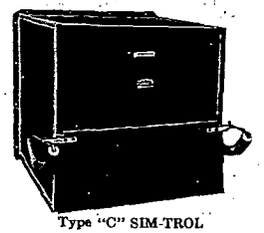
DESIGN FACTORS

Sising is important. The input opening should equal the stack area, plus 10 percent for each 35 ft of stack over 65 ft thereof. *Preference should be given to control width, rather than for height, for ease of adjustment and smooth gate rotation.*

Horizontal clearance from installation point approximates gate height plus 30 in. Over-all height approximates gate height plus 37 in. Over-all width approximates gate width plus 8 in. Designs for limited space may be made if plans are submitted.

SIM-TROLS *of types* A, C and F are individually designed to plant specifications, including breeching and stack dimensions, clearances, fuel, method of firing and number of boilers on the line. Detailed sketches are submitted for approval or suggested change without obligation.

SIM-TROLS—Types A, F and H-HG are designed to serve plants fired with solid, liquid or gaseous fuels under any method of firing. An adjustable "stop" is provided above the gate to allow dual gate action when used in connection with gaseous fuel, the stop being turned upward. For use with solid or liquid fuels the stop is turned downward effecting single action required for those fuels. Full capacity and efficiency are available for both draft control and relief of back pressure from any cause.



The Type C SIM-TROL is not adaptable to dual gate action, though it is efficient in connection with powered gas burners, or plants using induced draft equipment, or plants fired with solid or liquid fuels. We do not recommend the Type C SIM-TROL for plants burning gas and designed as purely atmospheric type.

Type "F" SIM-TROL

Type "H-HG" SIM-TROL

Type "C" SIM-TROL

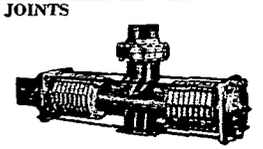
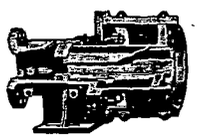
ADSCO CORRUFLEX PACKLESS EXPANSION JOINTS



Equalizing, Welding Ends

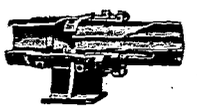
Adsco's Corruflex packless expansion joints absorb pipe expansion and are adaptable to any piping condition. The equalizing joint is used for various types of motions and is suitable for pressures to 300 psi and higher. They are made in sizes ranging from 3 in. to 54 in., with single or multiple corrugations, with flanged as well as welding ends. They can be supplied with covers and telescoping inner sleeves.

Non-Equalizing, Flanged Ends



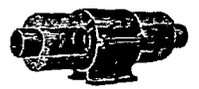
This type is generally used to absorb small amounts of expansion and to isolate vibration under vacuum or pressures to 50 psi. Depending on the metal used in the expansion element, both the equalizing and non-equalizing types are suitable for temperatures from sub zero to 1600 F. Adsco also manufactures a close-pitch type and a semi-equalizing type with root rings to reinforce the corrugations.

Special Types



Special types of Adsco Corruflex expansion joints, like the pressure-balanced above, can be designed and manufactured to absorb axial, lateral, or angular rotation, or any combination of these movements. Some of these special types of expansion joints are the universal, hinge, swing, gimbal, tie-rod, and internally-guided. Consult Adsco for details on the performance of these special expansion joints in pipe lines.

ADSCO SLIP-TYPE EXPANSION JOINTS



"PG" Joint, Flanged Ends

Slip-type expansion joints, designed for axial motion, offer long traverse, low initial cost, and produce minimum stresses on pipe anchors. The piston-ring joint, Type "PG", can be *unpacked and repacked under full line pressure* because of its piston-ring feature. The polished, chrome-plated slip cannot be scored by metal-to-metal contact. Packing can be quickly lubricated. In the externally-internally guided piston-ring joint the slip is fully supported at both ends throughout its circumference over the entire length of travel.

"P" Joint, Welding Ends

The internally-guided piston-ring joint, Type "P", being more compact, is especially recommended for use where space is limited. This unit, like the "PG" Type, can also be *unpacked and repacked under full line pressure*. Adsco slip joints are furnished in both single and double units with flanged ends or welding ends. Sizes range from 1¾ in. up, with traverse per slip from 4 in. to 12 in. Semi-steel joints can be used for working pressures to 250 lb and temperatures to 450 F. Steel joints can be used for working pressures to 400 lb and temperatures to 800 F.

Pipe Alignment Guides

Proper guiding of a pipe line, as obtained by Adsco pipe alignment guides, is essential to insure straight axial movement of the pipe to the expansion joint. Misalignment may damage equipment. A pipe line should be considered as a load-bearing column and pipe alignment guides should be used accordingly to prevent bowing and bending. Pipe supports such as hangers, chairs, or rollers are not to be considered as guides. Write for details on the latest designs in Adsco pipe alignment guides.

ADSCO STANDARD HEATERS

Storage Water Heaters

Adsco storage heaters are built in accordance with the *ASME* code for working pressures desired. Tanks are made of flange-quality steel, nickel-clad or stainless-clad steel, or copper silicon alloy. Where alloy tanks are used, tube sheets are of corrosion-resisting metal, so that service water does not come in contact with any ferrous parts. Steel tanks can be lined with all standard linings, including Adsco Phenolic 6-2 or Adscote bitumastic to prevent corrosion. Heating element is easily removed for cleaning.

Instantaneous Heaters

Adsco instantaneous heaters are made in a large variety of types, including the simple U-bend instantaneous shown above, which is used to heat water for showers, dishwashers, laundries, and other purposes. These heaters are also used as converters for furnishing hot water to space heating systems. Many straight-tube, float-head units are used as closed feed-water heaters, boiler blow-down heaters, and for various uses in the process industries.

Oil Pre-heaters

Adsco oil pre-heaters help obtain highly efficient performance from fuel oil by heating it properly for complete combustion in the burner. In many cases, the work done by oil pre-heaters permits the use of heavier grade, less costly fuel oil. These heaters frequently are used with Adsco tank suction heaters, the two units making an efficient team. Tank suction heaters, which heat only the liquid to be pumped and not the full contents of the tank, also are available.

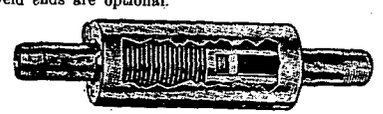
FLEXONICS EXPANSION COMPENSATORS FOR STEAM AND HOT WATER HEATING SYSTEMS

Model L for pressures to 60 psig

The Flexonics Model L Expansion Compensator consists of a two ply phosphor bronze bellows with copper tube end connections enclosed in a protective shroud of brass. It is especially designed for control of expansion in finned type convectors, baseboard, radiator or heating supply and return lines.

Sizes from ¾ in. through 2 in. Suitable for temperatures from −60 F to 250 F and for pressures up to 60 psig. A single unit will handle motion up to ⅝ in. (½ in. compression, ⅛ in. extension). Available with all commonly used fittings.



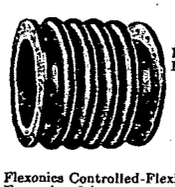
Sizes and Dimensions

Tube Size (in.)	Overall Length, in.		Max. O. D., in.	
	Sweat Ends	Female Threaded Ends	Sweat Ends	Female Threaded Ends
¾	6½	8 1/16	1⅛	1⅛
1	6 3/16	8 1/16	1⅜	1⅜
1¼	7	9⅛	2¼	2¼
1½	7 3/32	10 5/32	2½	2½
2	8¼	10½	3	3

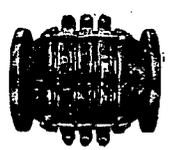
Model H for pressures to 175 psig

The Flexonics Model H Expansion Compensator is used primarily on vertical risers for high pressure steam and hot water lines. However it may also be used on horizontal runs. The Model H consists of a corrosion resistant Flexonics Bellows enclosed in an all-welded steel housing. The unit is provided with a positive anti-torque device to prevent possible bellows damage during installation.

Sizes from ¾ in. through 3 in. Suitable for temperatures from −60 F to 750 F. Maximum test pressures 50 psi over working pressures shown in table. A single unit will handle motion up to 1¾ in. (1½ in. compression, ¼ in. extension). Mild steel male NPT pipe nipples on both ends are standard. Ground joint unions or weld ends are optional.



Sizes and Dimensions



Pipe Size (in.)	O/A Length (in.)	Max. O. D. (in.)	Working Press (psi)	Unit Wt. (lb.)

2½	13 3/16	5	125	13.7
3	14 1/16	5¼	125	17.4

FLEXONICS EXPANSION JOINTS FOR POWER AND PROCESS PIPING

For medium and high pressure piping, Flexonics offers a complete line of corrugated expansion joints in free-flexing and controlled flexing types. Free-flexing units are available in standard sizes from 3 in. to 48 in. ID, for pressures to 30 psi, temperatures to 850 F. Designed for expansion travel up to 3¾ in. per unit. Controlled-flexing units are available in standard sizes from 3 in. to 48 in. ID, for pressures to 300 psi, temperatures to 850 F. Designed for expansion travel up to 7½ in. per unit. Both free-flexing and controlled flexing types are available with flanged or welding ends.

KEFLEX QUADRA-SIDE EXPANSION COMPENSATORS

FOR STEAM AND HOT WATER HEATING SYSTEMS

KEFLEX Type 7 Q and 7Q-T packless type, expansion compensators are designed to compensate for both expansion and contraction in low or high temperature heating supply lines as well as for fin tube baseboard radiators and convectors.

Type 7 Q has square brass ends with female tapered pipe threads.

Type 7Q-T has female copper tube ends for soldering to copper pipe.

The bellows section, made from highly flexible, multi-ply (two or more plies), Type 321 or 347 stabilized stainless steel, is protected from torsion, squirm, misalignment, and external damage by a square, brass, telescoping case having positive stops against over compression.

The force to compress KEFLEX Quadra-Side Compensators is less than 100 lb; Standard units will accommodate a total traverse of 2 in.; 1½ in. in compression and ½ in. in extension. Units for traverse in compression of ¾ in., 2 in. and 3 in. are available with proportionate extension. Made in sizes ¾ in. through 3 in.

All KEFLEX Quadra-Side Compensators are provided with a removable screw, set for the indicated traverse in compression.

KEFLEX TYPE 11Q-T QUADRA-SIDE EXPANSION COMPENSATORS

USED WITH CONVECTOR AND FIN TUBE BASEBOARD RADIATION UNITS IN SCHOOLS, HOSPITALS, OFFICES AND COMMERCIAL INSTALLATIONS

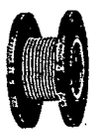
KEFLEX Type 11Q-T, packless type, expansion compensators are designed for use in low pressure heating systems where maximum test pressures do not exceed 150 psig. They will compensate for expansion in compression up to ¾ in. and ¼ in. in extension—a total traverse to 1 in.

The bellows section, made from Type 321 or 347 stainless steel, is enclosed in a square brass case which slides over a square guide to provide positive protection against torsion, squirm and external damage during installation. Sizes: ¾ in., 1 in., 1¼ in., 1½ in. and 2 in. Maximum Working Pressure 100 psig. Maximum Temperature 300 F.

KEFLEX TYPE QAB INTERMEDIATE ANCHOR BRACKET

Type QAB is a heavy bronze bracket for use with KEFLEX Type 7 Q Dual Expansion Compensators as an Intermediate Anchor. The bracket is provided with two holes to facilitate attaching to floor, wall or ceiling. A set screw cinches the bracket tightly to the 7 Q unit and limits the movement to each individual compensator. Suggested for use in long runs of fin tube piping where lines should be segmented between the main anchors.

KEFLEX VIBRATION ABSORBERS



The high flexibility of KEFLEX Vibration Absorbers makes them extremely suitable to absorb vibration from pumps, chillers, and compressors. Keflex Vibration Absorbers are packless type as they have a bellows made from laminated stainless steel, type 321 or 347.

They may also be used as low pressure expansion joints (75 psig) where axial movements of ½ in. in compression and ⅛ in. in extension are desired. A lateral movement of ½ in. is also obtainable. The close face to face or overall length measurement permits their use in very close quarters where longer lengths of flexible hose would be impracticable.

KEFLEX Type 301 Vibration Absorbers are designed for higher pressure service than Type 151, or Type 71. Reinforcements have been added to withstand pressures over 150 psig. A liner is not standard equipment but is available if required. Dual units with long spacer nipple for lateral movement or correction of misalignment are furnished to specification.

Type 71-21V is fitted with carbon steel mechanical flanges having special elongated bolt holes on series 15 bolt circle. Keflex reattachable flanges may be applied jobsite in making emergency repairs.

Type 151 is fitted with either carbon steel weld ends or 150 lb type rigid flanges having special elongated bolt holes on a series 15 bolt circle to permit easy installation.
Type 301 is furnished with either carbon steel weld ends or 150 lb type lap joint flanges; 300 lb type flanges are also available.

KEFLEX EXPANSION JOINTS
Corrugated, Packless Type
FOR STEAM AND HOT WATER HEATING SYSTEMS AND PROCESS PIPING

KEFLEX packless type Expansion Joints are made from highly flexible laminations of Type 321 or 347 stabilized stainless steel. Standard equipment in both KEFLEX Types 158 and 308 consists of a packless type, stainless steel bellows; weld ends or carbon steel flanges; self guiding, full bore, flow liner; and self equalising contour control rings in sizes over 4 in., also available for smaller sizes. Type 308 also has reinforcing shoulder rings. Sizes 2 in. through 48 in. The force to compress KEFLEX Expansion Joints is usually less than 100 lb.

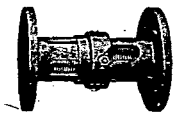
KEFLEX-KETROL CONTROLLED EXPANSION JOINTS FOR EXTRA SAFETY
POSITIVE PROTECTION AGAINST TORSION. FOR USE IN PIPE LINES TO COMPENSATE FOR EXPANSION AND CONTRACTION
(Patent Pending)

KEFLEX-KETROL, self guiding, anti-torsion, packless type, expansion joints are manufactured with multi-ply, Type 321 or 347, stabilized stainless steel and enclosed by a special alloy steel shroud having two matched sections. Each section has at least four equally spaced finger-type projections at one end, which fit axially into the space between the finger projections of the companion section so as to serve as a positive guide to the bellows element and prevent torsion and deflection. The shroud cage also protects the bellows from exterior damage.



The lengths of the finger projections determine the full extent to which the bellows may be compressed, and also provide sufficient travel to accommodate extension of the bellows in the event ambient temperatures drop below normal and the pipe lines contract accordingly. Steel rings to prevent over extension of the bellows element are attached to the ends of the finger projections of each companion section. The rings also maintain complete concentricity of the matched shroud-cage and insure structural stability.

KEFLEX-MAVE TYPE M PIPE GUIDES

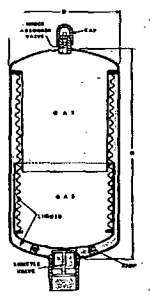
FOR CONCENTRIC GUIDING OF PIPE LINES

KEFLEX Type M pipe guides control the longitudinal movement of pipe and protect expansion joints from lateral deflection caused by bowing or bending of pipe lines. The fabricated steel shell and the inside clamp permit complete insulation of pipe at all points. Type M pipe guide is made of fabricated steel protected inside and out with a suitable finish. The body consists of a guiding cylinder with an anchor base welded on. The top half is removable for easy installation.

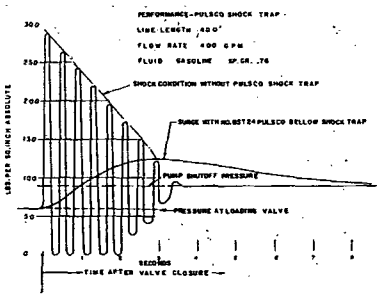
The pipe clamp is made in halves bolted together with the bore being ⅛ in. larger than the OD of the pipe. Set screws, in sizes 5 in. and larger, center the pipe and secure the clamp which moves through the body with the expansion and contraction of the pipe. The "ears" of the clamp ride on the inside surface of the cylinder.

Available for traverses of 3 in.-4½ in.-6 in.-9 in.-12 in., and for insulation thicknesses of 1 in.-1½ in.-2 in.-3 in.

KEFLEX-PULSCO TYPE P SHOCKTRAP FOR PIPE LINES, REFINERIES, CHEMICAL PLANTS, AIRCRAFT AND MARINE FUEL LOADING SYSTEMS

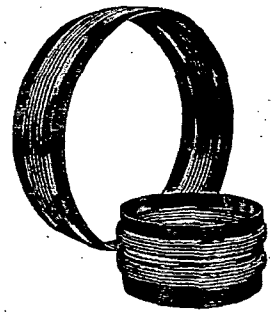


KEFLEX Type P Bellows shock traps are used to eliminate "water" hammer and reduce pressure surges in pipe lines operating under extremely high velocities, pressures, and hazardous "stop and go" flows which result in broken lines, meters and overstressed loading equipment, particularly where quick closing valves are used.



Type P is constructed of A-285 grade C steel enclosing a KEFLEX laminated Type 347 stainless steel bellows with a gas volume sealed in. The entrance to the shock trap is fitted with a special shuttle valve, consisting of an orifice restriction and a bleed hole for fluid exiting from the shock trap, and is guaranteed not to recycle. Surge resulting from the kinetic energy of the pipe line is absorbed by compressing the gas within the KEFLEX Bellows and by friction through the orifice in the shuttle valve.

The orifice in the shuttle valve is so sized as to provide the minimum gas volume for absorbing the surge. Kinetic energy in the pipeline is then converted into friction heat and into the work of compressing the gas in the KEFLEX Bellows gas chamber.



DIMENSION SHEET
PULSCO BELLOWS SHOCK TRAPS

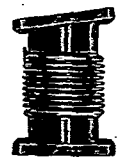
KEFLEX EXPANSION JOINTS

24 and 48 in. Type 151-2E Expansion Joints

KEFLEX Type 151-2E expansion joints in large sizes are particularly adaptable to ducting lines and wind tunnel installations as their high flexibility reduces anchor load requirements. The force to compress KEFLEX expansion joints is usually less than 100 lb.

The use of multiple laminations (or plies) of thin stainless steel, longitudinally welded, assures a long cyclic life for the unit and great resistance to pressures.



Type KST300-15-14E Dual Springtrol Expansion Joint

KST300-15-14E KEFLEX Springtrol assemblies are for use as controlled expansion joints where lateral deflection also occurs. Spring controlled tie rods support the long center section, between the bellows sections, and prevent over compression and extension.

Type KG300-14E Gimbal Type Expansion Joint

KG-300-14E KEFLEX Gimbal (hinged) joints are used when controlled lateral deflection is required and axial movement must be prevented or held to a minimum. The force to deflect KEFLEX joints is usually less than 100 lb.

Type 158-12 VSP for Diesel Exhaust

KEFLEX Type 158-12VSP Vibration absorbers are designed for use on diesel engine exhaust manifolds. They are usually fitted with a telescoping, self-guiding, full bore, liner to prevent direct impingement of flame on the bellows. They will absorb axial movement as well as the required lateral deflection. Flanges are furnished to match the drilling on the engine.

U.S. FLEX-KEFLEX EXPANSION JOINT MULTI-UNIT

Type 308-15CAB-14E. Traverse Provided for Job Requirement

MILITARY SPECIFICATIONS U. S. FLEX KEFLEX

Expansion Joints may be furnished to conform with Military Specifications MIL-E-17813a, Type I or II and Class 1 or Class 2.

LADISH . . . A COMPLETE LINE OF *Controlled Quality* PIPE FITTINGS

BUTT WELDING FITTINGS (IPS and Tube O.D.):

Sizes ½ in. through 42 in. Ranging from IPS Schedule 5S through double extra strong and special wall thicknesses through 5 in., plus complete range in Tube O.D. Fittings. These butt welding fittings align accurately for sound, fast welds to form an integral piping system of continuous efficiency. Smooth, flush, leak-proof joints reduce turbulence and pressure loss . . . and provide assurance of product uniformity.

FLANGES, LONG NECKS, ROLLED RINGS:

ASA, MSS, Light type and Corrosion Weight Flanges in sizes ½ in. through 24 in. —in pressure ratings 150 lbs through 2500 lbs; Large O.D. and T.E.M.A. Flanges in sizes up to 24 feet dia; Long Necks in sizes 1 in. through 24 in.—in pressure ratings 150 lbs through 2500 lbs; Rolled Rings, seamless or welded, are available in diameters up to 24 feet and in weights up to 140,000 lbs. All parts forged under exacting metallurgical controls, accurately machined to full dimensions.

SCREWED & SOCKET WELDING FITTINGS & UNIONS:

Forged Fittings in sizes ⅛ in. through 4 in.—in pressure ratings 2000 lbs through 6000 lbs. Sharp, clean threads of Ladish screwed fittings assure tight, leak-proof joints. Wide reinforcing bands provide ample wrench grip surface and extra strength at stress points. Socket Welding Fittings have deep, true welding sockets to assure proper alignment and slip fit. 150 lb STAINLESS STEEL SCREWED FITTINGS are also available in a complete range of sizes and types.

INDUSTRIAL TRI-CLAMP STAINLESS STEEL FITTINGS:

The industrial type Tri-Clamp Stainless Steel line presents a unique design concept in a dismountable fitting with particular application in process lines demanding contamination-free product flow. Available in sizes 1½ in. through 12 in., in IPS or Tube O.D., in type 304 and 316 stainless steel.

Tri-Clamp fittings make possible a light weight system with smooth inner walls . . . unobstructed flow . . . and no pockets and crevices to cause hazards of contamination. Simple assembly features . . . combined with light weight . . . assure fast, easy assembly and dismounting of lines for thorough cleaning, brushing and sterilization. Tri-Clamp line is assembled by either expand-on or weld-on methods.

A COMPLETE SERVICE TO MEET ANY REQUIREMENT:

Ladish offers complete service in pipe fittings regardless of type, size, pressure rating, wall thickness or material specification. Special emphasis on metallurgically sound materials and forging procedures . . . combined with advanced engineering . . . and rigid manufacturing controls assures users of Ladish fittings a uniformly high standard of dependability.

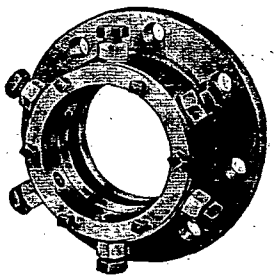
Weld+Ends Permits Welding a Pipe Line While Pumping Through It

WELD+ENDS is used as a safety welding coupling on crude oil, gas, gasoline, propane, asphalt, tar, steam and other pipe lines. *As soon as packing rings* and clamping screws are tightened, pipe line flow is resumed. After pipe line is restored to service, WELD+ENDS is welded to pipe, making a solid, all-welded joint.



PLIDCOFLANGE

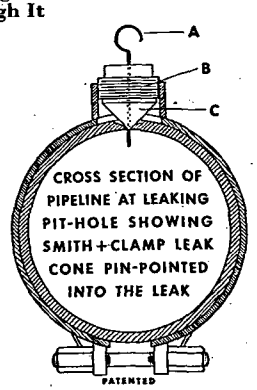
Plidcoflange is brand new. There are *countless* applications where this fitting excels. It slips over the end of the pipe, seals off like WELD+ENDS and mates up with standard flange facings.

Plidcoflange may be welded permanently to the pipeline while pumping or it may be bolted in place, permitting removal.

Plidcoflange is outstanding for use as a blind plate flange. Simply slide Plidcoflange back to change plates. Flange spreaders and jacks for springing pipeline are not needed.

Available in sizes 2 in. through 12 in. with 150 pound *A.S.A.* standard steel flanges. Other sizes and pressure classes on application.

New Smith+Clamp Permits Plugging and Welding Pit-Hole Leaks in a Pipe Line While Pumping Through It



SMITH + CLAMP utilizes a unique pilot pin. (See "A" in illustration at right.) Pin projects from Neoprene leak cone (C) and guides point of cone directly into leaking hole. Pilot pin is removable.

After cone is pin-pointed on leak, pressure is applied directly behind cone by means of Force Screw (B), thus forcing cone point into hole and stopping leak. Makes it possible to control higher line pressures with lower bolting pressure.

SMITH + CLAMP is available in sizes 1 in. through 36 in. or larger.

WELD PLATES are also available in sizes from 4 in. through 36 in. WELD PLATES are companion pieces, required only where welded repairs are specified. They fit over the Clamp and weld to pipe, making a permanent, all-welded, steel plate repair.

Leak Cones, available in *various diameters*, are made of Neoprene in the standard models. Also available in Silicone (for higher temperatures), Teflon, Steel, Lead and other materials.

TUBE-TURN® *Welding Fittings and Flanges*

In sizes ½ in. through 42 in. . . . in all types . . . all wall thicknesses . . . and all piping materials

Tube Turns is the originator and pioneer manufacturer in the development and use of seamless, forged welding fittings. This company offers fittings and flanges in all sizes and types for every pipe welding need. A few of the many advantages of TUBE-TURN fittings are listed here. Complete details are included in the Tube Turns *Catalog 511*, sent on request.

Outstanding Advantages of TUBE-TURN Welding Fittings

These sound advantages are solid reasons why TUBE-TURN welding fittings are *universally preferred today*: (1) Stronger, lighter, tighter piping systems. (2) Permanently leak-proof, trouble-free construction. (3) *Uniform* wall thickness of elbows and returns throughout, making possible exact alignment for better, *faster, lower-cost* welding. (4) Minimum maintenance cost. (5) Easy sweeping changes in direction reduce pressure loss. (6) Smooth inner walls for more efficient flow, less corrosion and longer life. (7) Proper grain structure with no internal stresses. (8) Easier to insulate. (9) Accurate dimensions that permit prefabrication of whole sections.

Materials and Construction

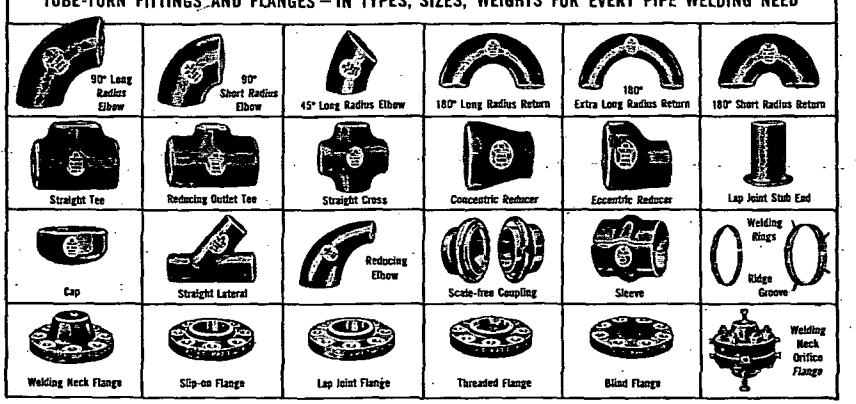
Regular carbon steel TUBE-TURN elbows and returns, in both long and short radius types, are made in Standard, Extra Strong and (in long radius only) Schedule 160 and Double Extra Strong pipe thicknesses. These fittings conform to *ASTM* specifications A-234. TUBE-TURN welding fittings in other schedule numbers and special thicknesses are like*wise available. They are also made of* types 304, 347 and 316 and other stainless steels, carbon-moly and chrome-moly steels, copper, brass, nickel, Monel, Inconel, wrought iron and aluminum.

The uniform high quality of TUBE-TURN elbows and returns is due to their unique and original manufacturing process —in which short sections of seamless tubing are forced over a curved expanding mandrel at a forging temperature. TUBE-TURN tees are also made by an exclusive process and to a design that provides many special advantages. Other TUBE-TURN *fittings offer similar quality* standards.

Fine Grade Forged Steel Flanges

Tube Turns manufactures a complete line of forged steel flanges of outstanding strength and dimensional accuracy.

Valuable Technical Data Available



Several items of authoritative technical literature on fittings, flanges and piping in general are available as are bulletins giving specification information on types, sizes and materials. Write for descriptive leaflet.

Distributor Stocks Throughout U. S. and Canada

TUBE-TURN welding *fittings* and flanges are available from distributors located in every important city and area in the *United States and Canada.*

TUBE-TURN FITTINGS AND FLANGES — IN TYPES, SIZES, WEIGHTS FOR EVERY PIPE WELDING NEED

Arthur Harris & Co.

Dept. H. 210–218 N. Aberdeen Street Chicago 7, Ill.

Engineers—Metal Float Manufacturers

Harris Floats

Harris Floats are made in a wide range of sizes in ball, column, disk, conical, cylindrical and rectangular shapes, and can be made of virtually any workable metal for open tank or high pressure and temperature installations. Some of the metals used in the manufacture of Harris Floats are Copper, Copper Plated Steel, Brass, Aluminum, Admiralty, Everdur, Monel, Nickel, Inconel, Stainless Steel, types 304 and 316, etc., and Steel, depending on the corrosion factors of the installation and the pressures under which they must operate.

Harris Copper Ball Floats

Harris Copper Ball Floats are made of two separate bodies, soldered together and then heavily copper plated to provide a seamless surface. They are usually supplied with a hexagonal female spud although other special connections can be furnished. These seamless copper ball floats are carried in stock in 3 in., 4 in., 5 in., 6 in., 7 in., 8 in., 10 in. and 12 in. diameters . . . for 25 lb, 50 lb, 100 lb and 150 lb working pressures. Special sizes to 18 in. diameter and special high pressure copper floats are made to order.

Harris Stainless Steel Ball Floats

Harris Stainless Steel Ball Floats for low or high pressure and Corrosion Resistance are carried in stock in diameters of 2½ in. to 12 in. Sizes from 12 in. to 14 in. diameters are made to order.

All Harris Stainless Steel Floats are joined by Atomic Hydrogen welding which produces an unusually smooth, uniformly strong and ductile weld, free from oxides or pin holes.

Corrosion Resistant Floats

Floats that must operate in corrosive liquids can be made of any workable metal that is resistant to the specific liquid in which they are to be used.

Plated Floats

Floats can be plated with copper, nickel, chrome, zinc, tinned or lead coated where called for by the installation.

Float Connections

A variety of connection styles are available, suitable for practically any type of attachment, including a tube through the center.

Harris Float Catalog

A very complete catalog, with much technical engineering data is available to prospective float users on request. The Harris engineering staff will be glad to consult with you on any float problems.

BURGESS-MANNING COMPANY

Architectural Products Division

5970 Northwest Highway, Chicago 31, Ill.

Distributors in Principal Cities

A suspended metal pan ceiling that supplies:

1. **RADIANT PANEL HEATING**
2. **RADIANT PANEL COOLING**
3. **ACOUSTICAL CONTROL**

The radiant panel principle of this modern ceiling provides HEATING AND COOLING independently of air movement.

For the heating cycle, hot water is circulated through the pipe grids. The aluminum ceiling panels, which are clipped directly to the grids are heated by conduction; thereby making the entire BURGESS-MANNING FUNCTIONAL CEILING a radiator which in turn radiates to every surface and object in the room, nature's way of controlling human comfort.

For the cooling cycle, cold water (above the dew point) is circulated and the above described heating cycle is reversed.

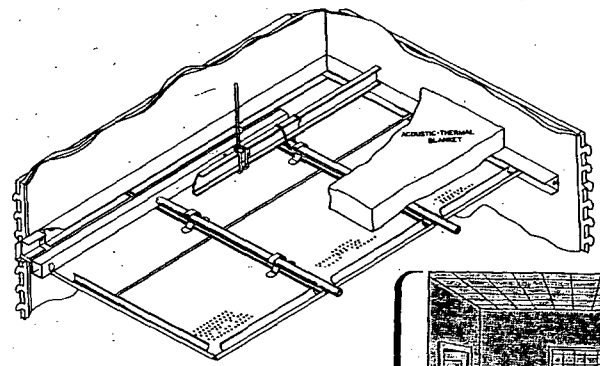
Uniform air temperatures are maintained, convection drafts and heat shadows are minimized. Concentrated heat sources and overheated air are eliminated.

THE BURGESS-MANNING 3-WAY FUNCTIONAL CEILING CREATES A NEW STANDARD FOR COMFORTABLE WORKING AND LIVING CONDITIONS

The BURGESS-MANNING CEILING carries the *Entire Heating Load.*

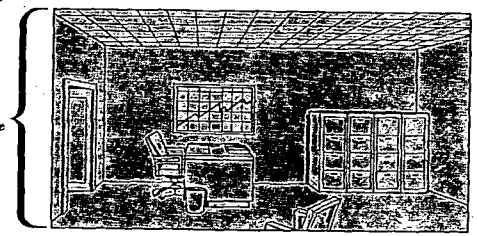
The B-M CEILING carries the *Entire Sensible Cooling Load* (in most cases).

Air requirements are limited to latent heat removal and ventilation requirements.



Reduced air handling equipment and smaller ducts SAVE BUILDING CUBAGE.

Heating and/or cooling source, entirely in ceiling, gives unrestricted use of the TOTAL FLOOR AREA.



Standard hot water controls are utilized. Response to temperature change is instantaneous—*No Lag or Overrun.*

Simple modular system lends itself to flexibility in layout of partitions, lighting and air distribution.

For design procedure and performance curves send for *catalog A-138-2-G.*

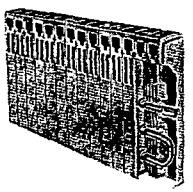
Dual-Vectors

Fan-coil units for heating and cooling with hot or chilled water. Two models: Free standing (DVF), and Semi-recessed (DV) *which fits between standard studs.* Optional outside air intake and dual room conditioning accessories. Sizes in 200, 300, 400, and 600 cfm. Write for *BULLETIN 1001-T.*

Convector-Radiators

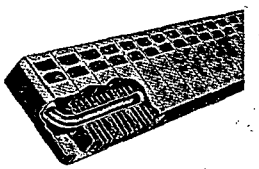


Floor, wall hung and recessed models. Famous KRITZER coil construction for steam and *hot water.* Bronze headers. Heavy, reinforced steel cabinets. Full range of sizes. Chain or knob operated dampers. Cabinets phosphatized. Gray prime baked-on finish. Write for *BULLETINS 600 and 601.*

Shaw-Perkins Manufacturing Company

201 East Carson St. Pittsburgh 19, Pa.

Manufacturers of SHAW Panel-Vectors delivering AIR-e-ATED Radiant Heat

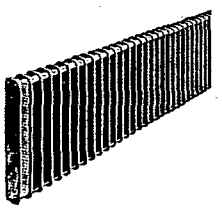


All Shaw Panel-Vectors and Perkins AIRadiators are complete one-piece factory assembled units ready for installation. Manufactured of heavy gage steel with full-length heating fins and vertical serpentine copper heating coils, pressure fitted for excellent heat transfer. Numerous sizes and models available to meet any area heat loss. Institutional models possess perforated paneling for low surface temperatures. Perkins AIRadiators are designed for industrial installations, and are readily mounted on either ceilings or walls.

SHAW Panel-Vectors (front or top air outlets)

DEPTH, front to back—3 in. **HEIGHTS**—8 in., 11 in., 14 in., 17 in., 20 in., 23 in., 26 in. **LENGTHS**—11 in. to 111 in. inclusive, in 2 in. increments. **TAPPING**—supply and return same end, right or left hand; also furnished on opposite ends. **PIPING**—connections for ½ in., ¾ in., or 1 in. piping. **RATINGS**—3.9 **EDR** to 117.7 **EDR,** based on 1 lb steam and 65° F inlet air. **INSTALLATION**—wall hung, free standing, open or closed recess. **APPLICATION**—hot water, high temperature hot water, steam to 150 psi. End panels, air chambers, wall brackets available for any application.

SHAW BASEBOARD Panel-Vectors



DEPTH, front to back—3 in. **HEIGHT**—8 in. **LENGTHS**—2 ft 5 in. to 72 ft 7 in. inclusive, in 2 in. increments. **TAPPING**—supply and return same end, right or left hand; also furnished on opposite ends. **PIPING**—connections for ¾ in. piping on same end, 1 in. piping on opposite ends. **RATINGS**—6.7 **EDR** per linear ft based on 1 lb steam and 65° F inlet air. **INSTALLATION**—wall hung with inside and outside corner runs. **APPLICATION**—hot water, steam to 150 psi. End panels, air chambers, and mounting screws included as standard equipment.

SHAW INSTITUTIONAL Panel-Vectors

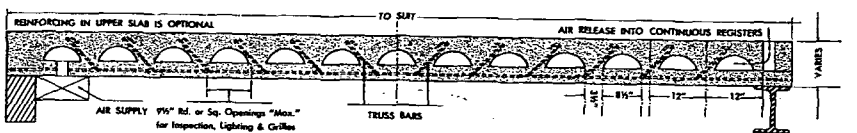
DEPTH, front to back—3 in. **HEIGHTS**—8 in., 11 in., 14 in., 17 in., 20 in., 23 in., 26 in. **LENGTHS**—11 in. to 111 in. inclusive, in 2 in. increments. Steel housing has ⅛ in. diam. perforations on 3/16 in. staggered centers. **TAPPING**—supply and return same end, right or left hand; also furnished on opposite ends. **PIPING**—connections for ½ in., ¾ in., or 1 in. piping. **RATINGS**—5.0 **EDR** to 100.9 **EDR** based on 1 lb steam and 65° F inlet air. **INSTALLATION**—flush mounting for violent areas, offset mounting for non-violent areas. **APPLICATION**—hot water, high temperature hot water, steam to 150 psi. End panels for complete pipe covering.

PERKINS AIRadiator

DEPTH, front to back—5 in. **HEIGHTS**—14½ in., 23½ in., 32½ in. **LENGTHS**—15 in. to 125 in. inclusive, in 2½ in. increments. **TAPPING**—supply and return on opposite ends; top and bottom arrangement reversible by reversing radiators. **PIPING**—connections for 1 in. piping; may be bushed to ½ in. or ¾ in. as specified. **RATINGS**—14 **EDR** to 187 **EDR** based on 1 lb steam and 65° F inlet air. **INSTALLATION**—ceiling or wall hung. **APPLICATION**—hot water, high temperature hot water, steam to 150 psi. Ceiling hangers or wall brackets available for mounting.

Represented in principal cities. Send for catalog.

AIRFLOOR Company of California, Inc.

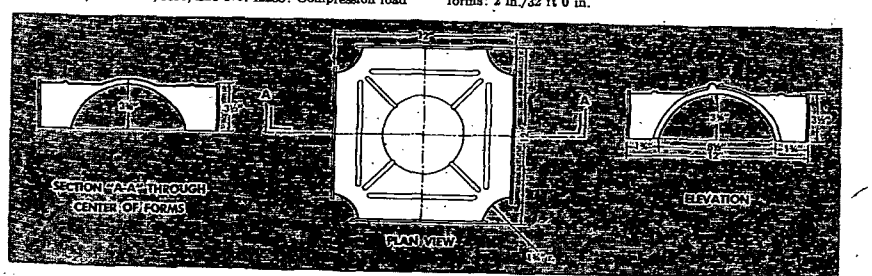


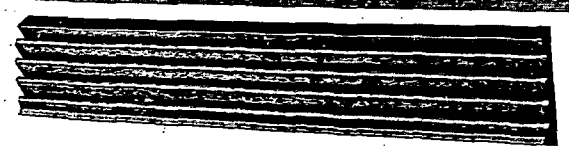
13729 E. Rosecrans Avenue, Sante Fe Springs, California

HOLLOW CONCRETE FLOOR PANEL FOR SINGLE AND MULTI-STORY CONSTRUCTION

Warm Air Radiant Heating and Ventilating or Complete Air Conditioning for Schools, Churches, Residences, Hospitals, Industrial Buildings

Airfloor forms create a strong, hollow floor serving as a common plenum for conditioned air, radiant heat, and positive mechanical ventilation for complete air-conditioning systems. Airfloor introduces all air passing through the floor into the occupied space. For use with Gas, Oil, Electric, or Coal Fired Furnaces, fan-coil units, multi-zone units, etc.





AIRFLOOR Truss Slab Provides:

1. A one-way or two-way truss within the slab.
2. A flat slab construction, which may be poured in place or lifted in place allowing flexibility of partition locations.
3. A ceiling already in place.
4. A reduced load of 35 pounds per square foot which in turn reduces concrete weight, supporting column, beam and foundation sizes.
5. A considerable reduction in seismic forces due to floor dead loads.
6. A plenum or duct through which conditioned air passes thus providing a radiant panel and simultaneous convection heating or cooling.
7. More utilizable volume in multi-story buildings, by eliminating required space for exposed ductwork at each floor level. This is especially important where limit-height buildings are concerned.
8. The ease of installation of hidden piping and electrical work. The necessity for rigid electric conduit is eliminated.
9. Flexibility in partition locations.

AIRFLOOR FORM SPECIFICATIONS

STANDARD MATERIAL: 26 gauge cold rolled steel (galvanized steel forms optional at extra cost).
STANDARD WEIGHT: One pound per sq ft.
SIZE: 12 in. x 12 in. x 3¾ in.
CONCRETE DISPLACEMENT: The concrete displaced by one Airfloor form is 0.223 cu ft.
COMPRESSION LOAD TEST: *By California Testing Laboratories, Inc.*, on June 8, 1955, Lab No. 42288: Compression load was applied to a six inch diameter (0.196 square foot) disc which centered over the one inch thickness of concrete at the center of the form.
The following tabulation gives the results of this test:
COMPRESSION LOAD IN POUNDS: 9,250.
RESULT: No cracks appeared until failure which fractured the concrete by punching shear at the edge of the disc.
FIELD CONDITIONS: Linear gain over installed Airfloor forms: 2 in./32 ft 0 in.

AIRFLOOR REGISTER SPECIFICATIONS.

Material: 20 gage cold rolled steel.
Length: 48 in. standard or cut to suit architectural requirements.
Height: 6¼".
Backplate & Dampers: Optional.
Finish: Canterbury Blue metal primer.

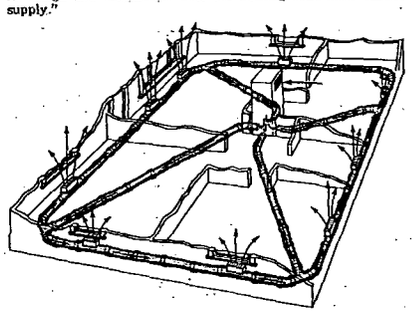
CLAY PIPE HEATING, VENTILATING, AND AIR CONDITIONING DUCTS



Information contained here includes the basic data, needed by *engineers, architects, builders,* and heating contractors to evaluate and install low-cost Vitrified Clay Heating Ducts in basementless slab-floor homes and other structures. This new development has become so popular that many requests for authoritative information have followed the publication of articles about the new system in the trade press. There are three major reasons for its popularity:

ECONOMY—The complete Clay Pipe installation is economical and efficient. It combines the advantages of radiant heat and controlled warm-air circulation at greatly reduced costs.

SERVICE—Clay Pipe is chemically inert and cannot be eaten away by lime in concrete. It does not rust, corrode, or disintegrate from moisture and furnace gases. It will not crush or deform as concrete is poured over it.

INSTALLATION—Clay Pipe's handy lengths and easy-to-make joints permit fast installation and lower labor costs. A wide variety of fittings is available to solve construction problems with no on-the-job delay, and Clay Pipe cannot float as the concrete is poured.

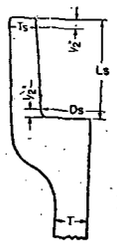
PERIMETER LOOP SYSTEM—The data and instructions contained here apply to the Perimeter Loop system, since it is more highly recommended by heating authorities. Its pattern eliminates the "waterfall" of cold air at the outer walls and effectively combats "radiant cold" at the outside edges of the slab. It combines the advantages of forced warm-air heating with heat by radiation through the concrete slab. Heat is concentrated where people are sitting—not at the ceiling. In test installations, the new heating method has cut operating costs from 20 to 30 percent by eliminating high heat-loss at ceilings or attics. Successful research conducted by the National Warm Air Heating and Air Conditioning Association has been followed with great interest by the building and heating industries. According to the Association, "Warm Air Perimeter Heating is a highly successful method of heating a basementless building.... It produces the ultimate of occupancy comfort. It is economical to install; can be designed to use a minimum amount of scarce materials; and requires no unusual skill in its design and installation that the heating contractor cannot supply."

The perimeter loop design shown here is used in structures built upon a concrete slab directly on the ground. Its air distribution system includes a warm air duct that extends completely around the perimeter of the building in a continuous loop. The ducts are buried in the slab 2 to 18 inches from its outside edge, and the tops of the bells will be 1½ inches below the slab surface. Heat is delivered into the rooms by warm air discharged from registers placed in the floor beneath the windows, and by radiant heat from the warm floor surfaces over the embedded ducts. The loop is supplied by feeders extending from a plenum chamber in the slab.

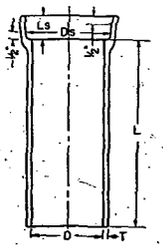
ADVANTAGES—It is well known that the greatest heat loss in a well constructed and insulated building—commercial or residential—will be found at the outside walls and glass areas. This loss will usually average 65 percent of the total structural heat loss. Concrete slab floors will account for approximately 18 percent of the total heat loss. The rest of the heat will be lost through the ceiling or attic. Perimeter heating introduces the heat along the outside walls and along the glass area. The heat rises and the resulting blanketing effect reduces the radiant heat loss from all outer walls and windows. Furthermore, this blanketing effect also eliminates air drafts which are caused by the cooling influence of the walls. The heating ducts, embedded in the concrete slab floors, help to maintain the floor surface temperature at desired comfortable levels. It can be seen that perimeter heating accomplishes three important basic functions: first, it replaces the heat that is lost; second, it replaces the heat at the same point where it is lost; and third, it replaces the heat as fast as it is lost. Tests conducted by the *National Warm Air Heating and Air Conditioning Association* at its University of Illinois Research Center and in actual installations throughout the country indicate that temperatures in residential structures can be maintained well within the limits established for comfort conditioning.

VERSATILITY—Clay Pipe heating ducts can also be adapted for ventilation and air conditioning purposes. This is another advantage of the under-slab design—the required amount of ventilation air can be circulated through the same distribution ducts used for heating.

FURNACES—Although a down-flow type of furnace is generally associated with the perimeter warm air heating system when installed in basementless structures, all types of winter air conditioning units can be used. Successful installations have been made using up-flow types of equipment as well as horizontal units. When up-flow furnaces or horizontal suspended units are used, down-comer ducts are used to connect the warm air plenum of the furnace unit with the distribution plenum in the floor. Also, two or more furnaces can be installed—each unit having separate control for its own distribution system so that various sections of the structure can have individual temperature control. However, one unit sized for the entire heat loss can be also installed, using two or more bonnet outlets with automatically controlled dampers in each.



National Clay Pipe Manufacturers, Inc.



Washington 6, D. C.

VITRIFIED CLAY PIPE FOR UNDERFLOOR HEATING DUCTS

Conforming to ASTM Specifications C-13

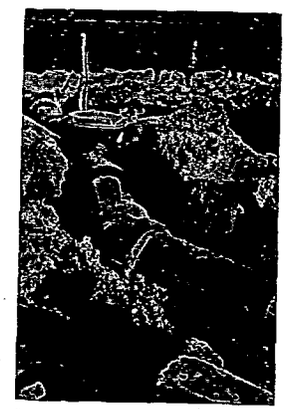
* There is no limit for plus variation.

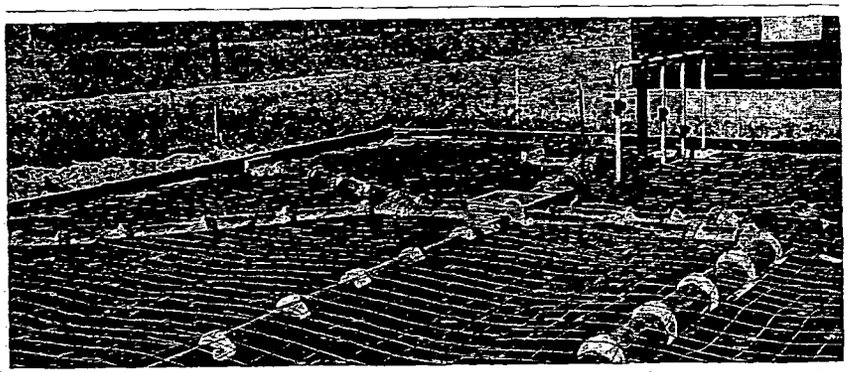


STORAGE—There are no storage problems, because vitrified clay pipe heating ducts can be exposed to weather in any season.

PERFORMANCE IN USE—Clay pipe ducts have such advantages as permanence, resistance to shock loads, and resistance to corrosion from lime in the concrete. They create no odor as warm air flows through them during furnace operation. The smooth inner surface eliminates turbulence and minimizes register noise. The clean smooth surface of the Vitrified Clay Duct is free from dust.

DESIGN DATA—Detailed design recommendations have been prepared by the *National Warm Air Heating and Air Conditioning Association* and are contained in the new revised edition of Manual 4 ($1.50) and Manual 9 ($0.75), which are available from the association's offices, 145 Public Square, Cleveland 14, Ohio. Manual No. 4 describes warm air perimeter heating systems as applied to structures without basements. Manual No. 9 contains detailed information on design and installation of warm air winter air conditioning systems and all necessary engineering data, tables, and recommendations for selection of proper heating equipment.

CASE HISTORIES—For data on actual case histories of Clay Pipe heating, ventilating and air conditioning duct installations in homes, schools, churches, hospitals, factories, gasoline stations, garages, stores, and theatres, write the National Clay Pipe Manufacturers, Inc., 1820 "N" St. N.W., Washington 6, D. C.



DRAINAGE—When planning basementless homes, great care should be taken to select only well-drained sites. Perforated Clay Pipe should be used to drain the building site. The drainage line should be laid around the outside of the footings and connected to an adequate lot-drainage system, in the herring bone, gridiron, or parallel patterns. Pipe with perforations half-way around the barrel provides good drainage yet carries off a minimum of dirt in suspension. For home drainage, Standard Strength (ASTM C-211) Perforated Clay Pipe is recommended.

Large diameter clay pipe heating duct and plenum connection used in commercial structure. This type of duct, when installed in garages and maintenance or repair shops, can be used for heating, ventilating, air conditioning, and removal of exhaust gases. When registers are located under the windows, the warm air will blanket the glass area and eliminate frosted and wet windows.

National Clay Pipe Manufacturers, Inc.

Washington 6, D. C.

Clay Pipe Heating Ducts ready for the concrete pouring. Wire mesh may be installed at the contractor's discretion to reinforce the floor slab.

CONSTRUCTION DATA—All ground beneath the building should be cleared of organic material. A four to six inch layer of coarse fill is then laid—washed gravel, crushed rock, or stone that has been passed over a coarse screen. Cinders or fine sand should never be used for the fill.

The fill must be covered with a moisture barrier before the slab is poured. This membrane should be the equivalent of a good grade of roll roofing at least 55 lb per 108 sq ft. Strips should be overlapped at least four inches and tarred. The barrier must completely cover the area within the foundation walls and extend up the walls to the top of the slab. See Figure 1.

Edge insulation must be placed completely around the concrete slab. Two-inch thick insulation is recommended, but one-inch is acceptable.

It is not necessary to anchor the Clay Pipe ducts to stakes, or to surround them completely with concrete (as with lighter materials). The Clay Pipe is laid directly upon the membrane, and gravel or sand is used to level it. Small depressions should be made in the fill or gravel so the pipe bells "hang free". This facilitates proper pipe alignment and prevents buckling at the joints. See Figure 2.

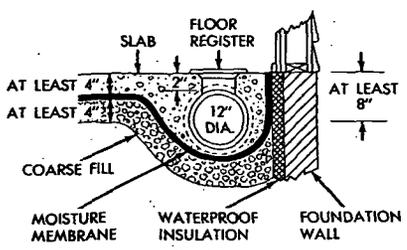


FIGURE 1

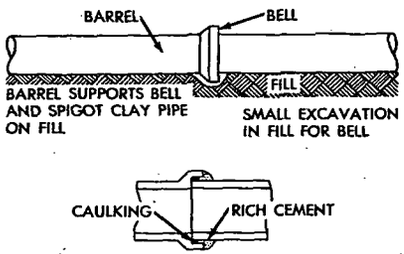

FIGURE 2

Registers must be located before the slab is poured. Wooden forms like those shown in Figure 3 are secured to the pipe by a wire wrapped around the duct. After the slab has hardened, the form can be removed and an opening cut into the pipe with a heavy hammer or bar. Some contractors prefer to retain the wooden register forms in the slab for register mounting frames.

The Clay Pipe bell at the plenum should be butted firmly against the wooden forms of the plenum pit and the concrete poured around it. See Figure 4. The pit floor is poured after the wooden form is removed. The moisture membrane must extend under the pit floor. Recommended distance from the slab floor to the top of the pipe bell is five inches.

Clay Pipe in the Perimeter Loop should be installed so that the top of the bell closest to the perimeter will be 1½ inches below the slab surface. Feeder ducts should slope downward toward the plenum, so that the top of the bell next to the plenum will be five inches below the floor slab surface. See Figure 5. All Clay Pipe joints must be waterproof.

Care must be taken when the slab is poured not to puncture the moisture barrier or dislodge the ducts. Wheelbarrows should not be moved over the ducts without suitable planking.

National Clay Pipe Manufacturers, Inc.

Washington 6, D. C.

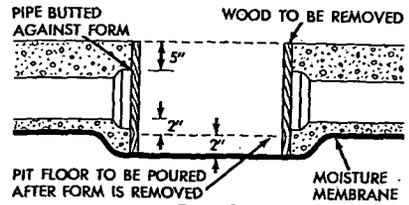

Figure 3

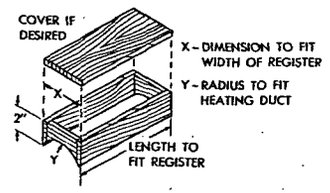

Figure 4

A strip of mesh should be placed over the top of the ducts to give added strength to the slab. Mesh may be extended over the entire slab at the contractor's discretion.

Perimeter insulation—Perimeter insulation material should have not more than 0.40 Btu conductance at 70° F per square foot per hour per degree temperature difference. The material must be moisture proof, vermin and insect proof, and resistant to deterioration from contact with organic materials in the ground. If the perimeter insulation is installed on the exterior of the foundation wall, it should be protected against damage. If installed vertically, it should extend downward not less than 18 inches and in extremely cold climates down to the frost line. Care must be taken not to rip or puncture the insulation material during installation. All openings and punctures should be closed with a suitable compound.

Fill placement—The coarse granular fill used under the concrete floor slab must consist of 4 to 6 inches of coarse material of uniform size, preferably ranging from ½ to 1 inch. It is recommended to use gravel, crushed stone, or slag that has been passed over a coarse screen. The material should be free of "fines" to insure maximum volume of air space in the fill. Sand, unscreened gravel, rock, or cinders should not be used. Cinders will pulverize in due time and their corrosive action may damage plumbing and utility lines. The fill should be distributed and leveled over the entire floor surface. After the fill has been leveled to a desired grade, it should be thoroughly compacted.

Trenches—Trenches should be of sufficient depth to accommodate the heating duct with 4 inches of coarse fill underneath it and a strip of moisture barrier laid on the top of the fill the entire length of the trench. The moisture barrier should be lapped at least 4 inches over the adjacent sections. The duct should be laid directly upon the barrier and gravel should be used to level and support the duct. The trench should be partially filled with gravel after the ducts are installed, aligned, and jointed.

Slab pouring and curing—Concrete must be made with durable, well-graded aggregate and should contain not more than 6 gallons of water per sack of cement, including the moisture contained in the aggregate. When using average moist sand, no more than 5 gallons of water per sack of cement should be added. The mix should consist of 1 part portland cement to 2¼ parts of fine aggregate well graded in sizes from ¼ inch down, and 3 parts of coarse aggregate well graded in sizes from ¼ inch up to 1 inch. Concrete should be placed and compacted thoroughly by vibrating or by tamping and spading. After the concrete is properly tamped, it should be screened to grade.

Concrete should be worked with a wood float, taking care to compact the surface properly. Depressions and inequalities of any kind should be avoided. After the concrete has hardened sufficiently to prevent fine material from working to the top (this will be indicated by the disappearance of "sheen" or shiny film of water on the surface) it should be steel-troweled, but excessive troweling should be avoided.

Concrete should be kept moist for at least 2 days. If the finished floor is to be exposed concrete, at least 5 days of moist curing is required. The floor slab should be covered with moist burlap, canvas or waterproof concrete curing paper during the curing period.

A full 28-day aging period should elapse before heat is introduced into the slab. The heating duct air temperature should be raised gradually during the first 96 hours of operation. Too rapid drying of a "green" slab may result in cracked concrete.

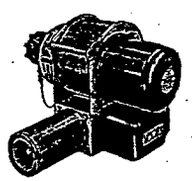
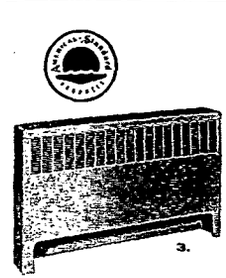
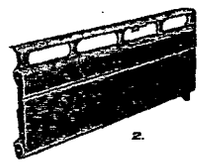
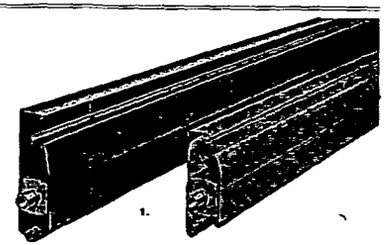
*Cast iron sections of hot water boiler guaranteed 25 years in residential applications



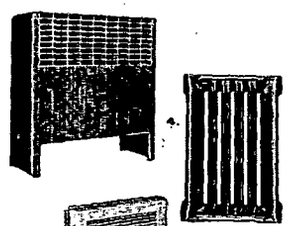


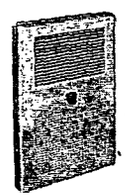


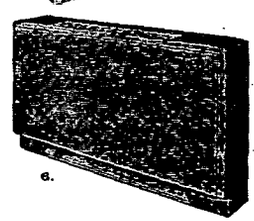
American-Standard boilers are designed for maximum efficiency in a minimum of space. They are noted for their dependability and durability, which is achieved partly through their use of corrosion-resistant cast iron sections. Many are available with tankless water heaters.

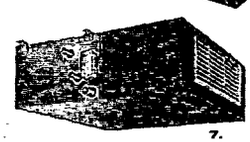


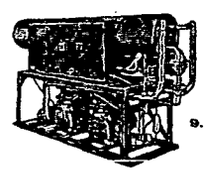
ARCOFLAME OIL BURNER—*Model PH2*—Newly designed inner assembly results in efficient, quiet operation and clean flame. Four disk-turbulator combinations provide an efficient firing range from 0.65 to 3.00 gal/hr. Hanger, pedestal and flange mountings. Tube lengths from 5" to 23". *Other models* designed for efficient operation from 0.70 to 7.00 gal/hr.











1. HEATRIM BASEBOARD PANELS—Nonferrous panels provide convected and radiant heat with forced circulation hot water systems only. Adaptable to mainless or series loop installations. Available in 4, 5, 6 and 8-ft lengths. Two models: 8"-high Model L and 10"-high Model H both available with ¾" or 1" element.

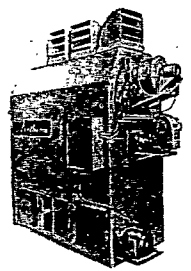
2. RADIANTRIM BASEBOARD PANELS—Replace ordinary baseboards. Cast iron panels provide all the advantages of convected and radiant heat. Model 10: 10⅜" high for forced hot water or two-pipe steam. Available in 12, 18 and 24" lengths. Sheet-metal accessories available for complete installation. Model 8: 8" high. Available in 12 and 24" lengths.

3. CONVECTORS—With cast iron (Arco) or non-ferrous (Multifin) heating elements. Styles and sizes for every need. Special designs for hospitals, institutions, etc. Multifin Type K (shown) available in 68 packaged stock sizes.

4. RADIATORS—SUNRAD: Recessed or free-standing. Needs no enclosure. Two sizes: 5" deep x 20" high, and 7½" x 23". Inlet grilles if desired. ARCO: Highly efficient, slim-tube radiators. Available in four widths—3, 4, 5 and 6 tubes—and four heights—19", 22", 25" and 32". PEERLESS: Cast iron radiators for economical heating where floor space is at a premium. May be installed on walls, ceilings or hanging from girders. Available in 2 sizes, 8 and 11 sq. ft. per section.

5. TYPE 10 REMOTAIRE ROOM CONDITIONER—Year 'round, central plant air conditioning for homes and small commercial buildings. Individually controlled room units recess into walls between studs. Units cool and heat by passing air over finned coil supplied with water from central chiller and boiler. Quiet fan motor in each unit. 150-cfm unit (shown) 24" high, 6" deep and 16" wide; 300-cfm unit 32" wide.

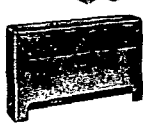
6. TYPE 20 REMOTAIRE ROOM CONDITIONER—Remote-type vertical unit provides year 'round hydronic air conditioning for multiroom installations such as office buildings, hotels, apartments and hospitals. Features individual room control. 200, 300, 400 and 600 cfm sizes—all 9" thin—for free-standing, partially and fully recessed installation. Test-rated capacities.



7. TYPE 30 REMOTAIRE ROOM CONDITIONER—Horizontal-style hydronic unit. Installed overhead, exposed or concealed. Four sizes: —200, 300, 400 and 600 cfm—three models to meet all design requirements.

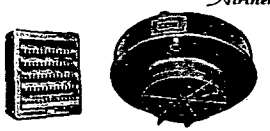
8. TYPE 40 REMOTAIRE ROOM CONDITIONER—Through-the-wall-type year 'round heating-cooling unit has a compact self-contained refrigeration circuit. Connects to two-pipe steam or hot water system or, equipped with integral electric heating coil. May be installed room or floor at a time without disturbing normal operations of a building. One unit can heat a room while another cools adjoining room. Two capacity sizes–8200 and 11000 Btuh.

9. PACKAGED WATER CHILLERS. Models BCS and ADS—Central chilled water source for medium- and large-size air conditioning systems. Model BCS (shown) in 4 sizes, 7.5 to 20 hp; Model ADS (direct drive) in 8 sizes, 25 to 125 hp. Completely packaged unit includes compressor and motor, evaporator, condensor, heat exchangers, controls, piping, framework. Model BCS tested and shipped with operating charge of refrigerant; Model ADS with holding charge.



Airtherm Manufacturing Company

708 S. Spring Ave. • St. Louis 16, Missouri

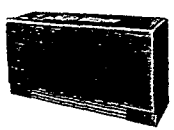


Airtherm HEAVY DUTY FORCED AIR HEATERS

HEATING SURFACES—Large, elliptically shaped stainless steel combustion chamber. Four complete passes of flame across air stream insure maximum heat extraction. One complete pass occurs in combustion chamber, with 3 separate passes through secondary heat exchanger where specially designed Turbolators swirl the hot gases. **LOW INSTALLATION COST**—Packaged, self-contained—requires connections only to fuel, power and exhaust. **APPROVED BY AMERICAN GAS ASSOCIATION AND LISTED BY *UNDERWRITERS LABORATORIES***—All control systems approved by Factory Mutual Insurance Companies. **10-YEAR WARRANTY**—All parts in direct contact with flame carry standard 10-year guarantee. **BURNERS**—Power type and available for oil, gas or combination gas-oil. Combination burners can effect immediate change-over from one fuel to another. Controls available for on-off control, high-low fire, or full burner modulation. Complete electronic protection provides power and fuel shut-off if flame fails. Heaters can be located on floor, or horizontally or vertically suspended from ceiling. Radiation shields reduce radiation and transmission losses. Casing temperature does not exceed 10 deg above ambient temperatures. **CAPACITIES**—The eight sizes have outputs of 400,000 to 2,000,000 Btu/hr. **STANDARD FAN CAPACITIES**—Range from 4900 to 24,500 cu ft per minute.

Airtherm CONVECTORS

Rounded corners and edges enhance safety and appearance. Cabinets are ruggedly constructed. Front panels are reinforced with formed edges and channel stiffeners welded to the back side. The heating elements are for use on all hot water and two-pipe, steam systems. Constructed with copper tubes and aluminum fins, with the tubes hydraulically expanded into the fin collars. Available in floor, wall or recessed cabinets and standard or heavy duty institutional construction.



Airtherm PROPELLER FAN UNIT HEATERS

Airtherm Horizontal and Vertical Unit Heaters are available in a total of 46 Standard and Low Outlet Temperature Models. Basic capacities range from 18,600 to 555,000 Btu/hr, offering a selection to meet every job requirement. The coils are constructed of copper tubes, aluminum fins and steel headers. The tubes are expanded into the fin collars with 2,000 lbs hydraulic pressure. The coils are tested with 500 lbs hydrostatic pressure. Casings are made of heavy gage steel, phosphatized and finished with attractive gray-green enamel.

Airtherm CABINET UNIT HEATERS

Feature efficient direct-drive power assembly with aluminum centrifugal fans and permanent split capacitor motor. The cabinets are made of 16 gage steel, reinforced with angle and channel stiffeners, phosphatized and finished with attractive gray-green enamel. Coils are constructed of copper tubes, aluminum fins and steel headers. Available in 8 models with basic capacities ranging from 375 to 1,630 cfm and 25,100 to 124,800 Btu/hr. Units are offered for Floor, Wall or Ceiling mounting and in exposed or recessed cabinets.

CLASSROOM HEATING AND VENTILATING UNITS

Feature functional design for heating and ventilating classrooms and similar spaces. Damper is arranged to provide from 0 percent to 100 percent fresh air. Damper can be operated manually or automatically by application of temperature controls. The cabinets are constructed of 16 gage steel, well reinforced, phosphatized and attractively finished. Adequate end pockets for piping and controls. Coils are made of copper tubes, aluminum fins and steel headers. Power assembly is efficient direct drive with aluminum centrifugal fans and permanent split-capacitor motor. Offered in 4 capacities, 375 to 960 cfm.

Airtherm AIR CONDITIONING UNITS

Airtherm Air Conditioners provide healthful all season conditioned air comfort using a central source of chilled water for cooling and hot water for heating. Designed for dehumidifying, ventilating, filtering and introducing outside air in new or existing buildings, such as offices, hotels, apartments, motels, schools, churches and hospitals. The units are available in 4 types, for exposed floor and ceiling mounting and for concealed floor and ceiling installations. Offered in 4 models ranging from 220 to 600 cfm and ½ to 2 tons nominal cooling capacity.

Airtherm CENTRIFUGAL FAN UNIT HEATERS

Designed to deliver a large volume of air at proper velocity and temperature through outlet nozzles or through a central duct system for heating and ventilating all types of institutional, industrial and commercial buildings. Available with mixing box and dampers, face and by-pass dampers, filter section and insulated discharge plenum. Three types of coils are available, hot water, standard steam and steam distributing tube. The units are offered in 8 models with basic capacities ranging from 1,800 to 22,000 cfm and 95,000 to 1,440,000 Btu/hr.

BOILER ENGINEERING & SUPPLY CO., INC.

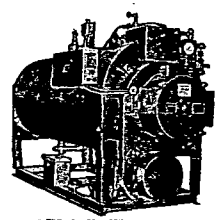
Phoenixville, Pa.

A HALF CENTURY OF BOILER MANUFACTURING EXPERIENCE

Continental AUTOMATIC BOILERS

20 TO 600 HP

STEAM . . . 15 TO 250 PSIG

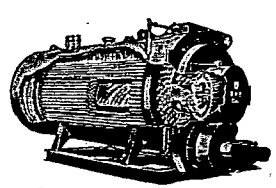


HOT WATER . . . LOW OR HIGH TEMPERATURE

ON-OFF, LO-HI-LO, AND MODULATING CONTROLS

OIL, GAS OR COMBINATION FIRED

BOILER-BURNER UNIT: COMPLETE — AUTOMATIC — ECONOMICAL



CONTINENTAL Automatic Boilers, fully-equipped for firing oil, gas, or for interchangeable oil or gas firing, generate steam at a guaranteed efficiency of not less than 80% of their conservative ratings. Units are shipped complete with wiring, glass fiber insulation, metal jacket and paint finish, ready for service connections. No special stack or foundation is needed. Necessary trim and fittings are supplied, and unit is mounted on structural steel base.

40 HP CONTINENTAL Boiler, arranged for firing light oil.

BOILER: SIMPLIFIED — RUGGED — ACCESSIBLE

Lower fuel and maintenance costs and longer service life are assured by simplified two-pass design and CONTINENTAL's unique "Spinning Gas" technique, which imparts a spiral motion at high velocity to the gases in the tubes and results in a high rate of heat transfer. Boiler Series F has five square feet of heating surface per horsepower. Built-in steam separator assures 99% dry steam. Hinged front and davited rear doors give easy access to heating surfaces. No refractory or brick-work needed, despite high furnace temperature and low stack heat. Boilers designed and built in accordance with ASME code requirements.

Rugged CONTINENTAL Boiler Design

BURNER: CLEAN — RELIABLE — EFFICIENT

Simple, rugged burner, of pressure-atomizing type, produces uniform, highly radiant flame for oil-fired burner. For gas burner, fuel is mixed with air at point of ignition; baffle-ported nozzle ends clogging or flashback. Blower drive is standard 1800 RPM motor, for forced draft at correct pressure and volume for most efficient combustion.

CONTROLS: MODERN — AUTOMATIC — DEPENDABLE

Control system, designed to meet Underwriters' Laboratories and Factory Mutual requirements as well as all local and national codes, provides such safeguards as electronic monitoring of flame, immediate shutoff and purge of burner after flame failure, low water cutoff and feed water control, front-panel signal lights.

DIMENSIONS and RATINGS

Ten Reasons Why It Pays to Buy a CONTINENTAL Automatic Boiler

- Guaranteed 80+% efficiency . . . Fire-tested before shipment . . . Range, 20 to 600 HP.
- Simple, practical two-pass design, for uniform flow of combustion gases through all return tubes.
- Maximum radiant heat transfer achieved by "Spinning Gas" technique for thorough mixing of air and atomized fuel.
- High-CO_2 and low-temperature stack gases — proof of high combustion efficiency.
- Free, rapid water circulation, to improve heat transfer, keep heating surfaces clean.
- Easy access to furnace and all return tubes. Refractory baffles and brickwork are not required.
- An engineered product, with every part designed for simultaneous operation and maximum efficiency with every other part.
- A single source of responsibility for the trouble-free performance of each component.
- Continental Boilers have received world wide acceptance by those who are most insistent in requiring silent operation, namely Hospitals, Schools, and Churches.
- A nationwide network of factory-trained servicemen, available through your local CONTINENTAL Boiler distributor.

Sunnyday Seven

Sunnyday 26

Sunnyday 30

Sunnyday 60

CRANE CAST IRON BOILERS

A complete line available for the hydronics* field. (* Industry's new name for the science of heating and cooling with water.) Residential and commercial boilers. Cast iron sections of all Crane Sunnyday residential hot water boilers carry a 20-year guarantee.

RESIDENTIAL BOILERS

Crane Sunnyday Seven. All new oil fired boiler. Available in 2 sizes, prewired, pre-assembled, ready for installation. Available with tankless water heater. Net *I=B=R* ratings: 78,000 and 117,800 Btu/hr. (water)

Crane Sunnyday 15. Saves up to 15 percent on fuel. Four sizes, oil or gas fired. Two sizes available assembled and wired. Net *I=B=R* rating: 66,800 to 156,000 Btu/hr. (water, oil fired)

Crane Sunnysaver 15E. New replacement boiler for customers who already have good burners and controls. Compact, easy to install. Attractive, fully-insulated extended jacket. Four sizes, Net *I=B=R* ratings: 66,800 to 156,000 Btu/hr. (water, oil fired)

Crane Sunnyday 2WG. Only 33 inches high. Four sizes, designed especially for gas. Two sizes available fully assembled and wired. *A.G.A.* input: 70,000 to 210,000 Btu/hr. Gross *A.G.A.* output: 56,000 to 168,000 Btu/hr. Net rating: 42,000 to 126,000 Btu/hr. (water)

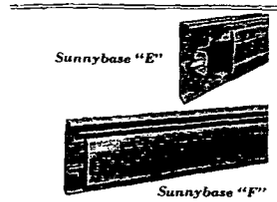
Crane Sunnyday 20 "All Purpose". All-fuel boiler for home or small commercial steam or hot water systems. Net *I=B=R* rating: 100,500 to 245,300 Btu/hr. (water, oil fired)

Crane Sunnyday 26. Gas fired hot water or steam boiler. Features tankless water heater on hot water models. New efficient ribbon burner. Equal ratings for all gases. *A.G.A.* input: 100,000 to 450,000 Btu/hr. Gross *A.G.A.* output: 80,000 to 360,000 Btu/hr. Net rating: 60,000 to 270,100 Btu/hr. (water)

Crane Sunnysaver 26. New low-cost factory-assembled gas fired hot water boiler. Available in 3 and 4-section sizes. Tankless water heater available in 4-section model. *A.G.A.* approved for all gases. Gross *A.G.A.* output: 80,000 and 120,000 Btu/hr. Net rating: 60,000 and 90,000 Btu/hr.

COMMERCIAL BOILERS

Crane Sunnyday 30. Medium size all-fuel boiler for small commercial steam or hot water systems (or large homes). 14-inch and 21-inch base for oil fired models. Net *I=B=R* rating: 225,100 to 843,200 Btu/hr. (water, oil fired)



Crane Sunnyday 40. Gas fired boiler for large homes or commercial use. Patented staggered heat travel. For hot water or steam systems. *A.G.A.* input: 350,000 to 2,380,000 Btu/hr. Gross *A.G.A.* output: 280,000 to 1,904,000 Btu/hr. Net rating: 210,100 to 1,478,000 Btu/hr. (water)

Crane 41. All-fuel boiler for commercial, industrial, or institutional installations. Precision ground cast iron sections easily assembled. Net *I=B=R* rating. 621,900 to 1,823,800 Btu/hr. (water, oil fired)

Crane Sunnyday 60. Big 6-inch gas boiler. Steam, hot water, or large volume indirect water heating. *A.G.A.* input: 625,000 to 5,000,000 Btu/hr. Gross *A.G.A.* output: 500,000 to 4,000,000 Btu/hr. Net rating: 374,100 to 3,108,000 Btu/hr. (water)

VALVES AND FITTINGS

A complete line. All the necessary piping items for any hydronic heating system.

Sunnywall Copper

Sunnywall Steel

Crane Stowaway Air Conditioner

Crane Packaged Air Conditioner

CRANE SUNNYBASE PANELS

Complete line of finned-tube residential radiation. Takes the place of woodwork. Saves space, leaves entire floor free for furniture.

Sunnybase Type E. Copper tube, aluminum fins. Fins are specially corrugated for rigidity and heat transfer efficiency. Free expansion of element is provided by electro-galvanized Silent-Glide Slide Shoes. Finished installation measures 2²³⁄₃₂ x 8½ in. 3, 4, 5, and 8-ft lengths, complete accessories available.

Sunnybase Type F. Copper tube, aluminum fins. Corrugated construction gives rigidity and increased heating surface (over 4 square feet per lineal foot of baseboard). Sized-to-mate tube ends, jointed without couplings, minimize brazed joints and save fittings. Finished installation measures 2¾ x 9⁹⁄₁₆ in. Available in 4, 5, 6, and 8-ft lengths, with complete accessories.

CRANE SUNNYAIRE UNIT HEATERS

Completely automatic, safe, economical. Easy to install and maintain. Gas, hot water and steam models available in full range of sizes.

Sunnyaire Gas Unit Heater. 10 basic sizes. *A.G.A.* approved. Designed for natural, manufactured, mixed, or LP gases. 25,000 to 200,000 Btu/hr. (input).

Sunnyaire Hot Water and Steam Unit Heaters. 58 models. Type HV—for both horizontal and vertical applications. Features wrap-around heating element. Capacities from 34,000 to 684,000 Btu/hr. Type H—for horizontal applications. Features continuous tube heating element. Capacities from 15,000 to 335,000 Btu/hr.

CRANE SUNNYAIRE CABINET HEATERS

Sunnyaire Hot Water and Steam Cabinet Heaters. A complete line of blow-through and draw-through types for all practical installations. 21 hot water models, 14 steam models with air capacities from 265 to 1005 cfm. Heating capacities: 71 to 313 Sq. ft. EDR for steam, 9.1 to 65 MBH for hot water.

CRANE SUNNYWALL COMMERCIAL RADIATION—I=B=R RATED

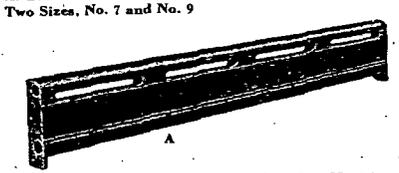
Two types of high-capacity, superior-quality commercial radiation: Copper tube with aluminum fins, steel tube and steel fins. Full line of accessories and optional equipment.

Sunnywall copper tube with aluminum fins. Ten types of heating elements. 700 to 3060 Btu per ft. (1 lb steam) 5 enclosure styles.

Sunnywall steel tube with steel fins. Five types of heating elements. 890 to 3280 Btu per ft. (1 lb steam) 3 enclosure styles.

CRANE AIR CONDITIONING

Crane Stowaway Air Conditioner. 2 and 3½-hp units. Compressor, condenser, blowers and evaporator all in one cabinet. Available with prefabricated Fiberglas ducts.



Crane Packaged Air Conditioners. A new line for offices, restaurants, banks, stores and small factories. Includes 3, 5, 7½, 10 and 15 ton units with front grille or top duct discharge. Water condensing units are factory assembled, wired, charged and tested. Air condensing units have receiver ready for addition of remote air-cooled condenser. All models fully warranted.

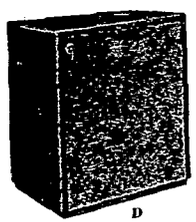
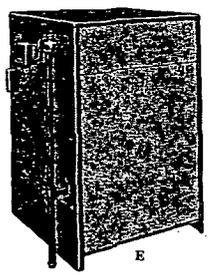
Two Sizes, No. 7 and No. 9

A

I=B=R Rating per sq ft for No. 7 is 2.35 and for No. 9 is 3.45 per sq ft Tappings ¾ in. top and bottom. Sections come in 12, 18 and 24 in. lengths. New matching sheet metal baseboard extensions and accessories available.



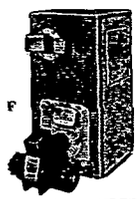
B



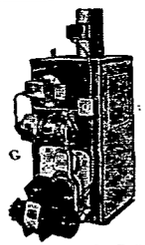
C

B. BURNHAM RADIANT RADIATORS—Two heights 20 and 23 in. Ratings 2.25 sq ft per section and 3.40 sq ft per section respectively.

C. BURNHAM SLENDERIZED RADIATORS—Three to six tubes in four heights 19 in. to 32 in. Ratings are from 1.6 sq ft per section to 3.7 sq ft per section.



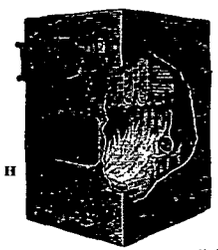
D



E

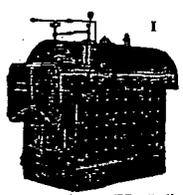
D. HOLIDAY Cast-Iron Boiler #60 is *A.G.A.* approved for manufactured, natural, mixed or LP gases and *I=B=R* approved and rated. Capacities for water from 300 to 1100 sq ft and for steam 190 to 690 sq ft. Can be equipped with built-in year 'round tankless hot water coil. Five sizes as HOLIDAY-PAK Factory assembled.

E. New HOLIDAY Cast-Iron Boiler #70 is *A.G.A.* approved for manufactured, natural or mixed gases and is *I=B=R* approved and rated. Capacities are for water 600 to 2700 sq ft and for steam 375 to 1690 sq ft. Can be equipped with tankless built-in hot water coil.



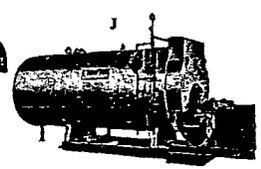
F

G



F. BURNHAM JUBILEE® Wet Base Cast-iron Oil Boiler—Vertical Flue Travel. Available in 7 sizes for steam, 320 to 955 sq ft and 8 sizes for water, 445 to 1525 sq ft. An overall range of 9 sizes. Flush and extended Jacket models. Provided with built-in hot water coils if desired.

G. BURNHAM JUBILEE PAK—Available in 5 sizes, 445 sq ft to 1010 sq ft water only. Shown with controls and wiring factory installed. Delivered crated ready for easy installation.



H

H. PACE-KING® BOILER—Exclusively oil fired for larger buildings. Vertical flue design . . . low stack temperatures. Tankless hot water heaters with capacities from 6 to 15 gal. 14 models from 1205 to 4500 sq ft for steam and 1925 to 7200 sq ft for water. Built according to *ASME* code and *I=B=R* rating and testing code.

I

J

I. WELDED STEEL Boiler—Compact type—Capacities from 2600 to 35000 sq ft for steam and 4680 to 56000 sq ft for water, EDR. Net *SBI* ratings. Furnished for coal, oil or stoker firing.

J. SCOTCH TYPE Steel Boiler—completely packaged with combustion unit or unpackaged. Net *SBI* capacities from 2600 to 35000 sq ft EDR steam and from 4680 to 56000 sq ft EDR water. Also we build these up to 4000 sq ft of heating surface.

Sales Offices in All Principal Cities

Pacific Standard Firebox Boilers

Pacific Scotch Type Boilers

Pacific "LoSet" Boilers

Pacific Split Firebox Boilers

SBI TABLE 1 BOILERS

A Complete Line of Low-Pressure Steel Heating Boilers For Commercial Application

All Pacific Commercial Boilers are built in conformity with the *ASME* Code for low pressure heating boilers and are rated in accordance with *The Steel Boiler Institute* Rating Code with the exception of the Scotch Type Boilers for forced draft firing which have Pacific certified ratings.

PACIFIC STANDARD FIREBOX BOILERS

Pacific Standard Firebox Boilers for Stoker, oil or gas firing are built in capacities of *SBI* rating from 2,840 to 64,280 sq ft for steam and from 4,540 to 102,850 sq ft for water. Design is of two types: Low Water Line and High Firebox. Pacific Direct Draft and Smokeless Boilers for coal firing are built in capacities of 2,200 to 35,000 sq ft for steam and in corresponding capacities for water.

PACIFIC SCOTCH TYPE BOILERS

Pacific Scotch Type Boilers are available for natural or forced draft firing with oil or gas. The Natural Draft Scotch Type Boiler ratings range from an *SBI* rating of 5,800 to 64,280 sq ft steam and 9,280 to 102,850 sq ft water. The Forced Draft Scotch Type Boiler ratings are manufacturers' certified rating and range from 1,969,000 to 21,775,000 Btu/hr. Both series applicable for steam and water heating.

PACIFIC "LOSET" BOILERS

Pacific "LoSet" Boilers for oil firing are available in 18 sizes with capacities of *SBI* rating from 4,500 to 64,280 sq ft steam and 7,200 to 102,850 sq ft water. Unique "LoSet" design requires minimum headroom without sacrificing boiler efficiency.

PACIFIC SPLIT-FIREBOX BOILERS

Pacific Low Water Line, High Firebox and LoSet Boilers are available in three sections—shell, firebox and base—and can be moved through minimum building openings. Where necessary, Pacific fireboxes can be split (as illustrated) to allow the boiler to be taken into the building in four pieces, through most doors, windows and hallways. No cutting or welding is required in assembling Pacific Boilers of this type.

Descriptive bulletins on Pacific Commercial Boilers will be mailed on request

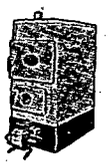
SBI TABLE 2 BOILERS

A Complete Line of Residential Steel Boilers for Coal, Stoker, Oil or Gas Firing

All Pacific Residential Boilers are built in conformity with the *ASME* Code for low pressure heating boilers and are rated in accordance with *The Steel Boiler Institute* Rating Code.

Pacific "Plate Flue" Boilers

PACIFIC "PLATE FLUE" BOILERS



Pacific "Plate Flue" Boilers are designed for oil or gas firing and are built in 4 sizes. *SBI* net ratings range from 108,000 to 243,000 Btu/hr for steam and water heating. They are available with either flush or extended jackets.

Pacific "Plate Flue" Oil Heating Units

PACIFIC "PLATE FLUE" OIL HEATING UNITS

Pacific "Plate Flue" Oil Heating Units are boiler-burner units designed for steam or hot water heating. Furnished with pre-cast combustion chamber, matched oil burner and automatic controls. Ratings are the same as for "Plate Flue" Boilers. Available with flush or extended jackets.

Boiler-Burner Units

Automatically Fired Boilers

PACIFIC SERIES "700" BOILERS (3-pass Design)

Pacific Series "700" Boilers of the 3-pass design (firebox and 2 passes of tubes) available for automatic and hand firing, also as oil or gas boiler-burner units. Designed for large residential installations. *SBI* Net Ratings range from 180,000 to 595,000 Btu/hr in 7 sizes for hand firing and from 297,000 to 810,000 Btu/hr in 7 sizes for automatic firing for steam and water heating. Available with flush jacket.

Boiler-Burner Units

Automatically Fired Boilers

PACIFIC SERIES "700" BOILERS (2-Pass Design)

Pacific "700" Series Boilers of the 2-pass design (firebox and 1 pass of tubes) available for automatic and hand firing, also as oil or gas boiler-burner units. Designed for large residential and small commercial installations. *SBI* Net Ratings range from 945,000 to 1,350,000 Btu/hr in 4 sizes for steam and water heating and for automatic firing. Hand fired *SBI* Net Ratings range from 690,000 to 990,000 Btu/hr. Available with flush jacket.

Descriptive bulletins on Pacific Residential Boilers will be mailed on request

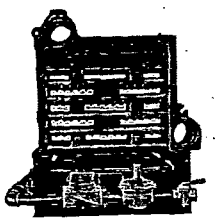
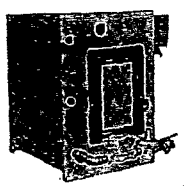
55 GAS FIRED SIZES

Rated 70,000 Btu to 5,400,000 Btu input/hr.

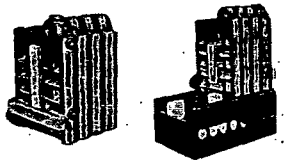


For close adherence to specifications.

Cast Iron Boiler **Gas Fired**



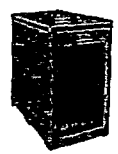
BIG SERIES 150



SERIES 150 High capacity gas fired boiler built to rigid specifications, designed for industrial use with Natural, Manufactured and Mixed gases, LP and LP Gas-Air Mixtures. Incorporates multiple pilot line, raised ports, cast iron burners, horizontal to vertical flue collector plus additional quality features. 33 Sizes. *A.G.A.* rated 600,000 to 5,400,000 Btu/hr input. Hot Water Steam and Vapor.

Peerless "SUPER" 13 gas passage, cast iron water tube section "H" block construction with 6 in. ports and tappings. Maximum strength and efficiency are attained.

SERIES 50 Recommended for industrial and large residential installations. Incorporates the same quality features of the 150 SERIES with less capacity and more compactness to enable installations where limited space is a requisite. The latest advancements and design are the features in the SERIES 50. 7 Sizes. *A.G.A.* rated 350,000 to 650,000 Btu/hr input. Hot Water, Steam and Vapor.

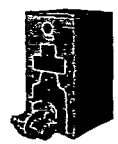


All Series 50 Cast Iron Boiler sections are preassembled in blocks of 3, 4 and 5 sections to effect a savings and assure positive installations. Section blocks are factory hydrostatically tested at pressures up to 200 lb.

The PEERLESS Series 50 and 150 introduces important advances in engineering research, modern design, new materials, manufacturing methods and boiler setting-up procedures. PEERLESS'S world famous master foundry workers and engineers have introduced sensationally new concepts in CAST IRON BOILERS, the lifetime metal. With the introduction of the Series 50 and 150, PEERLESS now offers 55 sizes of Gas Fired Boilers to meet every installation requirement from 70,000 to 5,400,000 Btu input.

A.G.A. A.S.M.E. I.B.R.

CAST IRON GAS AND OIL FIRED BOILERS



Series "TG"

Series "G"

Series "TO"

Series "TOU"

SERIES "TG" Gas fired cast iron boilers meet most residential requirements, including instantaneous domestic copper water heater. Available in deluxe flush and deluxe extended type jackets.

SERIES "G" Gas fired boilers incorporate the same features as the "TG" Series but do not have domestic hot water heater. Deluxe flush or deluxe extended jackets are available. Rugged cast iron construction for long life. Factory assembled block sections for fast set-up. Deluxe two-tone green enameled steel jackets. SERIES "TG" & "G" 6 Sizes—105,000 to 291,000 Btu Input hr. *A.G.A.* rated. Steam Water and Vapor.

SERIES "TO" Oil fired boilers with all Peerless water tube features: Factory assembled sections, domestic hot water heater optional. "O" Series available without domestic water heater.

SERIES "TOU" Oil fired boiler is the same as Series "TO" but includes Peerless Deluxe oil burner. Deluxe flush and extended jackets available. Peerless oil fired heavy duty residential heating boilers are made for homes of all sizes. 7 Sizes. Gross $I = B = R$ Output Btu/hr 93,000 to 234,000. Net Water Rating: 465 sq ft to 1170 sq ft. Net Steam Rating: 250 sq ft to 650 sq ft.

PACKAGED OIL AND GAS FIRED BOILERS

Series "TOUP" Crated

Series "TOUP"

Series "MM" Crated

Series "MM"

SERIES "TOUP" Oil fired boilers are delivered completely crated with all controls. Factory assembled and tested to assure time saving installations. 2 Sizes. "TOUP"-135A-W-Net Water Rating: 555 sq ft. "TOUP"-145A-W. Net Water Rating: 735 sq ft.

DESCRIPTIVE CATALOGS OF SPECIFICATIONS, RATINGS AND DIMENSIONAL DRAWINGS OF PEERLESS BOILERS WILL BE MAILED UPON REQUEST.

SERIES "MM" (Mighty Midget) boiler with compact design for installations in limited space areas. White baked enamel. Completely assembled and crated. "MM" 70B-W, *A.G.A.* input 70,000 Btu/hr, 24 in. high. "MM" 95B-W, *A.G.A.* Input 95,000 Btu, 30 in. High. "MM" 120B-W, *A.G.A.* Input 120,000 Btu, 36 in. High.

Gas Model

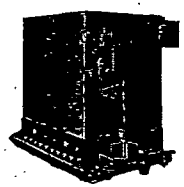
PEERLESS GAS AND OIL FIRED FURNACES

Peerless fully automatic Oil and Gas fired furnaces represent advancements in Engineering, Performance and Design.

A full line consisting of 9 Series with 22 models provide installations for every type of home.

Gas fired furnaces are rated 70,000–150,000 Btu/hr Input. Oil fired furnaces are rated 72,000–140,000 Btu/hr Output.

The 9 Series of Peerless gas and oil fired furnaces include 10 Models in the gas fired Series and 12 Models in the oil fired Series. Series include HI-BOY, LO-BOY, GRAVITY, COUNTERFLOW and HORIZONTAL TYPES.



Peerless warm air furnaces are completely assembled, wired and packaged at the factory for ease of installation. Specification sheets are available by writing The Peerless Heater Company, Boyertown, Pennsylvania.

PENNSYLVANIA FURNACE & IRON COMPANY

Warren, Pennsylvania
316 North Pine Street

Pennco Cast Iron Gas Fired Boilers, Pennsylvania Forced Air and Gravity Furnaces, Floor Furnaces, Conversion Burners, Multitube Burners, and Cooling Equipment

SERIES 6 PENNCO GAS FIRED BOILERS

Thirty sizes, all gases, 400,000 to 4,400,000 input.
Steam, water, vapor and volume hot water heating.
ASME and *A.G.A.* approved. Twice tested to 200 lb hydrostatic for working pressures of 15 lb steam or 80 lb maximum water pressure.
Base is of welded steel, shipped assembled complete with manifold and safety pilot in place.

Horizontal draft diverters save head room. Vertical diverters can be furnished upon request.
Front casing panel removable for convenience in cleaning.
Draw bolts for easy assembly of section. Holding bolts keep sections metal to metal.
Individual gas burner cocks for each section permit shutting off one or more burners and still maintain operation of the boiler.
Boilers are equipped with gas actuated controls to permit operation in event of electric failure. Electric controls are also available.

SERIES 3 PENNCO GAS FIRED BOILERS

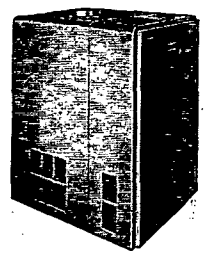
Eight sizes for all gases. Inputs from 96,000 to 432,000 Btu.
Steam, water, vapor and volume water heating.
ASME and *A.G.A.* approved. Two tests of cast sections at 200 lb hydrostatic. Water boiler approved for 80 lb working pressure.
Factory assembly of battery of sections.
Water leg sections provide increased efficiency.
Hollow projections on sections increase area of heating surface for faster transfer.

Boiler casing Standard type with controls exposed or DeLuxe type enclosing controls. Two-tone blue baked enamel finish.
Controls are gas actuated or electric types; factory assembled and fire tested. Color coding removes any guesswork during erection.

SERIES 2 PENNCO GAS FIRED BOILERS

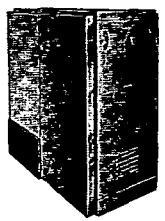
Four sizes for all gases. Water operation only. Inputs 44,000 to 87,625 Btu.
ASME and *A.G.A.* approved. Sections tested at 200 lb hydraulic pressure.
Approved for 80 lb working pressure.
Cast sections shipped assembled.
Adapted to heating of apartments, small homes, stores, and offices.
Wet base and diamond shaped hollow projections increase efficiency.
Choice of Standard casings for basement use or DeLuxe casing for installation in kitchens and other finished rooms.

SPECIAL



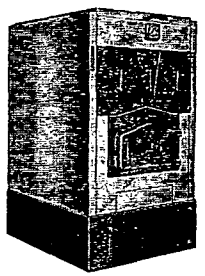
Stand-by controls to supplement natural or artificial gas with LP gas.
Automatic operation of dual gas controls. By predetermined setting based on outside temperature operation will swing from natural gas to LP gas and return as weather changes. *Ask for special bulletins.*

The H. B. SMITH COMPANY, INC.

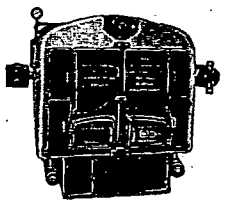


Westfield, Mass.

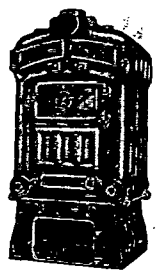
Branch Offices and Sales Representatives in Principal Cities



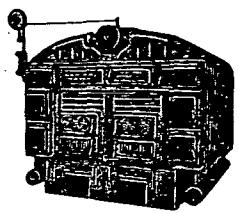
A complete line of modern cast iron sectional boilers for residential, commercial and industrial heating and for domestic hot water supply.



SMITH "CENTURY" GAS BOILER, *A.G.A.* approved, for steam or hot water heating. Input ratings from 138,000 to 745,500 Btu. Combines latest features of gas boiler design. Available with five sizes of built-in tank domestic hot water heaters, capacities to 168 gal. and eight sizes of tankless heaters, capacities to 8 gpm. Entire burner assembly mounted on wrought iron frame with casters for easy removal.



"100" & "2000" OIL BOILER-BURNER steam or water units for homes and small commercial installations. Furnished with line of tankless heaters with capacities up to 8 gal. of hot water per minute. Net radiation to 1275 sq. ft. steam; 2210 sq. ft., water.



SMITH-MILLS BOILERS, Series 15-20-25; capacities 200 to 2275 sq. ft. steam radiation. This complete line of modern push nipple boilers is available in models for gas, oil, stoker or hand firing. Have provisions for built-in domestic hot water heaters and controls.

MILLS WATER TUBE BOILERS, Series 24-34-44; capacities 900 to 13,380 sq. ft. steam radiation. Independent header type construction. Tens of thousands are installed in schools, hospitals, apartment houses, stores and other commercial and public buildings. Models for hand and all types of automatic firing.

SMITH HY-TEST BOILERS for hot water supply are furnished in several models, and many sizes for tank capacities to 20,000 gal. Constructed of the finest quality grey iron castings, these Hy-Test units are carefully tested at extremely high pressures before shipment.

"42" & "60" SMITH BOILERS, may be used in batteries for heating loads up to and over 100,000 sq. ft. steam radiation. Many of these large units installed in industrial plants furnish steam for processing requirements as well as for heating and domestic hot water.

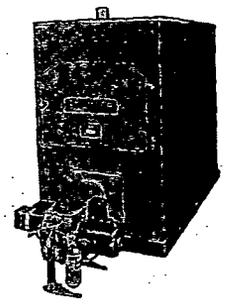
STEEL AND CAST-IRON HEATING BOILERS FOR EVERY BUILDING . . . FOR EVERY FUEL

"LW", "A", "CP", "R", and Suburban Series fully approved by Steel Boiler Institute

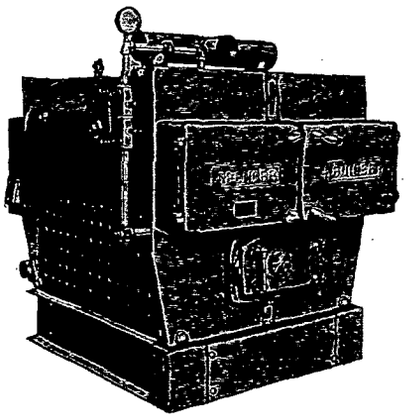


All products manufactured in strict accordance with the ASME code and carry the code seal. Every Spencer meets rated specifications, is easy to install; assured economical operation.

"A" SERIES

CAPACITIES 3,500 to 42,500 sq ft

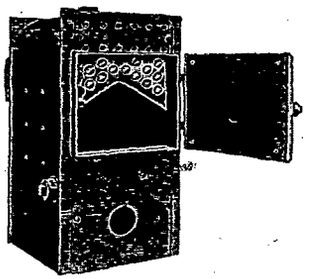
STEAM *SBI* RATING—A rugged, tough commercial and industrial heating boiler *designed for fast steaming* and efficient operation. All sizes available with front head cuts for low-set installations and with storage or instantaneous service water coils.



"CP" SERIES (OIL- OR GAS-FIRED)

CAPACITIES 1,300 to 5,000 sq ft

STEAM NET *SBI* RATINGS

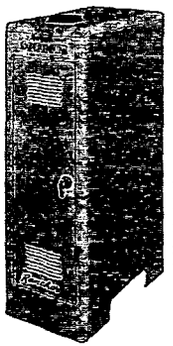


468,000 to 1,800,000 Btu GROSS OUTPUT—Incorporating a revolutionary refractory slab base and with either oil- or gas-burning equipment. Easy and quick to install. Low waterline for problem installations.

"LW" SERIES

CAPACITIES 2,200 to 42,500 sq ft

STEAM *SBI* RATINGS—A patented, divided low-waterline boiler *made in two watertight sections* that need no welding on job. Designed to overcome problems in low head room, excavation and entry. Particularly adapted for replacement installations. Available *with front head cut for extra low-set installations.*

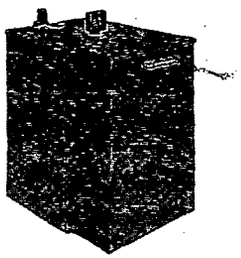


"R" SERIES

RESIDENTIAL STEEL BOILER

CAPACITIES 320 to 1,100 sq ft

STEAM, NET LOAD—*SBI* RATINGS—A ruggedly *constructed*, high-quality boiler for oil, gas, or stoker firing. Available with storage or instantaneous type service water coils in a wide range of capacities. Particularly suited for engineers and contractors who prefer to build their own design for heating installations. Available with both flush and extended model jackets.



"RANCHER" CAST-IRON GAS BOILER CAPACITIES:

1G series: 40,000 to 128,000 Btu

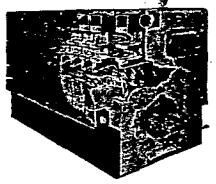
2G series: 80,000 to 232,000 Btu

A clean, neat compact design. Especially quiet in operation, using cast-iron burners with raised drilled ports. Also available with year-round domestic hot water coils.

"SUBURBAN" GAS-AND OIL-FIRED PACKAGE UNITS

CAPACITIES: 87,000, 108,000, 149,000 and 189,000 Btu—NET *SBI* WATER RATING—A compact, quality package unit designed for installation in kitchens, utility or rumpus rooms. Baked white enamel jacket. Completely wired and ready *for installation* . . . with volumes of year-round domestic hot water supply.

SPENCER HEATER



A PRODUCT OF AVCO MANUFACTURING CORP.

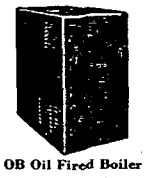
WEIL-McLAIN COMPANY

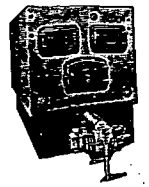
General Sales Office: MICHIGAN CITY, INDIANA



Distributors in principal cities

HR Heavy Duty Boiler for Horizontal Rotary Burners

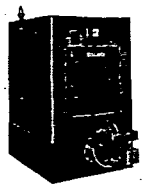
Special steel front plate and section simplify rotary burner installation. Large fire-box volume develops better combustion conditions—high base eliminates high brick foundation. *ASME* constructed.



Load range: Steam and Water 885, 200–2,942,500 Btu/hr.

OB Oil Fired Boiler

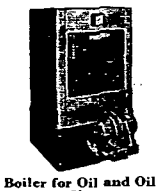
Cast iron boiler designed specifically to burn oil with great economy. Can be installed on any type of floor—special base plate allows free air circulation beneath boiler. Shipped completely assembled including specially designed refractory combustion chamber. *ASME* constructed.



Load range: Net *I=B=R* rating, Steam 68,000–88,000 Btu/hr.; Water 79,000–101,000 Btu/hr.

B-HO-40 and 44 Heavy Duty Oil Fired Boilers

For dependable, efficient operation in school, commercial and industrial installations. The burner and other components are engineered to function as a unit. High base eliminates brick foundation or pitting. New burner design assures smooth, quiet starts. *ASME* constructed.



Load range: Net *I=B=R* rating, Steam and Water 667,700–1,897,500 Btu/hr.

No. 82 Oil Fired Boiler and Oil Heating Unit

Available as "B" unit, including burner and combustion chamber; "A" unit with combustion chamber only; "O" unit, without burner and combustion chamber. An electronic safety control proves the flame in boilers burning 7 GPH and up. *ASME* constructed. Provision for single or dual domestic water heaters.

Load range: Net *I=B=R* rating, Steam and Water 339,100–793,700 Btu/hr.

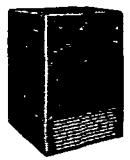
No. 72 Boiler for Oil and Oil Heating Unit

Exceptional fuel economy due to self-regulating, turn-around flue gas travel. Extra large fire box; wide, finned crown sheet. Available as "B" unit, including burner and combustion chamber; "A" unit with combustion chamber only; "O" unit without burner and combustion chamber. *ASME* constructed.

Load range: Net *I=B=R* rating, Steam 161,000–305,000 Btu/hr.; Water 180,000–331,000 Btu/hr.

Type J Gas Boiler for Hot Water or Steam

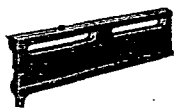
Cast iron construction for long life. Large water volume for longer steaming period, less tendency for flashing. Factory assembled controls. Completely insulated. *A.G.A.* approved for natural, mixed, manufactured or LP gases; *ASME* constructed.



Load range: Net *I=B=R* rating, Water and Steam 375,100–3,105,600 Btu/hr.

Type G Gas Boiler

Large capacity hot water boiler engineered into new, low space-saving design—*A.G.A.* approved for closet and alcove installation. Sections and base factory-assembled for easy installation. Corrosion-resistant cast iron construction. *ASME* constructed.

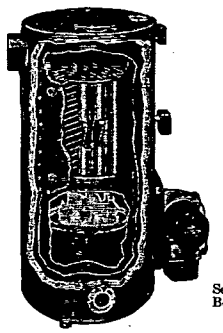


Load range: Net I=B=R rating, Water 45,000–135,000 Btu/hr.

Type H Gas Boiler for Hot Water and Steam

Medium sized unit designed for efficient combustion and thorough heat absorption. Built to *ASME* code. *A.G.A.* approved. Burns all gases including LP and LP gas-air mixtures. Safety pilot, convenient observation ports. Fully enclosing, insulated jacket.

Load range: Net I=B=R rating, Water and Steam 72,000–324,000 Btu/hr.



Cast-Iron Baseboards

Provide balanced combination of radiant and convected heat to assure uniform temperatures from floor to ceiling. Two heights—No. 7 and No. 9. Complete line of metal finishing accessories. Also Solray Cabinet Radiators, Raydiant Recessed Radiators, Junior Radiators.

Aldrich Company

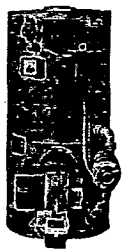
121 E. Williams St., Wyoming, Illinois

Series "D" Boiler Burner

Boiler-Burner Units, Hot Water Heaters, Domestic and Commercial Oil Burners

The Aldrich line of vertical firetube steel boiler-burner units are *ASME* constructed and stamped, *SBI* rated and listed in rating book of *Mechanical Contractors Association*. The Series "D" units are available in ten sizes for hot water heating, steam heating and hot water supply—oil or gas fired. Boiler shipped with round jacket, insulation, flue baffles, combustion chamber and tankless coil (if required) factory installed. Burner, trim and controls packed in carton. The Aldrich Series "C"—Gulf Stream boilers are available in five sizes from 495 to 1260 sq ft water for hot water heating and hot water supply—oil or gas fired. The packaged units are furnished completely erected, prewired with equipment installed. Units are compact, efficient and economical in operation.

Aldrich ASME boilers furnished as high delivery hot water heaters are ideal for large residences, motels, institutions, swimming pools, barracks and commercial applications where large quantities of hot water are required. Available in two types—direct heating galvanized storage (HSG) and indirect submerged coil (ID) with same ratings and either oil or gas fired. Available in wide range of sizes with outputs from 118 to 950 gph at 100 deg rise.



The Model E oil burner (0.5–4.0 gph) is available for domestic use and Model DX (4.5–10.0 gph) and JU (8.0–19.0 gph) for commercial applications.

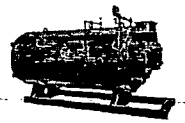
AMERICAN-Standard

KEWANEE BOILER DIVISION

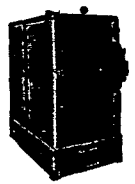


101 FRANKLIN STREET, KEWANEE, ILLINOIS

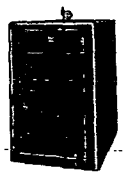
KEWANEE STEEL BOILERS ARE CONSTRUCTED IN STRICT ACCORDANCE WITH *ASME* CODE.

With a history of over 90 successful years, Kewanee Boiler Division today provides a complete line of steel fire tube boilers, both high pressure and low pressure, for heat, power and process steam in installations from coast to coast and abroad. Both Scotch type and firebox boilers are manufactured, with a total of 36 sizes of packaged boiler-burner units for oil, gas and gas-oil combination firing. *Your Kewanee Man* is always available to provide complete literature and specifications . . . solve installation problems . . . answer every question. Call him anytime.

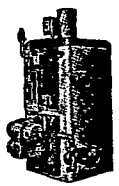
M-800 SERIES—Compact, efficient, economical to operate. High pressure HM Series in 14 sizes, 55 to 651 hp . . . corrugated furnace as shown. Low pressure LW Series in 16 sizes, 1,372 to 21,855 MBh . . . wet-back design provides additional primary heating surface. Both available as packaged units.



WELDED SCOTTIE JR.—Ideal for small industry, 8 sizes of welded Kewanee Scottie Jr. Boilers range in certified ratings from 18 to 92 hp in the high pressure models . . . 606 to 3,091 MBh in low pressure. Available as packaged unit with integrated burner for oil, gas or dual fuel firing.



"500" SERIES—For heavy duty heating, power or process requirements of hospitals, schools, industries or apartment buildings, the steel riveted "500" Series is available in 15 sizes, 32 to 321 hp, for 125 and 150 lb wp . . . and for high-temperature hot water systems above 250 F. Two-pass tubular, firebox type.



TYPE "C" SERIES—Compact boiler . . . all-welded . . . requires a minimum of floor space. Produces ample steam for heating large buildings at low cost. 15 psi steam or 30 psi water up to 250 F in 14 capacities 1,236 to 10,800 MBh. Corrugated crown sheet provides additional heating surface next to the fire. Has large firebox. Steel base.

SQUARE-HEAT TYPE "R"—Excellent source of heat for any medium size building, this one-piece, all-welded boiler fires efficiently from front or rear with any fuel. Twelve sizes range from 243 to 1,350 MBh 15 psi steam or 30 psi water up to 250° F. Available with attractive insulated jacket and packaged for oil, gas or combination oil-gas.

ROUND TYPE "R"—A rugged boiler with the capacity to serve today's larger, more extended homes. Its heavy steel plate construction assures many extra years of service. There are four Round "R" sizes from 108 to 243 MBh steam or water. Available with square or round insulated jacket.

OW AND GW SERIES—Packaged with oil or gas burner and all controls . . . for forced hot water heating of small to medium size homes. Compact design permits installation in any convenient location. Rated to produce 74 to 189 MBh. Also available as a boiler unit only, for oil or gas firing.

STORAGE WATER—Where large quantities of hot water are used at irregular intervals . . . and where exhaust or live steam is available—such as hotels, apartments, schools, hospitals, laundries, industrial buildings, etc. Capacities range from 92 to 2,240 gph. Equipped with supporting saddles.

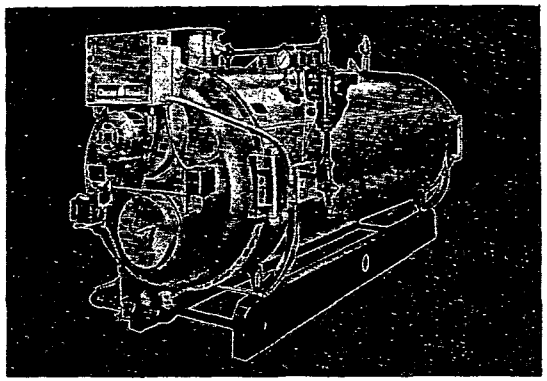
B&W INTEGRAL-FURNACE BOILER, TYPE FM

Shop-Assembled Steam Generator

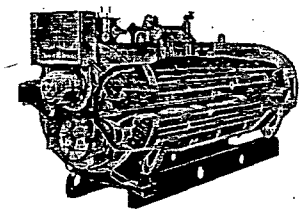
B&W Type FM Boiler combines the benefits of package steam with cost-saving big-boiler advantages. This compact self-contained unit has been widely applied to heating services in hospitals, schools, colleges, and other buildings. It has also gained wide acceptance throughout a broad range of industries—supplying steam for combination services.

The Type FM Boiler is particularly suitable for small- and medium-sized plants where excessive fuel consumption and costly maintenance are often serious problems. And, even for some larger steam requirements, multiple-unit Type FM installations have proved more flexible in operation and more economical than one or more large boilers requiring costly field erection and close operating supervision. A large part of the total FM capacity now in service or on order consists of multiple-unit installations.

The Type FM Boiler is fast steaming and features automatic operation with special safety provisions. It quickly responds to load changes and operates at high efficiency over the load range. This versatile unit burns gas and/or oil, separately or in combination, with quick and easy changeover accomplished at the control panel.



The Type FM Boiler is available in standard sizes for steam requirements to 40,000 lb per hr and for operating pressures to 235 psi. Many have been installed for higher pressures and with a moderate degree of superheat. *Details are given in Bulletin G-76—copies sent on request.*



CLEAVER-BROOKS COMPANY

498 E. Keefe Avenue, Milwaukee 12, Wisconsin

CLEAVER-BROOKS Packaged Boilers for high- or low- pressure steam, or hot water . . . for heating or processing

All Cleaver-Brooks boilers meet the following design standards for improved performance and operating safety. (1) Four-pass five tube construction. Higher gas velocities extract more heat from flame, assure better heat transfer with lower fuel costs. (2) Heating surface of 5 sq ft per hp. (3) Forced draft controls air for combustion and assures proper air-to-fuel ratio for top efficiency, eliminates expensive chimney. (4) Updraft construction with low furnace keeps hottest combustion gases deep within the boiler for greater safety.

19 sizes; 130 models—oil, gas or combination oil-gas firing. Model CB boiler (shown) incorporates control panel and other controls on front for convenience; available in sizes 15–350 hp, 15–250 psi. Model LR (not shown) is available in sizes 400–600 hp, 15–250 psi.

Cleaver-Brooks BOILERS—Steam or hot water, for heating and processing 15 to 600 hp, 15 to 250 psi. Oil, gas and combination oil & gas fired models

CLEAVER-BROOKS BOILER ADVANTAGES

Guaranteed 80 percent efficiency—Minimum 80 percent overall efficiency at 30 to 100 percent of full rating at working pressures.

Quiet operation—Even at peak load, boilers more than meet the low sound levels required for schools, hospitals and institutions.

Nation-wide starting service safeguards your boiler investment. Cleaver-Brooks' technician starts boiler, adjusts it to optimum efficiency and trains boiler operator.

Full factory tested including complete check of control system on every boiler. Your boiler is proved ready for efficient performance on arrival at your plant.

No costly chimney—Combustion gases are carried off through a small vent, eliminating high-cost chimneys.

One complete package—A complete unit from a single source—one responsibility. Ready for operation and service connections on arrival.

Compact—Maximum steam generating capacity in limited space. Requires little floor space . . . fits easily into low head room.

Automatic, safe operation—Controls centralized and conveniently located. Modern electronic combustion controls are standard equipment.

Fast, easy maintenance—Front and rear doors are hinged or davited for fast inspection, cleaning and servicing.

Fuel flexibility—Burns heavy or light oil, gas or combination oil/gas—simple, quick changeover.

Clean—Oil or gas firing keeps boiler room and plant clean, eliminates the problem of ash removal.

Totally enclosed control panel—Control panel conveniently located, contains burner switch, relays, blower motor starter and control switches. Wiring is in conformity with the National Electric Code.

Fast installation—No special foundations needed; existing concrete floors will suffice.

Complete unit approval—Labeled by *Underwriters' Laboratories* and *Canadian Standard Association*. Conforms to ASME codes; factory tested before shipment.

Cleaver Brooks
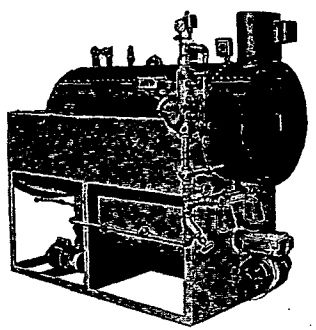
Monitor
Packaged Boiler

Low-cost dry steam for dairies, laundries, dry cleaners, canneries, food processing and industrial applications. Seven sizes . . . 15–60 hp . . . 150 psi. Available in oil, gas or combination oil/gas models with quick fuel change over.

Cleaver-Brooks Progress and Monitor Boiler Advantages:

- **A complete package**—From one company, one source. Factory-assembled, tested and shipped as a fully self-contained unit—ready for installation, and requiring only service connections.
- **Four-pass, forced-draft design** is an efficient combination to transmit a greater percentage of heat to boiler water.
- **Field starting service**—final check and adjustment by authorized service representative after installation, plus operator training—at no extra cost.
- **Quiet-running blower** supplies combustion air—eliminates need for expensive chimney.
- **Electronic combustion-safety controls** assure safe shut-down. Electric ignition assures smooth, noiseless light-off of main flame.



For complete details write direct or contact your Cleaver-Brooks representative listed under "BOILERS—MANUFACTURERS & DISTRIBUTORS" in your classified phone book.

COLUMBIA Boiler Company of Pottstown

Pottstown, Pa.

Makers of steel power and heating boilers

COLUMBIA'S H.R.T.* OIL OR GAS FIRED BOILER & STEAM GENERATOR

***ASME* CODE CONSTRUCTED**

Available for pressures of 15 to 250 psi.
A complete, automatic power plant wherever steam is used for processing

Columbia h.r.t. boilers are fully automatic, compact, complete steam generators. Available in sizes ranging from 2 to 100 horsepower. Designed for firing with gas, light or heavy oils. A special Columbia unit makes possible the inter-changeable use of gas or oil.

Overfiring Permitted: Conservative ratings plus large combustion volume permit overfiring. This frequently eliminates the need for additional boiler capacity, allows for plant expansion.

High Steam Output: Columbia's h.r.t. boilers have an unusually large heating surface to produce more steam at higher efficiencies. More heat is converted into steam since it is proportioned to make maximum use of hot gases of combustion for the production of steam.

Horizontal Design for longer life: The complete submersion of tubes protects them from water line corrosion.

Dry Steam Assured: Large steam space and greater liberation area virtually eliminate waste producing water carryover.

Over-All Efficiency: Factory installed, specially designed combustion chamber provides rapid heating refractory surfaces for peak combustion efficiency. Insulation, 7 inches thick in the combustion chamber proper, and 4 inches thick in the gas passage, keeps heat loss at a minimum. Special refractory brick heats up to great intensity to complete the combustion of previously unignited fuel particles. This complete combustion not only increases efficiency but makes for clean combustion. Soot accumulation on heating surfaces is minimized. Boiler tubes require less cleaning.

Safety Assured: Two pass updraft design lowers direct loss and reduces possibility of furnace pressure, pulsation or excessive combustion noises.

Accessibility and easy Maintenance: Simplified construction provides easy front and back access to the single bank of tubes. Entire unit can be gotten to for inspection of boiler and chamber by removing the covers.

Makers of steel power and heating boilers

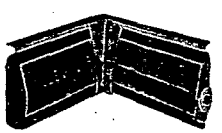
STEEL, TUBELESS, OIL-FIRED, WATER TUBE GAS-FIRED AND COAL-FIRED HEATING UNITS

***ASME* CODE CONSTRUCTED**
***SBI* RATED**
***A.G.A.* APPROVED**

Available with highly efficient, custom engineered gas or oil burners. Columbia steel boilers, gas or oil fired, have self contained large copper instantaneous tankless coils, supplying a continuous flow of year 'round domestic hot water.

Maximum operating efficiencies assured by the balanced design of the boiler and burner; by the arrangement of the baffles which force the hot gases to travel four or five times the full length of the boiler.

One piece electric welded construction: Columbia offers a heating unit with full electric welded construction of heavy copper bearing steel, to assure lower heating cost and longer operating life.



Quiet operation: Ample combustion space, the insulation and heavy steel jacket completely eliminate objectional noise.

Dual Firing: Columbia oil heating units may be easily converted for efficient gas firing.

Oil and gas burners for Columbia Boilers are designed and manufactured by Columbia to insure maximum performance of boiler-burner units and to provide undivided responsibility.

- Tension Fastening—no rattling!
- Low Angle Heat—no drafts!
- Pre-Punched Holes—fast installation!

BRYAN STEAM CORPORATION

Chili Pike, Peru, Indiana

Steam Boilers, Hot Water Boilers and Indirect Water Heaters designed exclusively for oil or gas firing.

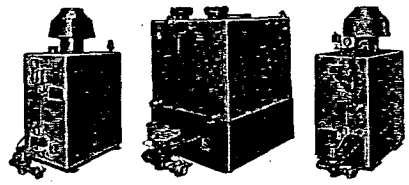
1. Bryan Copper Water Tube Boilers are engineered expressly for oil and gas firing. The Copper water tube construction offers these exclusive advantages:

(a) High heat conductivity of copper heating surface.

(b) Extremely rapid water circulation through the small diameter tubing.

(c) Tube arrangement causes products of combustion to be finely divided, reducing "surface film" to minimum.

(d) Relative corrosion resistance of copper.



(e) Flexibility of tubes—able to withstand sudden expansion and contraction—preventing "thermal shock" damage.

(f) Tubes easily replaced—requiring no expensive and time consuming tube welding or rolling.

All Boilers are built in accordance with requirements of the *ASME* Boiler Code. Gas Fired Heating Boilers are approved by the *American Gas Association* (*A.G.A.*)

2. Domestic Heating Boilers

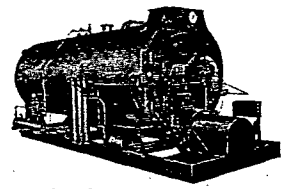
The Domestic Heating Boilers are available in 9 sizes, from 75,000 Btu to 600,000 Btu output. Oil and gas burners are installed at the factory as packaged units. Factory wiring is optional. Smaller models available as a completely packaged unit with all hot water circulation equipment installed.

3. Commercial Heating Boilers

The Commercial Heating Boilers (400 and 500 Series) are available in 8 sizes from 720,000 Btu to 1,800,000 Btu output, for steam and hot water radiation. These sizes are suitable for most schools, churches, small apartment houses and office buildings. Sizes up to 1,080,000 Btu are available as completely assembled and packaged units.

4. High Pressure Boilers

Bryan High Pressure Boilers are available in sizes up to 50 hp and up to 125 lb mwp. They are particularly noted for their ability to provide steam for applications requiring steam on short notice and at high efficiency. Hospitals, dry cleaning plants, laundries, dairies, tire repair shops, food processers and many others find them fine for this purpose.



5. Indirect Water Heaters

The Bryan Indirect Water Heaters are available in sizes from 112,000 Btu to 1,800,000 Btu output. This heater combines all of the advantages of the Bryan Copper Tube Boiler with the known advantages of heating water by indirect means. Widely used for one or two temperature water in restaurants, soda fountains, hotels, apartments, laundries, industry and others. Also available as a swimming pool heater.

SPECIAL CONDITIONS

Specifications are descriptive and not a representation. Equipment described or the equivalent furnished for either steam or hot water. Cyclotherm Division National-U.S. Radiator Corp., reserves the right to alter, without notice, dimensions, designs and components of Cyclotherm units.

For complete information on how Cyclotherm gives you more steam in less space at less cost write to Cyclotherm Division, National-U. S. Radiator Corp., Oswego, N. Y. for free booklet, Cyclotherm Cyclonic Combustion, The Advanced Combustion Method that Sends Steam Costs Down.

CYCLOTHERM STEAM AND HOT WATER GENERATORS

Guaranteed Minimum 80 Percent Efficiency. With Cyclonic Combustion, a patented Cyclotherm combustion principle, 65 percent heat transfer is reached in the combustion chamber alone and 15 percent more in one pass of return tubes. 80 percent efficiency—or better—in two passes.

Compact. By eliminating superfluous tubes and passes, Cyclotherm produces maximum steam in minimum dimensions. Up to one-third smaller than other package boilers.

Low Maintenance Costs. Cyclotherm parts are easy to get at, easy to clean. Simplified construction eliminates many man-hours of maintenance.

Shipped Complete. A complete package, Cyclotherm is ready to operate when shipped. One manufacturing responsibility behind the entire job.

Automatic Controls. On models up to 60 hp, burner automatically shuts off when steam demand is satisfied, automatically turns on when more steam is needed. On larger models, electronic controls modulate firing rate so that equipment may be operated at from 30 percent to 100 percent of capacity without loss of efficiency.

No special foundation or excavation is needed. You can relocate your Cyclotherm if you change your plant layout.

No Costly Stack. Cyclotherm requires only a simple flue.

Quick Changeover. Burning oil and/or gas, Cyclotherm offers an easy and quick changeover. You burn whichever fuel is more economical.

Full power from a cold start is reached in 15 to 20 minutes.

Conforms to Codes. Cyclotherm conforms to *ASME* codes and carries *Underwriters' Laboratories* label.

Worldwide Service Facilities. Cyclotherm Sales Engineers are ready to serve you wherever you are located.

One Year Warranty. If there is any defect in materials or workmanship within one year of the date of adjustment, Cyclotherm will repair or replace the defective part without any cost to you.

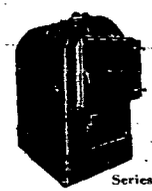
CYCLOTHERM® DIVISION NATIONAL-U. S. RADIATOR CORP.,
47 East First Street, Oswego, N. Y.

Federal BOILER COMPANY

Midland Park, New Jersey

Member SBI

Reg. U. S. Pat. Off.



The Federal Line of Hydronic Heating Equipment is fully rated in accordance with provisions as set up by the *Steel Boiler Institute (S.B.I.) Rating Code*. Federal commercial steel boilers are constructed in conformance with rigid standards as set up by the *American Society of Mechanical Engineers*. Every boiler receives extensive testing after assembly. Each boiler also bears the *ASME* stamp of approval. Other items in the Federal Line, not illustrated here, are: Vertical steam and hot water steel residential boilers; oil and gas-fired cast iron boilers; packaged steel and cast-iron boilers; "FBC Ultrapower" baseboard radiation; and a full selection of heating accessories.

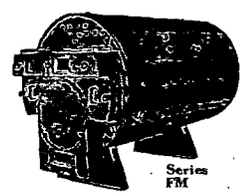
Series FD

SERIES FD—HORIZONTAL FIRE-TUBE RESIDENTIAL STEEL BOILERS:

Available in Stoker, Gas or Oil-Fired Models. 9 full range sizes to meet most residential heating needs . . . from 540 MBh Gross Output to 1800 MBh Gross Output (Net *SBI* Rating—1690 sq ft steam to 5620 sq ft steam). Features newly designed flue doors to prevent heat loss and infiltration of excess air. Rigid one piece steel base supplied . . . extra high bases for stoker fired models. *ASME* Coded and Stamped. Provides unlimited year round supply of domestic hot water.

Series FLR

SERIES FLR—INDUSTRIAL, INSTITUTIONAL AND COMMERCIAL HORIZONTAL FIRE-TUBE BOILERS:



18 sizes for all ranges of heating needs . . . 792 MBh to 12,600 MBh Gross Output (Net *SBI* Rating—2490 sq ft steam to 39,370 sq ft steam). Features hi-fire box design in larger sizes to increase efficiency of boiler. Dry base supplied in conventional heights or extra high for stoker fired models. Available with oversized tankless coils for abundant year-round domestic hot water supply.

Series FLW

SERIES FLW—LOW WATER LINE BOILERS:

For industrial, institutional, or commercial applications. Oil or gas-fired. Provides lowest water line of all Federal commercial firebox boilers. New special wet leg construction completely surrounds combustion area with water walls. Reduces costly pitting and combustion chamber installations. Supplied with revolutionary windbox to provide controlled firing of modern fuels. 21 full range sizes from 540 MBh to 12,600 MBh Gross Output (Net *SBI* Rating—1690 sq ft steam to 39,370 sq ft steam). Designed for installation in limited head room areas . . . or where water, rock conditions require costly foundation installation.

Series FM

SERIES FM—SCOTCH MARINE BOILERS:

For industrial, institutional, and commercial applications. Features "wet back" design for more efficient heat transfer. Compact and rugged, FM boilers are designed for low head-room installation. Available in 14 full range sizes from 936 MBh to 7200 MBh Gross Output (Net *SBI* Rating—2930 sq ft steam to 22,510 sq ft steam). Oversize tankless coils available for year-round domestic hot water supply. Available in oil or gas-fired models, jacketed or unjacketed.

HYDROTHERM INC

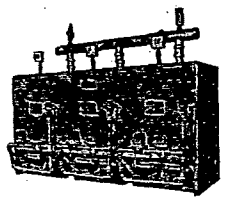
NORTHVALE, NEW JERSEY

PACKAGED AUTOMATIC GAS HEATING PLANTS

Providing Space or Volume Water Heating for Residential, Commercial and Industrial Uses

45,000 BTU/hr to 3,600,000 BTU/hr input ratings

HYDROTHERM



Model R-150
with Hammeroid finish jacket;
425 lbs, 16 in. x 31 in. x 27 in.

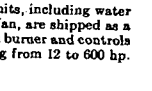
HYRDOTHERM boilers are of all cast iron construction and are exclusively designed for gas. The patented absorption unit, composed of deep-rib horisontal sections connected in sigzag, permits maximum heat transfer in minimum space with small water content. This "true" gas design results in low fuel consumption, quick heat response, uniform heat transfer, self cleaning flue passages, and small installation space. HYDROTHERM boilers are *A.G.A.*-approved for all gases and are factory assembled and wired with safety and gas controls, ready for quick installation. Boiler and controls are enclosed in an attractively finished insulated steel jacket.

All boilers are tested at 250 lb hydrostatic pressure and carry a 100 lb *ASME* rating which permits direct connection of boilers to city water lines as required for volume water heating applications.

MULTI-TEMP

Multi-Temp
Model R-900; 1800 lbs,
65 in. x 26 in. x 37 in.

MULTI-TEMP, a new concept in heavy duty gas-fired hot water heating, provides any desired capacity with a multiple of HYDROTHERM units, each equipped with its own controls. True input modulation is accomplished by making boiler units respond to the return water temperature through aquastats with differential settings in the return manifold. At a cold start, all units go on; as the return water temperature rises, one or more units drop out according to their own aquastat settings till the input is just enough to maintain the design water temperature, effecting a year-round fuel saving of up to 20 percent.



MULTI-TEMP, being composed of multiple units, offers extra protection against service interruption. Each boiler unit is shipped completely assembled to simplify field installation.

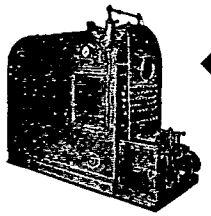
THE INTERNATIONAL BOILER WORKS CO.



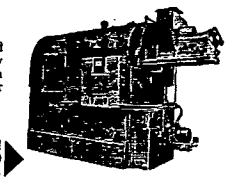
500 Birch Street · East Stroudsburg, Pa.

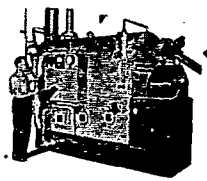
A Complete Line of WATER TUBE Heating and Power Boilers

International water tube design assures high heat absorption and exceptionally low operating cost with all fuels. Boiler water circulation is positive and directed, delivering a constant payload of steam or hot water to the boiler nozzle. Every International Boiler is built to *ASME* code requirements, and is tested and approved by a nationally recognized insurance company before shipment. Full access is provided for cleaning BOTH the fireside and waterside of all tubes without dismantling the boiler.

PACKAGE BOILERS

...fully automatic and factory coordinated.



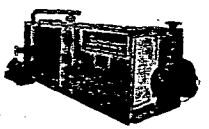


the COMPAK - Forced Draft Series

Forced draft operation eliminates the need for an induced draft fan or separate controls. Available as Type FPL for low pressure steam or hot water heating and as Type FPH for high pressure steam generation in sizes from 12 to 750 hp. Write for *Bulletin 1400.*

the COMPAK - Induced Draft Series

. . . noted for high thermal efficiency, quiet operation and convertibility to coal firing. Type PL units (15 lb steam, 30 lb water) . . . and Type PH units (130, 160 or 200 psig) are built in in sizes from 12 to 600 hp. Write for *Bulletin 600.*



the COAL-PAK AUTOMATIC - Bituminous Coal Fired

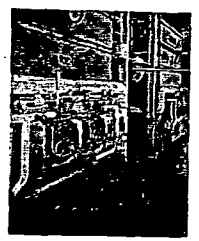
First FULLY AUTOMATIC package unit complete with combustion controls, automatic coal feed and ash removal system for burning LOW COST BITUMINOUS COAL cleanly and efficiently. Type PSL (15 lbs. steam, 30-160 lb water) and Type PSH (130, 160 or 200 psig) in sizes from 71.6 to 300 hp. Write for *Bulletin 1100.*

the THERMOJET-Oil/Gas Fired

This LOW HEADROOM forced recirculation package unit features famous LaMONT boiler design specifically adapted for SINGLE BUILDING low or high temperature hot water heating systems. Type TJW for operating pressures from 30 to 600 psig in standard sizes from 250,000 to 14,000,000 Btu/hr. Write for *Bulletin 1000.*

HEATING BOILERS—15 lb Steam—30 lb Water

TYPE C—built in *SBI* rated sizes from 2,190 to 51,000 sq ft steam. Can be equipped with an immersion coil of instantaneous or storage tank type for hot water service requirements. Write for *Bulletin 800.*



TYPE IDL & BBL Boiler-Burner Units are built in capacities from 1,820 to 84,000 sq ft steam. Write for *Bulletins 500 and 900.*

HIGH PRESSURE BOILERS—130—160—200 psig

TYPE CH Of all welded construction these boilers are available in standard sizes from 8 to 363 hp—oil, gas or coal fired. Write for *Bulletin 1500.*

TYPE IDH & BBH Boiler-Burner Units, including water tube boiler, steel base and induced draft fan, are shipped as a unit ready for installation of oil and/or gas burner and controls at job site. Built in standard sizes ranging from 12 to 600 hp. Write for *Bulletins 400 and 900.*

INTERNATIONAL-LAMONT . . . .

HIGH TEMPERATURE WATER GENERATORS

Discharge Temperatures to 430 F. Design Pressures to 600 psig

BUILT-IN ECONOMIZER permits safe use of temperature differentials to 200 F with no thermal shock. LOW HEADROOM reduces cost of new boiler house construction and permits installation in many existing structures. TYPE LFW available in standard sizes from 3 to 200 million Btu/hr. Completely packaged oil/gas fired units to 60 million Btu/hr. Write for *Bulletin 700.*

THERMAL LIQUID HEATERS

Safe, low pressure industrial process heat to 750° F. . . . plus temperature control to ±2 F. Ideal for use with Aroclor, Dowtherm, Mobiltherm and other thermal liquids.

TYPE TJH and LFH available in standard sizes from 150,000 to 50 million Btu/hr. Completely packaged units in sizes to 20 million Btu/hr. Write for *Bulletin 1300.*

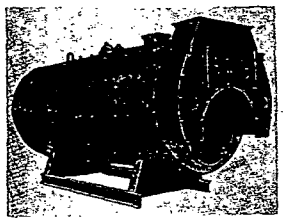
PACKAGED BOILER UNITS
FULLY AUTOMATIC
OIL OR GAS OR COMBINATION
OIL AND GAS

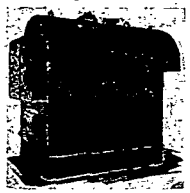
FORCED DRAFT
THREE PASS AND TWO PASS
COMPLETELY ASSEMBLED AND
FIRE TESTED AT FACTORY



HIGH PRESSURE TYPE from 75 to 750 hp and pressures of 125, 150 and 200 lb psi (250 lb available as a special).

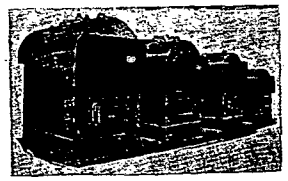
LOW PRESSURE TYPE for heating; 15 lb pressure, and EDR rating from 2190 sq ft to 42,500 sq ft steam.

ASME Code construction. *Underwriters' Laboratory* and *Factory Mutual* Approved. Specification Forms in detail to exactly cover the requirements of any particular job will be furnished upon request and without any obligation whatever. Ask for *Bulletins 509-B, 9600.*



POWER, PROCESS, HEATING

15 to 400 hp and pressures 15 lb to 200 lb psi. For mechanical firing with Coal, Gas or Oil. Overloads up to 200 percent of rating readily developed. Oil or Gas firing equipment and controls can be installed for completely automatic operation and in emergency or fuel scarcity, can be readily converted to Coal firing.



Ask for *Bulletin 4000 and 9500*

Firebox Heating Boiler, Compact Type. Oil, Gas, Stoker or Hand Firing. Three-Pass, 15 lb pressure, *ASME* Code. Capacities 2190 to 42,500 sq ft, *SBI* rating. Ask for *Bulletin 1500.*

Also built for High Pressure (125 psi). *Ask for Bulletin 702.*

WATERBACK DESIGN—Special attention is directed to this valuable feature. The rear combustion chamber is entirely submerged within the boiler water, eliminating use of firebrick, tile, or rear end refractories, thus avoiding the necessity of frequent repair and replacement costs.

SERVICE—Located in each sales area is a factory trained Service Engineer, capable of checking all phases of operation—adjusting controls and equipment to insure continuous maximum performance. Johnston service is prompt, liberal and cooperative—it is available to all customers.

Powermaster and POWER-PAK Packaged Automatic Boilers

Fuel Burning Systems—oil, gas and combination oil/gas

Powermaster boilers are modern, completely factory-assembled, automatic units with a world-wide reputation for highly dependable and efficient performance in public buildings, hospitals, schools, apartments, industrial plants and other installations. Three standard models are available in sizes of 20 hp to 600 hp for steam generation to 250 psi, and for hot water to 30 psi. All models are designed and built to *ASME* Boiler Code requirements, approved by *Underwriters' Laboratories, Inc.*, and fully guaranteed by Orr & Sembower, Inc. All units are factory fire-tested and afford these advantages:

- Simple cost-saving installation
- High efficiency at all loads
- Instant response to load swings
- 3-pass boiler with 5 sq ft of heating surface per bhp
- Forced draft firing
- Quick fuel change-over
- Clean, quiet operation
- Fully automatic operating and safety controls
- Convenient accessibility for inspection and servicing
- Nation-wide factory-trained service

NEW Powermaster Packaged Automatic Hot Water Boiler for Forced Circulation Heating Systems (patents applied for).

Powermaster Hot Water Boiler—Powermaster is one of the first hot water heating boilers developed and constructed specifically for modern institutional, commercial and industrial forced circulation heating applications.

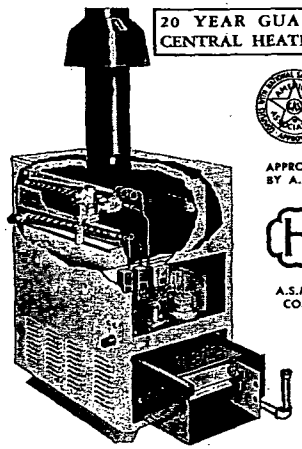
The *Powermaster* hot water boiler design and construction utilizes a dip-tube outlet located at the top of the boiler shell, designed to eliminate entry of air and vapor. The return connection, located at the center on the top of the boiler, is baffled to direct return water from the system down around the outer surface of the boiler. An integral vent connection is provided on the boiler.

The O & S *Powermaster* hot water boiler is not simply a steam boiler converted to hot water service. Its provisions for insuring efficient and effective internal circulation are the result of two years of concentrated research and development. These four advantages of the Powermaster packaged automatic hot water boiler emphasize its importance for every forced circulation hot water system:

1. **Powermaster hot water boiler offers more protection against thermal shock.**
2. **Powermaster internal circulation path eliminates short circuiting.**
3. **Powermaster internal circulation system eliminates stratification.**
4. **The hot water Powermaster insures uniform temperature gradients throughout the boiler.**

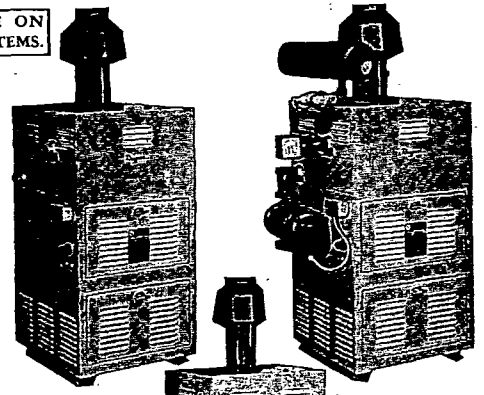
Write for information on the Powermaster packaged automatic boiler to meet your specific needs.

Raypak Company, Inc.



2416 Chico Avenue, El Monte, California

THE ADVANCED LINE OF GAS FIRED 100% COPPER AND BRONZE WATER TUBE HOT WATER BOILERS.



20 YEAR GUARANTEE ON CENTRAL HEATING SYSTEMS.

APPROVED BY A.G.A.

A.S.M.E. CODE

Raypak boiler cutaway with HWTG controls and Unatherm Governor.(PAT. PENDING)

160-T thru 1200-T extended jacket standard.

Models — TP typical pre-assembled package for central heating.

80-T and 120-T with flush jacket.

T MODELS cover standard boilers for central fluid heating, volume hot water supply and sanitizing 180F hot water applications. They feature a readily cleanable heat exchanger with individual bronze plugs for each tube, extended jacket, and gas modulation governed by water temperature. Temperature ranges to 240F.

TP MODELS cover the "plug-in" central heating package which Raypak developed and for which Raypak is so well known. They feature, in addition to T Model specifications, a high head circulator, heavy duty expansion tank with air charger, air vent, automatic make-up facilities, tridicator gage, relief valve, transformer relay (where applicable)—all wired and piped. The 80-TP Special, not a plug-in package, is an 80-T with pump, tank and accessories shipped loose.

HWTG MODELS include fully automatic swimming pool heaters. They feature Raypak's Unatherm Governor which prevents damaging condensate and virtually eliminates scaling—automatically—by maintaining 105-110F. boiler outlet temperatures regardless of flow rate changes from the filter system. In addition they feature a built-in pool aquastat, a self-contained independent electrical system and a low water cut-off device; no outside wiring—indefinite heat exchanger life, permitting no cost do-it-yourself scale removal.

All models feature extended and integral copper fin tubes, tapered bronze distribution headers, large ID inter-connecting bronze header in the combustion chamber, monolithic cast lightweight refractory, heavy 18 gage stressed-skin jacket, light weight (3 times the BTU's per pound of weight), compactness, A.G.A. approval on combustible flooring, and noiseless stainless steel ported burners with drawer-type mounting pan.

RAYPAK TRI-TEMP SYSTEM (patents pending) is a package for the food serving industry providing three temperatures of water from one boiler and includes glass-lined storage tank and heater coil.

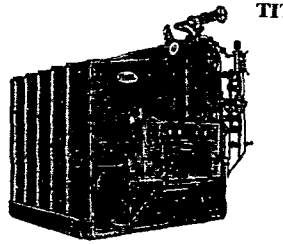
NOTES

NEW! Interconnecting bronze manifold design prevents air cavitation in heat-exchanger.

NEW! Heat exchanger jacket panel permits boiler water tubes to be inspected and cleaned without breaking pipe connections.

Raypak stainless steel burners permit the same propane ratings as for natural gas on every size boiler.

160 lb. A.S.M.E. working pressure on all models.



Standard heat exchangers tested at 1000 psi Hydrostatic pressure on request.

Model	MBH Input	MBH Output	EDR Sq. Ft. Gross	Approx. Wt. #

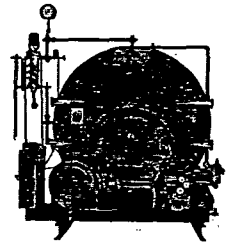
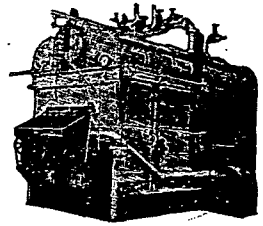
TITUSVILLE IRON WORKS

DIVISION OF STRUTHERS WELLS CORPORATION



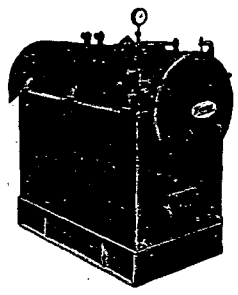
Titusville, Pennsylvania



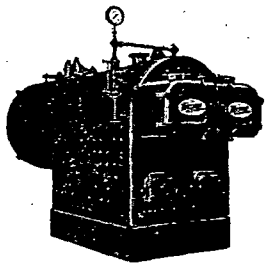
TITUSVILLE TYPE WTP PACKAGED STEAM GENERATOR

This compact, shop-assembled water-tube steam generator features simplicity and economy of operation, from 10,000 to 60,000 lbs of steam per hour. It is shipped as a package complete with firing equipment, controls and all other components installed ready for service connections in the field. Enclosed and protected by all-welded, pressure-tight steel casing, the unit is easy to move by lifting or skidding, and erection costs are reduced to a very low minimum. Forced draft, pressurized furnace operation eliminates need for stack or induced draft fan. The Titusville WTP Steam Generator is designed to use heavy oil, heavy oil and gas combination; light oil; light oil and gas combination; natural gas; manufactured gas; coke oven gas. Fully automatic welding is employed, welds are X-rayed, and drums stress-relieved. *Bulletin B-3255.*

TITUSVILLE 3-PASS Scotch Marine Boilers



The Titusville 3-Pass Scotch Marine Boilers for power (S-3P) and heat (S-3H) are compact to the limits of practical size while maintaining excellent thermal qualities. Featuring complete wet-back construction, eliminating refractory problems, these modern boilers have water-cooled rear combustion chamber, large primary heating surface area, 3-pass tubes for maximum efficiency in heat extraction. Heat release rates of less than 88,000 BTU/cu ft of furnace volume at maximum continuous output ratings assure easy firing by all leading types of forced draft packaged burners. Pleasing appearance joins with practical design for ample access to all sections of boiler for inspection and maintenance. *ASME* power and heating boiler codes followed throughout in design and construction. *Bulletin B-3333.*



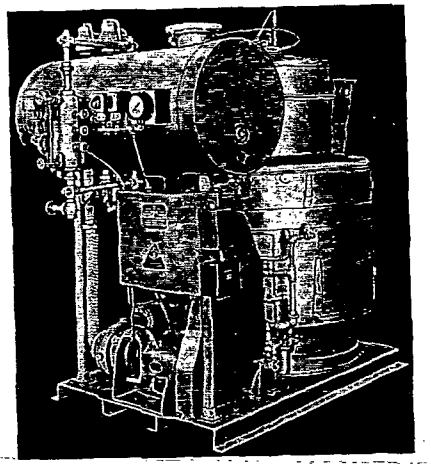
TITUSVILLE TICOTHERM STEAM GENERATORS

These large, highly efficient water tube steam generators are economical in operation and compact in design. They are constructed to meet or exceed a safety factor of 5, and drums are fusion welded, X-ray tested and stress relieved to meet or exceed ASME requirements as well as all local and state codes. Excellent results are achieved with any type of fuel. Ticotherm Steam Generators are completely insulated—top, sides and rear—with a minimum of 7 inches of refractory and insulation at side walls; boilers are completely steel encased. Four passes of gas travel are provided by vertical baffling, resulting in a minimum of draft loss and maximum heat absorption. Soot blowers are furnished as standard equipment on all boilers except gas-fired models. *Bulletin B-3250-A.*

TITUSVILLE ALL-WELDED FIREBOX BOILERS High and Low Pressures

The Titusville Compact Steel Heating Boiler (right) is compact in design, requiring less boiler room floor space than any other type. Excellent operating economies are obtainable, due to the unit's modern 3-pass construction feature. Built for use with all fuels and all types of firing—ample combustion space is provided to economically burn oil, gas, or coal. These all-steel boilers are manufactured in 19 different sizes, rated in accordance with latest rating code of The Steel Boiler Institute, constructed using ASME code rules. *Bulletin No. B-3000-B.*

Type WP Titusville All-Welded Firebox Boiler (left) is all-welded, utilizing advanced welding methods, quality steels and modern fabricating techniques. A streamlined boiler of exceptional strength, it has no riveted seams or screwed stays, remains tight under all operating conditions. Self-cleaning crown sheet and ample clean-out facilities are included in the design. These boilers combine high efficiency and low maintenance in service, and are readily adaptable for burning all sizes of bituminous and anthracite coal, or, in the WPO Model, for using any recognized oil, gas or combination gas-oil burners. *Bulletin No. B-3050.*



Write for the descriptive bulletins in which you are interested—let us arrange to have our nearest representative call to consult on your heating or power boiler requirements—without obligation of any kind.

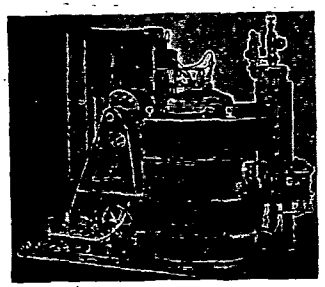
VAPOR MODULĀTIC WATER-TUBE BOILERS



DRUM TYPE

Dependable, compact, Vapor Drum Modulātics are designed to furnish high or low-pressure steam, with high or low temperature hot water for heating, power, processing, countless production applications. ¼ the size and weight of conventional boilers of comparable ratings—Modulātics provide 4 bhp per sq ft of floor space. Largest size takes only 40 sq ft, fits easily in unused corners or aisles. Lowest installation cost—Modulātics are delivered as complete units factory assembled, wired and job-tested, ready to connect and fire up. Largest unit fits through plant doors. No special foundations or chimneys required.

Operation is fast, positive, automatic. Full steam in 5 minutes, or instant hot water, from cold start. Tracks fluctuating steam demand up or down with speed and accuracy.

Multiple-unit Modulātic installations can have a single, automatic coordinated control that cuts whole units in or out as steam requirements vary, and modulates between these steps. Several smaller units always operating at design capacity minimize the inherent inefficiency of idling larger boilers as steam demand slackens.

Modulātic boilers *never require replacement* because design permits easy, simple replacement of water-tube coils, or other parts, for lifetime peak efficiency. Built-in automatic safeguards against no water, flame failure, excessive pressure. All Modulātics conform to *ASME* Power-Boiler Code and *ASME* Heating-Boiler Code.

DRUM-TYPE SPECIFICATIONS IN BRIEF

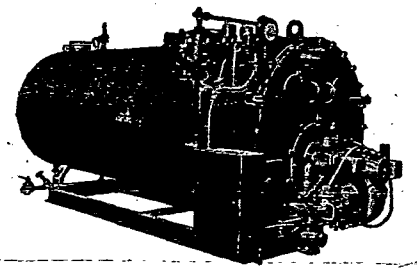
Six Sizes	20 to 200 hp
Pressures	0 to 15 psi 5 to 150 psi
Fuel	Oil, Gas, or Combination
Floor Area (200 hp)	5 ft x 8 ft
Height (200 hp)	7 ft 8 in.
Floor Load (max.)	150 lb/sq ft
Operation	Automatic

INDUSTRIAL TYPE

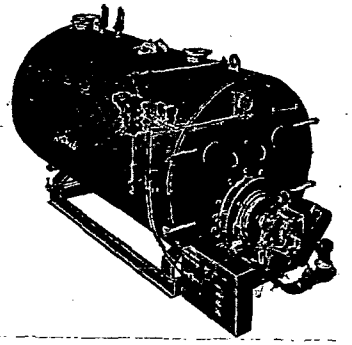
Heavy-duty Modulātic boilers are made in nine sizes to 150 bhp and pressures to 1000 psi. These industrial boilers have all Modulātic advantages of compactness, quick steaming, flexibility, and high operating efficiency with reliable, automatic performance and minimum maintenance. Thousands of Modulātics have proved themselves in tough, demanding service throughout the world. Literature is available upon request for both drum type and industrial type Modulātics.

INDUSTRIAL-TYPE SPECIFICATIONS IN BRIEF

Eight Sizes	10 to 150 hp
Pressures	2 to 1000 psi
Fuel	Oil, Gas, or Combination
Floor Area (150 hp)	5 ft x 8 ft
Height (150 hp)	6 ft, 10 in.
Floor Load (max)	150 lb/sq ft
Operation	Automatic



WESTERN BOILER COMPANY



1600 North Indiana Street, Los Angeles 63, California
1 Vanderbilt Avenue, New York 17, New York

Detailed on this page are a few of the many features of Webco-Ray packaged heating, power and process steam boilers. Webco-Ray 3-pass boilers combine in a *single guaranteed package, the skills and experience* of two leaders in heating and power equipment. All units are assembled, pre-wired and test fired at Western Boiler *Company prior to shipment*, making possible immediate hookup at the job site.

Component parts are integrated for balanced, economical performance and dependability. Forced Draft design eliminates unsightly, costly, tall stacks, an important advantage in todays modern buildings.

Sizes from 10 to 600 boiler horsepower, 335,000 to 20,085,000 Btu/hr for oil, gas and combination oil-gas operation.

PACKAGED PRESSURE FORCED DRAFT: These ruggedly constructed Webco-Ray packaged boilers are ideally suited for fully automatic forced draft operation in the 10 to 100 *boiler hp*, 335,000 to 3,348,000 Btu/hr range. Units are available for light oil, natural gas or combination gas-oil operation. All are guaranteed to provide quiet, efficient and economical performance. With **Webco-Ray Pressure Forced Draft** units, a single motor provides complete power for both the fan and oil pump with resultant savings in electricity. The single fan furnishes all air necessary for combustion and to overcome draft loss through the boiler. Air is supplied under constant pressure unaffected by atmospheric conditions. These forced draft features eliminate the need for tall stacks *or other auxiliary draft equipment*. Only a small vent is needed to carry off spent gases. Burners meet all requirements of the *National Electric Code* and *Underwriters' Laboratories*.

PACKAGED ROTARY FORCED DRAFT: *This highly efficient* **Webco-Ray** packaged boiler is *fully automatic*, incorporating the **Webco-Ray Forced Draft System.** It is designed and built to comply with the requirements of the *ASME Code* and displays the appropriate Code symbols. Sized from 40 to 600 boiler hp, 1,339,000 to 20,085,000 Btu/hr, units are available to achieve efficient combustion of light and heavy fuel oils—high or low pressure gas. Combination models fire either oil or gas. Webco-Ray boilers feature large furnace volumes for high radiant heat transfer, quiet operation, longer life and minimum maintenance.

Forced Draft—The Webco-Ray forced draft system enables this unit to operate efficiently on all fuels regardless of external atmospheric conditions. Forced draft firing eliminates the need for costly, unsightly tall stacks or overfire draft controls. Only a small vent *is required to carry off spent gases.* The belt-driven forced draft fan can be easily adjusted to compensate for varying altitude factors.

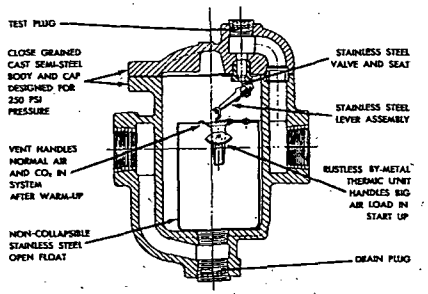
Open Float and Thermostatic Traps for Low Pressure Heating Service



Armstrong O. F. & T. traps answer the specific needs of low-pressure intermittent service where large amounts of air accumulate when the steam is off—especially good for unit heaters, pipe coils and standing radiation.

Design is open-float, single valve, with bi-metal controlled air vent. Conventional float and thermostatic connections—¾ in. to 2 in.

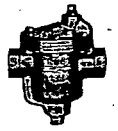
Mechanisms are of the same design, materials and workmanship as those used in Armstrong forged steel inverted-bucket traps for high-pressure, high-temperature service. Bodies and caps are close-grained cast semi-steel, designed for pressures to 250 psig.

Further information in *Bulletin No. 775.*

FEATURES

1. Low First Cost—on the basis of actual capacity for discharging hot condensate. No. 860 (¾ in.) has a capacity of 640 lb/hr at 15 psi, lists at $12. Other capacities to 6800 lb/hr.

2. Easy Installation—horizontal straight-through pipe connections minimize fittings and labor. Also, traps can be equipped with internal check valves.



3. Long Life and Low Maintenance—Armstrong O. F. & T. traps are non-air-binding and self-scrubbing. Working parts are corrosion-proof. Open-float is non-collapsible. Inadvertent admission of high pressure steam will not harm trap. Traps hydraulically tested at 500 psig.

4. Automatic Air Elimination—during warm-up, thermostatic vent is wide open to discharge large amounts of air rapidly. Regular vent handles normal air and/or CO_2 in system after heat-up, venting it at steam temperature.

5. Fast Condensate Removal—condensate is discharged at steam temperature—as fast as it enters trap. No cooling leg needed.

6. No Steam Loss—valve parts are always water sealed, and cannot be nicked by dirt or scale. Excellent for vacuum service.

ARMSTRONG INVERTED-BUCKET STEAM TRAPS

Side Inlet, Side Outlet

Bottom Inlet, Top Outlet

Side Inlet, Bottom Outlet

Integral Strainer

For draining steam mains and all types of institutional and industrial steam-heated equipment—including hot water heaters, and kitchen, hospital and laundry equipment. High capacity for size due to time-tested two-phase leverage system. Sizes for every capacity need. Cast semi-steel models may be used for pressures to 250 psi. Forged steel models available for higher pressures.

Features: basically the same as those outlined above for O. F. & T. traps except for the extra large air-handling capacity—air is discharged through the bucket vent.

Choice of body styles and built-in accessories minimize fittings and installation labor. Each type available with thermic vent for handling faster heat-up and/or internal check valves. Integral strainer traps are available which cost less to buy and install than standard trap plus separate strainer. Following table lists types, connections, and maximum capacities of hot condensate:

Type	Connections in.	Max. Cap. (lb/hr)
Side Inlet-Side Outlet	½ to 1¼	7500
Bottom Inlet-Top Outlet	½ to 2	19000
Side Inlet-Bottom Outlet	½ or ¾	570
Integral Strainer	½ to 1¼	3500

Other Armstrong traps available with capacities up to 300,000 lb/hr.

Complete details in *Catalog K.*

Y-TYPE STRAINERS

Semi-steel: screwed, ¼ in.–2 in.; flanged, 2 in.–6 in.

Carbon steel: screwed or socket weld, ½ in.–3 in.; flanged, 2½ in.–6 in.

Chrome moly: screwed or socket weld, ½ in.–2 in.

Bronze: screwed or silbras, ½ in.–2 in.

Type 316 stainless: screwed or socket weld, ½ in.–2 in.

Y-Type Strainer

Air Relief Trap

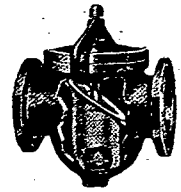
AIR RELIEF TRAPS

Ball-float traps for venting air from high points in hot-water systems. Corrosion-proof stainless-steel mechanisms. Smallest size is No. 21 (shown above)—½ in. or ¾ in. connections, 6¼-in. diameter, capacity of 10 cfm at 30 psi, list price $16.00. No. 21G, same capacity as 21 but fits between studs.

MUELLER STEAM SPECIALTY CO., INC.

29 Meserole Avenue, Brooklyn 22, New York

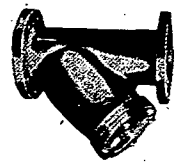
MUELLER



STRAINERS FOR ALL SERVICES

No. 251

251 SELF CLEANING "Y" TYPE



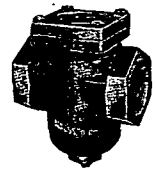
¼ in. through 3 in. Cast Iron, Cast Steel, Bronze and Aluminum. Pressures up to 600 lb steam.

No. 155

751 FLANGED SELF CLEANING "Y" TYPE

Sizes 1-½ in. through 16 in. Larger sizes available on application. Available in Cast Iron, Cast Steel, Stainless Steel and Bronze. Pressures up to 600 lb steam.

No. 751



155 and 165 BASKET TYPE

Basket-Type Strainers available with screwed or flanged ends, in Cast Steel, Cast Iron, Stainless Steel and Bronze. Furnished with closed or open bottom baskets.

Baskets lined with mesh are available where very fine screening is required. Drain plug at bottom of strainer easily removed for blowdown of accumulated sediment.

No. 165

No. 175

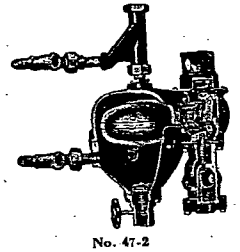
145 BASKET TYPE

Sizes ½ in. through 3 in. Iron Body and Bronze Body screwed end removable Basket-Type Strainers.

Screens and Baskets made from a variety of perforated metals and wire mesh available for all types of strainers.

Cast Carbon Steel and Stainless Steel Basket Strainers are available for gasoline and jet fueling applications . . . In full accordance with U.S. Government Specifications.

Every Mueller Strainer is individually tested and fully guaranteed



PRESSURE DROP CHARTS ON MUELLER STRAINERS AND 1959 CATALOG ARE AVAILABLE ON REQUEST.

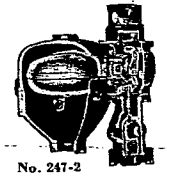
Doing One Thing Well



McDonnell Feeder Cut-off Combinations

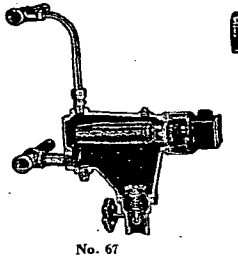
No. 47-2

No. 51-2

No. 247-2

No. 47-2 is for steam boilers used in closed heating systems, up to 5000 sq ft capacity. Feeder *adds water* automatically to boiler as needed, to maintain a safe level at all times. Cut-off switch stops burner if water level drops into emergency zone. Features include *cool feed valve*, deep sediment chamber, self-closing blow-off valve, Quick Hook-up, straight thrust stainless steel valve, packless construction. Maximum steam pressure, 25 lb. Maximum water supply pressure, 150 lb. Shipping wt., 30 lb.

No. 47 Boiler Water Feeder. Same as No. 47-2 but without No. 2 Cut-off Switch, *for hand-fired boilers*. Shipping wt, 29 lb.

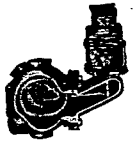


No. 51-2 is for steam boilers above 5000 sq ft capacity. Same basic features as No. 47-2 above, but has larger capacity and is installed with 1 in. equalizing pipes. Maximum steam pressure, 35 lb. Maximum water supply pressure, 150 lb. Shipping weight, 39 lb.

No. 51 Boiler Water Feeder. Same as No. 51-2 but without No. 2 Cut-off switch, for hand-fired boilers. Shipping weight, 38 lb.

No. 247-2 is for hot water space heating boilers. Hot water boilers can run into low water difficulties as a result of leakage, prolonged discharge by the *ASME* relief valve, or even failure to fill system properly. The No. 247-2 takes care of such situations by adding water as needed, and by stopping the burner should the water level drop into the emergency zone. Same as No. 47-2, but specially adapted for hot water service. Installed with 1 in. equalizing pipes. Maximum boiler pressure, 30 lb. Maximum water supply pressure, 150 lb. Shipping weight, 24 lb.

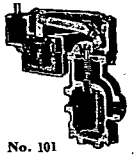
No. 247 Boiler Water Feeder. Same as No. 247-2, but without No. 2 Cut-off switch, for hand-fired boilers. Shipping weight, 23 lb.



McDonnell Low Water Fuel Cut-offs

No. 67

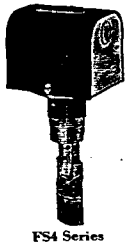
No. 69



No. 63

No. 67 is for steam boilers of any size; maximum steam pressure, 20 lb. *Dependably stops* burner when water level falls into danger zone. Has deep sediment chamber, packless construction, Quick-Hook-up, and extra switch which closes on small drop without stopping burner to operate alarm or control No. 101 Electric Water Feeder. Shipping wt, 11 lb.

69 Series "Built-ins" fit 2½ in. tappings provided in most modern jacketed boilers. Individual models in the series—No. 69, 169, 269, 369, 469, 569 and others—vary principally in length of mounting barrel, are specified by boiler make and model number. Same operating mechanism as No. 67. Shipping wts. vary from 4½ to 9 lb.



No. 63 is designed especially for use on hot water space heating boilers. Handles boilers of any size, pressures to 50 lb. Stops burner and prevents damage to boiler if low water condition occurs. (Can also be used on steam boilers.) Installed with 1 in. equalizing pipes. Shipping wt, 14 lb.

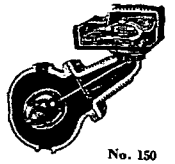
No. 101

McDonnell No. 101 Electric Water Feeder

Used with No. 67 and "Built-in" cut-offs—adds the convenience of automatic water feeding. For boilers to 5000 sq ft. Maximum steam pressure, 25 lb; water supply pressure, 150 lb. Water tappings, ½ in. Shipping wt, 8 lb. For gas boilers with low voltage control circuits order No. 101-24V, complete with transformer. Shipping wt, 12 lb.

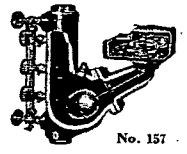
FS4 Series

McDonnell FS4 Series Flow Switch



Dependable, moderately priced device that makes or breaks electrical circuit when flow of liquid in a pipe starts or stops. Used to turn on signal or alarm, or start a motor, burner or metering device. Parts contacting liquid are copper, brass or phosphor bronze. Segmented paddle easily adapted for 1 in. or larger pipe. Models available to make or break circuit with flow. Shipping wt, 3 lb.

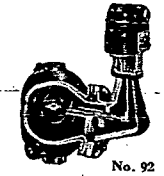
McDONNELL & MILLER, INC.



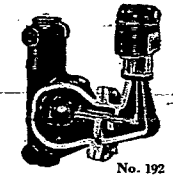
3500 N. Spaulding Ave., Chicago 18, Ill.

Doing One Thing Well

McDonnell Pump Controllers and Low Water Cut-offs



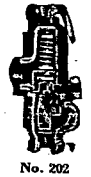
No. 150



No. 157

No. 150 is for steam boilers of any size. Maximum steam pressure, 150 lb. Most widely known and used control of its type. All operating parts are away from heat. No stuffing box to bind or leak. Has *two-switch* construction. One starts and stops pump as boiler calls for water; second operates on greater drop of water line to stop burner and/or complete alarm circuit. Has 1 in. equalizing tappings. Shipping weight, 31 lb.

No. 157 is same as the No. 150 above, but with water column type float chamber that greatly simplifies installation on boilers having separate water columns. Has tappings for ¾ in. water glass cocks, 1 inch equalizing pipes and ½ in. tri-cocks. Shipping weight, 50 lb.

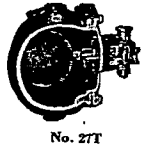


No. 92

No. 192

No. 92 *is for boilers of any size.* Maximum boiler pressure, 250 lb. New control on the market. Introduces the principle of repulsion magnetic switching. Remarkable dissipation of heat permits use of 75 C wire in junction box, as now required by *Underwriters' Laboratories*. Installed with 1¼ in. equalizing pipes. Shipping weight, 64 lb.

No. 192 is same as the No. 92 above, but with water column type float chamber that greatly simplifies installation on steam boilers having separate water columns. Body includes tappings for ½ in. gage glass and tricocks, and for 1¼ in. equalizing pipes. Shipping weight, 69 lb.



No. 202

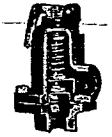
McDonnell 202 Series Pressure-Temperature Relief Valve

For hot water tanks and heaters. Bears the *ASME* symbol of approval, with pressure relieving capacity Btu rated by *National Board*. Also listed by *A.G.A.* All connections are ¾ in. internal tappings. Features special connection for flow to fixtures for easier hook-up, better operation; if use of this is not feasible order NF models.

McDonnell Valve No.		Opening Pressure	Output Btu./hr.	Shipping Wt.
With Fixture Connection	Without			
202-75	202NF-75	75	415,000	4
202-100	202NF-100	100	532,000	4
202-125	202NF-125	125	650,000	4

McDonnell Make-up Water Feeders

No. 27T



No. 21

No. 27T teams up with McDonnell pump controls to provide the one good way to control water level in steam boilers. Pump control calls for water as the boiler itself dictates. No. 27T makes sure there is always an adequate minimum supply in the receiving tank. Has large feeding capacity; stainless steel valve; all brass valve body. For external hook-up with 1 in. equalizing pipes on existing receivers. Feed water tappings, ¾ in. Shipping weight, 39 lb.

21 Series Teams up with McDonnell pump controls. Makes sure there is always an adequate minimum supply in receiver when pump control on boiler calls for water. Mounts right on receiver, and feeds directly into it. Two standard flange sizes fit most existing tank openings: *No. 21* has six bolt holes on 5¾ in. bolt circle, *No. 221* on 8½ in. circle. Feed water tappings, ¾ in. Shipping weights, 15 and 26 lb.

McDonnell 230 and 240 Series Pressure Relief Valves

No. 230-¾ in.-30

Comply with *ASME* Boiler Code in *every respect; tested and Btu rated by National Board of Boiler and Pressure Vessel Inspectors*. Basic construction of all valves is the same, except 240 Series has outlet one pipe size larger than inlet. All operating parts of non-*corrosive* materials. Independent-action testing levers cannot hamper normal operation.

For Hot Water Space Heating Boilers

McDonnell Valve No.	Boiler Size Btu./hr.	Inlet	Outlet	Opening Pressure	Shipping Weight
230-¾ IN.-30	303,000	¾	¾	30	3
240-¾ IN.-30	513,000	¾	1	30	3

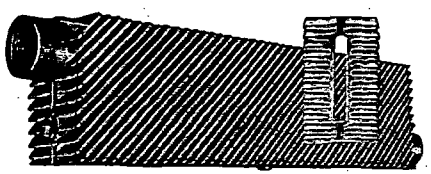
WILSON ENGINEERING CORPORATION

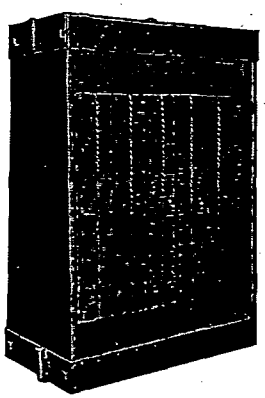
6 North Michigan Avenue, Dept. HG59, Chicago 2, Illinois



WILSON
CENTRIFUGAL BLOWDOWN SEPARATOR

SOLVES BOILER BLOWDOWN DISPOSAL PROBLEMS

Here is the safe, economical way to handle boiler blowdown . . . at atmospheric pressure. Steam flash is instantaneously cleared through the large top vent pipe. Water and sludge fall by gravity through bottom drain. No objectionable noise. Install where convenient, inside or out. One Wilson Separator can handle two or more boilers in battery, if desired. Special models with flanged or butt welding connections available.



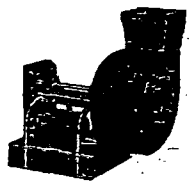
• MEETS REQUIREMENTS OF A.S.M.E. UNFIRED PRESSURE VESSEL CODE

• SIMPLE TO INSTALL • REQUIRES NO MAINTENANCE • THOUSANDS IN SERVICE

WILSON ALL-CAST ALUMINUM RADIATION ELEMENTS

Wilson All-Cast Aluminum Directional-finned Radiation Elements are readily adapted to many applications. The patented 45° directional fin feature and the chamber shape provide for compact installation and high thermal efficiency in heat transfer problems. Extremely rugged in construction. High pressure hydrostatic tested.

WILSON UNIT HEATERS



Provides large volume of warm air over wide floor areas. Completely dependable in service where corrosive atmospheres and maintenance costs are prime factors. Ask for specifications.

WHITTY COMPANY, INC.

86 Western Avenue — Boston 34, Mass.

MANUFACTURERS OF INDUCED DRAFT FANS, DAMPERS, AND DRAFT CONTROLS

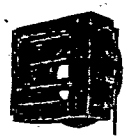
INDUCED DRAFT FANS

A, B, D Chassis

Used in lieu of tall chimneys; used to improve the combustion efficiency of automatic burners; used to correct inadequate draft.

Furnished in 22 models with capacities to 24,000,000 Btu boiler output. A size to match every boiler and heater in the Commercial-Industrial range.

Fan housing is mounted on a rigid structural chassis in either a clockwise or counter-clockwise rotation; with a choice of vertical, horizontal, or angular discharge.

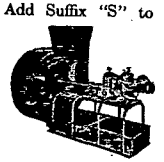


See "Time-Saver" chart below for application data.

K Chassis

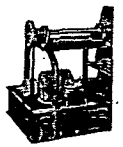
MULTI-BLADE DAMPERS

Inlet boxes with factory installed Dampers are available for use with power-operated draft regulators. Add Suffix "T" to model number.



Multi-Blade Dampers

Optional apparatus for regulating over-fire draft is available for shipment with Fans. Power actuators may be ordered for mounting to dampers at the factory.



STEAM DRIVE

Steam-turbine Drive has built-in speed reducer to maintain the same slow speed feature as the motor-driven models. Add Suffix "S" to model number.

Steam Drive

MECHANICAL TURNDOWN

Mechanical Turndown

Turning handwheel varies Fan speed through an automatic pulley device while maintaining constant motor speed. Add Suffix "J" to model number.

DRAFT MONITOR

Prevents start-up of burner unless boiler draft is proved adequate and cuts off burner whenever the draft becomes inadequate. Specify DM-3.

Draft Monitor

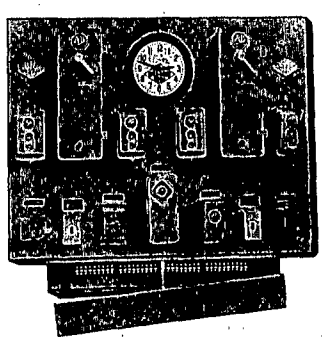
AIR-CONTROLLED BITUMINOUS STOKERS

- RESIDENTIAL
- COMMERCIAL
- INDUSTRIAL

HOPPER MODELS

BIN FEED MODELS

Hopper Models



Patented automatic air control insures delivery of correct quantities of air to meet constantly changing fire-bed conditions, eliminates need for banked firing methods and prevents back-smoking. If overload occurs, shear pin and automatic switch protect stoker against damage. Strong, cast iron hopper base with heavy gage rust-resisting steel hopper. Will-Burt hopper type stokers are available in 20 to 750 lb per hr capacities.

Bin Feed Models

Like the hopper models, Will-Burt bin-feed stokers offer all the advantages of automatic air control and the patented protective shear pin and switch. Patented flange and set screw locking device prevent coal screw from disengaging from drive shaft. Precision machined power unit. Capacities from 20 to 750 lb per hr.

PRE-WIRED PANEL CONTROL BOARDS

Prewired, pretested control panel boards provide an interconnected control system for stokers to be operated by either a common operating and/or individual holdfire control, depending on the setting of the safety switch, off-on switch and timeswitch cycle. Mounting wall brackets are provided. Not illustrated, but available are control cabinets with controls mounted and wired on a subpanel and completely enclosed in heavy steel cabinet.

REFERENCE MANUAL . . . *yours to use!* Specifications, drawings, technical data and recommended applications. Write for free copy.

STOKER RATING TABLE

* Load values given are based on coal having a heat value of 12,000 Btu per lb. (Density 48 lb per cu ft) and an overall efficiency of boiler and stoker of 65 percent to and including 100 lb/hr and 70 percent for those stokers over 100 lb/hr. Full-time operation.

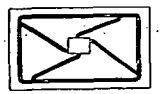
SONOCO SONOAIRDUCT® FIBRE DUCT

for slab floor perimeter heating or combination heating and cooling systems



Sonoco Sonoairduct is a round, lightweight fibre duct that is aluminum foil lined and wrapped with black, asphalt filled, duplex kraft paper. It is especially designed for use as supply and return lines in gas and oil fired, slab floor perimeter heating or combination heating and cooling systems. It can also be adapted for use in spot cooling and ventilating systems. Sonoairduct meets and exceeds *F.H.A.* criteria and test requirements for products in this category.
Sonoairduct is aluminum foil lined for lower co-efficient of air friction. The air friction loss of 8 in. Sonoairduct is 0.151 in. of water per 100 ft at a velocity of 800 ft per minute and 70 F. Sonoairduct has a heat conductivity of 0.46 Btu per hr per sq ft per deg F per inch of thickness. This low heat loss prevents hot spots in the slab above the encased duct.
Sonoairduct possesses a sound-deadening quality which minimizes transmission of noise from furnace and from room to room. As the wall thickness increases with diameter size, Sonoairduct is highly resistant to crushing.
Sonoairduct Fibre Duct is available in 23 sizes—2 in. to 36 in. I.D. Unless other lengths are specified, shipments will be made in standard lengths of 18 ft. It is easy to cut to exact length with a hand or power saw on the job. Long lengths mean faster leveling and fewer joints to make and seal. Sonoairduct fits all standard metal bends, elbows, T's and registers. All installations should be made in accordance with Sonoairduct Manual No. 557, which is available upon request.

AMERIVENT double-wall GAS VENT PIPE and FITTINGS

For Gas-Fired Water Heaters, Boilers, Furnaces, Space or Wall Heaters

Basically, AMERIVENT is a pipe-within-a-pipe. Like the familiar thermos bottle, it utilizes reflective surfaces possessing low heat-radiating values and separated by an insulating air-space which prevents excessive heat loss—and draft loss—from the vent. AMERIVENT'S thin aluminum inner pipe is designed to heat immediately to a fully-primed, fully-operating temperature, thus preventing condensation and dangerous spillage of waste gases into the structure through the draft hood. The heavy-gage galvanized outer pipe stays cool to protect against fire hazards and heat-damage and to permit low-clearance installation.

PIPE SIZE:	AVAILABLE LENGTHS: 5'	3'	24"	18"	12"	6"
Style "E" 3", 4", 5" & 6"						
7" & 8"						
Style "R" 10" & 12" & Larger						

Shaded area indicates available sizes

Two types of Round Amerivent—Style "E" and Style "R"—are available, depending on the size desired. Both types carry full *U-L* approval, both employ a high-purity aluminum inner-pipe enclosed in a galvanized steel outer-pipe and both require only 1 in. minimum clearance from combustibles when installed. In addition, both pipes feature the improved Amerivent SNAP-LOCK joint. To assemble, simply press mating ends together and snap—a secure gas-tight joint is formed. A complete line of fittings is available.

Shaded area indicates available sizes

Oval Amerivent is furnished in one model—Style "O"—in 4 in. and 5 in. sizes. It carries full *U-L* approval as a Type B gas vent requiring only 1 in. minimum clearance from combustibles. Style "O" Amerivent is also *UL*-approved as a Type B-W vent for use only with recessed (wall) gas heaters. In this application, 4 in. oval Amerivent can be installed in a 2 in. x 4 in. stud wall if used in conjunction with ceiling plate spacers and hold-down plate. A complete line of fittings is available, including adaptors for converting to or from Round Amerivent.

METALBESTOS DOUBLE-WALL GAS VENT PIPE AND FITTINGS

In Type B gas vent installations, the double-wall insulated design of Metalbestos gas vent pipe prevents condensation within the vent and spillage of combustion products at the appliance's draft hood. Rugged galvanized steel outer pipe is durable and strong. Inner aluminum pipe is corrosion-resistant, heats up quickly to create a strong venting draft. The built-in insulating air space prevents heat loss from flue gases as they pass through the vent to the out-of-doors.

RV METALBESTOS

Listed Sizes: 3 in., 4 in., 5 in., 6 in.

Standard Lengths: 6 in., 12 in., 18 in., 3 ft., 5 ft.

The convenient fittings of Metalbestos RV pipe permit complete venting for standard or special installations . . . eliminate job-site cutting and special hand-made parts. All RV round pipe features the quick-joining Rota-Lock Coupler.

QC METALBESTOS

Listed Sizes: 7 in. and 8 in.; Standard Lengths: 18 in., 3 ft., 5 ft.

Listed Sizes: 10 in. and 12 in.; Standard Lengths: 18 in. and 3 ft.

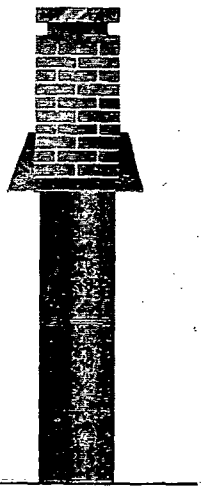
Larger-size QC Metalbestos is often required to furnish the common vent for two or more gas appliances. QC fittings are easily joined to QC standard lengths by means of the secure, die-formed QC coupler.

OVAL METALBESTOS

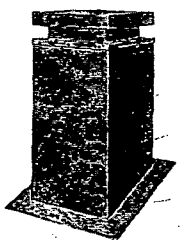
Listed Sizes: 4 in. (WV), 5 in. (Crimp)

Standard Lengths: 4-in. WV – 6 in., 12 in., 18 in., 3 ft., 4 ft., 5 ft.
5-in. Crimp – 3 ft. and 5 ft.

WV Metalbestos is designed for installation within 2 x 4 walls as Type B-W vent pipe for recessed wall heaters up to 65,000 Btu, and as Type B vent pipe for other installations. 5-in. Crimp-Joint Oval Metalbestos permits venting of larger-input appliances within 2 x 6 walls.



Metalbestos "Safety System" Gas Vent Tables Assure Correct Installation



The Metalbestos "Safety System" Gas Vent Tables were developed by the Metalbestos Division of the William Wallace Company to give installers a simple, scientifically accurate guide to safe, correct gas venting. Comprehensive charts cover both individual and combined gas vents and provide the information that allows installers to solve the majority of their gas venting problems.

Easily read and understood, the illustrated "Safety System" Tables include appliance sizes and vent diameters most frequently encountered in gas vent installation. *Copies of the Metalbestos "Safety System" Gas Vent Tables may be obtained by writing to Dept. 9, William Wallace Co., Belmont, Calif.*

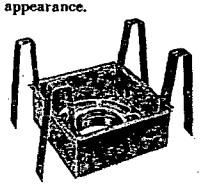
DELUXE AND STANDARD CHIMNEY HOUSINGS (16" x 16")

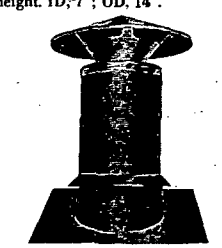
The four panels of the Standard Chimney Housing are simply assembled by means of slip-lock corners. Galvanized steel panels are easily painted in the same manner as galvanized gutter. Prepainted De Luxe Housing (shown in complete installation above) has the same construction as the Standard Housing and is available in attractive simulated red and buff brick. Heights: 3', 4', 5'.

THE METALBESTOS ALL-FUEL CHIMNEY FOR —



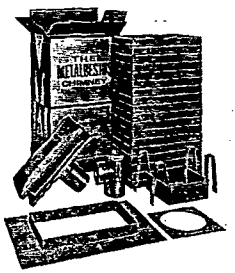
- Appliances Burning Oil . . . Gas . . . Coal . . . Wood
- Domestic Incinerators

The *light-weight, all-fuel* Metalbestos Chimney installs quickly and easily . . . reduces job-site construction time through simple, one-man installation. High-temperature-resistant mineral fiber and double-wall construction offer maximum performance and safety with any fuel. Exclusive Twist-Lock Coupling securely joins sections with a simple ⅛ turn . . . without cement, mastic, or screws. De Luxe Chimney Housing (shown at left) is one of four Metalbestos Chimney Tops designed to satisfy all requirements of cost or appearance.



CHIMNEY PIPE

Between an outer pipe of galvanized steel and an inner pipe of stainless steel, mineral fiber is packed to assure safe, light-weight insulation. Combinations of easy-to-handle 18-in. and 30-in. lengths provide required Chimney height. ID, 7"; OD, 14".



CHIMNEY SUPPORT ASSEMBLY

The sturdy Metalbestos Chimney Support Assembly when suspended from structural joists can easily support any Chimney height up to 53 feet.

ROUND CHIMNEY TOP ASSEMBLY

Contemporary in appearance, the Round Chimney Top handsomely complements modern building design. Complete assembly includes Chimney Top, Round Storm Collar, and Round Adjustable Roof Flashing. Tall Cone Roof Flashing is available for flat-roof installations.

CUSTOM CHIMNEY HOUSING

Custom Chimney Housing is pre-treated to permit direct paint application. "Shadow-Line" ridging adds extra reinforcement . . . simulates pattern of brick when painted. Custom Installation Package includes: Top, Housing, Chimney Flashing, Firestop Spacer, Support Assembly, Starter Tee.

This Metalbestos Chimney Catalog-Brochure gives you complete information on the all-fuel Metalbestos Chimney. Write to Dept. 9, William Wallace Co., Belmont, Calif.

DURA-VENT CORPORATION

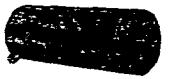
DURA-VENT DOUBLE-WALL GAS VENT PIPE AND FITTINGS ASSURES SAFE GAS VENTING



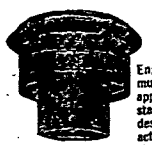
Dura-Vent Type B. Gas Vent Systems are made of 28-gage galvanized steel outer pipe and .016-inch aluminum inner pipe. The galvanized pipe complies with the U.L. requirements for fire stopping. The inner aluminum pipe is corrosion resistant to all flue gases, and it heats up quickly and maintains the proper temperature for a strong venting draft. The Dura-Vent design of continuous air space on all sizes of pipe and fittings keeps the outer pipe cooler than most other types of gas vent, and is preferred by most architects and specifying engineers.

ROUND PIPE

The 7-inch and 8-inch size pipe is made in the following lengths; 18-inch, 3-foot and 5-foot. The 10-inch and 12-inch size pipe is made in 18-inch and 3-foot lengths.
Dura-Vent round pipe and fittings are made in sizes from 3-inches to 12-inches in inside diameter. Pipe and fittings larger than 12-inches can be furnished on special order. The most commonly used sizes—3-inches through 6-inches—use the simple push-snap-twist lock. Pipe of larger sizes are locked together with screws.

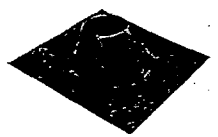
ADJUSTABLE LENGTH

Adjustable lengths are 12-inches long and available for 3-inch size through 8-inch size round pipe.



INCREASER

Increasers are used where two or more appliances are connected to the same vent. See Dura-Vent catalog for complete listing.



DRAFT-HOOD CONNECTOR

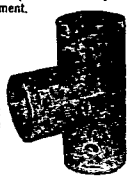
Draft hood appliance connectors are available in all sizes.

APPROVED DURA-VENT TOP

Engineered for maximum efficiency, smart appearance and easy installation. Scientifically designed to help draft action. Available in all sizes.

ADJUSTABLE ROOF FLASHING

Available in sizes 3-inch through 12-inch.



90° ADJUSTABLE ELBOW

Available in sizes 3-inch through 8-inch. A special feature of Dura-Vent is continuous air space the maintenance of in all positions of adjustment.

45° ADJUSTABLE ELBOW

Available in sizes 3-inch through 12-inch. A special feature of Dura-Vent is maintenance of continuous air space in all positions of adjustment.

TEE

Available in sizes 3-inch through 12-inch, plus a number of special reducing tees. Consult catalog for complete details.

OVAL VENT PIPE AND FITTINGS

STRAIGHT LENGTH

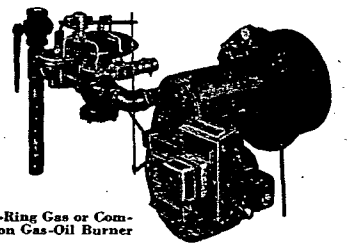
Available in 4-inch and 5-inch sizes. Consult catalog for details. Adjustable lengths are also available in 4-inch and 5-inch sizes.
Dura-Vent oval pipe and fittings are furnished in the 4-inch and 5-inch sizes. All oval pipe and fittings use the simple push-snap lock, which provides a rigid joint that can be easily taken apart if necessary.
The 4-inch and 5-inch size given for oval pipe refers to no measurable dimension, but signifies that the pipe is equal in venting capacity to 4-inch and 5-inch round pipe respectively.

45° ELBOW STANDARD

Standard 45° elbow illustrated. Available in 4-inch and 5-inch sizes. 45° flat elbow is also available in 4-inch and 5-inch sizes.

TEE

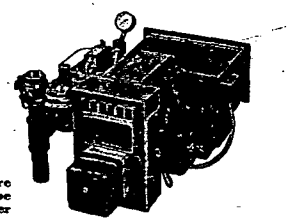
The oval tee available in 4-inch and 5-inch sizes.



ADAPTER, OVAL TO ROUND

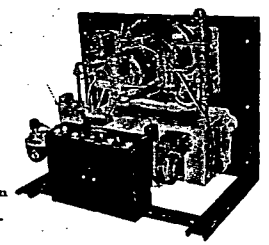
Oval to round adapter illustrated. Round to oval adapter also available. These adapters available in 4-inch and 5-inch sizes.

Gordon & Piatt, Inc. P.O. Box 914 Winfield, Kansas



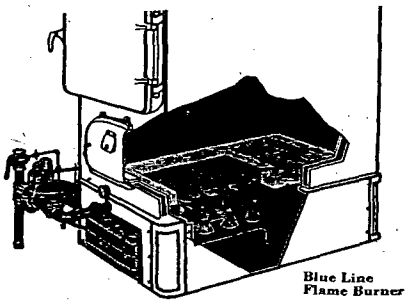
Combustion Engineering

TURBO-RING FORCED DRAFT GAS OR GAS-OIL BURNER provides all air for combustion under pressure adequate to fire Multiple Pass Scotch Marine Type Boilers without Stack or *ID* Fan. Complete package, with Combustion Safeguard, sequencing relays, indicating lights and switches prewired and tested. Natural Gas, No. 2 Oil, or Combination Gas-Oil in sizes to 200 hp. *See Cat. E-50.*



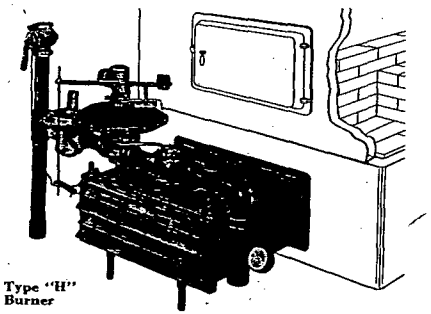
Turbo-Ring Gas or Combination Gas-Oil Burner

TURBO-FIRE POWER TYPE GAS BURNER refractory nozzles and distinctive air distribution give desired flame characteristics. Factory assembled with control panel prewired and tested. Sizes listed for 500,000 to 28,000,000 Btu/hr. *See Cat. C-10.*



Turbo-Fire Power Type Gas Burner

COMBINATION GAS AND ROTARY CUP-OIL BURNER for larger installations requiring high performance operation on both gas and either light or heavy oil. Turbo-Fire Power Type Gas Burner and Rotary Cup-Oil Burner. Factory assembled, prewired and interlocked. *UL* listed to 30,000,000 Btu/hr. *See Cat. E-FGO-10.*



Combination Gas and Rotary Cup-Oil Burner

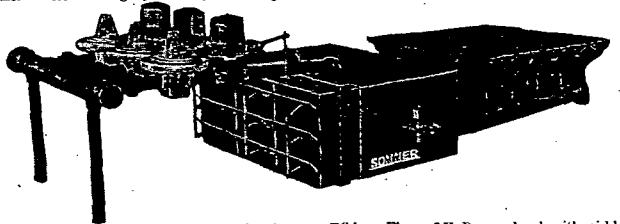
BLUE LINE FLAME BURNER atmospheric upshot type to convert large size heating plants and power boilers. Cast-iron burner heads with deep-slotted, machined ports suitable for natural gas or LP Gas under wide range of pressures. Welded manifolds to fit size and shape of fire box. On-Off, Throttling or Step-firing available. PBL Package Models to 960,000 in *Cat. A-11.* Larger sizes *Cat. A-10.*

Blue Line Flame Burner

TYPE "H" BURNER atmospheric inshot type for Scotch Marine Boilers and other applications where horizontal flame is indicated. Consists of removable cast-iron venturis with stainless steel flame retention nozzels. Natural or L.P. Gas. 33 sizes listed in *Cat. H-1A.* Others available on application.

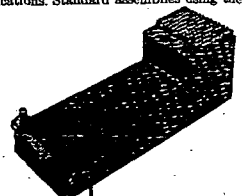
Type "H" Burner

GORDON & PIATT are Combustion Engineers and Manufacturers, specializing in the design and manufacture of a complete line of Gas and Combination Gas-Oil Burners.



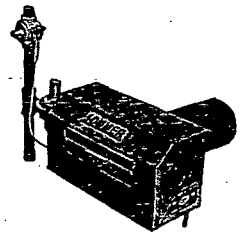
In addition to the burners illustrated, they manufacture Domestic Conversion Burners (7 Models listed by *A.G.A.* and *C.G.A.*). Control Panels, as cataloged, or custom-built to meet customers' requirements. Write for complete information.

The Sonner Burner Company

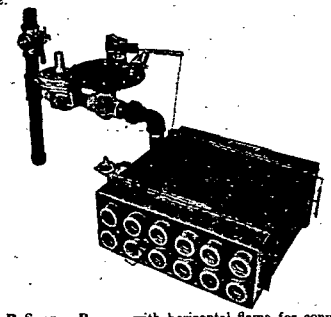


DESIGNERS AND MANUFACTURERS OF GAS CONVERSION BURNERS

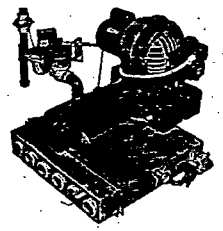
OFFICES AND FACTORIES: WINFIELD KANSAS



Sonner Gas Conversion Burners are a product of nearly a half century of specialization in design and manufacture. Many of the Sonner Conversion Units feature the Blue Ribbon Flame LV Burner Head with Airblend Design. Each ribbon of flame receives all the oxygen it needs to support complete effective combustion—from both sides along its full length—because the extraordinary Sonner Airblend Design provides just the right amount of secondary air in the right places. *Catalog 58-L-8* gives complete description of this efficient blue ribbon of flame. A wide range of designs provides a Sonner Burner for domestic, commercial, or industrial use. Sonner engineering service is always available for consultation; write for catalog containing complete line.



Type LVS Step-Fire Burner assemblies for large heating plants and power boilers where load varies to such extremes as to make this operation desirable. Three step control is the usual arrangement although it may be altered to meet engineers' specifications. Standard assemblies using the Sonner Blue Ribbon Flame LV Burner head with airblend design which provides just the right amount of secondary air to support complete and effective combustion, capacities for 1,440,000 to 7,200,000 Btu/hr are described in *Catalog 57-LVS-1*. Larger capacities available; consult Sonner engineering service.



Type L-1 Heat Machine is designed specifically for the conversion of residential heating plants, either round warm air furnace or a rectangular boiler, to gas. Completely automatic burner, using the Blue Ribbon Flame LV Burner head with airblend design, is *A.G.A.* listed. Available in two sizes with capacities ranging from 75,000 to 400,000 Btu/hr. *See Catalog 58-L-8.*

Type WX-55 Sonner Burner specifically designed for replacing small gun type oil burners in domestic furnaces and boilers. *A.G.A.* listed with inputs ranging from 75,000 to 200,000 Btu/hr. *See Catalog WX-55-1.*

Type R Sonner Burner with horizontal flame for conversion of scotch marine boilers and similar equipment to gas and stand-by fuel applications. A multiple-venturi burner in factory built fully assembled form. Standard assemblies from 240,000 to 7,200,000 Btu/hr. *See Catalog 58-R-1*. Larger capacities available; consult Sonner engineering service.

Gas-Oil Unit for commercial and industrial boilers, two fuel burning units, each designed for one fuel only—natural gas and light fuel oils. For capacities from 280,000 to 2,800,000 Btu/hr input; *See Catalog 58-CU-1*. Larger capacities available; consult Sonner Engineering Service.

THE CARLIN COMPANY

912 SILAS DEANE HIGHWAY · WETHERSFIELD 9, CONN ·

MANUFACTURERS OF OIL BURNERS AND OIL-FIRED HOT WATER HEATERS

Pressure-atomizing, fully automatic, gun-type Oil Burners for residential and commercial installations.

The Carlin Company manufactures a complete line of quality oil burners in capacities from 0.65 to 20.00 gph for use of No. 2 grade fuel oil. Pedestal and flange mounted models are offered. Suspension mounting to popular makes of boilers and furnaces is made easy with a wide selection of flanges and mounting plates especially developed by U.S.-Carlin. Advanced design features include the "Shell Head," a significant improvement in oil burning which develops higher combustion temperatures, makes heat-wasting soot deposits negligible, conserves fuel. With either distillate or catalytic fuels, operation is quiet, clean, economical. Generous use of heat and corrosion resistant alloys guards against deterioration—makes cleaning easier.

U.S.-Carlin Oil Burners are available with Electronic Controls which comply fully with Underwriters' Laboratories latest safety switch timing requirements. Many types are factory mounted and wired to insure proper hook-up and save on-the-job wiring expense.

For complete technical literature including consulting engineers' manual, specification sheets, electronic control data, combustion chamber dimensions, etc., address The Carlin Co., 912 Silas Deane Highway, Wethersfield 9, Conn.

CONDENSED SPECIFICATIONS

MOTOR—Long-hour duty with safety overload control. Complies with *NEMA* mounting specifications. ⅙ hp. (Models 400, 150F, 400S, 150SF-2, 500S-35); ⅓ hp. (Models 650, 700S-35, 800S-4); ¼ hp. (Model 1200); ½ hp. (Models 2000S-5, 2000).

TRANSFORMER—Shielded to block radio and TV interference. 10,000 volt (12,000 volt on Models 2000S-5, 1200, 2000).

AIR TUBE—Steel with heat resistant air cone.

FAN—Precision balanced. Mounted directly on motor shaft.

NOZZLE—Stainless steel alloy. Hollow cone spray (Hollow cone or solid spray on Models 1200, 2000). Dual nozzles on Models 500S-35, 650, 700S-35, 800S-4, 2000S-5, 1200, 2000.

FUEL UNIT—Single-stage standard on Models 400, 150F, 400S, 150SF-2, 500S-35, 650. Two-stage on Models 700S-35, 800S-4, 2000S-5, 1200, 2000. Built-in strainer and pressure regulating valve. Capacity of strainer equals or exceeds maximum firing rate of burner.

SOLENOID VALVE—Combination delayed-opening and instantaneous cut-off oil valve standard on all "S" models, also 1200, 2000.

COMBUSTION HEAD—Models 150F, 400, and 650 have standard head with diffuser vanes formed at a fixed angle to establish air pattern. Model 150F (0.65 to 1.35 gph capacity) and Model 400 (0.65 to 1.00 gph capacity) have a series of adjustable openings in center of diffuser for regulating air delivery to shape the fire.
All "S" Models have "Shell Head" and finned collar for efficient mixture of air with oil. Models 1200, 2000 have High Temperature Combustion Head with finned collar for greater firing rate (Model 2000) and narrower fire.

ELECTRODES—Nichrome steel with full-glazed porcelain insulators counterbored for utmost safety. Flared, "Wide-arc" design permits heavier spark and assures positive protection during low voltage periods.

BUS BARS—Rigid heavy-gage brass (Models 400, 400S, 500S-35, 700S-35, 800S-4); phosphor bronze (Models 150F and 150SF-2); high tension leads (Models 650, 2000S-5, 1200, 2000).

HOUSING—Cast iron. Designed to assure efficient air delivery and quiet operation. Machined to rigid standards.

COUPLING—Universal type with neoprene center piece. (Flexible type on Models 2000S-5, 1200, 2000).

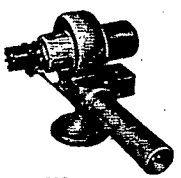
CONTROLS—Thermostat, Limit Control, and Stack Relay. Electronic Control set in place of Stack Relay on Models 800S-4, 2000S-5, 1200 and 2000.

ELECTRICAL CHARACTERISTICS—115V-60 cycle. 1725 rpm. All models except 150F and 150SF-2 available with 230V-60 cycle on special order. **Also a complete line of 110 and 220V-50 cycle models with capacities from 0.50 to 15.00 gph.**

MODEL 400
0.65 to 4.00 gph
Also available for flange mounting

MODEL 400S
0.75 to 3.00 gph
Also available for flange mounting

MODEL 150F
0.65 to 2.00 gph
Also available for *pedestal mounting*



MODEL 150SF-2
0.65 to 1.35 gph
Also available for pedestal mounting

MODEL 500S-35
3.00 to 4.50 gph

MODEL 700S-35
3.50 to 7.00 gph

MODEL 650
3.50 to 6.50 gph

MODEL 800S-4
4.00 to 8.00 gph

MODEL 1200
6.00 to 12.00 gph

MODEL 2000S-5, 7.00 to 12.00 gph
MODEL 2000, 10.00 to 20.00 gph

U.S.-Carlin Oil Burners are listed by *Underwriters' Laboratories, Inc.* and are approved under *U. S. Government Commercial Standard C372-58*. Grade of fuel oil recommended is No. 2 *U. S. Government Commercial Standard CS18*.

Enterprise Engine & Machinery Co.

ENTERPRISE BELT DRIVE HORIZONTAL ROTARY BURNERS

TYPE A OIL BURNER

A fully automatic burner equipped with either gas-electric or oil-electric ignition system. Firing rate controlled by either modulating or two position control meter, with low fire start.

TYPE I OIL BURNER

Manual—To be started, stopped and regulated by an attendant.

Semi-Automatic—To be started by an attendant. Firing rate controlled by either modulating or two position control motor.

COMBINATION GAS-OIL BURNERS

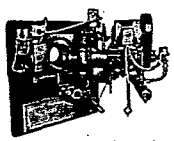
Three types of burners are available depending upon the method of starting the burners:

Type AY is furnished with gas-electric ignition and programming type safety combustion controls to provide full automatic operation. Requires manual re-set of control only after safety shut down.

Type AY-1 is furnished with manually operated gas-electric ignition and combustion safety control. Requires manual re-starting after shut down due to any cause.

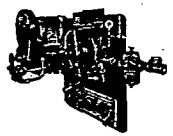
Type AY-2 requires manual starting and torch ignition of main flame on oil or pilot flame on gas. Utilizes combustion safety control which requires manual starting after shut down due to any cause.

APPROVALS



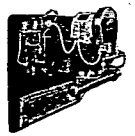
All Enterprise Burners are listed by *Underwriters' Laboratories, Inc.* and approved by *Canadian Standards Association* and many state and civic safety authorities.

FUEL

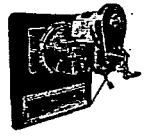


Burners are listed to burn oil not heavier than Commercial Standard Grade No. 5 without electric oil preheater and C.S.G. No. 6 when equipped with electric oil preheater; also natural, manufactured, or liquefied petroleum gases. Minimum required gas pressures of 2 to 5 in. water column, depending upon burner size.

DESCRIPTION



Burner utilizes standard electric motors with single- or multiple V-belt drive to provide full burner rating at any frequency of electric power. Available for either single or polyphase power, voltages of 110, 208, 220, 440 or 550 at 50 or 60 cycles. All listed types of electronic safety controls available. Burner may be furnished with integral fuel oil pump, with integral metering pump, or non-pump with separate pump set.



Type AY—Combination Gas-Oil Burner

Type A—Automatic Burner without Electric Oil Heater

Type A—Automatic Burner with Electric Oil Heater

Type I—Simple Manual Type Burner

Ratings are based upon the combustion of fuel having heat contents of 150,000 Btu per gal for oil and 1000 Btu per cu ft for gas, both at 75 percent efficiency. Outputs are based on the requirements of 970 Btu per lb of steam, 33.500 Btu per boiler hp, 240 Btu per sq ft of steam radiation and 150 Btu per sq ft of hot water radiation. When using lighter grades of fuel oil, burners will handle an increased oil input sufficient to maintain the same total heat output as for heavy oil.

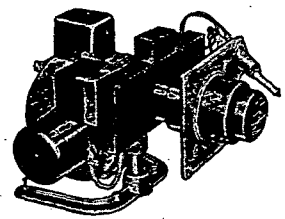
S. T. JOHNSON CO.

940 Arlington Ave., Oakland 8, Calif.

Johnson Oil Burners

Church Road, Bridgeport, Pennsylvania



BANKHEAT BURNERS

Pressure atomizing type. Fully automatic electronic controls. Built with the heat saving air-shut-off feature which prevents cold air from passing through the burner, firebox and flue when burner is not in operation. *Pump-driven oil is forced* through orifice, pressure-atomized and mixed with whirling jet of fan-driven air, to burn with a soft clean flame while suspended in air.

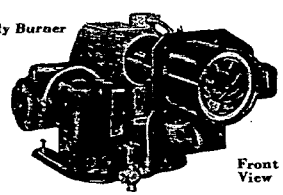
Notable for exceptional efficiency, fuel-economy and trouble free performance. Adaptable to most domestic and commercial heating needs. Particularly suited to use for "conversions." Easy to install and service.

Water Heaters, Boiler-Burner Units, Hot Air Furnaces

Johnson Water Heaters, Boiler-Burner Units and Hot Air Furnaces powered by Bankheat Burners are available in a wide range of sizes and types. Descriptive literature on any item may be had on request.

BANKHEAT Combination OIL-and-GAS BURNERS

Will automatically burn either oil or gas with high efficiency. An ideal installation for areas where low-cost gas is available only on a part time basis. You can change from one fuel to the other with a flip of the changeover switch (either manual or, at small extra cost, automatically controlled by outside temperatures).



Sizes and Capacities. Bankheat Burners

FORCED DRAFT BANKHEAT BURNERS

Fully automatic, for Firing on OIL only, GAS only, or COMBINATION OIL-and-GAS

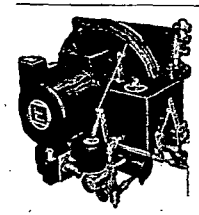
Gas Only Burner Size 100

Front View

Combination Oil & Gas Burner Size 100 Gas-Electric Ignition on Both Fuels.

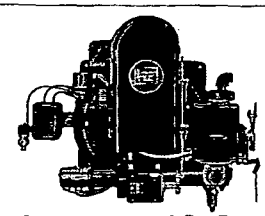
Rear View

Built to deliver all the air needed for combustion without the aid of an induced-draft fan or tall chimney. A special backward-curved fan rotating at twice ordinary speed drives this air with a minimum of pulsation in the air stream delivered to the combustion chamber. With Bankheat Forced Draft Burners there are few pulsation problems on "hard to fire" installations involving either positive or negative firebox pressures.



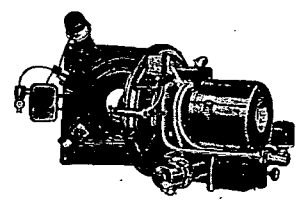
Made in 5 basic sizes: 30, 40, 60, 80 and 100 hp. These ratings are based on positive firebox pressures up to 0.75 in. wc. These units are easily wired, installed and serviced. Flange mounts are furnished. According to Type and Size, each burner is equipped with Straight-Electric or Gas-Electric ignition, with Electronic Controls to suit.

S. T. JOHNSON CO.



940 Arlington Ave., Oakland 8, Calif.

Johnson Oil Burners



Church Road, Bridgeport, Pennsylvania

Model 53 Burner

Model 53 Burner with Belt Drive

Model 53 Combination Oil-and-Gas Burner

JOHNSON MODEL 53 METERING PUMP BURNERS

Fast Positive Starting. Smooth Operation. Greater Fuel Economy.

These rotary-type burners were *designed to produce sure*, automatic "starts" even when the oil in storage tank and lines is cold and hard to pump. This important performance feature was accomplished by using a positive-displacement Metering Pump, . . . a 3-Way Magnetic Oil Valve, . . . and a high *efficiency Suction Pump*, which enable Model 53 Burners to maintain, automatically, a fixed air-fuel-ratio regardless of variations in oil temperature and viscosity.

They are easy to set and to control. Firing Rate can be determined by reading the setting of the Metering Pump Quadrant. All working parts are quickly accessible for servicing or repair. The fuel economy and reliability of these burners has been thoroughly established in every type of heavy duty service throughout America and numerous foreign countries. Model 53 Burners are available with either conventional Direct Drive or with Belt Drive for use in installations using 50 cycle current to maintain 60 cycle speed, . . . and on installations where additional capacity is required.

They are available for firing on Oil Only, Gas Only, or as Combination Oil-and-Gas Burners. There are 9 sizes ranging from 28 to 560 hp and from 3980 to 78600 sq ft Steam Radiation.

SIZES AND CAPACITIES, MODEL 53

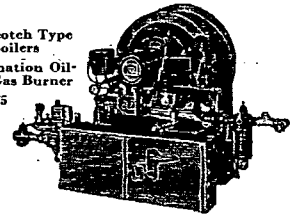
400	4	5	190	120	150	133	450	15600	62350	101200	15188
500	7½	10	225	150	187.5	168	560	19400	78600	126000	18900

Capacities and ratings are based on 60 cycle current.

* Burner size designation is boiler horsepower developed at nominal firing rate obtained at metering pump setting of 1.0.



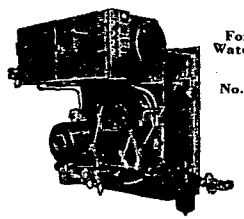
‡ *Maximum metering pump capacity setting 1.25 is maximum firing rate.*

† Burner rating is based on specific conditions of draft, combustion volume and combustion chamber design. Under favorable conditions, it may be permissible to use maximum firing rate. Under restricted conditions, it may be desirable to use reduced firing rates. Ratings based on 150,000 Btu/gal and 75 percent efficiency. For use with #2 to #6 C.S.G. Fuel Oil.

COMPACT FORCED DRAFT Package Unit BURNERS

For Scotch Type Boilers

Combination Oil-and-Gas Burner Size 75



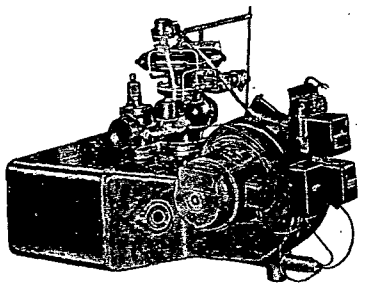
Built for firing on Oil Only, Gas Only or as Combination Oil-and-Gas Burners. Two types are available for use on Scotch Type or Firebox Type boilers. They are engineered to provide all the air needed for proper combustion regardless of stack conditions and firebox pressure variations.

For Firebox and Water Tube Boilers

Oil Only

No. 5 or No. 6 Oil

Size 150

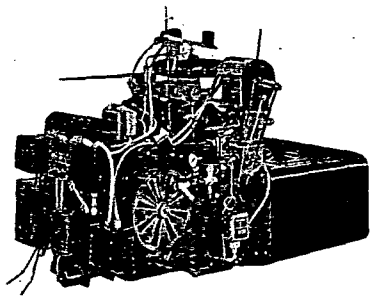


All these Forced Draft Package Units are factory-assembled, wired and tested, complete with all the controls mounted in dust type cabinet, ready for fast, inexpensive installation on any standard size and type of boiler. They are available in the sizes and capacities listed above for Johnson 53 Burners.

SHEETS GIVING CATALOG DATA AND SAMPLE SPECIFICATIONS ARE AVAILABLE ON REQUEST

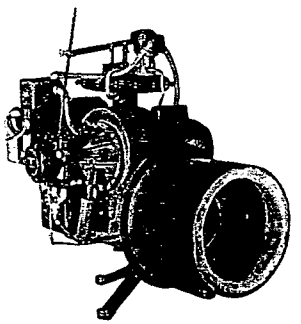
THE METTLER CO., Inc.

1101 Buchanan St., Rockford, Ill.



Division of Eclipse Fuel Engineering Company

Packaged burners for gas or combination gas-oil firing rated up to 800 bhp output have been designed and built by Mettler for more than 35 years.



FAN-AIR GAS BURNERS

For forced, induced or natural draft operation in large and small power plants with capacities from 1,300,000 to 35,000,000 Btu input. Eight largest standard size burners are equipped with enclosed control cabinets. *Details in Bulletin G-200-B.*

FAN-AIR COMBINATION GAS-OIL BURNERS

With output ratings of 25 to 800 bhp, change fuel at the flick of a switch located either on burner or at remote station. Oil-gas internal assembly combines gas pilot, oil nozzles, spark rods, flame rod, photo-cell and stainless steel Turbo-Fins in a single compact unit for adjustment or cleaning. *Details in Bulletin GO-200-B.*

TURBO-FLAME BURNER

Is a single port nozzle mixing burner for gas, oil, or gas-oil combination firing. Designed for use on Scotch marine boilers where back pressure or positive pressure exists or is likely. Capacity ranges from 500,000 to 5,000,000 Btu/hr depending on back pressure. *Details in Bulletin GO-300-B.*

Other standard Mettler burner lines include the Series "C" entrained combustion gas burners and Mettler junior "Fan-Air" burners rated at 150,000 to 1,400,000 Btu input. Literature on both lines available.

RAY BURNER COMPANY

Since 1872

1301 San Jose Avenue; San Francisco 12, California

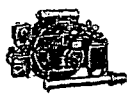
Atlantic Seaboard Div.; 629 Grove St., Jersey City 2, N. J. Distributors in All Principal Cities of the World

Scotch Marine application

Type for water tube boilers

RAY FORCED DRAFT PACKAGED BURNERS

A factory assembled unit readily applied to any type of boiler designed for forced draft operation. Fully automatic operation on oil, gas or combination gas-oil.



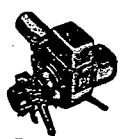
The combination gas-oil unit includes a rotary oil burner, integrated ring type gas burner, secondary air control with a forced draft fan, windbox, refractory support ring, completely wired control cabinet and pre-piping completely factory assembled for quick and easy installation to the boiler.

Oil components may be selected to burn any grade of oil with the secondary air control providing increased efficiency even with the difficult-to-burn catalytic residual #6 fuel oils. Sizes 1 to 10. From 40 to 750 developed output horsepower.

RAY COMBINATION OIL-GAS BURNERS

ARC-MODEL 550. Consists of a rotary type oil burner of Ray conventional design coupled with a gas housing for low pressure gas. The gas burner parts provide for the introduction of gas in a manner which fully utilizes the energy in the high pressure air supplied by the rotary burner fan. Gas and primary air are intimately combined, in two stages, before mixing with the secondary air which is introduced through a vaned annular opening concentric with the nozzle. Change-over requires less than one minute. Available to burn any grade of oil; 9 sizes with capacities to 31,500,000 Btu/hr. Gravity type to 48,000,000 Btu/hr.

TYPE PCP. Fully automatic combination gas-oil burner of the pressure atomising type. Available in three sizes with capacities from 560,000 to 4,200,000, Btu/hr. High speed 3450 rpm models available for forced draft operation. Also available for straight gas operation, as type PG.



ARC-144 Model 550 for heavy oil and Low Pressure Gas

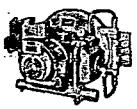
Type PCP for #2 oil or lighter and Low Pressure Gas

RAY DOMESTIC AND STEAM TURBINE BURNERS

RAY PRESSURE ATOMIZING OIL BURNERS. Fully automatic for #2 oil or lighter. 4 sizes with capacities from 1 to 30 gph. Pedestal or Flange mounting. All types have electric ignition interrupted or constant. AC or DC. Electronic controls are standard on all models above 7 gph capacity. High speed 3450 rpm models available for forced draft operation.

Fully Automatic, Type 1P, #2 or lighter oil

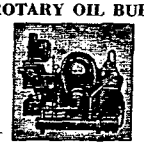
Steam Turbine Drive, Type TC, all grades oil. Tested and approved for U. S. Navy Service



RAY INSHOT GAS BURNERS

Multi-jet atmospheric type gas burners with high flexibility in nozzle number, arrangement and capacity, permitting high input ratings in limited space. For commercial and industrial application with natural or induced draft. Available in 36 different jet arrangements with capacities from 99 to 7512 cfh.

Size 2, IC-29



RAY HORIZONTAL ROTARY OIL BURNERS

Type AR-144 Size 10 for No. 6 oil, Available in 10 sizes from 2 to 210 gph. Fully automatic.

Fully Automatic Type AR-134, for No. 5 oil

Type BR-144, Belt Drive, Fully Automatic, Available in 6 sizes. Capacities from 2 to 110 gph.

Type ARIP, Fully Automatic for heavy oil where gas for ignition not available

Built in fully automatic, semi-automatic and manual types; in sizes from 7 to 1000 Boiler hp, 230 to 37,000 lbs/hr, to burn all grades of fuel oil.

Standard models include both direct and belt drives—the latter being recommended for use where other than 50 or 60 cycles AC, or only DC is available. Types for diesel electric or gas electric ignition; pump or gravity feeds. Direct drive types include a steam turbine driven model.

Most fully automatic types for heavy oil incorporate the Ray Dual Pump and Reservoir, with the Ray VISCOSITY Valve, a patented, exclusive feature which automatically meters the correct amount of fuel at all times, regardless of changes in viscosity of the oil due to temperature variations. All larger sizes employ dual ignition system, consisting of dual high-voltage transformers, dual electric ignitors and dual gas valves. Fully automatic burners include as standard equipment electronic pilot and flame failure control as required by code.

10	7½	50	210	155	700	5800	24400	7500	31500	23400	98300
12	7½	75	320	250	1000	8700	37000	11250	48000	35100	149200

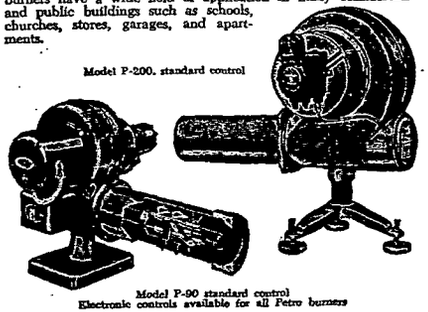
NOTE: These ratings are predicated upon specific conditions of draft and furnace volume. It may be permissible, under desirable conditions, to operate at higher rates, or advisable under restricted conditions, to operate at reduced rates. Heating capacities are based upon 150,000 Btu per gal of oil for rotary burners and 140,000 Btu per gal of oil for pressure atomizing burners and upon an overall boiler efficiency of 75 percent.

† Steam capacity based on steam F and A 212 F. * ⅓ hp on belt driven models.

** ¾ hp on belt driven models. †† Motor hp may be increased for forced draft operation.

PETRO

3242 West 106th Street, Cleveland 11, Ohio



Quality Heating and Power Equipment since 1903

PETRO REG U S PAT OFF — INDUSTRIAL AND COMMERCIAL OIL AND GAS BURNING SYSTEMS FOR EVERY NEED

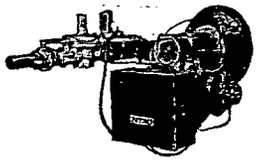
LARGE CAPACITY BURNERS, MODELS P-90, P-90E, P-200, P-200E:

In addition to domestic heating *in* large residences, these Petro burners have a wide field of application in many commercial and public buildings such *as* schools, churches, stores, garages, and apartments.

Model P-200, standard control

Model P-90 standard control
Electronic controls available for all Petro burners

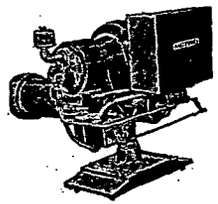
CAPACITY OF PETRO PRESSURE ATOMIZING BURNERS



Burner Model	Nozzle Size Gals. per Hr.	Total Capacity* Steam Sq. Ft.	Total Capacity* Hot Water Sq. Ft.**	Approximate Shipping Weight
P-90	5 to 9	1750 to 3150	2800 to 5050	130
P-90E	5 to 9	1750 to 3150	2800 to 5050	130
P-200	9 to 20	3150 to 7000	5040 to 11200	180
P-200E	9 to 20	3150 to 7000	5040 to 11200	180
P-300***	20 to 30	7000 to 10500	11200 to 16800	260

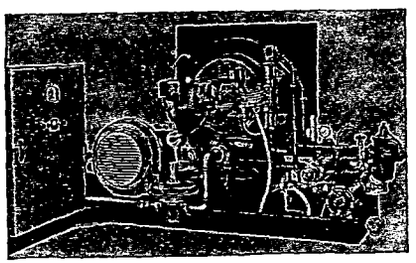
*Total capacity equals standing radiation, plus piping loss, plus pickup, plus hot water.

**Rating based upon water at 170°F in radiators.



***Standard with electric controls giving two-second shut-down.

NEW COMMERCIAL FORCED DRAFT PACKAGE BURNER —FOR OIL, GAS OR DUAL-FUEL—P-240 GOSM



Here is a completely new commercial pressure burner which offers two distinct features: forced draft operation and freedom from pulsation. All necessary operating controls, including an electronic combustion control system, are integral components. The units are complete fuel burning systems—assembled, wired and tested at the factory. Air for combustion is supplied under pressure by a highly efficient blower. Burners are available in two types of construction: fan housing above or below the draft tube. Models with fan housing below the draft tube are particularly adaptable to Scotch-Marine type boilers, as no burner parts project above the draft tube to interfere with boiler cleanout doors. Installation is simple. Capacities range from 8 through 24 gph for oil and for gas from 1,200,000 through 3,600,000 Btu input.

"PACKAGED" COMMERCIAL OIL BURNERS—FOR FUEL OILS UP TO AND INCLUDING HEAVY NO. 5

Here at last is a reliable gun type low pressure burner that will fire No. 5 oils or any lighter grade, using the supercharger-type fuel atomizer. Atomization is so complete that electric ignition can be used in place of the gas flame required by other burner types. The ability to fire heavy or light oils, and to modulate over a wide range, makes this burner unique in its field. Capacities are from 3 to 25 gph.

PETRO COMPLETE "PACKAGED UNIT" Consisting of Burner (for oil or gas or both), Fuel System, Control Panel, and Preformed Refractory Combustion Throat.

This Petro package unit is much more than a conversion burner. It's a complete combustion system in which all elements are correctly balanced and integrated—a thoroughly engineered firing plant. Includes burner (for oil or gas or both), fuel system, forced draft air supply, control panel, and pre-formed refractory combustion throat. Installation requires little more than bolting the entire unit to the boiler-front and making service connections for power and fuel. This represents a substantial saving in installation time and cost—but even more important it means a factory tested and assembled unit for high operating efficiency and fuel savings.

Control panel is totally enclosed, with all instruments wired and tested at the factory.

The units are designed for easy application to all types of boilers including the Scotch Marine. They operate either under normal firebox draft conditions or under positive pressure in sealed firebox boilers which are designed for operation under furnace pressure. Oil capacity—25 to 145 gph (No. 6 or lighter) and equivalent ratings in gas.

PETRO REG U S PAT OFF — INDUSTRIAL AND COMMERCIAL OIL AND GAS BURNING SYSTEMS FOR AUTOMATIC, SEMI-AUTOMATIC OR MANUAL OPERATION

FOR UNHEATED COMMERCIAL OILS

Model W-A: Automatic ignition with synchronized control of oil and air.

FOR HEATED OILS: HEAVY NO. 5 (MODEL W-A-E); BUNKER "C" NO. 6 (MODEL W-AH)

Models W-A-E; W-AH: Automatic ignition with synchronized control of oil and air, and automatic control of oil heaters.

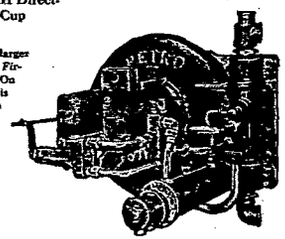
ALL PETRO MODEL W ROTARY-CUP OIL BURNERS:

A Petro Model W consists of a self-contained assembly of fan, pump, rotary cup atomizer and all oil and air adjustment apparatus. It is either direct-driven by means of a built-in motor, or belt-driven from motor mounted on burner housing. Interlocking oil and air control mechanism permits operation at any point within the burner's minimum and maximum range.

CAPACITIES OF PETRO MODEL W OIL BURNERS AT 75% BOILER EFFICIENCY

Burner Size	Maximum Gals. Per Hour	B.T.U. Release Per Hour	Rated Capacity Boiler Horsepower	Steam Radiation, Sq. Ft., E.D.R.
W-2½	11	1,650,000	36.9	5,150
W-3	15	2,250,000	50.4	7,030
W-4	25	3,750,000	83.8	11,720
W-5	35	5,250,000	117.3	16,400
W-6	50	7,500,000	167.5	23,400
W-7	70	10,500,000	234.8	32,800
W-8	100	15,000,000	335.0	46,800
W-8½	120	18,000,000	403.0	56,200
W-9	145	21,750,000	486.0	68,000
W-10	200	30,000,000	670.0	93,600

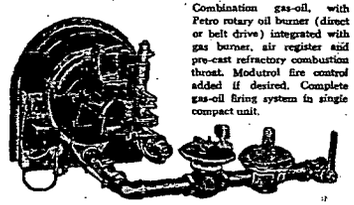
INDUSTRIAL COMBINATION GAS-OIL BURNERS USING NATURAL AND INDUCED DRAFT:



Model WG Industrial Gas-Oil Burner will fire low or high pressure natural gas or any grade of fuel oil, with natural or induced draft. It is a fully integrated unit in which primary air for combustion of both oil and gas is supplied by the oil burner fan. Secondary air is admitted around the burner opening, eliminating the deep firebox pit and brick checkerwork required in the conventional rotary oil burner setting. Enclosed control panel, with instruments installed, wired and tested at factory, may be mounted at burner or on boiler room wall. Fuel change is accomplished quickly by electrical switching. Oil capacities, 11 to 120 gph; gas 1,650,000 to 18,750,000 Btu input.

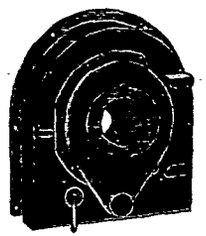
INTEGRAL AIR REGISTER CONVERSION KITS:

The Petro Air Register is ideal for converting oil installations to gas-oil. The rotary oil burner bolts on the register making an easy field conversion that is complete with refractory, combustion throat and the gas ring. All combustion air is admitted around the burner opening as required by Underwriters' Laboratories standards.



Model WD-AH Direct-Driven Rotary-Cup Type Burner

On W-5 and larger sizes, Modutrol Firing is standard. On smaller sizes, it is supplied as an extra.

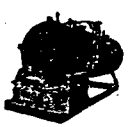


Model WG Burner

Combination gas-oil, with Petro rotary oil burner (direct or belt drive) integrated with gas burner, air register and pre-cast refractory combustion throat. Modutrol fire control added if desired. Complete gas-oil firing system in single compact unit.

New Air Register

Readily converts any Petro Rotary Oil Burner to combination gas-oil firing. Kit includes register, gas controls and standard parts groups. A minimum of installation time required. Air registers available also for straight oil firing.



• All Petro Model W burners are available in either direct- or belt-driven *motor* types.

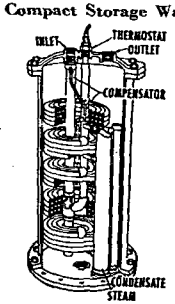
Aerco Corporation

Paris Avenue, P. O. Box 248
Northvale, N. J.

AERCO'S Controlled "HTR" (Heat Transfer Rate) Heat Exchanger is a Compact Storage Water Heater featuring an Internal Compensator which:



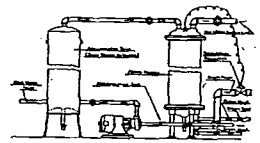


Figure 1—Sectional drawing of Aerco Compact Storage Water Heater

- *Anticipates* changes in *required steam flow before* the actual heat transfer takes place.
- *Meters the steam flow* accurately in direct proportion with load.
- *Prevents surges* in steam flow, *eleminating need for large storage.*
- *Maintains ACCURATE control* of outlet water temperature.
- *Prevents OVERRIDE* of outlet temperature on sudden interruption of water flow.

For **UNIFORMLY VARYING LOADS** (i.e. Hospital General Water Supply), the ability of the above heater to prevent steam flow surges **ELIMINATES** the need for large **STORAGE.**

For **NON-UNIFORMLY VARYING LOADS** or periodic high peak flows and low average demands (i.e. Small Commercial Laundry), the AERCO COMPACT STORAGE WATER HEATER with an Accumulator and Recirculating Pump (as shown in Figure 2) gives a low cost combination which also permits:

- *Minimum storage volume* for peak demands.
- *Minimum steam input* for required load.
- *Accurate* controlled outlet water temperature under *all* load conditions.

Figure 2—Aerco Compact Storage Water Heater in combination with Accumulator and Recirculating Pump

CONSTRUCTION

Shell fabricated to *ASME* Code Standards, of Flange Quality Steel with plastic or copper lining. Shell ends Cast-iron or Bronze. Internal parts of Copper or Brass. Tested for 125 psig operating pressure. Capacities, 300 to 25,000 gph.

OPERATION

Cold water enters top, flows down through the Compensator, then up across steam coils to discharge at top. Steam feeds into coils through Steam Riser and leaves through Condensate Return.

Compensator anticipates and controls heat transfer rate by *sensing* changes in flow or incoming temperature before water passes over the heating coils. It accomplishes this by causing variations of temperature to occur at the Regulator bulb which are definitely related to changes in flow and incoming temperature as well as the final temperature.

Send for booklet: "THE NEW APPROACH To the Design of Hot Water Supply Systems" and Bulletin #22 for capacity data and sizes.

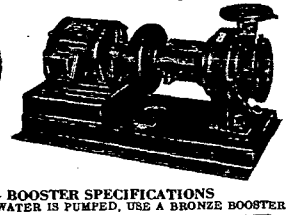
Hydro-Flo HOT WATER HEATING & COOLING SYSTEMS & SPECIALTIES

B & G Booster



B & G "PD" Booster

B & G Universal Pump

Oil Lubricated Bearings

B & G Booster

The B & G Booster is the basic unit of the B & G Hydro-Flo Forced Hot Water Heating System. The prime requisite of such a pump is quiet operation and in this respect the B & G Booster is completely outstanding.

The oversized, special alloy, mirror-finished shaft provides large, super smooth bearing surfaces. The heat-treated thrust collar, integral with the shaft, prevents end movement. Bronze, sleeve type bearings are extra long to maintain the shaft in exact alignment and help assure smooth, quiet operation. The Seal assembly provides positive protection against water leakage into bearings. The true centrifugal design impeller operates with a minimum of slippage, assuring a full quota of water with each revolution.

B & G Boosters have a genuine oil-circulating lubrication system—another reason for quiet, dependable operation. Oil is drawn from the oil well by wool fiber wicking and dropped on the horizontal bearing surfaces. Medium grade motor oil is used, and only a few drops at infrequent intervals are required.

B & G Universal Pump

Designed for forced hot water heating systems in apartment and office buildings, factories, schools, etc. The Universal is not an ordinary centrifugal pump, but is specially designed to assure quiet operation so essential in heating system applications.

B & G Monoflo Fittings—Cast-Iron or Copper

B & G Monoflo Fittings permit the use of a single pipe main instead of conventional flow and return lines. Installed at the junction of the radiator risers to the single main, they assure proper diversion of water into each radiator, convector or baseboard, regardless of its position in the system. They can be installed at either the return or supply riser, with the other main connection being a common tee.

B & G Relief and Reducing Valves

B & G Relief Valves, for relieving excess boiler pressures in hot water heating systems and in the lines of water service systems are designed and built to *ASME* specifications, tested by the National Board and labelled with the *ASME* symbol.

B & G Reducing Valves have all working parts made of brass, with built-in strainer and Anti-Siphon Check Valve. Adjustable to meet varying building heights.

Nos. 175–250–350–480 Relief Valves

No.	Size, Inches	Capacity Btu/Hr	Standard Setting, Lb[a]
175	¾	175,000	30
250	¾	250,000	30
350	¾	350,000	30
480	¾	480,000	30

[a] Also available at 15, 25, 45, 50, 75, 100, 125 lb settings.

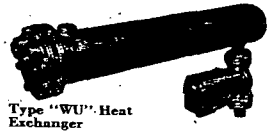
Nos. 750–1050–3300–4100 Relief Valves

No.	Size, Inches	Capacity Btu/Hr	Standard Setting, Lb
750	1	750,000	30[b]
1050	1¼	1,050,000	30[b]
3300	1½	3,300,000	30[b]
4100	2	4,100,000	30[b]

[a] Also available at 15, 25, 45, 50, 75, 100, 125 lb settings. [b] Also available at 55, 35, 45, and 50 lb settings.

No. 12 Reducing Valve

All working parts are of brass, with easily cleaned, built-in strainer and Anti-Siphon Check Valve. Factory adjusted at 12 lbs; suitable for 1, 2 and 3-story buildings.

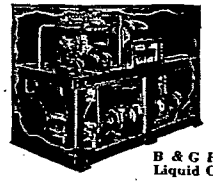


B & G Motorized Valves

Thermostatically operated valves used to control boiler water flow through individual circuits of zoned heating systems.

B & G Comfort Control System

Outdoor type, wind-compensating temperature control. The Regulator projects through the building wall, with the indoor end warmed by water in the radiation circuit. A small amount of this heat is conducted to the outside end, where it is dissipated at a rate dependent upon temperature and wind velocity. This heat dissipation governs the Control Valve, which permits hot boiler water to enter the system in required amounts.



For preventing gravity flow in forced hot water systems and to permit summer-winter operation of a B & G Indirect Water Heater. Sizes 1 in., 1¼ in. and 1½ in. are made in combination straight-angle patterns, and can be installed in either horizontal or vertical pump lines. Easy cleaning is a feature of B & G Flo-Control Valves—no need to break pipe connections for removal of foreign matter.

Type "WU" Heat Exchanger

Type "SU" Heat Exchanger

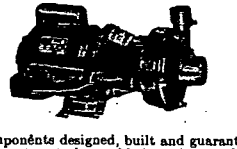
B & G Relief Valve

B & G Reducing Valve

B & G Motorized Valve

B & G Comfort Control Regulator and Valve



B & G HEAT EXCHANGERS AND WATER HEATERS

TYPE WU—A shell and tube heat exchanger with hot boiler water pumped through the shell by a B & G Booster, making possible big capacity in a small unit. Pumping water through the heater also affords excellent temperature control and permits use of much smaller pipe and fittings.

TYPE "SU"—For heating water with steam. An ideal selection for industrial plants or wherever large volumes of hot water are required continuously for service water supply or process work. No storage tank required—the large heat transfer surface in these units heats water instantly as needed. Available in a wide range of capacities.

B & G Centrifugal Pumps

Design and construction based upon years of experience in the industrial field. Rugged, compact units—built to withstand strain of continuous operation. Semi-open or enclosed impellers—motors flexible coupled or integral with pump. *Series 1522 illustrated.*

B & G Package Liquid Coolers

The only unit of its kind with all major components designed, built and guaranteed by one manufacturer. Everything included, no extras to buy—this is truly a package unit. Because of the many features included as standard equipment, this unit can be installed at smaller final cost. A complete line of refrigeration components is also available.

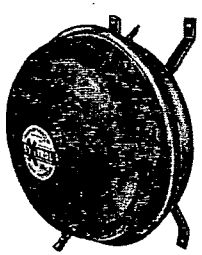
Diaphragm-type, Pressurized Expansion Tanks • "O" Ring Type Expansion Joints
Hot Water Heating Accessories



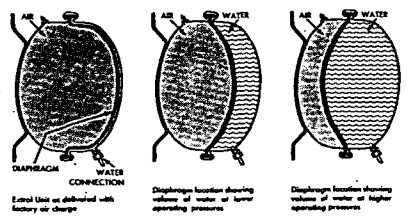
EXTROL EXPANSION CONTROL FOR HOT WATER HEATING SYSTEMS

APPLICATION

The Extrol Expansion Control Unit is a diaphragm-type, pressurized expansion tank developed by American Tube Products, Inc., specifically for use on hot-water heating systems. It replaces the conventional expansion tank.

DESCRIPTION

The Extrol Unit is constructed of two steel *ASME* hemispheres bonded together in a compact, sealed unit. A butyl diaphragm or bladder separates the unit into two chambers, one of which is factory pressurized with air. Thus there can be no contact between system water and air. Mounting and piping provisions are furnished.



ADVANTAGES

- No loss of air cushion through absorption by boiler water
- Air problems in system substantially reduced
- Use of compressed air to charge expansion tank reduces the required tank volume
- No maintenance or servicing—no draining or recharging necessary
- Reduces system corrosion
- Smaller space requirements
- Simpler installation
- Lower initial cost

OPERATION

As thermal expansion build-up develops in the system, water enters one chamber, displacing the diaphragm towards the other chamber and further compressing the air cushion. When water temperature decreases, the resulting contraction of water pressure allows the air cushion to deflect the diaphragm, returning water to the system.

INSTALLATION

Extrol units may be installed at any point in the system and in any position. Positioning for drainage is not required.

CAPACITY

Extrol volume is based on the *ASME* Formula as it appears in the ASHAE GUIDE under "Hot Water Heating Systems."

HISTORY

When the closed type hot-water heating system was introduced, permitting operation at higher temperatures, the expansion tank, usually installed in the basement, replaced the open attic tank.

Although superior to the open attic tank, the expansion tank created several adverse operating conditions.

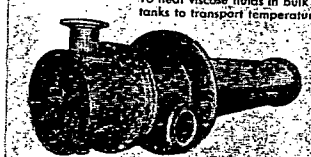
For one, because of the solubility of air and water, the conventional expansion tank readily lost its air cushion. Thus the air gravitated to other parts of the system, causing improper heating, excessive venting, noise, and corrosion.

Introduction of the Extrol unit, with its flexible butyl rubber barrier, prevents the loss of air. Furthermore, the barrier retains the air charge above atmospheric pressure, so that water is held in position at high points in the line as system water is alternately heated and cooled.

Until recent years, no suitable material was available for use as a diaphragm of this type—flexible, yet air-tight.

The Extrol Unit thus helps solve a number of problems formerly common to hot water heating systems.

Write for complete information and specifications on Extrol units for commercial, industrial, institutional, and residential applications



DAVIS ENGINEERING CORPORATION

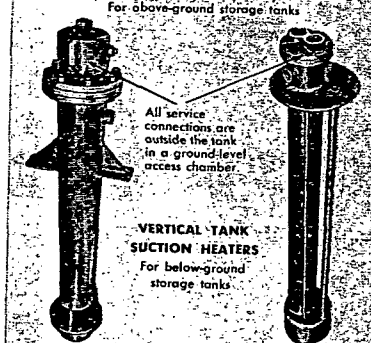
30 Rockefeller Plaza, New York 20, New York



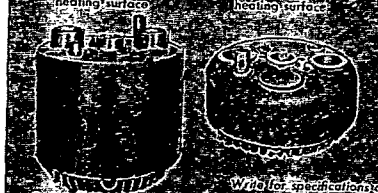
Paracoil
HEAT TRANSFER EQUIPMENT

Paracoil fuel oil heaters for every application.

TANK SUCTION HEATERS
To heat viscose fluids in bulk storage tanks to transport temperatures.

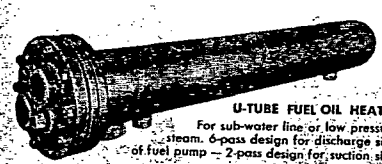
HORIZONTAL TANK SUCTION HEATERS
For above-ground storage tanks

VERTICAL TANK SUCTION HEATERS
For below-ground storage tanks



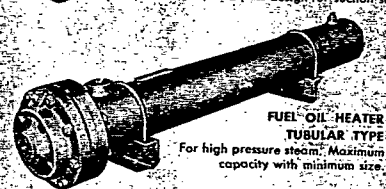
For high-pressure STEAM as heating medium

For hot circulated FLUID as heating medium

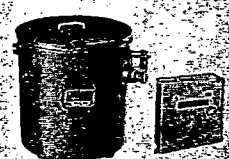


TANK SUCTION BELL HEATERS
For below-ground storage tanks—small-to-moderate demand installations.

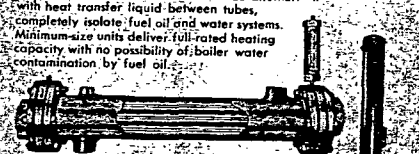
12 square feet of heating surface



6 square feet of heating surface



U-TUBE FUEL OIL HEATER
For sub-water line or low pressure steam. 6-pass design for discharge side of fuel pump — 2-pass design for suction side.



FUEL OIL HEATER TUBULAR TYPE
For high pressure steam. Maximum capacity with minimum size.

PARAPROBE OIL LEAK DETECTION SYSTEM
Protects against oil contamination by continuously checking purity of condensate leaving steam-type fuel oil heaters.

"THERMO-FILM" SAFETY TYPE FUEL OIL HEATER
Double tube elements (one tube inside another) with heat transfer liquid between tubes, completely isolate fuel oil and water systems. Minimum-size units deliver full-rated heating capacity with no possibility of boiler water contamination by fuel oil.

SELF-CLEANING TYPE HEATER
Interior baffles can be moved back and forth along tube surfaces to scrape away fouling deposits and restore full efficiency.

INDIRECT TYPE GAS FIRED FUEL OIL HEATER
Combination steam evaporator and tubular fuel oil heater. No flame contacts oil tubes; gas generates steam to supply heat. Maintains oil line temperatures during periodic main boiler plant shutdown.

Write for specifications on any of the above heaters.

GENERAL FITTINGS COMPANY

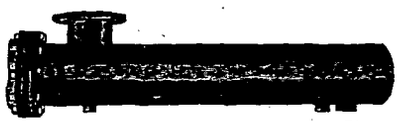
East Greenwich, Rhode Island, U. S. A.
P. O. Box 151K
HEAT EXCHANGERS

GENERAL Converters

GENERAL RC CONVERTERS

Steam Converter

GENERAL RC Converter ... shell and tube heat exchanger, two pass construction, steam in shell, water in tubes. U-bend copper tubing eliminates expansion strains. Removable tube bundle. Used for forced circulation hot water heating systems. Also for maintaining temperature in swimming pools. Capacities to 1800 gallons per minute flow.



GENERAL BC CONVERTERS

High Temperature Water Converter

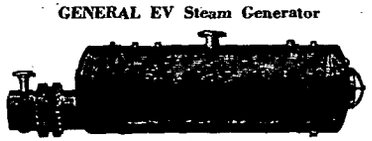
GENERAL BC Converters ... for high temperature hot water heating systems—high temperature, high pressure water circuit in tubes, medium temperature water circuit in shell. Number of passes in head varies from two to ten, depending upon design conditions and is combined with varying baffle pitch to give very high heat transfer efficiency. Design pressures tube side 400 psig and 660 psig. Inhibited admiralty tubing, semi-confined high pressure head gaskets, high temperature nozzles constructed with welding neck flanges. Design permits installation of temperature control bulb in shell for sensitive response. Capacities to 1800 gpm flow medium temperature circuit.

GENERAL Instantaneous Heaters

GENERAL ST Instantaneous Hot Water Heater

Steam Type

GENERAL ST Instantaneous Hot Water Heater ... for hot water supply in hospitals, institutions, hotels and industrial plants. No storage necessary—heats water as fast as it is drawn—should be sized to peak load requirements—can be used as a central hot water supply or as a spot source at point of use, such as a booster to provide sterilizing rinse 190° water for dish-washing machines. Capacities to 300 gpm.



GENERAL BT Instantaneous Heater

Boiler Water Type

GENERAL BT Instantaneous Heater ... Baffle construction for greater efficiency with boiler water circulated through the shell—circulator must be installed on boiler water circuit with control bulb in service water outlet. Affords accurate regulation. Excellent hot water supply for apartment buildings.

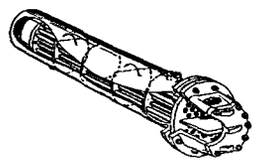
GENERAL EV Steam Generator

High Temperature Fluid Type

GENERAL EV Steam Generator ... evaporator designed for service with high temperature water, Dowtherm, Aroclor or Heat Transfer Oil through the tubes—boiling water in lower half of shell, steam in upper half. Built-in steam separator, removable tube bundle. Design pressure to 660 psig. Design temperature to 800F tube side.

GENERAL BO Fuel Oil Preheater

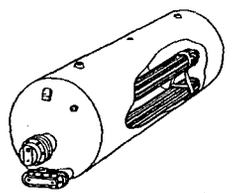
Baffle Type



GENERAL BO Fuel Oil Preheater ... Steam in tubes—oil in shell. Transverse baffles are designed to give outstanding turbulence and heat transfer characteristics within conservative pressure drop limitations. For installation on discharge side of pump. Can be used in conjunction with GENERAL Suction Oil Heater in tank. Capacities to 3800 gpm.

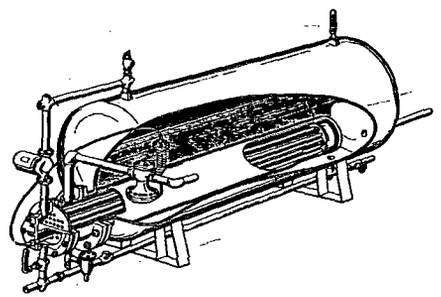
For full details, write Heat Exchanger Division

KILLEBREW Engineering Corporation



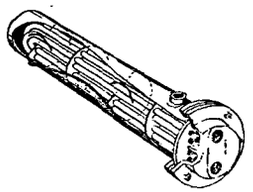
8640 Pardee Lane, Saint Louis 23, Mo.

ASME FABRICATION



FRE-FLO INSTANTANEOUS WATER HEATER

Easily cleaned, straight tube with removable cover plate and floating head. Designed for heavy loads and fouling fluids. Standard sizes from 50 gph up.



FRE-FLO STORAGE WATER HEATER

Steel (rust resistant lining optional) or alloys. Copper tubes on square pitch or flat bundles to set low in tank for use as condensate cooler or used where heavy fouling requires complete access for cleaning.

FRE-FLO LOAD LEVELER

A simple, rugged, *packaged* water heater designed specifically for handling extreme surge loads, yet levels the steam load on your boiler. Will deliver one or two temperatures of your selection, individually controlled. The Fre-Flo Load Leveler is completely assembled, ready to connect to utilities. Sizes from 450 gph and up.

FRE-FLO RADIATION CONVERTER

Complete range of sizes. Used with steam or boiler water. Cast iron head, steel shell, copper U tubes and bronze tube supports or baffles.

WRITE US REGARDING YOUR HEAT EXCHANGE PROBLEMS
FRE-FLO CATALOG AVAILABLE

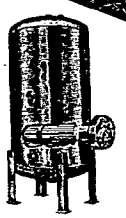
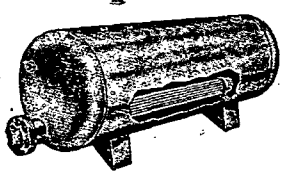
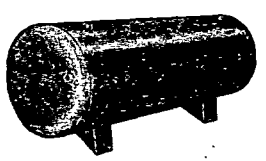
7th & Hospital Streets, Richmond, Va.



RECO TANKS, INC. Holts Chapel Road—Greensboro, N. C. P.O. Box 147—Columbia, S. C.



RECO



HEAT EXCHANGE EQUIPMENT

The **RECO** price is competitive! Delivery is fast and sure. All **RECO** products are guaranteed. Because **RECO** water heating plants handle maximum demand without straining, there will be a minimum of maintenance costs to add to your client's overhead. Specify **RECO** for your next heating job. For catalogs, write: Richmond Engineering Company, Inc., 7th & Hospital Sts., Richmond, Virginia.

CONVERTORS

For **forced circulation** hot water heating systems specify **RECO** convertors. Live steam in a steel shell heats water in a copper tubing network. Removable heating elements are seamless U-bend tubes to eliminate internal joints and expansion stresses.

INSTANTANEOUS HEATERS

Make it a **RECO** instantaneous heater when your steam supply is adequate for peak loads, and a continuous supply of hot water is needed. Live steam in a steel shell heats water or other liquids in a multiple-pass network of copper tubing.

STORAGE HEATERS

Vertical and horizontal **RECO** storage heaters furnish large quantities of hot water for use at irregular intervals. Removable heating elements of seamless copper U-bend tubes. Fabricated from steel, copper-silicon or stainless. Linings: Baked-on phenolic resin, galvanized, cement, copper or clad materials.

STORAGE TANKS

RECO custom-builds storage tanks to **your specifications.** Bulk tanks, hydro-pneumatic tanks, above or underground tanks . . . **ANY SIZE OR MATERIAL.** All carry the famous **RECO** one-year guarantee of materials and workmanship. Underwriter's label for oil tanks or *ASME* stamp for pressure tanks.

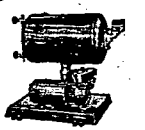
Sterlco®

CONDENSATION PUMPS

4100-4200 Series



A complete line of low pressure units for ratings up to 15,000 sq ft EDR at 20 psig. Four sizes assure accurate, easy selection of pump to boiler requirement. Steel or cast iron tanks. Centrifugal pumps, mechanical type seal, built-in Simplex or Duplex. Many modifications available to suit special applications.

4100–4200 Series

3500 Series

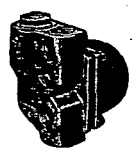
Heavy duty units built as condensation or boiler return systems. Pedestal mounted tanks. Horizontal pumps. Ratings up to 65,000 sq ft EDR, up to 150 lb psig. Available in standard units or built to specification. Special units for packaged boilers.

3500 Series

3700 Series

Built with extra heavy cast iron tanks for underground returns and pit installations. Standard units from 2,000 to 20,000 sq ft EDR, 30 psig. Special units for larger ratings and higher pressures.

SPECIAL UNITS



We specialize in designing and building special equipment to solve difficult condensate and boiler return pumping problems.

THERMOSTATIC TRAPS

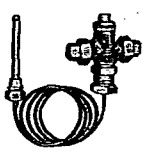
Exceptional for keeping radiation free of air and condensate. Uses the "Sterlco Vacuum Thermostat" which closes uniformly regardless of pressure variation. If damaged, the thermostat fails in the closed position shutting off the radiation and giving positive indication that the trap needs attention. Trap maintenance greatly simplified. All traps equipped with replaceable seats. Three pressure ratings: 15, 65, 100 psig ½ in. L.P. angle body has smallest overall dimension for use on fin tube radiation.

Thermostatic Traps

Float and Thermostatic Traps, Popular 69B Illustrated

FLOAT AND THERMOSTATIC TRAPS

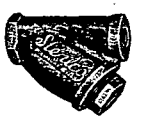
Used wherever it is desired to prevent flow of steam, but to permit passage of air and water . . . on unit heaters, large radiators and convectors, water heaters, steam main drips and other types of equipment where steam is used. Compact, rugged, easy to service. "Vacuum thermostat" vents air, float valve has plenty of capacity for large amounts of condensate. Sizes: ¾ in., 1 in., 1¼ in., 1½ in., 2 in. Maximum pressures: 15, 100 psig.



Thermotrols

120-A THERMOTROLS

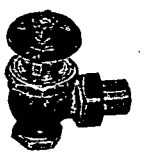
150-E SERIES TEMPERATURE CONTROL VALVE



Self-contained, thermostatically operated radiator valves for controlling individual room temperatures. For two pipe steam or hot water systems. A simple, relatively inexpensive system of control for new or old buildings. Especially good for remodeling old systems. ½ in., ¾ in., 1 in. sizes. Angle, straightway, corner body patterns.

150-E Series Temperature Control Valve

"Y" STRAINERS

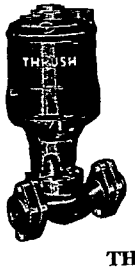


A complete line of "Y" Strainers. Brass strainers from ⅜ in. to 1 in. Cast iron from ½ in. to 3 in. 125 psig pressure rating.

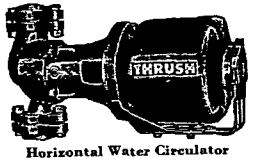
"Y" Type Strainers

RADIATOR VALVES

A complete line of Radiator Valves from hot water supply valves to heavy duty bellows seal type valves for Vacuum heating systems.



Radiator Valves



H. A. Thrush & Company

Peru, Indiana

FORCED CIRCULATING THRUSH FLOW CONTROL SYSTEM OF HOT WATER HEATING AND HEATING SPECIALTIES

Vertical Water Circulator

Horizontal Water Circulator

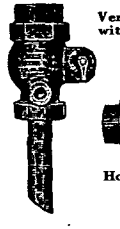
Thrush Flow Control System of Radiant Hot Water Heating assures continuous radiant heat with practically no variation of room temperature, regardless of outdoor weather changes. It offers an ideal means of control for use with radiant panels, radiant baseboards, convectors or radiators.

Circulation is forced and operation is entirely automatic. The Thrush Radiant Heat Control automatically compensates for outdoor weather changes. Provides an ample supply of hot water for kitchen, laundry and bath, both summer and winter. Wasteful overheating is completely prevented. Piping plans and engineering assistance are available to the trade.

THRUSH WATER CIRCULATORS

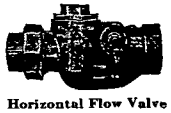
Forced circulating pumps for Hot Water Heating and Domestic Water Systems. Insure uniform heating. Quiet and efficient, long lived and vibration-free. Sealed-in lubrication. Vertical and Horizontal are made in seven sizes, ¾ in., 1 in., 1¼ in., 1½ in., 2 in., 2½ in. and 3 in. Hi-Head Vertical and Horizontal Thrush Water Circulators, designed for use with radiant baseboards, convectors, radiant panels, etc., which require higher heads, are also available in ¾ in., 1 in., 1¼ in. and 1½ in. sizes. Thrush Water Circulators are also available with Bronze body in 1 in. and 1¼ in. sizes, both horizontal and vertical. Female threaded connections.

THRUSH FLOW CONTROL VALVES



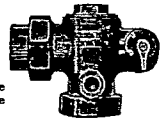
Special check valves for use with automatically fired boilers, automatically control circulation when installed with a Thrush Circulator. Close tight when Circulator is not running, prevent gravity circulation when heat is not needed in the radiators. This permits maintaining boiler water temperature high enough to heat domestic water, winter and summer, without overheating the building. Available with Air Tube which vents air from boiler into pressure tank, greatly improving heating efficiency by eliminating air from the system. 1 in. through 1½ in. valves also available with solder type outlet unions. Also made in angle type with or without air tube. Six sizes in Angle or Vertical types, 1 in., 1¼ in., 1½ in., 2 in., 2½ in. and 3 in. Horizontal Thrush Flow Control Valves, 1 in. through 2 in. sizes, are recommended for zoned systems and installations where head room makes it necessary to keep mains low.

THRUSH AIR ELIMINATOR

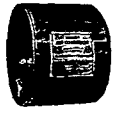


Thrush Air Eliminator Tank collects and removes air from water in the heating system. Air in the water moves with circulation and will be trapped and released in the Eliminator preventing its interfering with circulation. Designed primarily for floor and ceiling panel systems, it can also be used with baseboards, convectors or radiators. Made in seven sizes, all with 1 in., 1¼ in. or 1½ in. tappings.

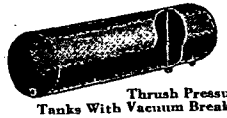
THRUSH PRESSURE TANKS NOW HAVE VACUUM BREAKER



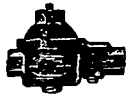
Thrush Pressure Tanks are made of heavy welded steel shells and heads and are guaranteed to be air tight. Each Thrush Pressure Tank comes equipped with a Thrush Vacuum Breaker at no extra cost. Makes tank draining simple and quick. It is only necessary to close valve in tank line, open drain and unscrew vacuum breaker.



Vertical Flow Valve with Air Tube



Horizontal Flow Valve



Angle Type Flow Valve

Thrush Air Eliminator Tanks

Thrush Pressure Tanks With Vacuum Breaker

Automatic Filling Valve ½ in., ¾ in. and 1 in.

No. 4 Relief Valve ¾ in. and 1 in.

THRUSH AUTOMATIC FILLING VALVES AND LOW PRESSURE RELIEF VALVES

Whenever system pressure drops below setting of valve, city water pressure will be admitted by Thrush Automatic Filling Valve until system pressure is restored. Pressure setting is adjustable.

Thrush Water Relief Valves protect heating boilers from excess pressures. Large diaphragm assures positive opening and closing. Convenient testing lever.

H. A. Thrush & Company

Peru, Indiana

ASME RATED No. 46 THRUSH SAFETY RELIEF VALVE FOR HOT WATER HEATING SYSTEMS

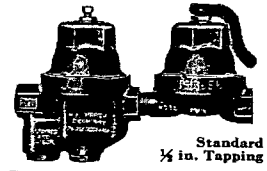
Rated output of 283,500 Btu based on steam capacity discharge. Primarily a water relief valve. Will also relieve steam should critically high temperatures occur. Testing lever. 30 lb pressure. ¾ in. inlet, 1 in. outlet. Same type available in settings to 125 lbs.

No. 75

No. 76

No. 75 Thrush High Pressure Water Relief Valves

To protect hot water heaters, range boilers and automatic water heaters from excess pressure. Factory setting 85 lbs. Adjustable at factory to 150 lbs maximum. *Other types available in ½ in., ¾ in. and 1 in. sizes.*



No, 76 High Pressure and Temperature Relief Valves

The valve illustrated above at right has an *added safety* feature. It not only guards against excessive pressures, but also relieves if excessive temperatures develop. A fusible element melts at 210 F. Other types available in ½ in. and ¾ in. sizes.

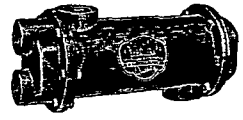
No. 170M - 170F AUTOMATIC RESEATING TEMPERATURE AND PRESSURE RELIEF VALVES

Where an Automatic Reseating Temperature and Pressure Relief Valve is required by code, the No. 170M which has a *male inlet or the No. 170F* which has a female inlet will provide the positive protection required. Reseats automatically after each operation. Has convenient testing lever. 6 in. stem or short stem. *ASME* rating 75 lbs, 450,000 Btu per hr; 100 lbs, 575,000 Btu per hr; 125 lbs, 700,000 Btu per hr. *AGA* rating, 550,000 Btu per hr input.

Standard ½ in. Tapping

DUAL CONTROL UNITS

Thrush Dual Control Units provide automatic filling and pressure relief for hot water heating systems. Proper water supply and working pressures in boiler maintained automatically. All have built-in strainers and check to prevent back flow from system. Low in cost, safe and dependable. Made in four types, all *with brass working parts. Adjustable* pressure setting. ½ in., and ¾ in. sizes.



Adjustable Supply Tees for One Pipe Systems

Provide exact balancing of forced circulating one-pipe hot water heating systems. Available in bronze with solder connections for use with copper pipe and in threaded cast iron for steel pipe. Non-adjustable tees also available.

Thrush Twin-L Balancers

Used to join two supply or two return branch mains into one common main. Handy lever permits balancing of circulation in each circuit easily and quickly. Saves ten fittings commonly used to accomplish this. *Available in cast iron or* bronze in three sizes.

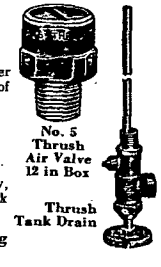
THRUSH WATER HEATERS

Highly efficient heat exchangers or converters. Provide Domestic Hot Water at low cost. Also used industrially for heating or cooling liquids. Fourteen sizes, for Hot Water or Steam. Pressure up to 125 lb for water, 50 lb for steam.

Constructed with heavy cast iron shells and straight seamless copper tubes. Both heads are removable for inspection of *tubes and for easy cleaning.*

1 *in. and 1¼ in.*, 2, 3 and 4 outlets

⅜ in. or ½ in.



THRUSH MANIFOLDS AND BALANCING VALVES

Thrush Manifolds save time, space and labor installing Radiant Heating. Avail*able in 1 in. and 1¼ in. sizes, each with* two, three or four ⅜ in. or ½ in. threaded branch outlets. Also available in 1¼ in. and 1½ in. sizes with three or five ¾ in. solder branch connections. Ends have solder connections.

Manifold with Balancing Valves as shown above is used in return lines only. Used in supply lines without valves. Balancing Valves permit individual filling of each coil, eliminate air quickly and save time. Two types, three sizes, ⅜ in., ½ in. or ¾ in. Flared coil fittings for ⅜ in. and ½ in. *tubing, ¾ in. has solder connec*tions.

No. 5 Hot Water Air Valve

An inexpensive, dependable, automatic air vent for Hot Water coils, convectors, radiators, unit heaters, and high points of mains. Tapping ⅛ in., IPT.

No. 5 Thrush Air Valve 12 in Box

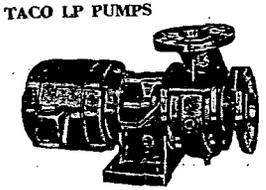
Thrush Tank Drain

THRUSH TANK DRAIN

Combines Drain Valve and Vacuum Breaker in one handy, *inexpensive fitting. Removing plug admits air to permit quick* draining of waterlogged tank.

Write For New Condensed Catalog

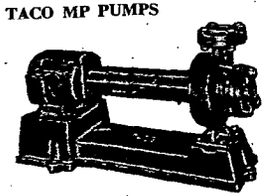
TACO HEATERS, INCORPORATED



1160 Cranston Street, Cranston 9, Rhode Island

Corporate Office: 324 Madison Avenue, New York. In Canada: Taco Heaters of Canada, Ltd., 4 Gilead Place, Toronto 2

Serving the Hydronic Industry Since 1920



Rigid control of quality, advanced designs, nation-wide service and engineering assistance are your assurance that you can specify Taco with complete confidence in product performance.

TACO LP PUMPS

A line of single stage centrifugal pumps with: relatively few sizes; many interchangeable parts; broad range of performance; high efficiencies.

TACO MP PUMPS

A base mounted line of pumps with the rugged dependability large installations require.

TACO WATER HEATERS, CONVERTERS, AND CHILLERS

Taco Converters and Water Heaters provide hot water and radiation for commercial and institutional heating purposes. Chillers are designed for chilling water in the air conditioning and refrigeration fields.

TACO CIRCULATOR

Packed with quiet power and proven performance; sizes ¾ in. through 3 in.

TACO 170 CENTRIFUGAL PUMP

Excellent for cooling tower jobs; air-conditioning installations . . . wherever a small top-quality built centrifugal pump is needed.

TACO PERFECTA

Outstanding circulator; so quiet you won't believe it's running.

TACO FLOW REGULATOR

Limits water flow to specified requirements.

TACO FLOW CHECK

Easily installed in either angle or horizontal position, the Taco Flow Check prevents hot water from entering the system when the thermostat stops the circulator.

TACO PANELTROL

Adjustable to deliver water to radiant heating panels for any temperature between 110F and 150F even though boiler water is kept at higher temperature for summer-winter hot water.

TACO VENTURI FITTINGS

Powerful suction action draws water through radiator for positive circulation. May be used for above or below main radiation. Taco Super Venturis save you money by reducing branch sizes, copper tubing, pipe fittings and labor costs.

TACO AIR-SCOOP

Scoops air bubbles from hot water system by a series of baffles. Air is then vented to either atmosphere or expansion tank. When system is first filled . . . vent radiators and high points once . . . no return to job!

TACO TEMPERING VALVE

Guards against excessively hot domestic hot water. Mixes cold water with hot water from Taco Tankless for storage heater to provide tempered water at fixtures.

TACO AUTOMATIC AIR VALVES

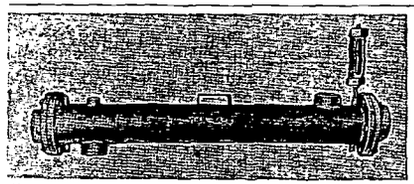
Taco-Vent for water systems is leak-proofed. It has a porous plug that limits the flow of water through valve. The Steam Vent eliminates pinging, clicking or hissing.

TACO RELIEF AND REDUCING VALVES

Automatically maintains sufficient water and pressure in system. The Taco *ASME* Relief Valve handles 80 percent of all hot water heating jobs, and is set to relieve at 29 lbs. Reducing Valve is factory set at 12 lbs.

SEND FOR CATALOG CONTAINING COMPLETE INFORMATION AND ENGINEERING DATA

YULA CORPORATION



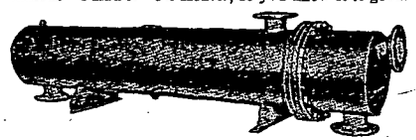
(formerly)

Yula Water Heaters Inc.—Established 1926.

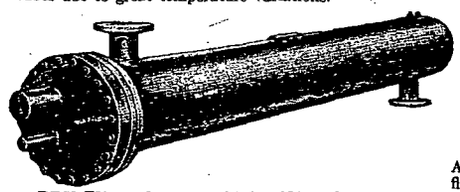
330 Bryant Avenue, New York 59, New York

Designers and Manufacturers of Heat Transfer Equipment

Member Fuel Oil and Water Heater Manufacturers Association



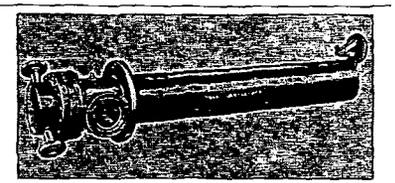
"YULATOM" FUEL OIL PROTECTION HEATER." Type "YA", approved by the Board of Standards and Appeals, City of New York-Cal. No. 678-57-S.A.



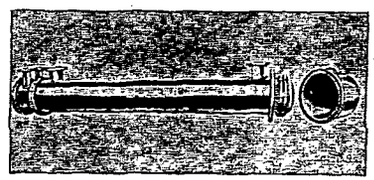
Here is a truly low cost, light weight, easy to install below water line oil heater.

Due to its counterflow operation the exit oil can be delivered at high temperatures.

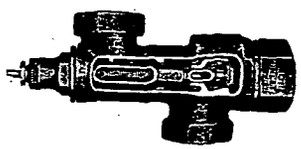
Should a leak occur it is impossible for oil to get into Boiler or Piping. Made by the designer of the famous "Yulatrol" Oil Heater, so you know it is good.



"U" TUBE CONVERTOR—used in hot water heating systems where steam is passed through the shell while circulated water passes through the tubes. "U" Tube construction allows for expansion of the tubes due to great temperature variations.



DRY EXPANSION TYPE FREON COOLER



The Yula Dry Expansion Freon Water Cooler is for use in air conditioning, refrigerating, industrial and process cooling, using water and other fluids. The refrigerant passes through the tube side and is vaporized. The fluid being cooled passes through the shell side which is baffled. The carefully designed tube arrangement in these coolers provides high thermal efficiency and little pressure loss. Sound engineering has assured a positive oil return with the refrigerant in these units. Heat transfer and turbulent flow is assured.

OIL TANK SUCTION HEATER—used to lower the viscosity of oil in bulk storage tanks to facilitate pumping. Only oil being drawn off is heated making it unnecessary to heat entire tank.

FULL FLOATING HEAD EXCHANGER—used where straight tube construction is desirable affording easy access and cleaning of interior chambers while allowing for expansion of tube bundle.

YULA THERMOSTATIC MIXING VALVE

Automatically mixes hot and cold water and other fluids. Delivers mixture at any pre-determined constant temperature. Sizes ¾ in. through 3 in. Special calibrations are possible.

Special Features: Liquid expansion thermostat gives uniform power at all points of the range with positive, gentle throttling action. The disc controlling the ports has two seats on a 35 deg angle; precluding freezing. Seat is in one part. Castings are heavy bronze. Close temperature regulation is obtained because valve is extremely sensitive. Seat spring is made of durable, corrosion resistant stainless steel. Complete shut-off on hot and cold water port in "non-draw" periods.

We manufacture all types of Heat Transfer Equipment for use in many fields

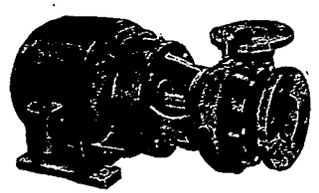
Buffalo Pumps

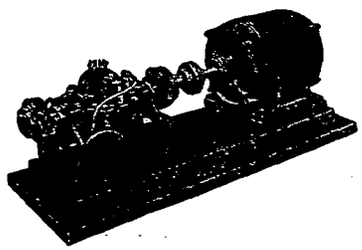
Division of Buffalo Forge Co.

450 Broadway, Buffalo, N. Y.



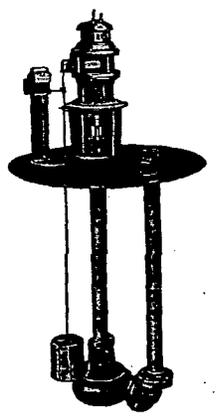
Canada Pumps, Ltd., Kitchener, Ont.

A complete line of Centrifugal Pumps, Single and Double Suction, Single and Multistage, for all types of heating and air-conditioning installations. Write for Engineering Bulletins mentioned below, or consult the Buffalo Engineering Representative in any principal City.



DOUBLE SUCTION SINGLE STAGE PUMPS

Extensively used for handling chilled water and other air-conditioning and clear-water applications including air washers, these pumps are available in capacities from 10 to 14,000 U.S. gallons per minute, against heads up to 350 ft. Highly efficient operation is provided by their simply formed water passages and their hydraulically balanced impellers (water enters each side of impeller with equal pressure and volume). All parts are ample for durability under hard service. Top half of the casing is readily removable for servicing without disturbing piping. Write for *BULLETIN 955S.*



CLOSE-COUPLED SINGLE SUCTION PUMPS

These pumps offer the advantages of compactness, high performance and simple installation without need for shaft alignment. (A 4 in. pump, delivering 600 gpm at 60-ft head, requires less than 2 cu ft of space.) Available in 1 in. to 6 in. discharge sizes. Design permits vertical or horizontal installation, with discharge adjustable to desired angle. These pumps are suited to handling hot water with low submergence. Write for *Bulletin 975E.*

SINGLE SUCTION MULTISTAGE PUMPS

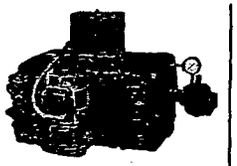
Used for boiler-feed and other clear water service, these heavy-duty pumps are especially suited to delivering at high pressures and temperatures. Available in two- and four-stage models for capacities from 20 to 900 gpm at heads up to 1500 ft. Shaft is extra-heavy and oversize bearings support the shaft on each end. Top-half of pump casing is removable for servicing without disturbing piping. Write for *BULLETIN 980E.*

AUTOMATIC SUMP PUMPS

These are shipped as preassembled units ready to put into the sump pit, wire and start pumping. No priming is necessary, since there is no suction lift. Thrust load is carried by ball bearings, and the shaft is fully enclosed to prevent fouling with waste or stringy matter from the sump. All parts are readily accessible. Write for *BULLETIN 963H.*

DOMESTIC PUMP & MANUFACTURING CORP.

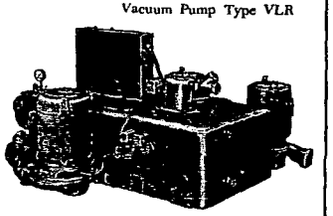
SHIPPENSBURG — "DOMESTIC" ® MAKERS OF DEPENDABLE COMMERCIAL PUMPS SINCE 1903 — PENNSYLVANIA



Products: Return Line Vacuum Heating Pumps; Condensation Pumps; Boiler Feed Pumps; Condensate Accumulators; Vertical, Horizontal and Flange Mounted Centrifugal Pumps; Air Separators.

FOUR COMPLETE LINES OF VACUUM HEATING PUMPS

Type VLR and VL Single and Duplex Units for Standard and Special capacities thru 65,000 sq ft EDR and up to 75 psi. Bulletins GS-110A and GS-131.

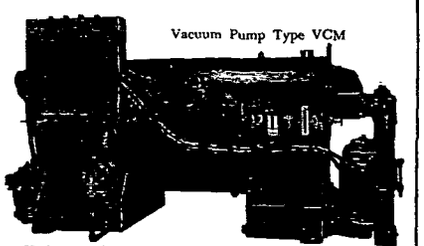


Type VCA with individually sized and separately controlled vacuum and condensate pumps. Air capacities thru 75 cfm and 20 in. Hg and condensate capacities thru 150 gpm at 75 psi. Bulletin GS-152.

Type VCM custom designed for each application. Automatic make-up. Pumps individually sized and controlled for maximum flexibility and economy. Available with 1, 2 or 4 vacuum pumps, each rated up to 90 cfm and 20 in. Hg and 1 to 4 boiler feed pumps, each rated up to 400 gpm and thru 75 psi discharge pressure. Bulletin GS-152.

Vacuum Pump Type VLR

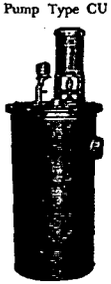
The heart of all Domestic Vacuum Pumps is the multi-jet vacuum producer. Average air evacuating rate is twice its rating, reducing operating time and power cost. Removes up to 300 per cent of rated air capacity at start of heating cycle to shorten warm-up period. It is simple, efficient and capable of producing a near perfect vacuum. It will retain its original effectiveness year after year.



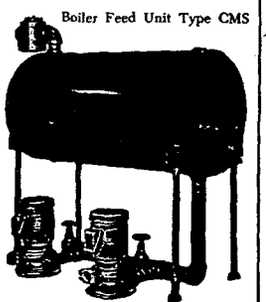
Vacuum Pump Type VCA

CONDENSATION & BOILER FEED PUMPS

Types SC and CC Single and Duplex units for systems thru 100,000 sq ft EDR and 60 psi. A compact dependable condensation pump with motor vertically mounted above floor dirt and water. Each motor is controlled by its own float switch. Low inlet receiver of lifetime cast iron. Bronze fitted centrifugal pumps for long life at peak efficiency. 1750 and 3500 RPM motors. Bulletins GS-202 and GS-221.



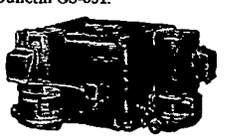
Type CMS and CM units provide automatic water make-up to replace water lost from the system and to maintain the most efficient boiler steaming level for systems thru 200,000 sq ft EDR and 60 psi. Single and Duplex units with receivers sized for ample condensate storage. 1750 and 3500 RPM bronze fitted centrifugal pumps designed to handle near boiling water. Bulletins GS-202 and GS-230.



Vacuum Pump Type VCM

Type CU units for use where the return mains are below the floor or lower than the inlet of a horizontal condensation pump. The lifetime cast iron receiver is buried with the cover flush with the floor and with the motor and float switch extending above it. Bronze fitted centrifugal pumps have ball thrust bearings, stainless steel shafts and flexible couplings. Single and Duplex units for capacities thru 50,000 EDR and 75 psi, 1750 and 3500 RPM motors. Duplex units have automatic mechanical alternation and stand-by or double capacity in event of abnormal demand. Bulletin GS-240.

Underground Condensate Pump Type CU



Boiler Feed Unit Type CMS

CENTRIFUGAL PUMPS

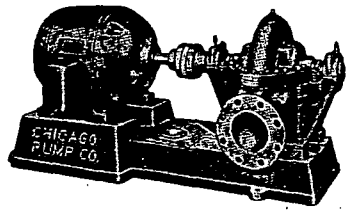
Horizontal, vertical and flange mounted pumps have same high quality that is built into all "Domestic" heating pumps. Heads to 230 ft, capacities to 450 gpm. Bulletin GS-691.

Condensation Pump Type CC

General Purpose Close Coupled Centrifugal Pumps

Putting Ideas to Work

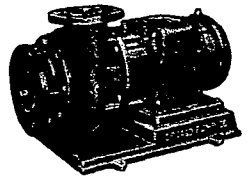
FOOD MACHINERY AND CHEMICAL CORPORATION



CHICAGO PUMP COMPANY

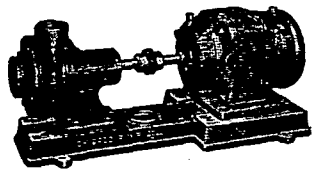
622 DIVERSEY PARKWAY • CHICAGO 14, ILLINOIS

Distributors In Principal Cities Throughout The United States and Foreign Countries



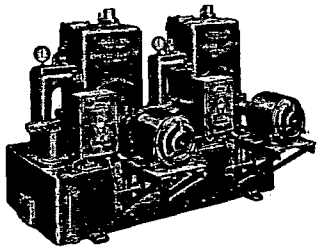
PRODUCTS

Condensation, House, Booster and Fire Pumps . . . Return Line Vacuum Heating and Boiler Feed Pumps . . . Circulating, Brine, Sewage, Sump, Sludge Pumps . . . Pneumatic and Tankless Water Supply Systems . . . Sealed Electrode Floatless Pump Controller . . . Automatic Alternator for Duplex Sets of Pumps



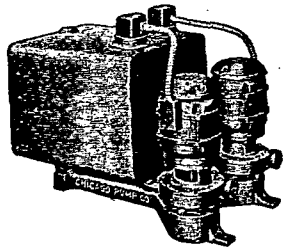
HORIZONTALLY SPLIT-CASE PUMPS

For house, fire and booster service. Ruggedly constructed, heavy duty, providing lasting, maintenance-free operation. The rotating assembly may be inspected without disconnecting the piping. Capacities up to 1900 G.P.M.—heads to 530 ft. Ask for Bulletins 98 and 102.



TYPE CC, CLOSE COUPLED BOOSTER PUMP

Designed to handle the toughest pumping jobs efficiently and in the least possible space. May be mounted in any position as long as the motor is not lower than the pump. Provided with leak-proof mechanical seal. Capacities up to 500 G.P.M.—heads to 215 ft. Ask for Bulletin 108.



TYPE FC, PEDESTAL MOUNTED SIDE SUCTION PUMP

Manufactured to the same exacting engineering standards as the Type CC Pump, and with the same capacities and heads. The flexible coupling drive permits easy field servicing . . . choice of motor manufacture. Ask for Bulletin 107.

DUPLEX CONDO-VAC® RETURN LINE VACUUM AND BOILER FEED PUMPS

Specifically designed for vacuum heating systems. The water capacity of CONDO-VAC® pumps remains constant up to the boiling point. The air capacity remains constant up to the evaporation point. Pressures up to 40 lbs. Capacities from 2500 to 150,000 EDR. Ask for Bulletin 270.

SURE RETURN® CONDENSATION PUMP & RECEIVER

For systems up to 75,000 EDR and for low and medium pressures. Available in either single or duplex units. The base serves as a large capacity manifold through which the condensate flows by gravity from the receiver to the pump. SURE RETURN® pumps never steam bind. Ask for Bulletin 250-F.

TYPE AVC CONDENSATION PUMP & RECEIVER

Heavy cast iron receiver with low inlet for floor mounting or shallow pit. Sets on floor — no foundation bolts necessary. Weight of unit and piping hold unit firmly in place. For 500 to 10,000 EDR and 10 to 30 lbs. pressure. Ask for Bulletin 245-F.

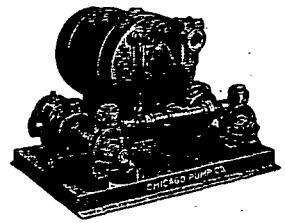
Pneumatic and Tankless Water Supply Systems . . . Sealed Electrode Floatless Pump Controller . . . Automatic Alternator for Duplex Sets of Pumps

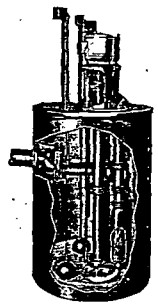
TYPE NVC VERTICAL CONDENSATION PUMP & RECEIVER

Specifically designed for low return service and underground installations. Flanges are accurately finished and gasketed to prevent steam leaks. Pump and receiver are shipped as a unit, ready to install. For 1000 to 40,000 EDR and 10 to 25 lbs. pressure. Ask for Bulletin 254-A.



TYPE LGL2 AUTOMATIC ELECTRIC SUMP PUMP

Specifically designed to drain basements, pits and sumps. Centrifugal volute pump with open bronze impeller. A cast iron strainer of large area surrounds the suction opening. Ask for Bulletin 118-F-3.



VERTICAL CLOSED SHAFT NON-CLOG PUMP

Available in either single or duplex units . . . suitable for either sump or sewage service. Pump is mounted on separate floor plate to allow easy removal for servicing. Ask for Bulletin 124-F.

TYPE FC DUPLEX CONDENSATION UNIT

Single or duplex units are specifically designed for operating conditions where pressures are high and capacities relatively small. For duties up to 50,000 EDR and discharge pressures up to 150 lbs. Ask for Bulletin 260-C.

TYPE F FLUSH KLEEN® CLOG-PROOF SEWAGE PUMP

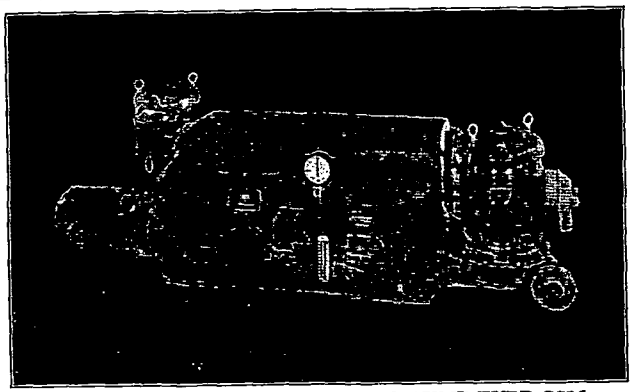
Only liquids are handled by the impeller. Solids and other coarse matter are retained in the strainer housing until cleanly flushed to the sewer. Ask for Bulletins 122-C, 122-S.

SEWAGE AND SUMP PUMPS NOW AVAILABLE WITH sealtrode*

*a trademark of Chicago Pump Company

SEALED ELECTRODE FLOATLESS PUMP CONTROLLER . . . used exclusively with "Chicago" Sewage and Drainage Sump Pumps.

The SEALTRODE* Controller has every advantage of other floatless controllers, plus these advantages of being sealed:



- Electrodes never become insulated and coated with grease, oil or soap.
- Electrodes are never affected by corrosive elements in sewage and drainage water.
- No moving parts in liquid.
- Low original cost . . . eliminates need for duplex float switches and float guide pipes.
- Low maintenance cost.

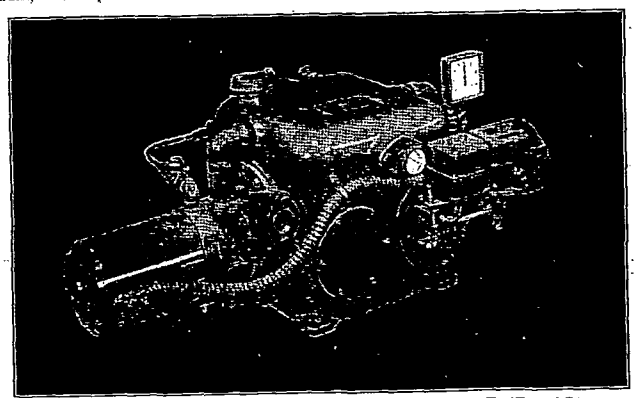
Sales and Service Offices in all Principal Cities



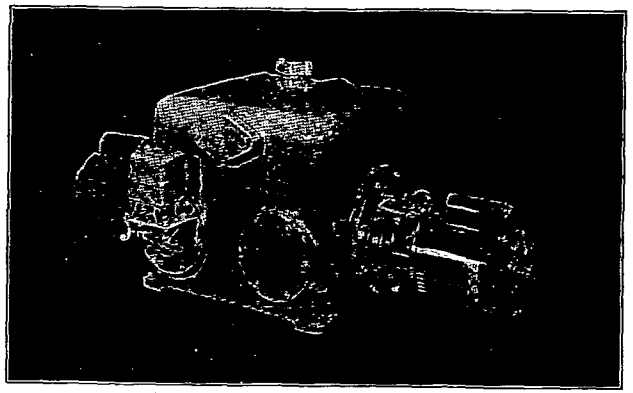
RETURN LINE VACUUM HEATING PUMP TYPE CSM

The new CSM Heating Pump achieves a high level of performance and efficiency. Complete flexibility is secured in this design, since each pumping element is driven by its own motor, actuated by its own control.

This makes possible a wide range of air and water capacities that can be selected to meet the exact requirements of each particular job.

These pumps are now available in a full range of air and water capacity combinations, for operation up to 20 inches Hg vacuum, and for pressures from 10 lb to 70 lbs. *Bulletin on request.*

RETURN LINE VACUUM HEATING PUMP TYPE CSI

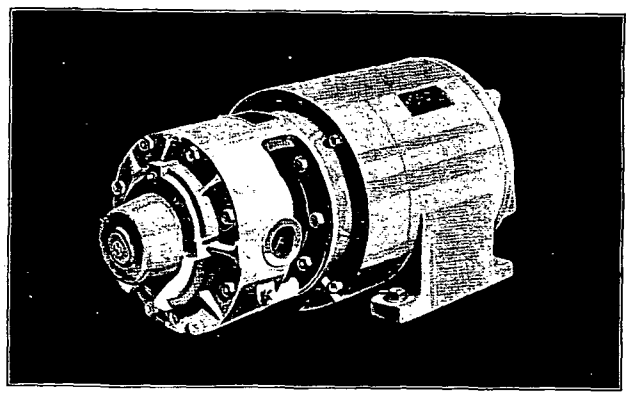


Now a Nash quality Vacuum Heating Pump can be economically installed and operated on any steam heating job. Engineered for high performance and low installed first cost, this new pump still makes use of time tested Nash principles of operation.

The Nash CSI has generous air capacity and features a wide choice of water capacities and discharge pressures. The right combination of capacities is at hand to match the requirements of the job. It is no longer necessary to pay extra for a pump with excessive water capacity, excessive discharge pressure, or in an attempt to get adequate air capacity. Capacities to 40,000 sq ft EDR. *Bulletin on request.*

THE NASH ENGINEERING COMPANY

234 Wilson Road **South Norwalk, Conn., U. S. A.**



Sales and Service Offices in all Principal Cities

CONDENSATION PUMP TYPE CS

Following the advanced design of our CSM Heating Pumps, the CS Condensation Pump has features representing long life, dependable operation and low maintenance and installation cost.

Pump is single suction centrifugal in bronze fitted construction with renewable bronze sealing rings. Balanced impeller is designed for high efficiency handling hot condensate. Pump and motor form a compact unit. Simple mechanical seal replaces conventional stuffing box, eliminating maintenance. Strainer area nearly three times that in previous pumps. Easily removed for cleaning. Inlet connection is only 12, 14 or 15 inches, depending upon size of unit, permitting easy and low cost installation. *Bulletin on request.*

NASH HOSPITAL PUMPS

For vacuum and pressure systems in hospitals to provide vacuum or pressure to operating rooms, laboratories and wards. Nash pumps possess particular characteristics adapting them to this exacting service. Silent service is assured, because the pumps and equipment are installed in a mechanical equipment room. Automatic control assures constant maintenance of the correct vacuum or pressure. No pulsation is present in either vacuum or pressure produced by Nash Pumps. Air delivered by Nash Compressors is entirely free from dust, heat or oil. Even dust entering the pump inlet is effectively removed. No oil or dust filters are required. No expert attendance is required. *Bulletin on request.*

APPLICATION

We have concentrated for a period of over 30 years on the design, development, manufacture and supply of pumps, separators and fluid handling accessories to meet the requirements of original equipment manufacturers where our products become an integral part of machines and installations. We do not believe any one design will meet all requirements, and our extended line reflects the wide variety of standardized equipment now available. If none of these items meet your needs, Kraissl Engineers will be most happy to consider modifications or design for your application.

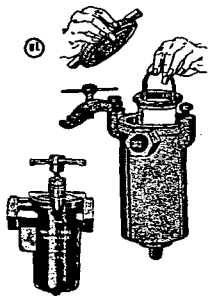
KRAISSL AIR PUMPS

Rotary Compressors and Vacuum Pumps
Single stage; vane and roller designs
Capacities: ¼ to 170 scfm
Pressures: to 50 psig
Vacuums: to 28 in. Hg (except laboratory models to 29⅓ in. Hg)
Patented force feed system of lubrication on oil lubricated models. Dry lubricated models also available. Convection, fan, and water cooled models.

KRAISSL LIQUID PUMPS

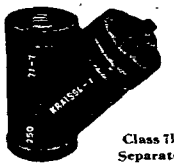
Gear, roller and centrifugal designs; direct and reduction drives for standard and high pressures.
Designed for applications in the fuel oil and hydraulic fields. Class 60 fuel oil pumps are *UL*-listed in most commonly used sizes.
Capacities: to 210 gpm
Pressures: to 400 psig

KRAISSL SEPARATORS



Filters and strainers in single and duplex models for liquids and steam. Listed by *Underwriter's Laboratories* in most commonly used sizes.
Sizes: ¼ in. to 6 in. std., single special to 12 in.
Body materials: C.I., C.S., Bronze, S. S.
Basket materials: Brass, Steel, Monel, S. S.
Basket openings: .0017 in. to .250 in.
Working Pressures: To 600 psig standard, special 1200 psi.

Write for General Bulletin A-1803 which summarizes our line and indexes available literature or specific bulletins describing products of your interest.



In addition to the products indicated, we currently manufacture a line of special TRANSFER VALVES, small capacity CENTRIFUGAL PUMPS, and AIR FILTERS.

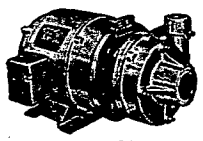
PEERLESS PUMP DIVISION

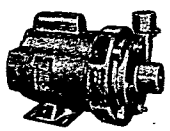
Food Machinery and Chemical Corporation



PLANTS: Los Angeles 31, Calif. 301 West Avenue 26 — Indianapolis 8, Ind. 2005 Northwestern Avenue

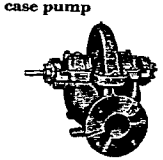
Offices: New York; Atlanta; Indianapolis; Chicago; St. Louis; Dallas, Plainview, Lubbock, Texas; Albuquerque, New Mexico; Phoenix, Arizona; Fresno, Los Angeles, Calif.

Products:



Vertical Pumps: Deep and shallow well pumps; water supply, boosting, circulating and waste disposal pumps; condensate pumps; sump pumps. All types of drive.
Horizontal Pumps: General purpose horizontal split case and end-suction pumps; turbine vane type pumps; boiler feed pumps; condensate pumps; circulating pumps; process pumps. All types of drive.

Peerless Type PE integral HP general purpose end-suction close-coupled pump



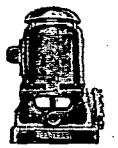
HP range: 1 to 40 HP. **Capacities:** 30 to 800 gpm. **Heads:** up to 260 ft. **Design:** single-stage, end-suction. **Drives:** standard horizontal *NEMA* motor. Screwed and flanged connections. Bronze impeller. Compact, versatile, dependable and efficient. Good hydraulic characteristics. Extremely durable and economical to operate. **Completely described in** *Bulletin B-2300.*

Peerless Type PE-A fractional HP general purpose end-suction close-coupled pump

Very good for adaptation to liquid moving equipment or systems. **HP range:** ¼ to 1½ HP at 3450 rpm. **Capacity:** 10 to 65 gpm. **Heads:** up to 110 ft. **Design:** single-stage, close-coupled, end-suction. **Drives:** ball bearing motor with stainless steel shaft. Cast iron volute, cast bronze impeller. Designed for installation at any angle; compact, flexible. **Completely described in** *Bulletin B-2300.*

Peerless Type AquaLine general purpose horizontal centrifugal split case pump

For hot and cold water handling, circulation and boosting. **Discharge sizes:** 1½ in. to 8 in. **Capacities:** up to 2600 gpm. **Heads:** up to 350 ft. **Temperature range:** up to 250°F. **Drives:** motor. The AquaLine volute is cast iron, bronze fitted, impeller is cast bronze. Available with packing gland or replaceable mechanical shaft seals. Highly dependable and economical to operate. **Fully described in** *Bulletin B-2100.*



Peerless Type A general purpose horizontal centrifugal split case pump

For the widest variety of pumping services. **Capacities:** to 70,000 gpm. **Heads:** to 300 ft. Single stage, split case design. **Drives:** direct-connected electric motor; belted drives; diesel, natural gas, and gasoline engine; steam turbine; combination drives. Double-suction sizes 1½ in. through 48 in., bottom suction sizes 12 in. through 42 in. **Completely described in** *Bulletin B-1500.*

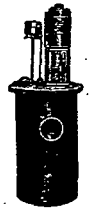
Other comprehensive, illustrated bulletins describing Peerless' complete line of vertical and horizontal pumps for all types of domestic, industrial and commercial service are immediately available. Request copies describing the type pump in which you are interested to the factory, address shown above.

Peerless deep well pump

For water supply services. **Capacities:** 15 to 30,000 gpm for installations in 4 in. wells or larger, to any practical depth. Adaptable to motor, belt, gear or steam drives. This turbine pump features several design advantages special with Peerless; the cooling method, unique bearing contact, and packing arrangements are examples. Available in water or oil lubricated line-shaft types. **Described in** *Bulletin B-141.*

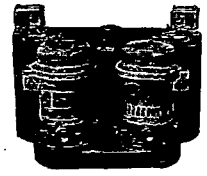
Peerless Vertical Pump

For application to cooling tower service, tank pumping, line pumping, boosting and recirculation. **Capacities:** 30 to 40,000 gpm. **Heads:** to 1000 ft. **Hp range:** electric, up to 2500 hp; right angle gear drives, up to 300 hp; steam turbine, as required. **Pump column sizes:** 2½ in. to 30 in. inclusive. **Liquid temperature range:** to 250 F. Available in water lubricated open line-shaft construction and enclosed line-shaft oil lubrication types. **Described in** *Bulletin B-505.*



Peerless Hydro-Line encased, close-coupled vertical centrifugal pump

Especially suited to pumping hydrocarbons such as gasoline, butane, propane, hot oils, etc.; hot or cold water; mild acids, basic and salt solutions. **Capacities:** up to 3000 gpm. **Heads:** to 1000 ft. **Temperatures:** up to 400 F. **Drives:** as required, standard vertical solid shaft or explosion-proof motors, steam turbines. **Request** *Bulletin B-1700.*

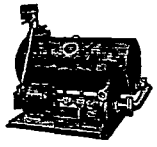


SKIDMORE CORPORATION

ST. JOSEPH, MICHIGAN

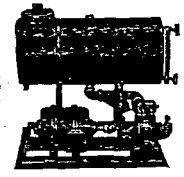
Quality Heating Pumps Since 1921

Write for Bulletin No. 19-A on type UV Pump



Write for Bulletin No. 21-C on type CCVS Pump

SKIDMORE TYPE UV PUMP



The Skidmore Type UV Condensation Pump, single or duplex unit, is designed for use where returns are too low to permit the operation of horizontal type pumps. Type UV Pump operates very satisfactorily where condensate is to be returned to the boiler or other points, from all types of steam heating systems or process equipment. Type UV Pump consists of vertical pump and motor unit with float and float switch mechanism mounted on cover plate which is bolted to sump type receiver. Capacities 2000 to 40,000 sq ft EDR and discharge pressures from 10 to 75 lb.

SKIDMORE TYPE CCVS PUMP

The Skidmore Type CCVS Condensate Pump is new close-coupled design. Built to give maximum efficiency, yet requires a minimum of space. Shown above is the duplex pump with two float switches. This model is also furnished with automatic alternator. The CCVS Pump is also built in single unit. Motor and pump are bolted to receiver. Pump is bronze fitted throughout with enclosed centrifugal impeller of special design for hot water. Capacities 500 to 10,000 sq ft EDR and pressures from 10 to 40 lb.

Write for Bulletin No. 14-B on type HS Pump

Write for Bulletin No. 17 on type TM Pump

SKIDMORE TYPE HS PUMP

The model HS Condensation pump is economically designed to offer maximum efficiency with lower operating cost. The Type HS will operate at high temperature encountered in condensation pump service. The pump can be disassembled without disturbing piping connections. Furnished in either single or duplex type. Pump casing is constructed of heavy close grain cast iron, vertically split, bronze fitted throughout. Capacities 1,000 to 125,000 sq ft EDR, pressures 10 to 75 lb.

SKIDMORE TYPE TM PUMP

Type TM pump consists of motor, steel receiver, automatic make-up valve mounted on receiver, water level gage glass mounted on receiver, self-cleaning strainer between pump and receiver, assembled and mounted on steel base. Cast iron base furnished if required. Electric boiler water level controller furnished for mounting on boiler. The Type TM Condensate and makeup water pump is of turbine type designed for boilers up to 250 hp and pressures up to 150 lb.

Skidmore Pumps are built in single and duplex units

TUTHILL PUMP COMPANY

979 East 95th Street, Chicago 19, Illinois

Representatives in all principal cities

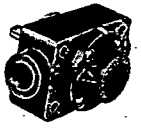
Pumps for Your Purpose

Tuthill manufactures a complete line of positive displacement rotary pumps for transfer oil burner, lubrication, and other services. Capacities from ⅓ to 200 gpm, for pressures to 500 psi, speeds to 3600 rpm. Also, pump units and special models for built-in applications. Write for catalog describing complete line.

SU Belt-Driven Pump Unit. For handling heavy fuel oil in commercial oil burner applications or with packaged boilers. Internal-gear pump design and 2 to 4 "V" belt drive insure quiet operation. Economically priced, it includes quality construction features such as two ball-bearing pillow blocks, one point take-up which simplifies adjustment of belt tension and special fabricated steel base with versatile motor mounting.

SU pump units are compact—can be provided with overall dimensions of only 14⅜ in. x 25¼ in. Furnished with a wide variety of pump and motor combinations, for pressures up to 300 psi, capacities to 2030 gallons per hour. Sub-assemblies of pump, stub shaft, pillow blocks and sub-base can be provided for incorporation into larger equipment. Ask for *Catalog 107*.

Model L—Small Industrial Pumps. *Underwriters' Laboratory* approved heavy oil pump series widely used for oil burner service, lubrication, liquid transfer and general industrial use. Model L is a compact, highly efficient, positive displacement, internal-gear rotary pump with mechanical-seal. It is provided for capacities from 20 to 360 gallons per hour at pressures up to 500 psi. Available with a variety of flange or foot mountings. Model L is directional in rotation and designed for direct drive at standard motor speeds. Ask for *Catalog 101*.



Model R—Automatic Reversing Pumps. Model R incorporates the Tuthill automatic reversing feature—designed to maintain constant direction of flow from the same port regardless of the direction of rotation of the driving shaft, without the use of check valves. Available in 11 sizes ranging in capacities from ⅓ to 200 gpm, for pressures up to 400 psi. Variations of models are available with mechanical shaft seal, internal-relieving feature and various mountings. Write for *Catalog 106*.

Stripped Pumps for Built-in Applications. For incorporation into products of manufacturers, Tuthill pumps can be furnished with the mounting bracket removed (Series S), or with mounting bracket and housing removed—providing pumping elements only (Series SA). Stripped pump units are furnished in 10 sizes in capacities from ⅓ to 200 gpm for pressures up to 200 psi. The series includes nonreversing and automatic reversing type pumps as well as units with automatic internal-relieving feature. Ask for *Catalog 106*.

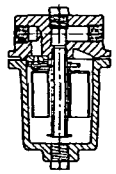
Cartridge-Type Lubrication Units. These compact, cartridge-type lubrication units are provided in 4 different models, each in 3 sizes, with a capacity range of from 55 to 170 gallons per hour, for pressures up to 200 psi. They may be furnished for non-directional service or with the automatic reversing feature where the pump must be driven by a reversing shaft. Choice of internal or external porting. Designed for flange mounting. Ask for *Catalog 103*.

Integral Motor—Pump Units. Tuthill provides a complete range of close coupled pump and motor combinations for use where space and weight are primary considerations. Units such as illustrated can normally reduce space required for pump and motor by at least six inches and cut weight by several pounds. Capacities range from 20 to 300 gph. Pumps are available for pressures to 500 psi.

Larger pump and motor combinations can be provided with capacities to 50 gpm, for pressures to 400 psi.

For original equipment applications involving substantial quantities Tuthill can develop a special POWERMITE combination where pump and motor are incorporated into one unit which takes up no more space than a standard electric motor (a typical POWERMITE measures only 3⅞ in. x 7½ in.).

Water Pumps. Tuthill provides vane-type water pumps for capacities up to 75 gph at pressures up to 150 psi. These are particularly adapted for applications involving boiler make-up water, or other boiler feed applications.



Catalog No. 100 Describing Complete Tuthill Line Also Available on Request.

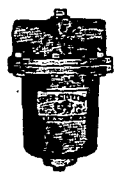
FOUR TYPES OF STEAM TRAPS
A Trap for every purpose

Super-Silvertop Inverted Bucket



Heat-Kwik Combination

Quik-Flex Thermostatic

Anderson Float

SUPER-SILVER TOP Inverted Bucket Steam Traps

Application—The inverted bucket trap is recognized as the best trap for most inside installations, as it is actuated by a liquid or gas rather than temperature. Available standard or with air eliminator (sometimes called blast type trap) where it is necessary to remove air quickly.

Description—Hooks up as an elbow or straight-in-line—only one nipple needed. Head and body of cast semi-steel; valve and seat of Anderloy; stainless steel mechanism and copper bucket (stainless steel buckets available).

Precision Parts Alignment—The bucket does not swing free. It is guided on a hexagonal tube. Keeps all parts in proper alignment and prevents bucket damage. Positive closing of the valve is insured.

*Capacities based on continuous flow. When ordering be sure to specify maximum steam pressure. *Note:* Pipe sizes shown in heavy type are standard and traps will be shipped tapped standard unless otherwise specified. Pipe sizes shown in light type furnished at no additional cost but only from Cleveland stock.

Write for *Bulletin* 657.

HEAT-KWIK Combination STEAM TRAPS

Application—For fast air and condensate elimination, even at extremely low pressures. This feature is an advantage in systems requiring fast heat such as kettles, autoclaves, dryers, cookers, etc.

Description—Traps have separate orifices, one for condensate and a separate bellows orifice for air. Head and body of cast semi-steel; valve and seat of Anderloy; stainless steel mechanism; copper bucket; bronze bellows for BL series for 50 lb service and monel bellows for BH series for 150 lb service.

QUIK-FLEX Thermostatic STEAM TRAPS

Application—Designed primarily for outdoor installation where a freezeproof trap is required; such as tracer lines, meter boxes, drips, etc., found in chemical, refinery, solvent and other industrial plants. Air and condensate is automatically discharged.

Description—A bellows actuated trap for fast air removal and condensate drainage for pressures up to 250 lb. Furnished with either bronze or monel bellows. Body and head of brass and cast semi-steel (see below) Valve and seat of Anderloy, a tough chrome nickel alloy. Guaranteed against freezing.

SPECIFICATIONS

Size Number of Trap	B-1	B-2	C-1	C-2	C-3	C-4
Size Pipe Connections	½	¾	¾	¾	1	1¼
Maximum Gauge Pressure	150	150	250	250	250	250
Body Material	Bronze	Bronze	Semi-Steel	Semi-Steel	Semi-Steel	Semi-Steel
List Price (Monel Bellows)	$21.00	$21.00	$33.00	$33.00	$48.00	$48.00
List Price (Bronze Bellows)	$21.00	$21.00	$30.00	$30.00	$45.00	$45.00

Differential Pressure	CAPACITIES IN POUNDS OF CONDENSATE PER HOUR

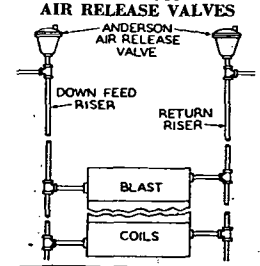
ANDERSON FLOAT TRAPS

SPECIFICATIONS

Size Number of Trap	81	82	83	84
Size Pipe Connections	½"-¾"	½"-¾"	1"-1¼"	1½"-2"
Maximum Gauge Pressure	250	250	250	250
List Price (standard)	$17.00	—	—	—
(stainless steel float)	$27.00	$23.00	$ 91.00	$170.00
(with gage glass)	—	75.00	105.00	185.00



Application—Use in steam lines or systems where traps must discharge continuously. (Inverted bucket traps discharge intermittently.) Use to drain moisture and entrainment from air and gas pipelines, purifiers, separators and gas equipment.

Description—Anderson Float Traps are continuous flow type desirable for draining moisture from air or gas equipment and ahead of condensate meters where intermittently discharging traps cannot be used. Traps are of rugged construction for heavy duty service. The head and body are cast semi-steel, float stainless steel and working parts bronze and stainless steel.

Differential Pressure	CAPACITY IN POUNDS OF WATER PER HOUR				
20	2200	4400	18000	24600
50	1580	3850	11000	27500
100	1200	4100	10700	25800
150	1000	3100	7800	20200
250	600	1900	5850	13600

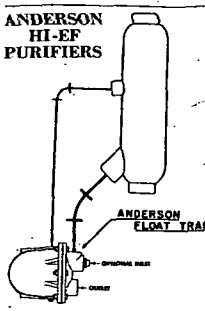
ANDERSON AIR RELEASE VALVES

Application—Designed to eliminate air and gases from pipelines in applications such as domestic hot and cold water systems, hot water heating systems, chilled water coolers, air conditioning systems, filters and any individual pipe-line or equipment carrying liquid.



Description—Anderson Air Release Valves are automatic and release air from the lines as fast as it accumulates. They are built to withstand pressures up to 500 lbs. Install at the highest point in all your liquid systems.

Size Number of Valve	70	72	73	13
Size Pipe Connections (inlet)	½"	½" or ¾"	1"-1¼" -1½"	½" or ¾"
Size Pipe Connections (outlet)	½"	½"	¾"	½" or ¾"
Maximum Gauge Pressure	150	250	250	500
List Price	$12.00	$22.00	$48.00	$90.00

Operating Pressure	CAPACITY—CU. FT. FREE AIR PER MINUTE			
10	7.0	20.0	52.0	
50	9.3	22.5	77.0

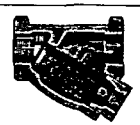
ANDERSON HI-EF PURIFIERS

* Type LC Small Line Purifiers

Type	LC-50	LC-75	LC-100	LC-125	LC-150	LC-200
Size	¼	¾	1	1¼	1½	2
Diameter	2¾	3¾	3¾	3¾	5	5
Length	9	9	15	15	17	17
Vent Size	¼	¼	¾	¾	¾	¾
Drain Size	½	½	¾	¾	¾	¾

Type L*150, *300 & 600 PSIG Large Line Purifiers



Type	L-250	L-3	L-4	L-5	L-6	L-8	L-10
Size	2½	3	4	5	6	8	10
Diameter	5¾	8¾	10¾	12¾	14	18	20
Length	18	22	26	30	34	44	52
	22	25	30	35	39	49	60
Vent Size	½	¼	¼	½	½	¾	¾
Drain Size	1	1¼	1½	3	3	3	3½

All above dimensions in inches. Bold face figures for 600 PSIG Line Purifiers. Write for Bulletin 501 for sizes ½ in. through 2 in. Bulletin 201 for sizes 2½ in. and larger.
* Available from stock.

Application—On steam lines and in boilers for clean, dry steam. Type L ahead of steam engines and turbines protect against slugs, line scale, moisture, salts and dirt. Type LC ahead of smaller steam air equipment such as heat exchangers, dryers, drums, etc. Internal type in boilers to deliver clean dry steam. For cleaning and drying air and other gases.

Description—Type L (flanged) for sizes 2½ in. and larger. Type LC (threaded) for sizes ½ in. through 2 in. Units are installed as a compact unit in pipeline adjacent to the equipment they protect. Low and high pressure types available, many from stock. Drained automatically by Float Trap (air or gas) or Inverted Bucket Trap (steam).

Write for *Bulletin* 252.

Application—Anderson Self-Cleaning Strainers remove scale, grit and sediment from the line ahead of steam traps, reducing valves, air tools, pumps, etc.

Description—Stainless steel screens, (brass available on 2½ in. and 3 in.) standard equipment, have extremely large free area. Screen for steam and gases has 1/64 in. openings—for liquids 1/32 in. openings. Other sizes furnished when specified, prices on application.

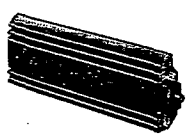
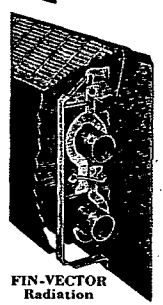
AIR CONDITIONING, REFRIGERATION, HEATING PRODUCTS AND ACCESSORIES

CONVECTORS—Attractive, *easy-to-install*. Use with hot water or steam. Eight models, capacities with steam 1 lb entering air 65F: 9 to 139 EDR. Dimensions: 4, 6, 8 and 10 in. wide; 18 to 112 in. long; 12 in. window convector, 20, 24, 26, 32, and 38 in. high. Picture window, extra long, plaster front and institutional types also available.



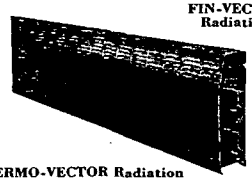
Type F Convector

TYPE BFOT—High output baseboard with "snap in" features for even greater ease of assembly. Same damper choice and heating element selection as BE-10. All accessories tailored to close tolerances enhancing beauty and simplifying installation.

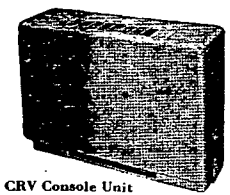


BFOT

BE-10 BASEBOARD—Snap-on front baseboard for forced hot water, steam or vapor heating. Fits flush with floor. 10 in. high. Shipped in 2-ft to 10-ft lengths for easy, on-the-job cutting. Steel or copper elements shipped in 1- to 6-ft lengths. Semi-recessed and flush-back enclosures. 12 in. baseboard also available for commercial applications.

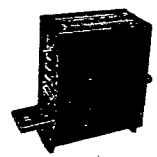


Baseboard Radiation

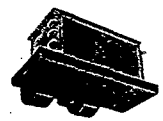


FIN-VECTOR Radiation

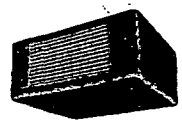
FIN-VECTOR®—Can be installed at any level above 4 in. from floor. Three style covers: sloping top, flat top, expanded metal. Adjustable hook-and-link hanger or new ball bearing bracket supports elements. One, two, or three tiers high. Two tube sizes, 1¼ in. and 2 in. steel or 1¼ in. copper tube. Self-spacing fins.



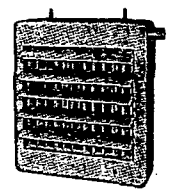
THERMO VECTOR® RADIATION—For along-the-wall heating of educational, commercial or institutional buildings with steam or hot water. Flush-type model, one, two or three tiers high. Two tube sizes: 1¼ in. and 2 in. Lever- or knob-operated damper.



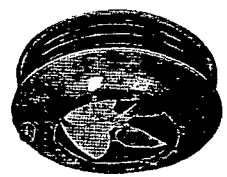
THERMO-VECTOR Radiation



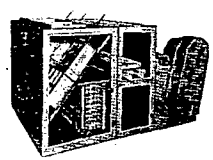
CRV Console Unit



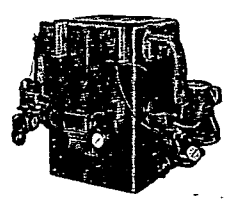
CRV Basic Unit



CRH Basic Unit



CRH Unit with Cabinet



Horizontal Unit Heater

Vertical Unit Heater

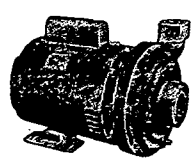
Multi-Zone Unit

Model C2 Vacuum Pump

HEATING-COOLING UNITS—For individual cooling with chilled water or heating with hot water; for individual cooling with direct expansion or heating with steam; cooling and ventilating; or heating and ventilating. Four sizes of vertical floor mounting type. Five sizes of horizontal ceiling mounted type. Can be exposed or recessed.

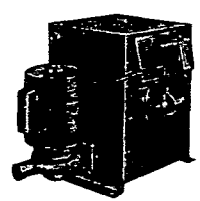
UNIT HEATERS—Type M, Model H and HM, not shown. Cabinet type. Seven styles, 3 sizes. Blower fans directly mounted on double end shaft motor. Capacities at 2 lb steam, 60 F ent. air: 18,000 to 108,000 Btu.

UNIT HEATERS—Type H. Horizontal discharge. 11 sizes, 2 models. Capacities at 2 lb steam, 60 F ent. air: 18,600 to 285,800 Btu per hour.



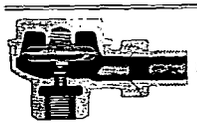
UNIT HEATERS—Type C. Vertical discharge. Four types of diffusers available. Ten sizes, 2 models. Capacities at 2 lb steam, 60° F ent. air: 45,400 to 598,000 Btu.

MULTI-ZONE UNITS are available in 9 sizes from 2560 to 28,800 cfm. They provide for simultaneous air conditioning of separate rooms or zones at desired temperatures. They make possible individualized conditioning of such areas with a single unit instead of several units.



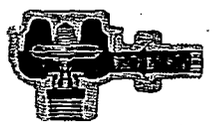
VACUUM PUMPS—Pull and maintain, at low amperage, up to 26 in. vacuum without dependence on close clearances. Only ONE principal moving part. Single motor easily handles BOTH air and condensate removal. Low 9⅛-in. return line connections. Capacities: 2,500 to 65,000 EDR. Single or duplex units.

CENTRIFUGAL PUMPS—Volute type for horizontal or vertical installation. Thirteen sizes ranging from ⅓ hp to 2 hp, capacities to 150 gpm. Typical supply system applications include boiler feed, processing, drainage, washer service and booster service. Also used as circulators in evaporative condensers, cooling towers, hot water and chilled water systems etc. For applications involving fluids other than water (glycols, brines, light oils) consult factory for recommendation.

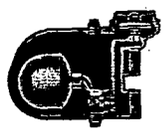


CONDENSATION PUMPS—Pumps feature mechanical seal that eliminates stuffing box worries. Capacities: 2,000 to 50,000 EDR. Single and duplex units.

A5 Centrifugal Pump

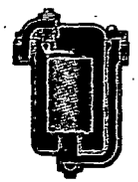


Type CHV Condensation Pump



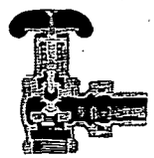
No. 1E Radiator Trap

RADIATOR TRAPS—For all types of low pressure steam heating systems. Body and cover of cast bronze, disc of non-corrosive metal. Available in 6 patterns. Capacities from 200 to 700 EDR.



Type TH1-A Thermostatic Trap

THERMOSTATIC TRAPS—Trap has cast brass body and cover; replaceable stainless steel valve and seat; disc of non-corrosive metal. For 5 to 100 lb working pressures. Capacities from 125 to 4,500 lb of condensate per hour.

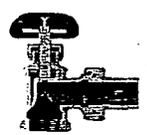


Series 30 Float and Thermostatic Traps

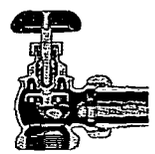
Types OB and OBS Bucket Traps

FLOAT AND THERMOSTATIC TRAPS—Use as drip trap for steam mains, unit heaters, heat exchangers. Float, copper; float valve and seat, Monel metal. Up to 25 psi gauge working pressure. Sizes: ¾, 1, 1¼, 1½ and 2 in. with capacities from 100 to 5,750 lb of condensate per hour.

INVERTED BUCKET TRAP—Body and cover of high tensile iron castings. Valve and seat (renewable and interchangeable) are specially hardened, corrosion-resistant steel. Operating pressures 20 to 150 lb gauge. Sizes ½, ¾, 1 and 1¼ in. Capacities from 220 to 5,600 lb of condensate per hour.



No. 740 Radiator Valve



Type 1140 Radiator Valve

SPRING PACKED VALVES—For low-pressure systems up to 25 lb. Heavy coil spring keeps packing tight around valve stem. Body and bonnet, cast brass. Sizes: ½ to 2 in. in 4 body patterns.

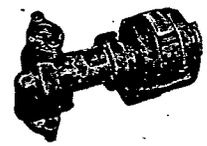
PACKLESS VALVES—Packless construction (no packing spring or stuffing box) provides tight permanent seal. Sizes ½ to 1½ in. in 4 body patterns.

No. 400 Radiator Valve

No. 600 Radiator Valve

HOT WATER VALVES—For hot water heating systems with pressure to 125 lb. Cast brass body. Packing nut, one-piece asbestos ring provides tight stem seal: Sizes ½ to 2 in.

PACKED STEM VALVES—For low-pressure steam systems and hot water systems up to 125 lb. Cast brass body and bonnet. Sizes: ½ to 2 in.



Vari-Vac Panel

DUNHAM-BUSH HEATING SYSTEMS

VARI-VAC® DIFFERENTIAL VARI-VAC HEATING saves up to 40 per cent on fuel because VARI-VAC automatically provides the exact amount of heat needed by using a continuous flow of sub-atmospheric steam at temperatures that vary with the weather.

METRO® single-riser method of piping, costs less to install and maintain. Provides continuous path for flow of steam from top to bottom of building. Continuous pipe runs down through overlying rooms and is offset into each room into convectors or baseboard radiation.

DUNHAM-BUSH CIRCULATORS—Standard and high head capacity models for all water heating or cooling systems. Single spring motor coupling. Special brand name motor with built-in overload protection. Extra-large oil reservoir. Field replaceable seals.

FLOW CONTROL VALVES—Completely automatic. No adjustment for winter-summer operation. Easy to clean without breaking pipe connections or removing valve mechanism. Universal pattern: 1 through 1½ in. incl. Horizontal patterns: 2 to 3 in. incl.

AIR SEPARATORS—Automatically remove air from forced hot water heating system. One-piece construction. **Positively prevents re-entry of air** into system. 30 psi working pressure. Sizes: ¾ to 2½ in. incl.

FLOW DIVERTOR FITTINGS—Assure proper water flow through **all radiation.** Only one fitting normally needed (on return) for each unit of radiation. Size (thread to thread): 1 in. x ½ in. to 2 in. x 1 in. incl.; (sweat to sweat): ¾ in. x ½ in. to 1 in. x ¾ in. incl.

RELIEF AND REDUCING VALVES—Pressure Relief Valves have extra-large diaphragm area, non-stick design. Factory set at 30 lb. **Pressure Reducing Valves** have built-in strainer. Factory set 12 lb. Adjustable. **Combination Relief and Reducing Valves** available.

CIRCULATOR VALVES—Pat. 2,817,489. Extra-large flow area reduces water resistance and circulator load. T-type handle operates in only ¼ turn. Straight-way and angle patterns; thread or sweat; full range of sizes; 125 psi working pressure.

BALANCING ELBOWS AND FITTINGS—Extra-large flow area. Unique sloping seat provides V-shaped opening for accurate balancing from full open to any degree of closure. Thread or sweat. Complete line includes vent tees, union elbows, connectors.

AUTOMATIC AIR VENTS—Expansion Type Vents need no adjustment. Manual venting for rapid air removal when system is first filled. 50 lb working pressure. **Float Type Vent** has built-in siphon to prevent water-logging. 35 lb working pressure.

VARI-FLOW CONTROLS—Fully automatic indoor-outdoor temperature controls for all types of hot water heating systems. No seasonal adjustment needed. Immersion bulb and capillary "wrap-around" types.

DISTRIBUTOR HEADS—For radiant panel and "spaghetti" type hot water heating. Same 1¼ in. copper head usable for supply or return, both ½ and ⅜ in. tube connections. Each length has 14 pairs of connections.

DUNHAM-BUSH, Inc., manufactures a complete line of air conditioning, refrigeration, heating products and accessories. For catalogs and literature write: Dept. HVAC-59, Dunham-Bush, Inc., West Hartford 10, Conn., or see your local Dunham-Bush Sales Engineer.

ENGINEERED VENT VALVES for STEAM and HOT WATER SYSTEMS

1A

VALVE NO.	CONN. (IN.)	RADIATOR—STEAM
1A	⅛	Adjustable for proportional venting.
2A	⅛	Vacuum—Adjustable for proportional venting.
70A	⅛	Meets Federal Spec. WW-V-151 for Type I Valve.
1000	⅛	Large Port—Extra large venting capacity.
40	⅛	Single Port—For small *one pipe systems.*
500	⅛	Disc type—For small one pipe systems.

71A

VALVE NO.	CONN. (IN.)	CONVECTOR—STEAM
1B	¼	Adjustable for proportional venting.
71A, 71B, 71C	⅛, ¼, ½x¾	Single Port—Vents the air, seals against the escape of water and steam in modern convectors that have high condensating rates.

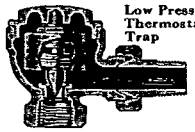
75

VALVE NO.	CONN. (IN.)	MAIN—STEAM
4A	½x¾	Single Port—For small systems.
16A	½x¾	Single Port—Vacuum—small systems.
75, 75A 75H	½x¾	Single Port—For medium and large systems.
76, 76A	½x¾	Single Port—Vacuum—For medium and large systems.

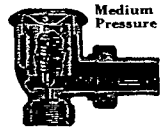
79

VALVE NO.	CONN. (IN.)	WATER VENTS
500	⅛	Disc type—For radiators.
790	⅛	Single Port—30 psi—For convectors.
791	¼	Single Port—50 psi—For convectors and mains.
79	½x¾	*Single* Port—75 psi—For mains.
78	½x¾	Single Port—150 psi—For mains and process applications.

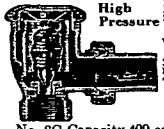
78



SPECIAL VENTS



VALVE NO.	CONN. (IN.)	*UNIT HEATER STEAM VENT*
74	½x¾	Single Port—Vents with rising, steady, or falling pressure.



74

		STRAIGHT SHANK VENTS
41, 43, 45	⅛, ¼, ½x¾	*Single Port*—For small steam systems.
		THERMOSTATIC VENT
4	½x¾	For use where water is not encountered.

LOW, MEDIUM AND HIGH PRESSURE THERMOSTATIC TRAPS

Low Pressure Thermostatic Trap

Medium Pressure

High Pressure

Low pressure traps have brass bodies, caps and union nut and tailpiece. 17C is made in Angle, Swivel and Vertical patterns. 8C is made in Angle and Straightway patterns. 9C is made in Angle pattern only. Thermostat and seat both renewable.

No. 17C Capacity 200 sq ft EDR 25 lb pressure ½ in. connection

No. 8C Capacity 400 sq ft EDR 25 lb pressure ¾ in. connection

No. 9C Capacity 700 sq ft EDR 25 lb pressure 1 in. connection

Medium Pressure Nos. 8 & 9 and High Pressure Nos. 8H & 9H have all bronze bodies and caps with union nut and tailpiece. Thermostats are 6 diaphragms of special non-corrosive metal. Thermostats and seats are renewable. ½ in. sizes are furnished in Angle, R.H., L.H. and Straightway patterns, others in Angle only. Medium Press. 50 lb. limit. High Press. 125 lb.

F & T TRAPS, DIRT STRAINERS AND SUPPLY VALVES

F & T Trap

Y-Strainer

Supply Valve

50 Series Float and Therm. Traps are available in pressure ranges to 125 lb. Used for venting and draining risers, steam mains, unit heaters, blast coils, etc. 50 Series Traps are made for easy servicing with all working parts mounted on cover. Remove four bolts to expose all parts. Pipe sizes are from ¾ in. to 2 in. cap. from 70 to 12,000 lb condensate per hour.

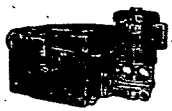
Radiator Supply Valves are made in sizes from ½ to 2 in. in Angle, R.H., L.H., and Straightway patterns. Brass bodies, union nut and tailpiece. Nos. 180 and 185 have non-rising handles. Both are packless. No. 186 is especially suited to vacuum systems.

Hoffman Y-Strainers are self-cleaning. Available for 125 lb, 250 lb and 400 lb pressures. Semi-steel and Brass bodies. Should be used in line ahead of all traps, valves, and pumps. Available with brass and monel strainers.

HOFFMAN INVERTED BUCKET TRAPS

Series 600

Working Pressures to 250 lb



Simple mechanism assures high operating efficiency. *Features include*—straight-through pipe connection; simple seat adjustment; all working parts connected to bonnet and easily removed with it; stainless steel seat and pin. Series 600 AS has integral stainer.

WATCHMAN CONDENSATION PUMPS

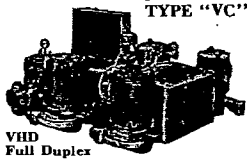
Condensation Pump

A standard unit, single or duplex, for systems up to 12,000 sq ft EDR and 20 lb discharge pressure. A low cost, vertical type condensation pump with cast iron receiver. Pump is bronze fitted with stainless steel shaft, one-piece bronze impeller. Duplex units have two pumps, two motors, and two float switches.

CONDENSATION AND VACUUM PUMPS

Hoffman pumps are available in varying capacities, a-c and d-c current, single, two, or three phase, and in pressures up to 60 lb.

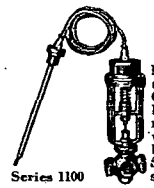
Condensation Pump Single and Duplex Units Capacities from 500 to 150,000 sq ft EDR



Vacuum Pumps Single and Duplex Units Capacities from 2,500 to 100,000 sq ft EDR

TYPE "UH" UNDERGROUND PUMPS

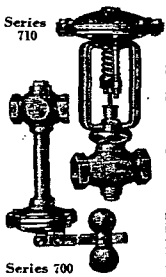
"UHS" Single Unit



Single or Duplex units for systems up to 50,000 sq ft EDR. Units are equipped with single stage vertical type centrifugal pump with cast iron receiver. Pump has enclosed type bronze impeller and stainless steel shaft. Special pits are not necessary with the Hoffman Underground Pump.

TYPE "VC" VACUUM PUMPS

VHD Full Duplex



Individually sized and separately controlled vacuum and condensate pumps provide unusual flexibility of arrangement and sizing. A wide selection of vacuum pumps and condensation pumps is interchangeable on a *group of cast iron receivers* so that an ideal assembly can be specified which will best serve the requirements of any particular application. Air capacities up to 70 cfm at 20 in. Hg vacuum. Condensation pump capacities up to 150 gpm and up to 75 psi. Duplex units provide double capacity.

HOFFMAN TEMPERATURE REGULATORS

Series 1100

Series 1100—for steam pressure to 150 lb per sq. in. Standard temperature range, available between 80 F to 250 F. Other ranges available. Self-motivated. Hydraulically formed bellows of selected material. Rugged construction. For water heaters, convectors, fuel oil preheaters and other similar applications. *Single and double seated. Bronze and* stainless steel trim available.

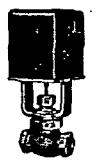
HOFFMAN PRESSURE REDUCING VALVES

Series 710

Series 700

Series 700 Max. Press. 200 psi., Low Press. 1 to 15 psi.

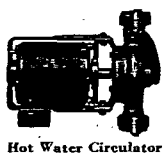
Series 710 Max. Press. 250 psi., Low Press. 5 to 80 psi.



Series 715 Max. Press. 250 psi., Low Press. 2½ to 125 psi.

Series 720-S & 720-W Max. Press. 250 psi., Low Press. 2 to 125 psi.

Series 750 Max. Press. 250 psi., Low Press. 2½ to 25 psi.



Choice of types specifically engineered for your needs—continuous service, or, for tight sealing against low pressure side when there is no demand—and with typical Hoffman features of design.

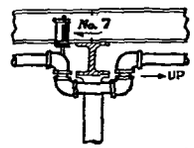
Maid-O'-Mist, Inc.

3217 No. Pulaski Road
Chicago 41, Ill.
Manufacturers of
Heating and Air
Conditioning Specialties

Products: Automatic air valves for (hydronic) hot water heating and cooling systems; automatic humidifiers for steam or hot water; automatic humidifiers for warm air furnaces; steam boiler water line controls; water line float control valves; liquid gas and air strainers.

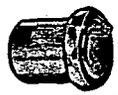
AUTO-VENT®



Air Eliminators

Maid-O'-Mist Auto-Vents permit automatic venting of the air which causes circulation trouble in heating and cooling systems. More and more, contractors who value satisfied customers are installing these trouble stoppers.

No. 7 Auto-Vent. For mains, pipe lines, unit heaters, chillers, convectors, coils, etc. Designed for vertical mounting only. Size 4⅜ in. x 2¼ in. with ⅛ in. IP female connection. Made of brass and equipped with a self-closing, float operated valve. All working parts, including valve and copper float, mounted on a removable bonnet for quick servicing or replacement. Valve is equipped with a Monel metal spring and a Neoprene valve seat which is unaffected by high temperatures, oil, antifreeze, etc. For pressure not exceeding 75 lb.



No. 7 Auto-Vent

Venting trapped mains and circulating lines

No. 77 Auto-Vent. Identical to No. 7 Auto-Vent, except for an additional ⅛ in., IP side opening to permit its use on overhead pipe lines, coils, etc., where head room is factor. Ideally suited fo Diesel engine and cooling manifold use, where vibration demands secure mounting. No air chamber required.

Auxiliary Equipment: No. 7X—bonnet assembly for No. 7 and 77; No. 777—self-closing valve core; No. 7A—connector for safe waste.

No. 27 Auto-Vent For Horizontal Mounting Only with ⅜ in. IP female side connection —Size 3 in. x 2⅛ in.

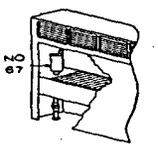
No. 27 and 37

Auto-Vents

No. 37 Auto-Vent For Horizontal Mounting Only with ⅜ in. IP vertical male bottom connection—Size 3 in. x 2⅛ in.

For convectors or baseboard radiation;—high points of overhead Mains; Radiant Panels; small Unit Heaters. Construction and internal working parts are same as in No. 7 Auto-Vent. Made of non-ferrous metals and designed for pressure not over 50 lb. No air chamber required. Auxiliary Equipment: No. 27X—bonnet assembly for Nos. 27 and 37; No. 7A—connector for safe waste. No. 666 valve core.

Write for price sheet and descriptive literature.



No. 67 Auto-Vent

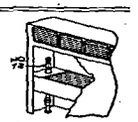
No. 67 and 68

Auto-Vents

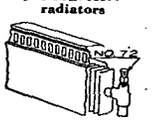
For convectors and baseboard radiators. Designed for vertical mounting only. Size 3 3/16 in. x 1½ in. with a ⅛ in. IP male connection for No. 67 and ¼ in. IP connection for No. 68. Designed for limited space, small, self-closing, float operated valve may be installed in trouble spots previously neglected or improperly vented. Valve is equipped with a Monel metal spring and Neoprene valve seat, which is unaffected by high temperature, oil, etc. No air chamber required. For pressures up to 30 lb.

Where a Safe Waste is needed, specify No. 7A connector fitting.

For venting convector radiators



No. 72 Auto-Vent



No. 72 Auto-Vent

For convectors, baseboard and free-standing radiation. Designed for both vertical and horizontal mounting. Size 1¼ in. x ⅛ in. with ⅛ in. IP male connection. No. 72 Auto-Vent is a fast venting self flushing valve of the expansion type. All expansion and contraction of the single, non-porous, composition disk is confined to four port vents. Internal siphon tube prevents waterlogging when installed in either vertical or horizonal position. Immediate drainage means fast disk drying, quick venting cycle which is continuous and no air chamber is needed.

Manual venting features plus tight shut off are all controlled by valve cap adjustment. Valve cap is tamper-proof and can be removed and replaced without damage or special tools for cleaning or flushing, if needed.

For convector radiators

For baseboard radiation

No. 14, No. 15 and No. 16

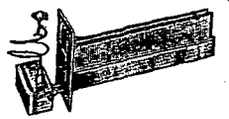
Balancing Valve Adapter Units for Hot Water Heating and Cooling Systems

No. 14

No. 15

No. 14 for copper and bronze tees. Nominal pipe sizes ⅜ in., ½ in., ¾ in., 1 in., 1¼ in.,

No. 15 for tees. Sizes ½ in., ¾ in., 1 in., 1¼ in., 1½ in.



Maid-O'-Matic Valve Adapter Units make any copper, bronze, or cast brass or iron tee a balancing valve. These units, quickly soldered or sweat fitted into copperfi brass, and bronze tees or threaded into cast iron tees, regulate hot water flow through radiators, convectors, baseboard panels, radiant coils, return mains, and branches. Can be inserted in side outlet or run of tee of same pipe-size to complete either a straightway or angle balancing valve. Full, free flow of water through the tee is possible. Since there is no inside reduction of pipe diameter, there is no water restriction except for the balancing required. This permits the use of additional balancing in a heating or cooling system without preliminary planning. Precision made of non-ferrous metals. Simple balancing requires only a screw driver.

No. 16 unit for ¾ in. and 1 in. cast brass tees to complete angle balancing valves.

CONVECTOR HUMIDIFIER

Maid-O'-Mist Convector Humidifier has no flat bottom to block the flow of warm air. Their individual ⅜ in. copper water troughs are spaced 1 in. apart to allow unrestricted air flow between the evaporator pads. Maid-O'-Mist Convector Humidifiers are designed for use with radiators and cabinet convectors in hot water heating systems and for all types of warm air furnances.

2 Trough Convector Humidifier, also available in 1 and 4 trough sizes

No. 50 SERIES FLOAT CONTROL VALVES

The No. 50 Series Float Control Valves are precision designed to fill requirements for humidifying units, pan fillers, air conditioning equipment, evaporative coolers, air washers and other applications where dependable water level control is essential in limited space to meet various operating conditions.

(No. 51 float control valve)

(No. 52 float control valve)

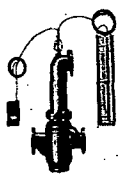
***No. 51 Float Control Valve.** Only 5¾ in. long overall, including copper float which is 2⅛ in. diameter by 1¼ in. deep. Valve body is made of hex-brass rod with removable, raised, hard nylon valve seat. Valve stem is brass with an incased heat and oil resistant, special Neoprene washer. Valve seat is protected with a 100 mesh Monel Metal screen. Valve body is fitted with two ¼ in. IP locknuts for horizontal mounting securely in 5/16 in. hole—or valve may be screwed directly into tapped opening. Supply is equipped with union coupling for ¼ in. OD copper tubing. Working pressures up to 85 lb with capacity of ½ gal per minute at 50 lb pressure.

***No. 52 High Duty Float Control Valve.** Same general construction as No. 51 but designed for use where a larger volume of water is required. Capacity 1 gal per minute at 50 lb pressure, with working pressures to 125 lb. Overall length 8 in. with oversized float 1½ in. diameter by 4⅛ in. long.

* **No. 53Y High Duty Float Control Valve.** Same general construction as No. 52 except valve is vertically mounted with specia bracket as integral part for mounting on reservoir or pan, well above water line. Only 6½ in. long. Non-back-siphoning when installed according to instructions.

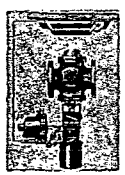
No. 54 Float Control Valve. Same general construction as No. 59 Valve except designed for use where a larger volume of water is required. Capacity 1 gal per minute at 50 lb pressure. Overall length 5 in.

* **No. 59 Float Control Valve.** Same general construction as No. 51 valve, except valve is vertically mounted with special bracket as integral part for mounting on reservoir or pan, well above water line. Non-back-siphoning when installed according to instructions. Only 5 in. long.



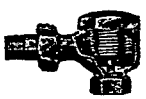
* NOTE: Nos. 51, 52, 53Y, 54, and 59 can be furnished with a ⅜ in. IP male connection at additional cost, when specified on order.

Series 6900—Water Line Float Control Diaphragm Valves. The No. 6900 Series float control valves are heavy duty large capacity water level controls. Rugged, strong and precision made, the cast brass body is fitted with a removable chromium valve seat. Controlled water level is accomplished through the action of the oversized copper float, linkage and special Neoprene diaphragm. Valve can be furnished to discharge water in an upward or downward position as specified. Can also be furnished with 8 in., 12 in., and 16 in. length float arm. Inlet and outlet tapping ⅜ in. IP. Capacities from 1½ gal to 6 gal per min. The No. 6927 Brass Mounting Plate (3 in. diameter) with gasket and screws is used where special mounting of the No. 6900 Series Valves is necessary. Write for prices and descriptive literature.

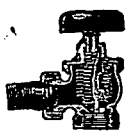


Sarco Company, Inc.

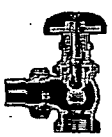
SARCOTHERM CONTROLS, INC.



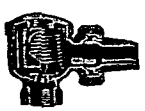
635 Madison Ave., New York 22, N. Y.



Type ST A-2 for Hot Water and Radiant Heating Systems



Type W for Steam Heating Systems



Radiator Trap, Type H

Type 40

Type SM

N-100 Medium Pressure Trap

Fully automatic weather modulated control systems for all types of heating, and all necessary accessories.

Hot Water and Radiant Heating

Sarcotherm provides a carefully engineered control system for hot water or heating which is fully modulating, and allows continuous circulation.

For forced hot water heating system for garden apartments, housing developments, hospitals, and institutions, Sarcotherm provides a completely zoned control system, including automatic night set-back and automatic morning pick-up.

Steam Heating Systems

The Type "W" Sarcotherm Control system can be applied to control condensate, vapor on low and high vacuum systems to promote fully modulating, continuous flow of steam in accordance with requirements of varying outdoor temperatures.

Complete program control panels and adjustment above or below normal requirements are provided.

Engineering Assistance

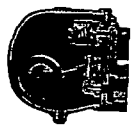
Consulting Engineers and Contractors are invited to consult with our Engineering Staff on any proposed control system. There is no obligation.

Other Products. Room thermostats, lift traps, balancing fittings, dial thermometers, motor valves, cooling controls.

SARCO RADIATOR TRAPS

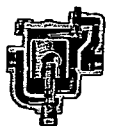
Type H for vacuum, vapor, or gravity steam systems. Self-adjusting bronze bellows for highest vacuum to 25 psi. Body and cap of brass. Self-aligning head and removable seat of hard bronze or stainless steel. Angle, straightway, offset, vertical, ½ to 1 in. *Cat. N 225.*

SARCO RADIATOR VALVES



Type 40—Bellows Packless—for steam heating. Valve stem sealed by packless bronze bellows, balanced pressure type. Angle or globe, ½ to 1¼ in.

Brass body, reversible discs, bakelite handle. Available with modulating devices. Wheel or extension handles; lockshield tops. *Cat. N 255.*



Type SM—Spring-packless or gland packed for all steam and hot water systems. Angle, globe, offset, ½ to 2 in. Same details as for above type 40. *Cat. N 225.*

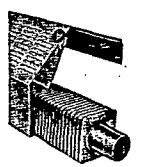
SARCO N-100 TRAPS

Similar in style to above Sarco Radiator Trap, the N-100 Thermostatic Trap is suitable for operation at pressures up to 125 psi. Stainless steel renewable valve head and seat. Angle, straightway and vertical. Sizes ⅜ in. to 1 in. *Bulletin N 155.*

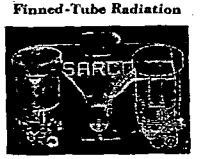
Float-Thermostatic Trap

Inverted Bucket Trap

Thermo-Dynamic Trap



Type 50-21A Regulator for hot water storage tanks, fan units, etc.



Water Blender Type DB

Type 6 Air Eliminator

Finned-Tube Radiation

Type S Condensate Pump

SARCO FLOAT-THERMOSTATIC STEAM TRAPS

Discharge condensate at steam temperature, continuously and without shock. Automatically vent air and gases by built-in thermostatic by-pass. Immediately responsive to varying loads and pressures. Sizes ¾ in. to 2½ in. for pressures to 200 psi. *Catalogs No. N-450 and N-455.*

SARCO INVERTED BUCKET TRAPS

Sarco Camlift valve mechanism provides rapid and free discharge of the condensate. Special design to prevent prime loss on light loads. Sizes ½ in. to 2 in., for pressures to 900 psi. *Catalog N-360.*

SARCO THERMO-DYNAMIC® STEAM TRAPS

These new type traps virtually eliminate maintenance. Stainless steel throughout . . . immune to both internal and external corrosion. Safe in fire-hazard locations. Not affected by corrosive condensate, superheat, water-hammer. Only moving part is solid stainless steel disc. No valve-closing mechanism to wear or stick. No critical clearances to choke. No gaskets to leak. Same trap for pressures 10–600 psi. Sizes ⅜ in. to 1 in. *Bulletin No. N-257.*

SARCO PIPELINE STRAINERS

(Also Scraper Strainers)

Brass, semi-steel or cast steel for all commercial pressures. Also furnished with hand or motor operated rotary scrapers, which clean the screen without flow interruption. *Catalogs No. N-1200, N-1210, and N-1225.*

SARCO SELF-POWERED TEMPERATURE REGULATORS

These self-powered units use the uniform force of liquid expansion. No stuffing boxes to leak, no auxiliary "power" required. All moving parts are inside the regulator. For steam, gas, oil, water or brine for temperatures to 300°F. *Bulletin N-620 and N-625.*

SARCO WATER BLENDERS AND TEMPERING VALVES

For automatic mixing of hot and cold water at desired temperatures. Type MB for showers, wash basins, etc. Type DB for use with submerged heating coils or tankless heaters. *Bulletin N-800.*

SARCO AIR ELIMINATORS

For steam and hot water heating systems, chilled water lines. Semi-steel or cast brass body. ¾ in. and 1 in. *Bulletin N 170.*

SARCOFIN FINNED-TUBE AND BASEBOARD RADIATION

A complete line with approved ratings as established by *Institute of Boiler and Radiator Manufacturers. Bulletins Nos. N-1640, N-1650, and N-1660.*

SARCO CONDENSATE AND VACUUM PUMPS

Complete line of condensate and vacuum pumps for all capacity ranges. *Bulletin N-1465.*

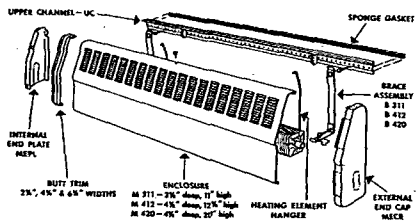
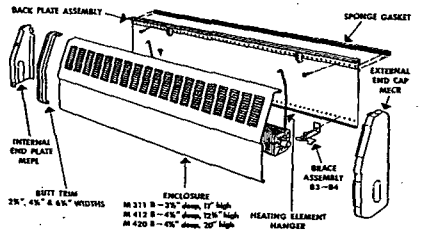
WEBSTER TRU-PERIMETER HEATING

Webster Tru-Perimeter Heating uses Webster Walvector and/or Webster Baseboard to replace heat at the perimeter, where heat loss occurs. Heating elements are mounted close to the floor along outside walls, spreading gentle heat the entire length of the exposed walls. Webster Tru-Perimeter Heating warms the air, the floors, and the inside surface of outside walls. Air is drawn to floor level and across floor into inlet opening of radiation. Radiant heat rays strike the floor along the full length of exposed walls.



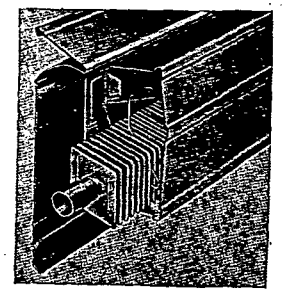
Modern School interior showing wall-to-wall installation of Webster Walvector, blanketing entire window area.

Webster Walvector



Webster Walvector for steam or forced hot water heating is an elongated convector designed for mounting along the wall, close to the floor line and under windows. For new buildings or modernization. Combines an attractive steel enclosure newly styled and improved, and a highly efficient heating element of copper tubing and aluminum fins in 3 in. and 4 in. fin sizes. Features simplified, low-cost, one man installation.

Custom Webster Walvector employs 3 in. or 4 in. fin size heating elements, single or double row. Front or top outlet enclosures for wall mounting or with integral sill. Custom Webster Walvector is custom made to meet architectural and construction requirements . . . yet sufficiently standard to permit production on an economical basis.



Deluxe Webster Walvector combines all the advantages of Standard Webster Walvector with a wider choice of enclosure, special wall trim and caps to achieve pleasing lower alignment and clear, simple lines.

Exploded view of Webster Walvector showing component parts

Exploded view of Webster Walvector with full back plate showing component parts

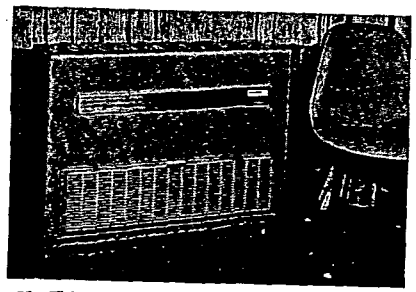
Cut-away view showing design simplicity of Webster Tru-Perimeter Baseboard

Versatile lower outlet location puts the heat where needed—excellent for panel wall construction.

Ask for Bulletins on Walvector, Custom Webster Walvector and Deluxe Webster Walvector.

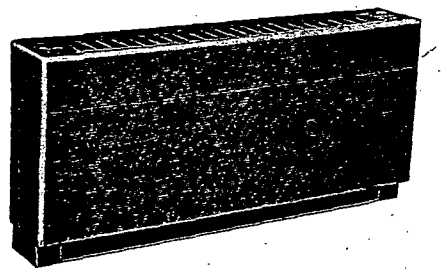
Webster Baseboard Heating

Webster Baseboard Heating is a forced hot water system in which a convector heating element is concealed within a specially built metal baseboard. It is run in a continuous loop around the exposed walls of the house, with a separate loop for each floor or zone. Heating element is copper tubing with aluminum fins.



Send for bulletin.

WEBSTER AIR CONDITIONING



Webster Newport: Provides heating and cooling in a single compact cabinet for through-the-wall installation. Contains heating coil for connection to steam or forced hot water heating system, and self-contained hermetically-sealed refrigeration cycle. Provides easy, inexpensive way to modernize hotels, office buildings, apartments or motels.

Webster Riviera Heating-Cooling Conditioner: Cabinet-contained unit utilizes same piping for winter heating with warm water and summer cooling with chilled water. Boiler and chiller are connected in parallel and fitted with valves for seasonal change-over.

Ask for bulletins.

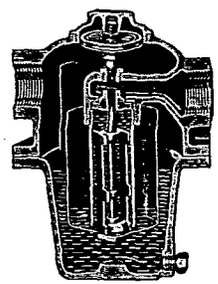
Float and Thermostatic Traps Series G



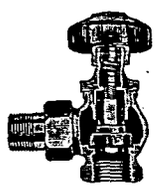
For Low Pressure Service

Compact, simple, accessible, durable, dirt-proof. Positive valve action. Wire drawing impossible. Low discharge temperatures. Efficient air venting. Trap not damaged by freezing.

Recommended Applications

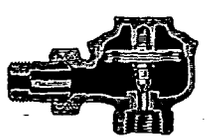
For draining Low Pressure Heating Systems, Ventilating Units, Unit Heaters, Pre-Heaters, Re-Heaters, and other Fan System Heat Surface, Process Heaters, Hot Water Generators, *Drips of Mains and Risers.*

Series G operating ranges from 25 inches vacuum to 15 lbs. pressure.



Series G

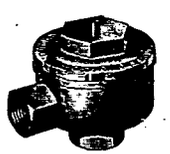
Illinois Radiator Supply Valves



Quick Opening, Spring Loaded, Packless. For any two-pipe steam, vapor or vacuum heating system.

Extremely smooth and easy to operate with a cool, break-proof plastic handle for finger tip control.

Illinois Thermostatic Trap Series G



For Vacuum and Vapor Heating Systems—For Working *Pressure Up* to 15 Pounds Positive acting and responsive to the slightest temperature changes, it discharges condensate quickly and freely without loss of live steam.

Illinois Thermostatic Traps for High Pressures

Series HG—Maximum working pressure 150 pounds. *Used where neat* appearance and compactness are desirable, as for trapping sterilizers or water stills in hospitals; steam jacketed kettles, coffee urns, warming tables and for process work.

These traps are also furnished for medium pressures.

Representatives in principal cities. See the *"Valve" Classification in the Yellow Pages of your local telephone directory*

AUTOMATIC VALVES; BOILER PRESSURE CONTROLS; RELIEF VALVES; BACK PRESSURE VALVES; PRESSURE REDUCING AND REGULATING VALVES

BOILER PRESSURE CONTROLS

TYPE "CQ"

TYPE "CQ" DUAL CONTROL—Combines pressure reducing boiler feeder with a positive *ASME* listed relief valve in one body, plus an easily accessible in-built strainer. All bronze, body, silicone relief seat. High relief design for good water or emergency steam relief. Keeps water in system above 13 psi and below 30 psi continuously and automatically.

TYPE "CBL"

TYPE "CBL" DUAL CONTROL—Combination reducing and regulating valve, by-pass valve and positive relief valve all in one body. Automatically keeps heating system filled with water above 13 psi and below 30 psi. Relief side protects aginst high pressure due to thermal expansion. By-pass affords quick filling at higher pressures.

RELIEF VALVES AND SAFETY DEVICES

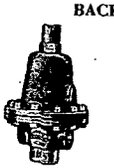
TYPE "F-51"

TYPE "F-51-F-52"—*ASME* tested and rated safety relief valves for hot water *space heating boilers, larger storage* tanks and water heaters. Fully meets *ASME* requirements in safe-guarding against maximum steam a boiler might generate in runaway conditions. Available with male and female *inlets in sizes* ¾ in. to 2 in.

TYPE "V"

TYPE "V"—Offers twofold protection for hot water heaters. Relieves in conditions of both excessive pressure and dangerous temperatures. Contains a new patented solid-filled thermostat. Reseating is automatic when dangerous conditions subside. Pressure setting from 50 psi to 175 psi available. ½ in. or ¾ in. size. *A.G.A.* listed.

TYPE "FV"



TYPE "FV"—*Provides maximum tank* and heater protection. Combination pressure and temperature relief valve. Contains new patented solid-filled thermostat, eliminating fuse plug replacement. Bronze bodies, brass internal parts, silicone seat discs. Pressure settings 75 to 150 lb. Test lever standard on all models. Size ¾ in. *ASME* and *A.G.A.* listed.

TYPE "F-3T"

TYPE "F-3T"—Newly designed offset valve body permits replacement of short or 6 in. fuse extension without removing or disassembling valve. Relieves from both pressure and temperature excesses. Pressure setting 25 to 200 lb. Fuse plug melts at 210 F. Also available with fuse plug *in side of straight* valve body. ½ in. and 3 in. sizes.

BACK PRESSURE VALVES

TYPE FR

BACK PRESSURE RELIEF VALVE—*High quality industrial type.* Iron or bronze; suitable up to 400 psi. For practically any service (except steam). *Unusually accurate control;* good capacity. ½ in. to 2 in. sizes.

TYPE "FHTL"

DIAPHRAGM TYPE PRESSURE RELIEF—For water heaters, storage tanks, etc. All bronze. *A.G.A.* listed, With or without test lever and temperature fuse plug. ⅜ in, ¾ in. and 1 in. sizes.

PRESSURE REDUCING AND REGULATING VALVES

TYPE "B"

TYPE "B"—Industrial type pressure reducing valve, designed for maintaining *desired pressure in service line regardless* of fluctuations in pressure from supply. Available with pressure settings of 2 to 200 psi, and for gas or fluid service. ¼ in. to 2 in. sizes.

TYPE "E"

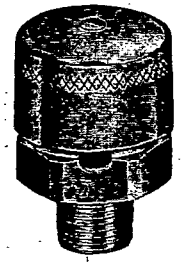
TYPE "E"—Water pressure reducing valve designed for domestic supply service. *Keeps pressure in homes at 45 psi* or whatever pressure is desired. All bronze, large in-built strainer with separate cleanout. Maximum inlet 250 psi. 1 in. to 2 in. sizes.

TYPE "BBC"

PRESSURE REDUCING AND REGULATING VALVE—Similar to Type "B" above except modification for heavy, dirty or viscous fluids, including Bunker "C" Oil. Stainless steel working parts. Features new "universal" joint seat, assures good operation. ⅜ in. to 1½ *in. sizes.*

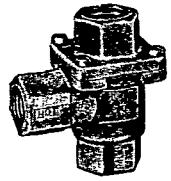
TYPE "BH"

DIFFERENTIAL PRESSURE REGULATOR—For controlling desired rate of flow by maintaining constant pressure "drop" across an orifice. Suitable for Bunker "C" oil. ⅜ in. to 1½ in. sizes.



THE DOLE VALVE COMPANY

Plumbing and Heating Division

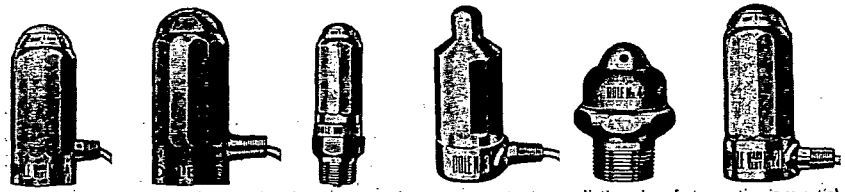


6201 Oakton Street, Morton Grove, (Chicago Suburb), Ill.

WATER MIXERS • AUTOMATIC REGISTERS • AIR and VACUUM VALVES • The All Star Line Control with DOLE

DOLE 20 SR. VENT (LEFT)

This high-quality hot water air valve is designed to provide an automatic air eliminator, a manual shutoff and a manual air vent. A Dole design developed on the hygroscopic principle by The Dole Valve Company. A selector dial permits various settings and provides for faster venting. One of a complete line of Dole Hot Water Air Valves.



DOLE NO. 100 WATER MIXER (RIGHT)

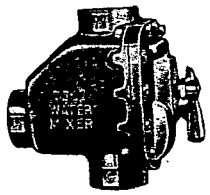
Here is a new water mixing valve utilising the famous Dole element which gives extra power. It is noncorrosive and trouble-free. The No. 100 is made of a brass forging and yet despite its high quality is low in cost, making it a top value. Nonadjustable. 140 deg setting.

Designed for installation at the water heater or storage tank.

DOLE AIR VALVES

The complete Dole line includes air valves for every type of heating system. Below are six typical valves from the line.

DOLE NO. 1 A VARI-VENT—adjustable valve that provides an infinite number of venting speeds.



DOLE NO. 1 D—a very fast venting, fixed-orifice, nonadjustable air valve. Factory-set to vent two or three times as fast as regular type air valves.

DOLE NO. 1 B VARI-VENT—provides better control of heat on convector type radiation where faster venting is essential.

DOLE NO. 3—designed to assure utmost heating performance on hand-fired steam heating systems. Complete venting is assured at any pressure up to 10 lbs.

DOLE NO. 4 QUICK VENT VALVE—for quick venting steam mains and returns up to 25 lbs pressure.

DOLE 2 B VARI-VENT VACUUM VALVE—for use on hand-fired gravity one-pipe steam heating systems. Has the Dole patented bellows that locks air out once it has been expelled.

DOLE WATER MIXERS

Dole Water Mixers provide safer tempered domestic hot water on all tankless heaters and storage tank installations. Available in three sizes: ½ in., ¾ in. and 1 in.; adjustable range—125 to 175 deg F.

DOLE AUTOMATIC REGISTER

Provides individual room temperature control. Operates thermostatically from room air temperature. Completely self-contained. Dial permits setting for the heat desired. Made in sizes to fit practically any stack-head opening.

DO YOU HAVE THIS HELPER?

For clear, complete, easy-to-find data on valves and how to select and use them, reach for this latest Jenkins Catalog.

HELPFUL FEATURES

FOUR TYPES OF INDEXES LEAD QUICKLY TO DATA NEEDED

Four-way indexing—*General*, Alphabetical, Fig. No., and Sectional—leads the reader instantly to the information desired, from *any point of reference* . . . pattern, metal, number, or function.

VALVE SPECIFICATIONS LIST ADVANTAGES AND MAJOR USES

Every Jenkins Valve in every group,—Bronze, Iron, Cast Steel, and Stainless Steel—is fully illustrated and described in *detail*, with an explanation of its principal advantages and uses.

HELPFUL INSTRUCTIONS FOR CHOOSING AND USING VALVES

Thirteen pages of basic information,—"Fundamentals of Valve Design and Application"—serve as a guide in selecting the correct type of valve, and provide instructions for their proper installation and maintenance to assure maximum service life.

USEFUL TABLES AND REFERENCE DATA TO WIN FAVOR OF ENGINEERS

In the 23 pages of the "Engineering Data" section, Catalog No. 56 provides a compilation of useful required tables, charts, and codes —the information wanted by the men who plan piping layouts . . . *and specify valves.*

From cover to cover this 296 page general catalog of Jenkins Valves was designed to give specifiers and buyers all the data they want . . . and FAST. It's the book to reach for FIRST when you need valves or valve information. Write for your copy.

JAS. P. MARSH CORPORATION

Marsh Instrument and Valve Co. (Canada) Ltd., 8407 103rd St., Edmonton, Alberta.

Dept. 5, Skokie, Illinois

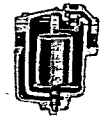
Branches in Principal Cities

Houston Branch Plant: 1121 Rothwell St., Sect. 15, Houston, Texas.

Marsh products include: Pressure, Vacuum and Compound Gages; Dial Thermometers; Steam Traps; Vents; Packless Radiator Valves and Radiator Traps; Refrigeration Water Regulators; Refrigeration Testing Instruments; Solenoid Valves; Needle Throttling Valves.

Radiator Traps—Equipped with the famous Marsh phosphor bronze diaphragm charged with volatile fluid. Extremely rugged, but so sensitive it closes tight on steam and opens instantly to pass condensate and air at only a few degrees below closing temperature. Highly efficient on pressures from below atmospheric up to 25 psi. Other traps available for pressures up to 125 psi.

Marsh Radiator Trap and Packless Valve. Both are available in full range of patterns.



Packless Radiator Valves—Not just packless in name; the ingenious Marsh annular mechanical seal does away with packing of **any kind**. Valves close on less than one turn. For either steam or hot water. Maximum water pressure, 125 psi.

Float and Thermostatic Traps—Designed for complete removal of air and condensate from steam mains, branches and risers. Condensate discharged through float operated valve at bottom; air through vent in top. Wide range of pressure and capacity ratings. One of the many float and thermostatic traps is illustrated. Line also includes float traps.

Marsh Float and Thermostatic Trap.

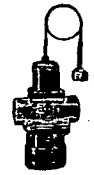
Inverted Bucket Traps—Marsh quality and performance in a trap for applications where the inverted bucket type is indicated.

Marsh Inverted Bucket Trap.

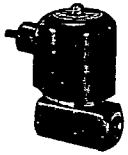
Marsh No. 50 Air Vent

Air Vents—Automatically remove air and gasses from tanks, coils or piping, liquid pump systems, and other similar applications. Float holds valve tightly closed when system is filled. Opens only when air accummulates. Has vacuum check which prevents return of air. Type illustrated is for working pressures up to 125 psi. Other types, including float and thermostatic types, for low pressure.

Pressure Gauges and Dial Thermometers—The respected Marsh line covers every requirement for pressure, compound, altitude gauges, ther-altimeters and dial thermometers. Marsh instruments are the product of nearly a century of experience. Sizes, ranges and case styles for all needs.



Marsh Ther-altimeter (Square and Round types)

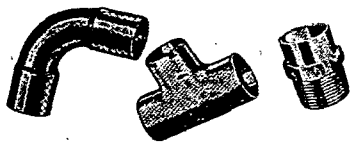


Marsh Ounce-graduated retard gauge

Refrigeration Valves—Recent addition to the Marsh line of water regulating valves is the Type 56 pressure actuated regulator illustrated. It is adjustable for both Refrigerant 12 and 22—adjustable from 60 to 270 psi—*by simply twisting* handy knurled cap on bottom. Although small and compact for installation in tight quarters, it has ample capacity for wide range of applications. Other Marsh Water Regulators, both temperature and pressure actuated, for practically every cooling or heating application.

Marsh Type 56 Regulator, made in sizes of ⅜ in., ½ in., ¾ in. and 1 in. Other types available.

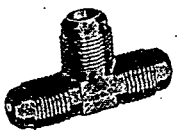
Solenoid Valves—Bodies made from solid bar stock. Packless, smooth-operating, tight seating valves with coils that withstand frost and moisture.



Marsh Solenoid Stop Valve. Direct acting and pilot operated valves which cover a broad range of requirements.

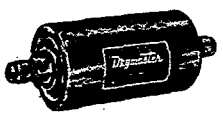
Ask for catalog

The comprehensive Marsh line is merely high-lighted here. Ask for catalog information covering your specific needs.



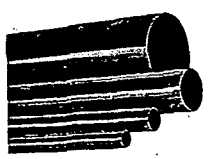
MUELLER BRASS CO.

PORT HURON 12, MICHIGAN



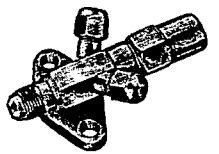
WROT-SOLDER TYPE FITTINGS

Manufactured from seamless copper tubing. Uniform solder cup depths; soldering temperatures reached quickly. Available for all plumbing, heating and air-conditioning systems.



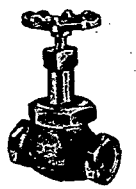
FLARE FITTINGS

Accurately machined threads for tight, leak-proof joints. Made from forgings or drawn brass rod to eliminate porosity.



DRIERS, FILTERS, STRAINERS

Many styles and sizes to fit every installation requirement including new Drymaster with balanced filtering and drying combined in one unit, also Deluxe Driers, versatile angle-type drier-strainer; Guardsman Drier, an angle strainer and a Y-type water strainer.

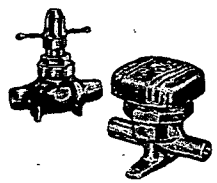


COPPER TUBING

Fine quality dehydrated and sealed copper tubing of dead soft temper. No moisture or foreign particles. Hard-drawn copper in straight lengths available in variety of outside diameters.

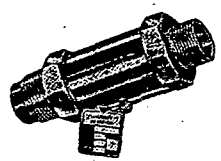
COMPRESSOR VALVES

Made of either forged brass or all steel, Mueller Brass Co. compressor valves are sturdy and dependable. Single, double port or adjustable . . . available in both flare and solder type connections in many sizes.



CAST BRASS WATER VALVES

Streamline cast bronze or forged brass valves. Packless and packed types variety of sizes and styles. Compression stops, gate, globe, swing, check and valves in various end connections available. 125 psi, 150 psi water, oil, gas service.



LIQUID INDICATORS

Available in straight-through, single or double port models with flare or solder end connections. Versatile new Sightmaster employs light refraction to indicate refrigerant supply. Easy, leak-proof, trouble-free installation.

REFRIGERATION VALVES

Diaphragm and packed valves for refrigeration and air-conditioning service have forged brass bodies. Carefully engineered and constructed of highest grade materials to give long trouble-free service on every installation. Many sizes in line, angle, two-way and three-way, either backseating or non backseating types.

SAFETYMASTER RELIEF VALVES

Designed and engineered for positive instantaneous action with exceptionally high volume discharge. Built to satisfy *ASA* B.9 code requirements for refrigeration vessels safety devices. Available in either straight-thru or angle types, in a total of 12 different inlet and outlet size combinations. Pressure settings from 150 to 450 lbs.

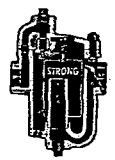
STRONG®

Strong, Carlisle & Hammond

508 Sandusky Street, Conneaut, Ohio

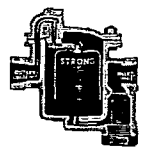
The Complete Steam Specialties Line

● STRONG *HYDRO-FLEX* STEAM TRAPS (semi-steel)

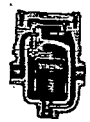


for pressures to 250 psi, temperatures to 450° F

Strong *Hydro-Flex* Steam Traps feature quick, positive *lever-lift* action for high discharge capacity and unmatched performance on light or heavy loads. There are only two moving parts—bucket and lever—reducing wear to a minimum. Pins, fixed fulcrums and hinges are eliminated from larger traps. Screwed-in renewable valve and seat are of wear-resistant *Anum-Metl*, guaranteed leakproof for one year. All internal parts are stainless steel and attached to the cover for ease of maintenance.



140 Series Standard In-Line Traps and Blast Traps



140, 141 and 142

143 and 144

140-S and 141-S

141-T and 142-T

Side inlet and side outlet permit quick removal of cover for maintenance without disturbing piping connections. Extra bottom connection is provided for draining or cleaning.

140-S Series has built-in strainer for removal of foreign matter in the line to prevent clogging of the trap.

140-T Series Blast Traps have thermal vent for use on jobs requiring very rapid starting or excessive air capacity.

144	1–1¼	250	4970	30	46.00	*	*

* *Note:* When ordering, always state highest pressure.

40 Series Standard Bottom Inlet Traps

43, 44, 45 and 46

Heavy-duty bottom inlet, top outlet traps for severe service on low, medium and high pressures to 250 psi at 450 F. Long operating life at sustained high efficiency with minimum maintenance.

Where excessive air venting is required, the *Strong Thermal Bucket Vent* with a bi-metal element is available.

Trap No.	Pipe Size (in.)	Continuous Capacity at psi	Continuous Capacity lb/hr	Weight (lb)	List Prices
43	½–¾	200	1520	7½	$15.00
43	½–¾	250	2380	14	20.00
44	¾–1	250	4970	28	28.00
45	1¼–1½	250	8720	48	60.00
46	1½–2	250	21600	84	90.00

Note: When ordering, always state highest pressure.

● STRAINERS

Strong Strainers collect foreign matter to protect expensive equipment, reduce maintenance and servicing on pressure and temperature regulating valves, steam traps and other fittings in heating systems. Standard screen is stainless, with 0.027 in. perforations. Stainless screens with 0.045 in., 0.062 in. and 0.125 in. perforations are available at no extra cost. Special screens furnished at extra cost.

Semi-Steel Strainers

Type "SY" with bushing for blow-off connection. Screwed pipe connections.

Type "SYG" with cap and gasket for blow-off connection. Screwed pipe connections.

Ductile Iron Strainers

Type "SYD" strainers are made of *Ductile (Nodular) Iron* that can be bent or twisted without breaking in case of fire or explosion. Suitable for steam pressures of 600 psi at 650 F.

Pipe Size (in.)	Blowoff Size (in.)	List Prices Type "SY"	List Prices Type "SYG"	Type "SYD"	Extra Screens
¼	¼	$2.00	$3.50		$1.30

* 2½ in. and 3 in. strainers have flanged blowoff.

● PRESSURE REGULATING VALVES

Type "C": Pilot-operated, single-seated, packless valve. Recommended for installations requiring the most accurate and dependable regulation. Semi-steel or cast steel construction. Reduced pressures from 0 to 200 psi. Screwed connections on sizes under 2 in. Others flanged.
Type "K": Self-contained, direct-operated valve for a maximum initial pressure of 225 psi for reduced pressures from 0 to 85 psi. Has internal strainer. Screwed connections.
Type "O": Same as "K", except for sizes and no internal strainer. Screwed connections.

Type "C"

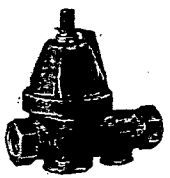
RELIEF VALVES AND CONTROLS FOR

HOT WATER SPACE HEATING

No. 174A

PRESSURE RELIEF VALVES FOR HOT WATER HEATING BOILERS (*A.S.M.E.* Rated)

174A Series



For dependable protection against over pressure. A complete line of sizes, ¾-in. to 2-in. inclusive. Bronze body and internal trim. Non-mechanically guided, stickage-free design.

74A and 740 Series

These valves are the same as the 174A Series except for increased outlets to provide greater capacity. Both series are tested and rated by the *National Board of Boiler and Pressure Vessel Inspectors.*

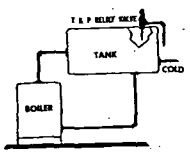
No. 560

FEED WATER PRESSURE REGULATOR WITH BUILT-IN CHECK VALVE



No. 560

Automatically supplies water as needed to maintain minimum system pressure under normal operating conditions. Regulator is set to deliver 12–15 lbs, but may be adjusted to higher pressures. Female inlet and outlet connections. Sizes, ½-in. and ¾-in.

HOT WATER SUPPLY SYSTEMS

No. 40XL

SELF-CLOSING TEMPERATURE AND PRESSURE RELIEF VALVES (*A.S.M.E.* and *A.G.A.* Rated)

40, 140, 240, 340 Series

For hot water supply system protection. Available in short or extended type thermal elements. Temperature relief 210°F. Pressure range 75–150 lbs. Standard setting 125 lbs. Sizes, ¾-in. to 1½-in. inlet connections. Female outlet connections.

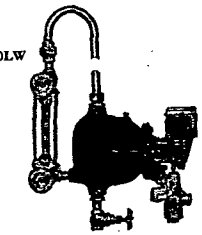
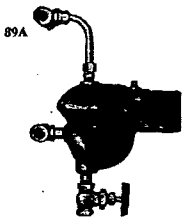
No. 400TS



TEMPERATURE ONLY RELIEF VALVES (*A.G.A.* Listed only)

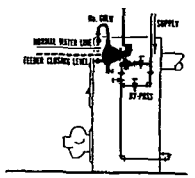
Nos. 400T, 401T



Temperature only relief valves for hot water supply tanks and heaters where separate temperature relief valves are desired or required. Btu/hr ratings up to 1,000,000. Sizes, ¾ in. or 1 in. inlet, ¾ in. female outlet. Available with fixture connection.

STEAM BOILER WATER LEVEL CONTROLS

No. 60LW



No. 89A

No. 50A

BOILER WATER FEEDERS AND FEEDER CUT-OFF COMBINATIONS (Listed by Underwriters' Lab.)

Feeder automatically feeds water to maintain safe water level in boiler. Cut-off switch interrupts burner circuit in the event of an emergency low water condition.

60 Series

Maximum steam pressure 25 lbs. Gage glass type. ½ in. feed valve connections. Available as feeder only or combination feeder and cut-off. Up to 5,000 sq ft radiation.

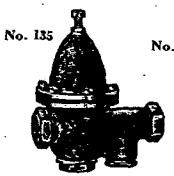
76 Series

Maximum steam pressure 35 lbs. Larger float and body design. Available in same models as 60 Series. ¾ in. feed valve connections. Float chamber connections 1 in. female. For over 5,000 sq ft radiation.

LOW WATER CUT-OFFS (Listed by Underwriters' Lab.)

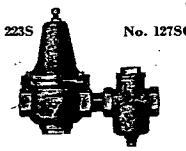
No. 89A

Maximum steam pressure 25 lbs. Gage glass type with deep sediment chamber. Available with single throw mercury switch for cut-off service only, or double throw for cut-off and alarm service.



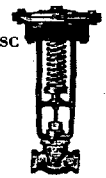
Ideally suited for self-energized control circuits on *gas-fired heating* installations.

No. 50A

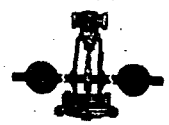


Maximum steam pressure 50 lbs. Heavier float and bellows construction for use on small and medium size process boilers as low water cut-off or pump starter. Also used on hot water heating boilers. 1 in. female top and bottom float chamber connections. See diagram on facing page.

PRESSURE REDUCING VALVES FOR WATER AND STEAM SERVICE

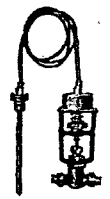


No. 135



No. 223S

No. 127SC



No. 125

No. 152

No. 155

REGULATORS FOR WATER SERVICE

No. 223S

High capacity water pressure reducing valve with separate strainer attached. For initial pressures up to 250 lb. Reduced pressure range 30–75 lb. Sizes 1¼ to 2 in.

No. 135

Water pressure reducing valve and integral stainless steel strainer. For water or air service on household and industrial applications. Initial pressures up to 250 lb. Sizes, ¼ in. to 2 in. inclusive. 135*LP* for reduced pressures under 30 lb.

No. 127W

Remote control, diaphragm-operated spring type pressure reducing valve. Sizes, ½ in. to 3 in. Initial pressures up to 250 lb. Reducing pressure range 10–100 lb.

REGULATORS FOR STEAM SERVICE

No. 127SC and No. 125

No. 127SC is spring type and No. 125 weight and lever type remote control diaphragm regulators. Sizes, ½ in. to 3 in. inclusive. Initial pressures up to 250 lb. Reduced pressure range range 1–100 lb. Sizes 2½ in. and 3 in. available with flanged connections. Also available as double seated regulators in sizes up to 6 in. Stainless steel trim.

No. 152

Self-contained type. Sizes, ½ in. to 1 in. Initial pressures up to 250 lbs. Reduced pressure range 5–40 or 25–100 lb.

No. 155 and No. 257

These regulators are for controlling the temperature of liquids in vats, pipe lines, tanks, etc. No. 155 single seated, No. 255 double seated direct acting regulators. Sizes, ½ in. to 1½ in. inclusive. No. 257 is reverse acting, double seated regulator. Sizes ½ in., ¾ in., and 1 in.

GILSULATE®

TRIPLE ZONE INSULATION FOR UNDERGROUND HOT PIPES

GILSULATE is a solidified hydrocarbon of high resin content which in granular form is poured directly around underground hot pipes for insulation and corrosion protection.

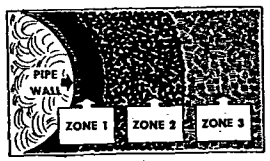
GENERAL DATA

1. Low cost per installed linear foot
2. Easy-to-use: pour ... tamp ... normal pipe heat does the rest
3. Fuses itself in hours into 3 zones of permanent protection for the pipe against all commonly-encountered buried-line conditions such as acids, alkalies, roots, water, and corrosion
4. Tested and proved in actual use in hundreds of new construction and replacement installations
5. Can be used under all multiple-pipe and cramped space conditions (see illustration below)
6. Needs no housing or mechanical sheaths to protect it
7. Requires no mixing or special handling
8. Can't be punctured, obviating need to remove rocks from backfill
9. Only normal pipe spacing required; steam and condensate lines can run side by side
10. Pipe expands and contracts within GILSULATE structure
11. Makes repairs to the pipe quick, easy and economical

GRADES AND TEMPERATURE RANGES

Type A	220F to 300F
Type B	300F to 385F
Type C	385F to 520F

TRENCH SIZE



4 in. to 22 in. wider than pipe diameter, 12 in. minimum backfill over the GILSULATE bed.

EFFICIENCY

Heat loss 8-12 percent of bare pipe. Inert to ordinary acids and alkalies found in soil, excellent dielectric.

For further data or information, write: American Gilsonite Co., Municipal Air-Port P.O. Box 15, Salt Lake City, Utah, or 3537 Lee Rd., Cleveland 20, Ohio.

ZONE 1 Dense, semi-plastic coating bonded tightly to pipe surface permits pipe to expand and contract while pipe wall is hot. Zone is waterproof and a thermal and electrical insulator.

ZONE 2 Sintered zone provides excellent thermal insulation under wet or dry conditions. Zone 2 is also water resistant.

ZONE 3 Unconsolidated GILSULATE particles provide excellent thermal insulation and a high load carrying capacity.

DURANT INSULATED PIPE COMPANY

PALO ALTO, CALIFORNIA

Durant Insulated Pipe Co., Inc. Williamstown, New Jersey

DURANT Pre-Sealed INSULATED PIPE

DURANT
manufactures pre-fabricated underground conduit systems to meet ALL federal and state specifications.

DURANT
pipe is suitable for steam, hot water, refrigerants, process fluids, and for tracer type systems.

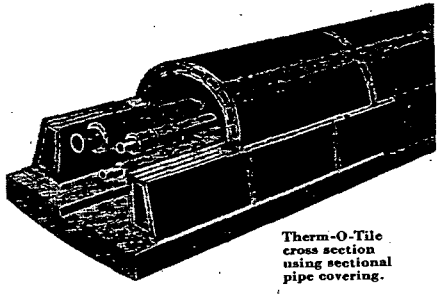
DURANT
maintains complete manufacturing facilities on both the East and West Coasts to render maximum delivery service at the most favorable freight rate.

DURANT
representatives are at your service in the principal cities of the U. S. and Canada.

Fabricated in all standard sizes

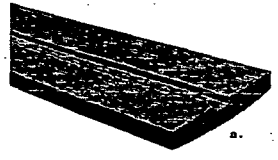
PRE SEALED®

Manufacturers of conduit systems since 1934



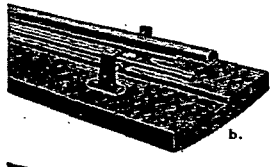
Therm-O-Tile®

conduit
FOR UNDERGROUND PIPING

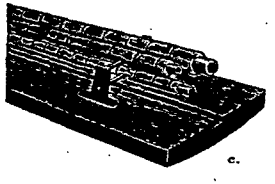


H. W. Porter & Co., Inc.

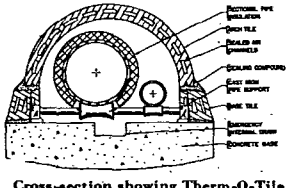
Newark 12, N. J.
or Subsidiary
REID HAYDEN, INC.
Baltimore, Md. Charlotte, N. C. Richmond, Va.



Thermo-O-Tile conduit is comprised of a vitrified tile envelope joined by cement mortar on a concrete base. It is designed to provide permanent protection of underground steam, high temperature or domestic hot water lines. Thermal efficiencies of 90 percent and higher are obtainable through the use of the proper commercial insulations.



Therm-O-Tile cross section using sectional pipe covering.



a.

b.

c.

Cross-section showing Therm-O-Tile features

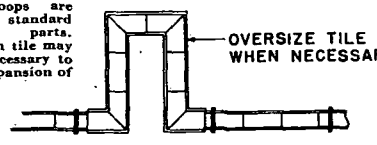
Thermo-O-Tile offers other distinct advantages: 1) Reasonable in cost; 2) Unusually strong—extra strength tile; 3) Accessible for piping repairs; 4) Internal drain assures dry pipe area.

Four simple steps are required in the installation of Thermo-O-Tile:

a. **Concrete Base.** The concrete base is poured directly on the trench bottom and provides a permanent foundation for the piping and conduit.

b. **Piping and Supports.** The piping is installed on factory assembled pipe supports which have been placed on the concrete base.

c. **Insulation.** The piping may be insulated separately with sectional pipe covering or with compacted inorganic filler, as approved by H. W. Porter & Co.

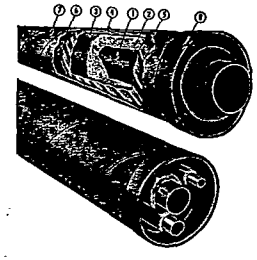


d. **Tiles.** The tile sections are manufactured from selected clays which have been salt glazed and vitrified. The base tiles are made from 4 in. to 12 in. high in 2 in. increments, and are 18 in. long. The arch tiles are made 9 in. to 30 in. in diameter in 3 in. increments, and 3 ft in length.

For complete specifications, ask for *Bulletin 9156*.

LOAD BEARING COMPARISON TABLE

Diameter Size	Pounds per linear foot, Sand Bearing Method, Pittsburgh Testing Lab	Average strength, minimum pounds per linear foot, Sand Bearing method, *ASTM* Specifications	
		Standard Strength Clay Sewer Pipe	Extra Strength Clay Sewer Pipe
	Therm-O-Tile	ASTM: C 13 - 57T	ASTM: C 200 - 57T
15"	4400	2625	4125
18"	5200	3000	4950
21"	6000	3300	5775
24"	6700	3600	6600



Expansion loops are formed of standard Therm-O-Tile parts. Oversized arch tile may be used if necessary to provide for expansion of pipes.

Prefabricated Insulated Piping Systems Underground and Overhead
Representatives in Principal Cities

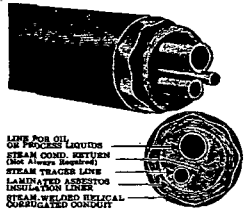
HEL-COR* INSULATED PIPE UNITS

1. Steam, hot water, oil or refrigeration pipes
2. *Insulation*
3. Asbestos-felt jacket—asphalt saturated
4. *Air space*
5. Hel-cor conduit
6. High temperature asphalt coating
7. Asbestos felt—asphalt saturated
8. Welded collar

*Hel-cor is a registered Trade-Mark of Armco Steel Corporation

Ric-wiL Hel-cor Insulated Pipe Units are factory prefabricated to meet specifications for insulating and protecting single pipe or any combination of multiple pipes—for steam, hot water, oil, other viscous fluids, process liquids and refrigeration lines. Pipes may be of any conventional material and pipe joints made as required.

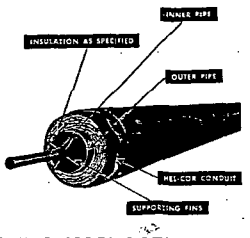
Insulation may be Ric-wiL Sectional Fiberglas insulation which has a lower K factor *than most other insulations now on the* market. Return lines or other pipes not requiring insulation can be left bare.



Pipe and insulation, covered with a jacket of asbestos roofing felt, are housed in exceptionally strong, load-carrying, Hel-cor conduit—16 gauge, helically corrugated steel of full welded construction, hot dipped galvanized. The *conduit is* given two heavy applications of high temperature asphalt, forming a thick reinforced asphaltic coating to assure maximum protection *against corrosive elements.*

For overhead piping, asphalt coatings and felt wrappings are omitted. Heavier gauge spiral weld conduits are also available.

Sturdy pipe supports, spaced according to requirements, carrying the weight of the pipe and assuring proper alignment, while *leaving the pipe free to expand and con*tract in the conduit without injury to the insulation.



10-gauge steel collars are welded to the ends of the conduit.

This prefabrication technique produces units of exceptionally high *thermal efficiency* and durability. Because of their inherent strength and flexibility, they can be installed in shallow, narrow trenches —*even under highways* and railroad tracks. Shipped in 21 or 41-foot lengths with odd lengths and accessories as required, they are easy to handle and easy to install with a minimum of field work.

TYPE UL UNILINE INSULATED PIPE UNITS

In this type of Ric-wiL Insulated Pipe Unit pipes are nested inside an insulation liner so that they are insulated from the *exterior* but not from each other. Any desired temperature can thus be maintained in system with tracer lines for steam, hot water, brine or any other heating or cooling medium, liquid or gas. Uniline Insulation Liner is of highly efficient insulating material, in any specified thickness, fitted to inside diameter of conduit. Individual pipes may be insulated if required.

TYPE J INSULATED JACKETED PIPE UNITS

Ric-wiL Insulated Jacketed Pipe Units are designed so that desired temperatures can be maintained in the system, with either pipe carrying the process liquid while the other carries the temperature controlling medium. Outer pipe is covered with insulation as specified *in any desired thick*ness, covered by asbestos roofing felt jacket. Firm supporting fins are welded to the inner pipe only, providing free move*ment of pipes independently of each other.*

LOW TEMPERATURE UNITS

Ric-wiL Insulated Pipe Units with Low Temperature insulation are highly efficient for either *single or multiple pipe distribution* systems carrying brine, ammonia, freon, ice water, and other low-temperature liquids or gases. Low Temperature *insulation in any specified thickness is* given a heavy coating of asphalt and a tension wrap of asbestos felt to form a moisture barrier before it is inserted in conduit when moisture barrier is required. Low Temperature insulation may also be used for Insulated Jacketed Pipe Units.

CAST IRON INSULATED PIPE UNITS

Ric-wiL Cast Iron Units provide a heavy-duty outside housing for insulated pipe lines buried underground—specifically designed to afford protection from corrosion and moisture infiltration. Mechanically-sealed joints provide ease of installation.

It is an ideal system for steam or hot water lines for heating purposes, oil lines, *service lines for railroad yards, and insulated* piping for handling viscous fluids, chemicals, and refrigerants in various manufacturing and process industries.

Cast Iron Units with pipe, insulating material and conduit as per individual project specifications and requirements, are completely assembled at the factory and delivered to job site in approximately 18½ Ft. lengths, with pipe at each end extending 3" beyond insulation and conduit.

Three different methods are provided for making joint closures.

Solid Sleeve—The best flexibility and the easiest to install.

Standard Mechanical Joint—Good flexibility, lower in material cost but usually more time required to install.

Flanged—May also be furnished.

Conduit diameters *are available in all* commercial sizes of Cast Iron Pipe, allowing a wide range of pipe sizes and insula*tion thicknesses for any temperature* or *pressure conditions.* Ric-wiL Cast Iron Insulated Pipe Unit systems are complete, with all accessory units and fittings prefabricated and insulated to conform with straight length units to make a finished piping system. Including housed expansion devices.

UTILIDOR CONDUITS

Meet all service tunnel requirements of industrial plants, railroads, municipalities, institutions, etc. Wide range of conduit diameters 36" through 84".

G. S. ZIEGLER & COMPANY

Great Neck, New York

TRI-SUL-ITE

3-WAY PROTECTION SYSTEM

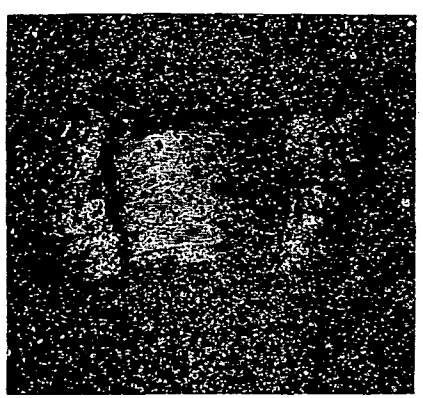
FOR HOT UNDERGROUND PIPES

Representatives throughout the United States and Canada

Tri-Sul-Ite is a specially selected pure gilsonite used for protecting hot underground pipes against water, corrosion and heat loss.

After being poured around and under the pipes and tamped, **Tri-Sul-Ite** forms, by proper curing, *3 efficient zones of protection*. Curing is accomplished by transmitting heat through the pipes.

ZONE 1 PROTECTION



Permanent Water Barrier—The first zone of **Tri-Sul-Ite**, adjacent to the pipe, fuses from pipe heat into an impermeable, waterproof, corrosion-proof coating. It resists normal soil acids and alkalis. The first zone of **Tri-Sul-Ite** gives positive assurance that water cannot follow the grade of the pipe.

ZONE 2 PROTECTION

Excellent Insulator—The second zone of partially fused **Tri-Sul-Ite** is a highly effective insulator which minimizes heat losses.

ZONE 3 PROTECTION

Insulator and Water-Barrier—The third zone of unfused **Tri-Sul-Ite** granules adjacent to the soil, provides maximum insulating efficiency, high resistance to water penetration and protection against surface shocks and subsoil stresses.

Close-up photo illustrates the plastic zone of Tri-Sul-Ite peeled back to show excellent adhesion for pipe protection

- **Water cannot follow the grade of the pipe**
- **Excellent corrosion protection**
- **High insulating value**
- **Minimum capital investment**
- **Adaptable to wide range of multiple piping arrangements**
- **Very simple to install**
- **Cushions shocks and stresses**
- **Pipe maintenance practically eliminated**

TYPES OF TRI-SUL-ITE AND PIPE TEMPERATURE RANGES

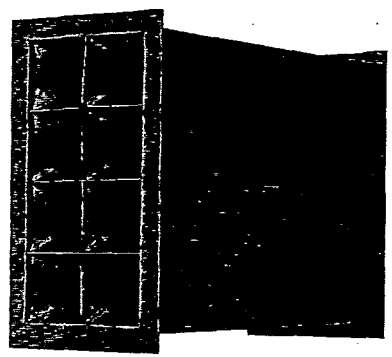
Type I	220° F to 300° F
Type II	300° F to 385° F
Type III	385° F to 520° F

COMES READY TO INSTALL

Tri-Sul-Ite arrives at the job site ready to install. No special mixing or preparation of the material is required. It is supplied in 100-lb (2½ cu ft) black and silver multiwall bags.

FUTURE PIPING CHANGES SIMPLE

Should branch lines or additions to the piping system be necessary, it is a relatively simple matter to open the trench, expose the piping, perform the necessary work and obtain quality protection with **Tri-Sul-Ite** as in the original installation.



TECHNICAL SERVICE—FIELD SUPERVISION

Trained men are available to cooperate with the engineer in adapting **Tri-Sul-Ite** to the piping system. Supervision is available for installations providing it is arranged in advance.

SAMPLE SPECIFICATION

Noise within all duct work shall be controlled by installation of Acousti-Duct units as manufactured by General Sound Control, Inc., 6711 South Sepulveda Boulevard, Los Angeles 45, California. Appropriate series and model of Acousti-Duct shall be used in accordance with the drawings.

Construction of the Acousti-Duct shall be No. 22 gage or heavier sheet steel, and shall be constructed to allow straight through airflow. Smooth aerodynamically contoured sheet metal transition sections shall be built into inlet and outlet ends of each Acousti-Duct to flow air smoothly from the entire cross section of the unit into the sound absorbent tubes. All sound absorbent material shall be faced with perforated sheet metal of not less than No. 22 gage.

Acousti-Ducts shall be provided with standard 1 in. flanges at each end for connection to the duct system, or they may be provided with other standard forms of duct jointing when specifically called for on the drawings.

The contractor shall furnish and install transition sections at inlet and outlet ends of each Acousti-Duct to the adjoining ducts whenever their cross section is different from the Acousti-Duct.

Noise reduction in each frequency band shall be not less than is specified in Acousti-Duct *Bulletin 205* by General Sound Control, Inc.

Pressure drop through each Acousti-Duct shall not exceed values specified in Acousti-Duct *Bulletin 205* by General Sound Control, Inc.

ACOUSTI-DUCT

- Are complete **ECONOMICAL** duct silencer units ready, to install in heating, ventilating, and air conditioning systems.
- Are **ENGINEERED** to provide straight through air flow with aerodynamically formed sheet metal entrance and exit sections for minimum pressure drop.
- May be selected by length to provide any required amount of **SOUND REDUCTION.**
- Are available in **STANDARD SIZES** from small to large duct sizes and from 2 to 10 feet in length.
- May be easily selected from **BULLETIN 205** which provides complete engineering data.
- Send for **Bulletin 205.**

Additional information and technical data may be obtained by writing to: Mr. Richard S. Dryden, % General Sound Control, Inc., 6711 S. Sepulveda Blvd., Los Angeles 45, Calif.

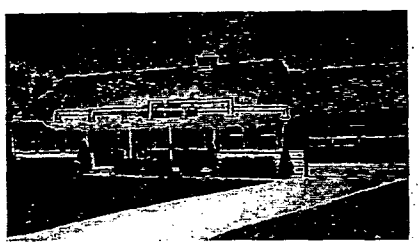
Distributors in All Principal Cities (Consult Classified Phone Directory)



G-B Snap* On Pipe Insulation

Ultralite Duct Insulation (Thermal)

Ultralite Duct Liner (Acoustical and Thermal)

G-B Duct

G-B Snap* On® Pipe Insulation

A one-piece molded pipe insulation of fine glass fibers for heated and chilled piping. "K" factor is truly exceptional—0.23 at 100 deg mean. The insulation is feather-light . . . flexible and resilient . . . insoluble in water . . . easy to cut with a knife . . . won't break or crumble . . . dustfree . . . clean and pleasant to handle . . . available with canvas, vapor barrier, or roofing felt jackets. Snaps quickly on pipe. Single seam can be closed with any standard fastening means. Available in 6-ft and 3-ft long, single-piece sections, sizes ½ in.–36 in. and copper tubing sizes to 6 in. See *Sweet's Architectural File* or write for *Bulletin SO*.

Ultralite® Duct Insulation (Thermal)

A highly efficient "wrap-on" type thermal insulation weighing only 1 oz per board foot in the popular ¾ lb/cu ft density. Available plain or with your choice of a number of facings already adhered to insulation (when a vapor barrier and/or a base for finished appearance on duct runs is required). Shipped in compressed rolls. (Write for *AIA File 37-D-8*)

Characteristics of Ultralite. Ultralite Duct Insulation and Ultralite Duct Liner are composed of long, fine, textile-type glass fibers, bonded with a thermo-setting resin. Both are manufactured by a patented process and shipped in blanket-like rolls. Both are immune to fire, rot, corrosion, age, rodents and insects, odors, vibration, and are low in moisture absorption. Ultralite is resilient—quickly returns to original dimensions if compressed.

Application Characteristics. Ultralite Duct Insulation and *Ultralite Duct Liner* are exceptionally light in weight. Can be cut readily with a knife, quickly run around curves and corners without special fitting. Can be adhered with adhesives, metal screws and washers, even staples. Ultralite is not unpleasant to handle. Extreme simplicity of application keeps applied costs down.

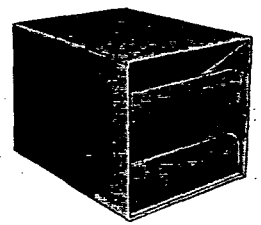
Ultralite® Duct Liner (Acoustical and Thermal)

A sound-absorbing insulation to be applied to interior of duct. Effectively absorbs objectional fan, air-rush and transmitted noises. Also an excellent thermal insulation. 3 types to cover full velocity range up to 7500 fpm. Won't break, chip or dent. Available in ½ in., ¾ in. and 1 in. thicknesses, coated one side with a fire resistant coating. Can be adhered to flat metal sheets and fabricated with the metal through brakes and shears. A new coating is available which complies with all provisions of NBFU Bulletin 90-A. Carries *Underwriters'* label with flame spread classification less than 25. (Write for *AIA File 37-D-8*)

G-B® Duct

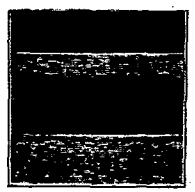
New prefabricated glass fiber for residential heating and air conditioning. Made of glass fibers and encased in an air-tight plastic vapor barrier. Hence, thermal insulation, sound absorber and vapor barrier are built-in. Comes in 6-foot sections in 4 in., 5 in., 6 in., 7 in., 8 in., 9 in., 10 in., 12 in., 14 in., 16 in. and 18 in. sizes. Approved for use in *FHA* insured homes. Tested by *Underwriters Laboratories* and now under label service.

Pipe Coupings and Fittings



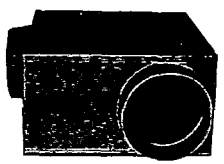
Write for descriptive literature on G-B's complete line of couplings and fittings for plain end and grooved pipe.

ELOF HANSSON, INC.



Acoustical Division, 711 THIRD AVENUE, NEW YORK 17, N.Y.

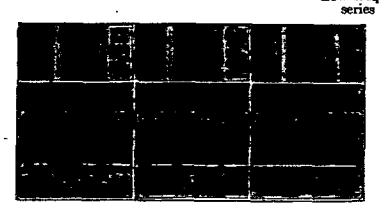
UNI-SILENCER®



For AIR CONDITIONING and VENTILATING SYSTEMS

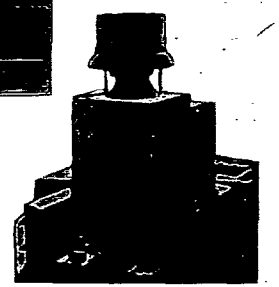
UNI-SILENCER* MODEL A
Moderate pressure drop, standard acoustical efficiency

UNI-SILENCER* MODEL B
Higher pressure drop, maximum acoustical efficiency

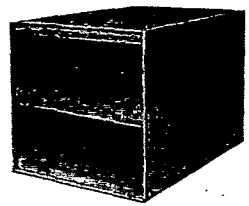


T. O. SILENCER
Elbow silencer for ducts

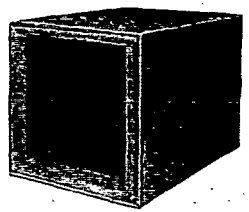
A full line of Elof Hansson silencers to effectively reduce airborne noise generated by fans in air conditioning, ventilating systems and by power roof ventilators. They are easily and conveniently installed in building structures at low cost due to new mass-production methods made possible by standardizing on modular sizes. Savings are of such proportions that UNI-SILENCER* prices compare favorably with conventional duct lining.



The performance of UNI-SILENCERS,* both as to acoustical attenuation and pressure loss have been tested and *certified* by independent, impartial outstanding authority. The certified data are *guaranteed in writing* and bonded. Free engineering service!



Distributors in all major cities.



UNI-SILENCERS* are slip-joined in simple manner as with children's building blocks, to fit almost any conditions or requirements

E H ROOF VENTILATOR SILENCER for power roof ventilators

UNI-SILENCER* MODEL LPD
Lowest possible pressure drop, moderate acoustical efficiency

UNI-RESONATOR*
Low frequency duct silencer—used in series with UNI-SILENCERS*

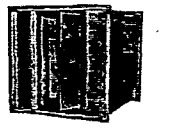
INDUSTRIAL ACOUSTICS COMPANY, INC.

341 Jackson Avenue • New York 54, N. Y.

SPECIALISTS IN NOISE AND PULSATION CONTROL
Manufacturers of Engineered Acoustical Products for Industry

Quiet-DUCT Silencers

STANDARDIZED "PACKAGE" SILENCERS for SOUND CONTROL of AIRFLOW

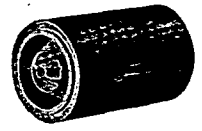


Quiet-DUCT Silencers

200 standard sizes

Quiet-DUCT Silencers are engineered units having proven acoustical and airflow performance in the silencing of heating, ventilating and air conditioning systems. Easily fitted into existing systems, or in the design stage of new projects, Quiet-DUCTS Silencers provide the following advantages:

1. Quiet-DUCT Silencers measuring in length from 2 to 10 feet will give as much attenuation as a conventional lined duct measuring from 30 to 200 ft long, depending on the frequency involved.
2. Quiet-DUCT Silencers eliminate empirical formulae and coefficient "guesstimates" out of the acoustic design of air-conditioning, heating and ventilating systems as all attenuation data has been determined by actual tests in our laboratories and verified by independent laboratories.
3. Air-flow vs pressure drop data has also been determined in our laboratories and verified by independent laboratory tests.



"MOD-U-SIZE" Quiet-DUCT Silencers

3 economical sizes

Full Size	Half Size	Quarter Size
24 x 24	12 x 24	12 x 12

"MOD-U-SIZE" Quiet-DUCT Silencers are availabe in three stock production sizes; Full Size—24 in. x 24 in. x 30 in.; Half Size—12 in. x 24 in. x 30 in.; Quarter Size—12 in. x 12 in. x 30 in.: These MOD-U-SIZE Quiet-DUCT Silencers actually cost 20 percent less than other silencers, an economy made possible by production-line volume of popular sizes carried in stock.

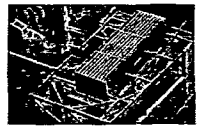
MOD-U-SIZE Quiet-DUCT Silencers achieve further economies by reducing handling and installation costs. They can easily be "built-up" in parallel or in series to meet any capacity and/or acoustic requirement. Their smaller "Module" size enables them to be easily taken through existing doorways, etc. MOD-U-SIZE Quiet-DUCT Silencers are certified for air-flow vs pressure drop, as well as acoustic performance by tests from recognized independent laboratories.

Conic-FLOW Quiet-DUCT Silencers

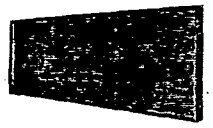
100 standard sizes

"CONIC-FLOW" Quiet-DUCT Silencers are designed especially for axial flow fans and the higher pressure systems. CONIC-FLOW Quiet-DUCT Silencers are available in from 4 to 10 ft lengths and provides the attenuation achieved with 30 to 200 ft of lined duct! Engineered and manufactured to a special design for exceptional attenuation, Conic-Flow Quiet-DUCT Silencers can be used on high pressures. They are also used on lower pressure systems. They are especially applicable on jobs having high acoustic sound pressure levels.

Selecting Quiet-DUCT silencers



Complete technical data; attenuation, airflow vs pressure drop, and sizing, is available in the new Quiet-DUCT Silencer catalogs. Will be sent upon request.



Quiet-VENT Silencers

Quiet-VENT Silencers are special size Quiet-DUCT Silencers for installation on doors and in walls of air-conditioning and ventilating systems! These unique silencers prevent the passage of sound in either direction, yet permit the free circulation of air. Quiet-VENT Silencers are designed to fit snugly inside walls or to "hug the wall", and are available in depths of 3½ in., 5 in. and 7 in.; and in widths of 30 in. and 42 in.; to handle 260 to 1710 cfm each. Used in offices, factories, apartments, homes, etc.

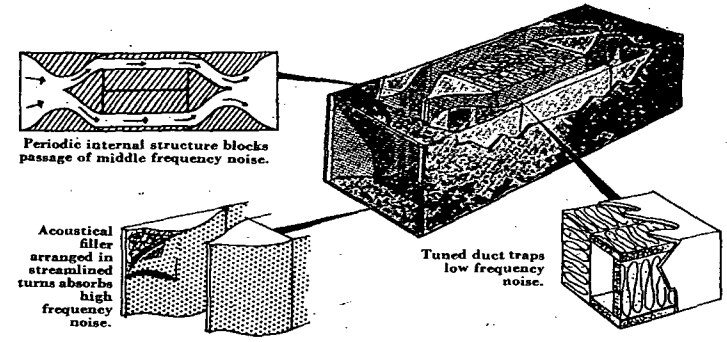
QUIET-FLOW Cooling Tower Silencers

Noise from Cooling Towers is controlled by "Quiet-FLOW" Silencers using special acoustic panels (and adjustable Resonators when necessary.) Quiet-FLOW Silencers for Cooling Towers are designed to assure proper attenuation of both intake and/or discharge. They are designed for minimum pressure drop to meet specifications.

FAN PLENUM ABSORPTION PANELS & SPLITTERS

Standard interchangeable acoustic panels & splitters available for hundreds of noise control applications! Available in many sizes and thicknesses, including panels with built-in resonators. Can be used to construct sound-proof enclosures, noisy machinery enclosures, shop offices, fan plenum absorbers, etc. All parts interlock and may be removed and reused again and again.

Technical Data regarding all phases of Noise Control is available by writing Industrial Acoustics Company, Inc., Air Conditioning Department.



KOPPERS COMPANY, INC.

Sound Control Department • Baltimore 3, Maryland

Aircoustat

PACKAGED SOUND CONDITIONING

SOUND TRAPS FOR ALL AIR HANDLING SYSTEMS

This combination of acoustical structures in a single assembly is a unique and patented feature of *Aircoustat*. (*U.S. Pat. Nos. 2759554-2759556*)

Aircoustat sound traps are a fully effective means of silencing air conditioning and air handling system noises of all frequencies in the audio frequency range. They have been thoroughly laboratory and field tested and proved in thousands of installations throughout the United States and Canada. The units are simple to select and easy to install and no maintenance is ever required.

All **Aircoustat** cases and angles are constructed of 18 gage galvanized steel, assuring a structurally rigid, internally braced package. All units are internally damped to prevent noise leakage. All welds are continuous and all seams are mastic-sealed and guaranteed to be airtight when operating under an internal pressure of 8 in. of water. All acoustical materials are retained by a sheet of bonded matting plus a perforated galvanized face sheet. Units are rated as Class "A" fire resistant. Two inch metal extensions are standard on all units for making quick, easy, airtight connections to ductwork.

Aircoustats are available in over 60 models, with cross section sizes ranging from 6 in. x 14 in. to 36 in. x 28 in. Larger cross sections are achieved by assembling these small units into one large unit right at the job site, making it possible to accommodate unlimited airflow requirements and avoiding the necessity of handling lengths to meet all noise reduction criteria*.

All **Aircoustat** pressure loss and noise reduction values have been verified by qualified and independent laboratories—the United States Testing Company, Inc. and Bolt, Beranek and Newman, Inc., Acoustical Consultants. In every case, all acoustical and airflow data are clearly defined to the satisfaction of the architect and consulting engineer.

* See page 335 of this edition for further information and tables.

L·O·F GLASS FIBERS COMPANY

Dept. 19-118, 1810 Madison Ave., Toledo 1, Ohio

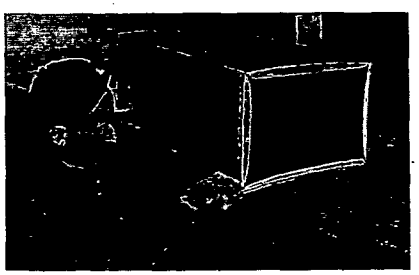
L·O·F GLASS FIBERS' DUCT INSULATIONS

LIGHTWEIGHT, FLEXIBLE, EFFICIENT

Properties: Made from fine, consistently uniform glass fibers bonded together in blanket form, L·O·F Glass Fibers' Duct Insulations resist the transfer of heat. They also resist fire, settling and the effects of humidity. Glass fibers are inorganic. They provide no sustenance for fungi, bacteria, rodents or insects.

Application: Lightweight, flexible and resilient, L·O·F Glass Fibers' Duct Insulations are easy to handle in large sections, easy to fasten securely by standard methods. They can be cut quickly with knife or shears; bent around curved surfaces; easily fitted into irregular areas.

DUCT LINERS



Microtex® Duct Liner effectively reduces mechanical noises, especially in the 250 to 4,000 cps range where most air-conditioning and heating system noises occur; retards heat transfer through duct walls. When lined with Microtex, the metal of the duct acts as a vapor barrier.

Product Data: Microtex is a semi-rigid, lightweight insulation made from fine glass fibers, reinforced with glass textile yarn, and bonded with a thermosetting resin. Also available: L·O·F Glass Fibers' Microlite and Super·Fine Duct Liner, non-rigid blankets made from extremely long, fine glass fibers without yarn reinforcement.

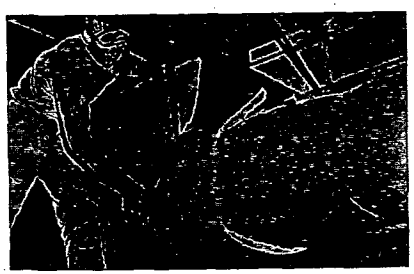
Noise Reduction Coefficient: Microtex Liner 1 in. thick has a coefficient of 0.70 in 1½ lb/cu ft density; 0.74 in 2 lb density and 0.75 in 3 lb density. No. 6 mounting used.

Packaging Data: Microtex Liner comes in densities of 1½, 2 and 3 lb/cu ft. Widths—36 in. and 48 in. Thicknesses—1 in. and 1½ in. Lengths—in rolls, 50 or 100 ft.

Coating: Duct Liners are coated on one side with black vinyl to resist air erosion even at peak operating velocities.

Microtex Duct Liner is an efficient acoustical and thermal insulation for air-supply ducts. *Lining is attached* to flat metal sheets with adhesive or mechanical clips; then formed in the brake with the metal.

DUCT WRAPS



These low-density, resilient glass fiber insulating materials have high thermal efficiency and sound-absorption characteristics. Countless tiny air cells formed by millions of fine glass fibers effectively minimize heat loss or gain.

Product Data: Duct Wraps are available under the trade names Microlite®, Super·Fine and Microtex®. Microlite and Super·Fine are non-rigid blankets formed of extremely long, fine glass fibers. Microtex is a semi-rigid blanket of fine glass fibers, reinforced with glass textile yarn.

Thermal Performance: At 75 F mean temperature, Microlite or Super·Fine Duct Wrap of 1 lb/cu ft density has a k-factor of 0.24 (Microtex ¾ lb/cu ft density 0.29).

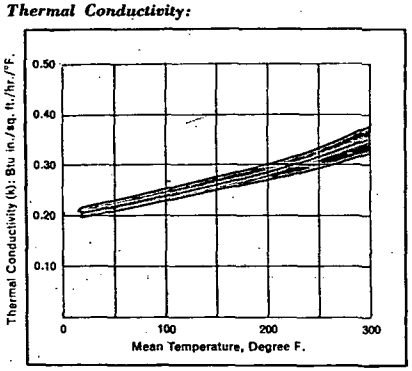
Packaging Data: Densities—½, 1 lb/cu ft (Microtex ¾ lb/cu ft). Width—18, 24, 36, 48 and 72 in. Thicknesses—1 in. and 2 in. Lengths—in rolls to 200 ft, depending on thickness and density desired.

Facings: All Duct Wraps are available plain, or with vapor-barrier facings such as reinforced paper and foil, vinyl film or aluminum foil applied. Where required, standard widths may have a 2 in. sealing tab on one or both sides.

L·O·F Glass Fibers' Duct Wraps can be fitted quickly around duct and suporting hangers. Light-gage wire ties complete the job. Workmen find these insulations soft and flexible; pleasant to handle without gloves.

L·O·F GLASS FIBERS COMPANY

SALES OFFICES: Atlanta, Baton Rouge, Boston, Charlotte, Chicago, Cincinnati, Cleveland, Dallas, Detroit, Houston, Jacksonville, Kansas City, Mo., Los Angeles, Milwaukee, New York, Philadelphia, Richmond, St. Louis, Syracuse, Toledo, Washington, D. C.
DISTRIBUTORS: (Located in principal cities)

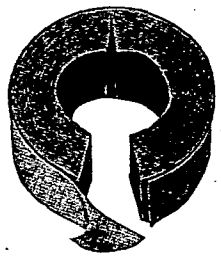


L·O·F GLASS FIBERS' MICRO-LoK PIPE INSULATION

MICRO-LoK* a resilient one-piece, molded glass fiber PIPE INSULATION with full-length "Spring-Hinge" action.

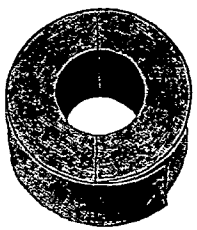
Description: Micro-LoK Pipe Insulation is made from long and fine glass fibers molded together into one-piece, three-foot sections for use in all standard iron pipe and copper tubing. Temperature limit is 350 F maximum down to −120 F. Primary uses are cold and hot water supply lines; heating supply and return lines, either steam or hot water; dual temperature lines; and chilled water, brine, refrigerant and special process piping.

Properties: Density—3.50 lb nominal. Moisture absorption—less than 0.2 per cent by volume. Alkalinity—less than 2 percent expressed as Na_2O. Corrosivity—(with steel, copper, aluminum) does not cause or accelerate. Specific Heat—0.20 Btu/lb/F. Thermal Diffusivity—@ 150F mean temperature 0.032 sq ft/hr. Micro-LoK is lightweight—a 3 ft section of 1 in. thick for fitting a 2 in. pipe weighs ¼ lb L.F. It does not break or crumble during shipment or application. Glass fibers are incombustible ... resistant to moisture ... and will not rot, shrink or swell.



Thermal Conductivity:

Shaded area represents normal variation in conductivity due to manufacturing and raw material tolerances and to differences in testing equipment. Black curve shows average values and is used for heat loss calculations.



Jackets: Available in canvas, weather resistant, or a variety of vapor barrier jackets, such as general purpose, dual temperature and flame resistant. All jackets factory applied with a minimum 1½" longitudinal lap.

Application: Micro-LoK features an automatic "Spring-Hinge" opening and closing action that works like this:

Opens easily

Each section has a longitudinal cut completely through one wall and partially through on the other.

Closes Automatically

Locking action produces snug closure to insure minimum heat loss or gain.

The fiber lay-up of Micro-LoK permits easy cutting and fitting of the inside diameter to conform to irregularities common in pipe line systems, such as couplings, unions, etc. No tools—other than an ordinary knife or shears—are needed.

Packaging Data: Available in all standard wall thicknesses—especially ½ in. and ¾ in.—for all standard pipe and copper tubing sizes. Lengths—3 ft sections. Shipped in corrugated cartons.

For more information and samples on Micro-LoK Pipe Insulation, write or call the nearest *L·O·F Glass Fibers Company Sales Office, or Dept. 19-118, L·O·F Glass Fibers Co., 1810 Madison Ave., Toledo 1, Ohio.*

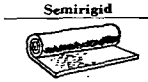
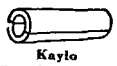
OWENS-CORNING
FIBERGLAS



OWENS-CORNING INSULATION SELECTION GUIDE TOLEDO 1, OHIO

Owens-Corning Fiberglas Corporation has long been a supplier of quality insulation products for the heating, ventilating and air conditioning industry. The selection guide below illustrates the broad range of products designed specifically for nearly every mechanical equipment insulation requirement. Additional information and complete product specifications are available from any Owens-Corning Fiberglas Corporation branch office or authorized distributor.



DUCT INSULATIONS

TYPE	USE	FACINGS FACTORY-APPLIED	OPERATING TEMPERATURE
 Semirigid	Semirigid board type duct insulations for all types of heating, ventilating, air conditioning and dual-temperature duct systems. Available with a variety of facings for appearance and for functional use.	Plain (no facing) for heating ducts	To 250 F
		Coated for heating ducts	To 250 F
		Vapor barrier for cooling or dual-temperature ducts with asphalt adhered kraft paper (SF) or fire-retardant embossed foil (FF)	SF to 150 F FF to 250 F
 Flexible	Resilient, flexible insulating blankets in rolls for insulating round and rectangular duct work and fittings. Available with a variety of facings for appearance and for functional use.	Plain (no facing) for heating ducts	
		Vapor barriers: Aluminum foil 0.001 in.; 0.002 in. thick; 0.004 in. grey vinyl film; 30-30-30 duplex kraft; reinforced foil and kraft laminate. Joint flange overlaps furnished.	To 250 F

DUCT LINERS

 Semirigid	Semirigid PF board type acoustical insulation liner for absorbing duct system noise. One or both sides are coated to reduce air friction loss and bind surface fibers. Also insulates thermally.	Fire-retardant	To 250 F
		Neoprene coating	Velocities to 6000 fpm
 Flexible	A sound-absorbent, mat-faced, flexible duct liner for rectangular or round duct systems. The smooth mat-faced surface reduces air flow resistance to a minimum and virtually eliminates the possibility of fiber air erosion.	Glass mat facing bonded to insulation	To 250 F

PIPE INSULATIONS

TYPE	USE	JACKET	OPERATING TEMPERATURE
 PF	With a variety of factory-applied jackets this universally used pipe insulation insulates all types of pipe and tubing from subzero to 450 F.	Universal Dual-Temperature Canvas Flame-Retardant Vapor Barrier Roofing Felt	−120 F to 450 F
 O-C Flexible Tubing Insulation	A molded foamed plastic insulation for iron pipe and copper tubing cooling and heating lines, chilled water and refrigerant lines.	None	0 to 200 F
 One-Piece	One-piece is a new addition to the Fiberglas line of pipe coverings. It has multipurpose use for all types of piping, is lightweight and easy to apply.	Same as PF	−30 F to 400 F
 Kaylo	Kaylo pipe and block insulation is a hydrous calcium silicate insulating material for heating lines and equipment operating at temperatures up to 1800 F	Canvas—Standard Weight	Standard Kaylo Up to 1200 F
		6 and 8 oz	Kaylo-20 Up to 1800 F

EQUIPMENT INSULATIONS

TYPE	TYPE	USE	FACING	OPERATING TEMPERATURE
 PF	Fiberglas PF equipment insulation is a highly versatile and efficient insulating material. Made in a wide range of thicknesses and densities to meet most requirements.	Heating and cooling equipment	Field-Applied	Up to 400 F
 Metal Mesh Blankets	Fiberglas metal mesh blankets are made with unbonded fibrous glass faced on one or both sides with wire mesh or metal lath. They conform readily to irregular shapes.	Heating equipment insulation	Available with a variety of meshor lath facings to receive surface finish.	Up to 1000 F

OWENS-ILLINOIS

General Offices, Toledo 1, Ohio

GLASS BLOCK AND TOPLITE PANELS

TWO (I) PRODUCTS

GLASS BLOCK PANELS. Owens-Illinois Glass Block are hollow, hermetically sealed glass units containing a 3/5 vacuum. They are laid in mortar to form light-transmitting panels in vertical walls. Owens-Illinois Glass Block provide quality-controlled daylighting by glass areas which reduce heat loss, surface condensation and infiltration in cold weather and heat gain in warm weather.

TOPLITE PANELS. Owens-Illinois Toplite Panels are made of hollow, partially evacuated and hermetically sealed glass units, prefabricated at the factory into panels of insulated aluminum-grid construction. Used horizontally in roofs, Toplite Panels offer controlled daylighting with reduced heat loss, surface condensation and solar heat gain.

THERMAL INSULATION. The coefficients of heat transmission 'U' for panels of O-I Glass Block and Toplite are as follows:

Size of Block		'U' (Btu/sq ft/hr/F Temp Difference)
5¾ in. sq		.60
7¾ in. sq		.56
7¾ in. sq	with Glass Fiber Insert	.48
11¾ in. sq		.52
11¾ in. sq	with Glass Fiber Insert	.44
Toplite Panels		.58

See page 123 in this GUIDE for additional U-Factors applicable to Owens-Illinois Glass Block.

SURFACE CONDENSATION. Because of the low over-all, air-to-air heat transfer, the exterior air temperatures which will produce condensation on panels of O-I Glass Block and Toplites are much lower than those for ordinary single glass. This permits higher humidities to be maintained where needed for winter air conditioning for comfort or for industrial processes.

INFILTRATION. Panels of glass block which are laid in mortar provide a barrier against infiltration. Dusts, drafts, and air and vapor leakage are minimized. Natural ventilation requirements can be met by installing windows in glass block panels.

SOLAR HEAT GAIN. Complete instantaneous solar heat gain data applicable to Owens-Illinois Glass Block designs for all exposures are given on Pages 190 through 194 of this Guide. The O-I design numbers which compare with the ASHAE type numbers are as follows:—

ASHAE Type No.	O-I Block Design Nos.
I	307, 316, 330, 331, 370
II	340
III	340 with Fiberglas Insert
IVA	365
V	363

New O-I glass block designs #80 solar-selecting and #80 solar-selecting green are available. They have a lower solar heat gain than any of those shown in THE GUIDE. These blocks have a variable rate of solar energy transmission depending on sun altitude. When the solar energy is maximum on the exterior of the wall, the #80 glass blocks have a minimum transmission. Calculated values of solar heat gain for these blocks are now available.

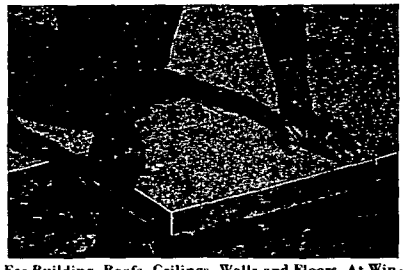
Solar heat gain through Toplite panels is much less than that through single glass or plastic skylights, due to their solar-selecting characteristics. They act as a mirror in reflecting a high percentage of the solar energy when the sun is at high altitudes as in the spring and summer months.

DESIGN AND SIZES. Owens-Illinois Glass Block are made in a variety of face designs and in three standard sizes (5¾ in. sq, 7¾ in. sq, and 11¾ in. sq—all three are 3⅞ in. thick). Mortar joints of ¼ in. thickness are recommended.

Prefabricated Toplite Panels are available in seven standard sizes: 2 x 2, 3 x 3, 4 x 4, 2 x 6, 3 x 6, 4 x 5, 5 x 5.—all 7 are 3 1/16 in. thick. Complete technical data, description and details will be gladly sent. Write: Kimble Glass Company, subsidiary of Owens-Illinois, Department HV, P. O. Box 1035, Toledo 1, Ohio.

PITTSBURGH PC CORNING

DEPT. S-9, ONE GATEWAY CENTER PITTSBURGH 22, PA.

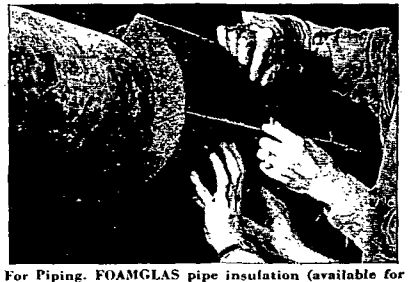


FOAMGLAS® . . . the cellular, stay-dry insulation

What FOAMGLAS® is . . . FOAMGLAS is a unique thermal insulation composed of closed cells of glass. It possesses a combination of physical characteristics which makes it virtually an ideal insulation.

It is completely inorganic and thus will not burn, rot, swell or slump. Its closed cell structure renders it impervious not only to moisture but to moisture vapor as well. Because it is water and vapor proof, it retains a constant insulating value (k) for the life of an installation. In addition, **FOAMGLAS** doesn't require a costly separate vapor barrier.

FOAMGLAS is unusually strong, having an average ultimate compressive strength of nearly 7 tons per square foot. But **FOAMGLAS** is light in weight, works easily with ordinary tools and therefore is very easily installed.



All of these characteristics have enabled **FOAMGLAS** users to benefit from its constantly-high insulating performance. That's why **FOAMGLAS** has gained recognition as an excellent insulation for roofs, ceilings, walls, and floors of all kinds of buildings as well as for hot, cold and dual temperature piping, tanks, and other equipment.

For Building, Roofs, Ceilings, Walls and Floors. At Winston-Salem, FOAMGLAS' high strength permitted insulating parking deck-roof of Sears Roebuck's air conditioned store. In your building, moisture-proof FOAMGLAS insulation can help maintain air conditioning system efficiency.

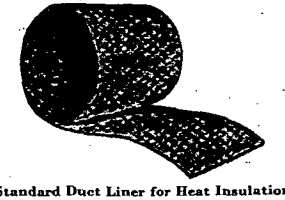
For Ducts. Light-weight blocks of FOAMGLAS were easily applied to these metal air conditioning ducts at the Moses H. Cone Memorial Hospital, Greensboro, North Carolina.

For Piping. FOAMGLAS pipe insulation (available for up to 36 in. pipe size) was applied on this welded pipe carrying cold water for the system air conditioning several new skyscrapers.

HOW FOAMGLAS can benefit you:

Properties		Benefits
Absorption	0	Moisture reduces insulation effectiveness and life. *FOAMGLAS* stays dry, maintaining constant insulating value.
Combustibility	Incombustible	Protects from fire hazards.
Compressive Strength	100 lbs/sq in.	Offers unusually high strength for varied structural and load bearing applications.
Hygroscopicity	No increase in weight in 365 days in air at 90 percent relative humidity	*FOAMGLAS is its own vapor barrier.*
Density	9 lbs/cu ft (ave)	Lightweight, easy to handle and install.
Thermal Conductivity (k) at 50°F	0.38 Btu/hr/sq ft/°F/in.	Excellent insulating value that *remains constant.*

FOAMGLAS is approved by *Underwriters' Laboratories* and is listed under Label Service.



For full technical information, please write for our new catalogs indicating which of the above uses of FOAMGLAS you are most interested in. Address Dept. S-9, Pittsburgh Corning Corporation, One Gateway Center, Pittsburgh 22, Pa.

Pittsburgh Plate Glass Company

FIBER GLASS DIVISION

One Gateway Center Pittsburgh 22, Pennsylvania

FIBER PG GLASS

Standard Duct Liner for Heat Insulation

Neoprene Coated Duct Liner for Sound Absorption and Heat Insulation

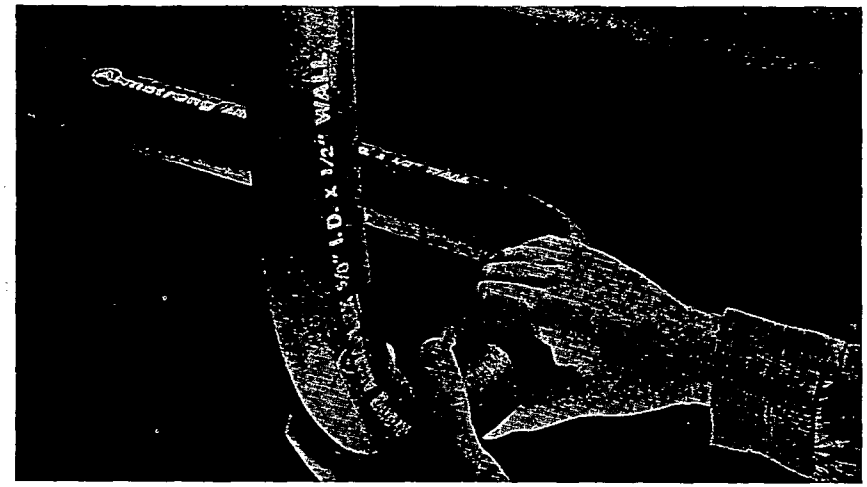
Pittsburgh Superfine insulation is composed of extremely fine glass fibers, ranging upward in diameter from only 3/100,000 of an inch. It's an exceptionally light-weight, efficient thermal and acoustical insulating material. When specifications call for control of heat or cold—or you need sound absorbed or deadened—here are some of the advantages Pittsburgh Superfine Fiber Glass insulation provide:

High Thermal Efficiency—Thermal conductivity, k, at a mean temperature of 75 F is 0.22 to 0.29 Btu (sq ft) (hr) (deg F) (in.) thickness, depending on density. Effective for both high and low temperatures ranging up to 500 F.

Fine Acoustical Properties—Noise reduction coefficient of a 1 in. thickness is as high as 0.85 with the sound absorption curve showing high efficiencies in the ranges of the most irritating noise.

Light Weight, Easy to Handle—Added load in any application is virtually negligible. Readily cut with knife, shears, or die. Can easily be sewed and quilted, glued, tacked or taped into position.

Flexible, Resilient, Tough, and Soft—Made from long, fine glass fibers to attain superior qualities. Can be used on round or irregularly shaped objects and spaces as easily as in conventional layers. Fits closely into corners and tight spots quickly and easily, without damage to its structure.



Saves Vital Space—In use: Higher insulating efficiency means less thickness of Superfine required, as compared to ordinary insulation. In shipment: Packaged compressed to reduce shipping and storage space.

STANDARD SPECIFICATIONS—Pittsburgh Superfine is available in standard roll widths of 18 in., 24 in., 36 in., 48 in., 54 in. and 72 in. It can be supplied in any desired width down to 2 in. Rolls are wound on 2 in. tubes and wrapped in heavy kraft paper. Superfine is also available in special lengths on request. It is furnished neoprene coated for *Duct Liner or with various paper, cloth or foil facings.

Type	Density (lbs per cu ft)	Thickness (inches)	Approx sq ft per lb	Typical Roll Length (feet)	Approx OD of Rolls (inches)
S-314	½	½	40	100	18
		¾	26.7	100	22
		1	20	100	26
		1½	13.3	100	30
		2	10	100	32
		3	6.7	100	38
S-315	¾	½	64	100	10
		½	32	100	16
		¾	21.3	100	20

ARMSTRONG ARMAFLEX PIPE INSULATION

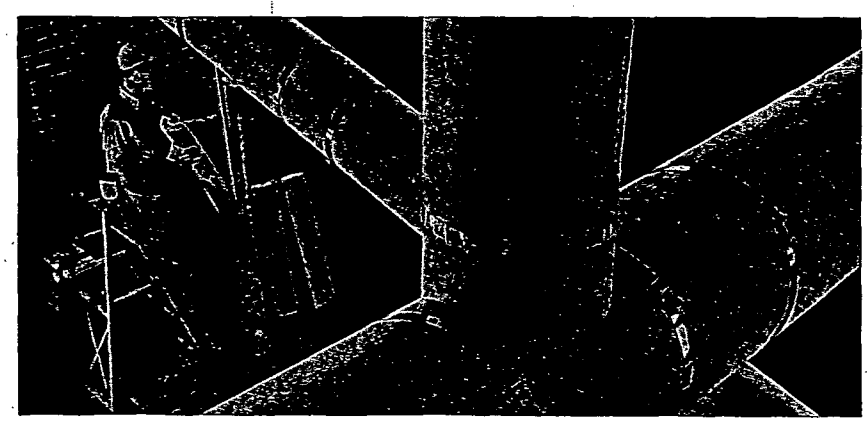
for all air-conditioning, refrigeration, and plumbing and heating lines

Armstrong Armaflex is a flexible foamed plastic insulation in pipe covering and sheet form. Pipe covering is manufactured in nominal ⅜ in., ½ in., and ¾ in. thicknesses. These thicknesses are calculated to prevent condensation on cold lines within their individual recommended usage ranges at temperatures down to zero. Armaflex also can be used on heating lines, where it will withstand temperatures to 200° F. On outdoor installations, consideration should be given to weatherproofing. In sheet form, Armaflex is used for insulation of larger pipe sizes and for covering tanks and vessels of any size or shape.

The closed cell structure of Armaflex gives it a low k value of 0.28 at 75° F. mean temperature. Armaflex resists deterioration, so efficiency remains high in service.

The uniformly sized closed cells of Armaflex seal out air and moisture. The result is a vapor transmission rating of less than 0.1 perm.

Shrinkage of Armaflex when the inner surface is exposed to temperatures to 200° F. is negligible. Armaflex is only slightly affected by solvents and for all practical purposes is unaffected by oils, common corrosive chemicals, or fungus.



The extreme flexibility of Armaflex Pipe Covering and Sheets makes application very rapid. They can be applied in close quarters. Pipe covering can be slipped onto pipe and tubing prior to its installation or slit and snapped over piping that is already in place. The only sundry material required is Armstrong 520 Adhesive. Scotch Brand #472 Tape may be used to seal Armaflex joints on straight piping. Fittings are insulated with miter cut pieces of covering, quickly cut and assembled on the job, using 520 Adhesive to adhere joints.

Physical Properties of Armaflex

Pipe Covering	
Wall thickness—inches (nom)	⅜, ½, ¾
Inside diameter—inches	⅝ to 3⅛
Length of section—feet	6
Sheet Armaflex	
Size—inches	30 x 36
Thickness—inches	⅛, ¼, ⅜, ½, ⅝, ¾
Thermal conductivity	
Btu-in./sq ft-hr-°F-k_{75}	0.28
k_{125}	0.30
Water vapor transmission	
Perms (Grains-in./sq ft-hr-in.-Hg.)	less than 0.1
Air transmission—static pressure at 10 in. Hg. cu ft-in./hr-sq ft	less than 0.03
Water absorption—28 days submersion—percent by volume	3.9
Density—lbs-cu ft	
	pipe covering 7.5
	sheets 6.5
Fire rating	self-extinguishing

For complete application instructions and specifications, write today to Armstrong Cork Company, 5800 Preston Avenue, Lancaster, Pennsylvania.

THE DOW CHEMICAL COMPANY
Plastics Sales, Midland, Michigan

STYROFOAM® STOPS MOISTURE, REPELS HEAT

Advantages of Styrofoam* as a Low Temperature Pipe Covering

(1) Low "k" factor stays low because Styrofoam (a Dow plastic foam) resists water and water vapor. (2) Prevents condensation and dripping. (3) Light, clean, easy to handle, economical to apply. (4) Resists rot, mold, deterioration. (5) Will not split or crack nor is it subject to ice build-up around valves in extreme cold.

USES

Pipe covering • Wall, floor and ceiling insulation for low temperature work • Cavity and core walls • Insulation-plaster base • Refrigerated vehicles • Curtain wall panels • Perimeter and foundation insulation

ENGINEERING DATA

THERMAL PROPERTIES

Thermal Conductivity (k factor), Btu/(hr) (sq ft) (°F/in.)	Average less than 0.28 at mean temperature of 40°F.
Linear Thermal Coefficient of Expansion	.00003 to .00004 in./in.°F. between . . . 0°F. and 80°F.
Specific Heat	0.27 Btu/(lb.) (°F.) at 40°F.
Resistance to Heat (Maximum recommended temperature for continuous use)	Styrofoam 22—170°F. Styrofoam 33—160°F.

PHYSICAL PROPERTIES

		Styrofoam 22	Styrofoam 33
Density	(lb/cu ft)	1.6-2.0	1.7-2.3
Compressive Yield Strength	(psi)	16-32	16-38
Tensile Strength	(psi)	45-61	65-95
Shear Strength	(psi)	27-36	30-40
Flexural Strength	(psi)	42-61	48-99
Compressive Modulus	(psi)	1200-1700	1500-2000
Bending Modulus	(psi)	1000-1285	1250-1760
Modulus of Rigidity	(psi)	700-1600	1000-1300

WATER RESISTANCE PROPERTIES

Capillarity	None
Water absorption (When subjected to 90°F., 90 per cent relative humidity for 15 days)	Less than 0.03 per cent by volume
Water absorption (When completely submerged for one week)	Water pick-up only on surface cells less than 0.15 lb./sq. ft. of areas

VAPOR TRANSMISSION

When Styrofoam acts as a barrier between spaces having different atmospheric conditions	1.0-2.0 grains/(sq ft) (hr) (in. thickness) (in. of Hg. vapor pressure difference)

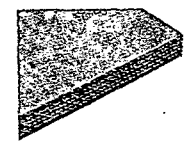
Carey PRODUCTS

ALLTEMP PIPE INSULATION

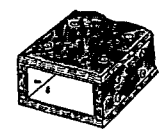
Uses: Alltemp pipe covering is an all-purpose insulation for temperatures from 100 F to 1600 F. It has an extremely low thermal conductivity, low internal shrinkage, and exceptional moisture resistance. Alltemp is particularly recommended for irregular surfaces, and for use around valves and fittings where it can be applied in single-layer, or broken-joint double-layer construction.



Description: Alltemp is a combination of special inorganic silicas and asbestos fibres. Every cubic foot is honeycombed with millions of tiny sealed air cells. Having excellent physical and chemical properties, Alltemp retains its high thermal efficiency and structural strength even when subjected to long and continuous exposure to high temperatures and moisture. Alltemp sectional pipe covering is available through 12 in.; tri-sections and quad-sections available in larger sizes. "Nesting OD" pipe covering sizes provide accurate tight fits over or into another size. This permits a wide range of assemblies and gives the advantage of building up many thicknesses from a limited number of prime units.

ALLTEMP BLOCK INSULATION

Uses: Alltemp Block is recommended for high temperature surfaces such as oil stills, ovens, boiler walls, breechings, furnaces and other equipment whose surfaces are between 100 F and 1600 F. It has an extremely low thermal conductivity, low internal shrinkage, and exceptional moisture resistance. Alltemp Block is available for flat and curved surfaces. It is particularly recommended for irregular surfaces which require an easy-to-apply insulation.



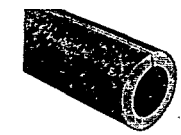
Description: Alltemp is a combination of special inorganic silicas and asbestos fibres. Every cubic foot is honeycombed with millions of tiny sealed air cells. Having excellent physical and chemical properties. Alltemp retains its high thermal efficiency and structural strength even when subjected to long and continuous exposure to high temperatures and moisture. It is available in blocks 1½ in., 2 in., 2½ in., 3 in., 3½ in. and 4 in. thick, measuring 6 in. and 12 in. wide and 36 in. long.

FIREFOIL BOARD

Uses: Carey Firefoil is recommended for insulated and acoustical duct construction in heating and air conditioning systems, industrial ovens, coil housings, plenum chambers, marine bulkheads, etc. Firefoil is recommended for interior use and under dry conditions.

Description: Firefoil Board is formed of laminated plies of corrugated and flat asbestos paper sheets, bonded with a special fire-resistant adhesive. Firefoil has approximately eight corrugated layers per inch of thickness. It is chemically treated and hardened to give it strength and resistance to both fire and water. Carey Firefoil is a most efficient and economical panel material for many industrial and building construction applications. Firefoil is recommended for use at temperatures up to 1000 F. Carey Firefoil is available in thicknesses from ½ in. to 3 in., in ½ in. multiples. Standard panel size is 48 in. by 96 in., but smaller sizes can be factory-cut to order.

CAREY SPUN WOOL DUCT INSULATION



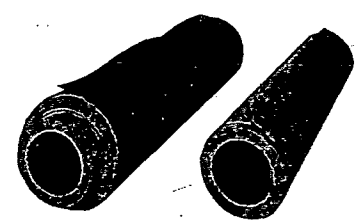
Uses: For insulating rectangular, metal ducts for ventilating, air-conditioning and cooling systems in schools, stores, office buildings, factories, apartments, etc., where non-combustible insulation is required.

Description: Made in semi-rigid panels, processed from long, fine fibers of spun mineral wool. Panels are available faced with 0.0025 embossed aluminum foil, securely attached with non-flammable adhesive; coated for interior duct sound-proofing or asphalt-kraft vapor barrier facing. Light in weight, with a density of approximately seven pounds per cu ft, this insulation is easy to work and handle, is quickly installed and provides a high degree of thermal efficiency. Foil faced duct insulation is non-corrosive and has been tested and approved by *Underwriters Laboratories*. Sheet size is 24 in. x 48 in. in 1 in., 1½ in. and 2 in. thicknesses.

THE PHILIP CAREY MFG. COMPANY

LOCKLAND, CINCINNATI 15, OHIO

Carey PRODUCTS



THERMOGLASS PIPE COVERING

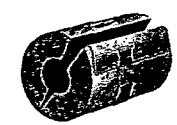
Uses: Thermoglas pipe covering is used for pipe temperatures up to 350 F. It is recommended for hot water and low-temperature steam piping in industrial plants, commercial buildings and institutions. Thermoglas can be used as an outside layer over a high-temperature insulation.

Description: Thermoglas pipe covering is used on pipes having temperatures up to 350 F. It simply "snaps in place." Thermoglas is exceptionally lightweight insulation composed of long, fine, blown glass fibers bonded with thermal-setting phenolic resin. It is a strong, semi-rigid and resilient insulation with no coarse fibers to irritate hands or skin.

Thermoglas is available in one-piece sections made in 3-ft lengths for small sizes. Medium and large sections are furnished in 6-ft lengths. Canvas white and black dual-temperature and roofing felt jackets are available.

SUPERBO PIPE COVERING

Uses: Carey Superbo is a rigid dual temperature pipe insulation for chilled water piping or piping operating at alternating high and low temperature with a service range of from 35 F (lower limit) on the cooling cycle to 200 F (maximum) on the heating cycle. The integral vapor barrier jacket properly applied and sealed will protect chilled water lines from condensation or sweating. Thickness requirements vary with the pipe size and conditions of temperature and humidity. Where recommended thickness exceeds 1½ in. and the pipe size is 6 in. and over, double thick Superbo construction and broken joint application is required.



Description: Carey Superbo is a rigid pipe insulation made of multiple layers of "dry" insulating felt (wool felt) firmly cemented together. The inner surface is lined with asphalt saturated organic felt. A factory applied white vapor barrier jacket is furnished consisting of aluminum foil laminated between two layers of special creped Kraft paper, bonded with asphalt. This same vapor barrier jacket is also available with a black outer surface. Superbo is furnished with 4 in. wide collars of the same vapor barrier material as the jacket.

IMPERVO WOOL FELT PIPE COVERING

Uses: Impervo is used primarily for insulating chilled water and ice water pipe lines operating at temperatures between 40 F and 60 F. It is specially designed to keep water cold and prevent condensation causing damage from dripping. Recommended for cold service water piping under particularly high humidity conditions such as in laundries, kitchens, bakeries, textile and paper mills.

Description: Impervo is composed of multiple layers of insulating felt with water resistant felts on the inner and outer surface of each layer. It is furnished in sections three feet long with canvas jacket, for both iron and copper pipes from ¼ in. through 24 in., and is regularly made in Double ½ in. and Double 3.4 in. thickness. Other thicknesses can be made special to order. Four inch (4 in.) wide collars for sealing end laps, as well as longitudinal flaps on outer water resistant felt will be furnished special on request.

PERFECTO WOOL FELT PIPE COVERING

Uses: Perfecto is an efficient economical pipe insulation for temperatures between 60 F and 225, keeping hot water hot and cold water cold, and preventing sweating of cold water service lines. For service water temperatures between 45 F and 60 F, integral jackets with properly sealed joints give adequate service for intermittent operation. For continuous operation a water vapor barrier integral jacket should be used. Perfecto is not designed for dual temperature systems.

Description: Perfecto is a semi-rigid structure made of multiple layers of indented "dry" insulating felt (wool felt) firmly cemented together. The inner surface is lined with asphalt-saturated organic felt. Carey Perfecto covering is furnished with a white wrapper under the canvas.

Perfecto is finished with 10.2-yards-per-pound cotton cloth jackets. Heavier canvas jackets can be furnished. Perfecto can be finished with roofing jackets, such as the Carey recommended jacket of 45-lb Surety Roofing.

Descriptive Bulletins and Catalog Pages on Carey Insulation Products are available at Carey District Offices. Application details and specifications can be obtained by writing INSULATION DIVISION, The Philip Carey Mfg. Company, Plymouth Meeting, Pennsylvania.

B. F. Goodrich

The B. F. Goodrich Company
574 Derby Place, Shelton, Conn.

B. F. Goodrich Molded Cell-Tite® Tubing for moisture-proof insulation

B. F. Goodrich Molded Cell-Tite tubing is made of tough, flexible rubber with uniform non-connecting cell structure. Especially efficient and convenient for pipe insulation, it will not absorb moisture nor support combustion. Insulation value is excellent.

Easy application

Wherever used, B. F. Goodrich Molded Cell-Tite may be easily secured with air-drying adhesive. Short lengths of tubing may be slipped on; longer ones may be slit lengthwise, snapped over pipe and adhesive applied to cut edges. These edges will not absorb moisture.

Low water absorption

B. F. Goodrich Molded Cell-Tite meets ASTM specifications. Weight gain is under 10 percent after 24 hours immersion in water; under 5 percent after 3 minutes additional atmospheric pressure.

Efficient insulation

Thermal conductivity of B. F. Goodrich Molded Cell-Tite is 0.28 at 75F with no deterioration in service.

Low shrinkage and aging

B. F. Goodrich Molded Cell-Tite has no appreciable change after 7 days at 200F. Resistance to weather-aging is good. Linear shrinkage, when aged 4 weeks at 158F is under 10 percent, most shrinkage occurring in the first week.

Wide range of density and firmness

Standard grades of B. F. Goodrich Molded Cell-Tite are ASTM 41 to 43 (from 5–13 psi to compress a one square inch disc to 75 percent of its height). Can be made in practically any firmness. Density varies, depending upon size and firmness, averaging 10 lb per cu ft for soft, 15–20 lb per cu ft for medium, and 20–30 lb per cu ft for firm.

Many sizes

B. F. Goodrich Molded Cell-Tite tubing is made with standard outside diameters of ¾ in., 1 in., 1¼ in., 1½ in., and can be made 1⅝ in., 1¾ in., and 2 in. Almost any inside diameter is available up to ¼ in. of the outside diameter. Lengths up to 50 ft facilitate ease and simplicity of installation.

Variety of colors

Black is standard and can be furnished as non-staining to lacquer, enamel or plastic. (Tested for 24 hrs under ultra-violet light or for 10 days at 158F.) Any one color available for requirements of 7,500 ft or more. White, if specified, would be off-white.

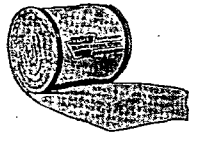
HAGAN Mfg. Company, DELPHOS, OHIO

Thermal and Acoustical CELLULOSE FIBER INSULATION



PREFERRED BY MANY in the ELECTRIC HEATING INDUSTRY

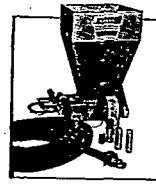
K-24 NATURE'S INSUL-FIBER

BLOWING WOOL

K-factor = 0.24 • Quality production control • Only first-grade cellulose material used • Pressure atomization process for consistent density and texture • Positive chemical control provides permanent protection • Permanent fire resistance, rodent and vermin resistant, harmless to handle • Expels moisture • Bonded material.

BLANKETS

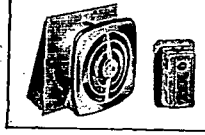
K-factor = 0.24 • Light weight Resilient • Moisture Resistant Vermin Resistant • All std. sizes All std. moisture barrier configuration



SILL PAD

Designed for easy application around high heat loss window and door framing—4 50 ft. rolls 6 in. wide to the carton.

WHY IT IS USED



Insulated Surface	U Factor	Watts Factor
BLOWN MATERIAL		
Ceiling with 6"	.038	.011
Ceiling with 4"	.055	.016
Frame Walls with 3⅝"	.059	.017
BATT MATERIAL		
Knee Walls with 3⅝"	.063	.018
Double Wood Floor with 2"	.088	.027
Double Wood Floor with 3"	.065	.019

These coefficients, from HAGAN products, provide **LOWER** ELECTRIC HEAT OPERATING COSTS. Products proved in thousands of electrically heated homes and commercial buildings.

HAGAN MODEL J BLOWER — PORTABLE, 110 VOLT

- 1 H.P. Tornado Blower motor, ½ H.P. agitator motor, controlled air flow. Moves 25 bags per hour.
- Airtight shut-off nozzle.
- 20-yr. Hagan experience perfected this applicator package for cellulose material. Complete with hole saws, couplings, 75 ft. hose, nozzle, etc. Package complete.
- All wiring properly protected from damage due to rough handling.
- Operating instruction manual included.

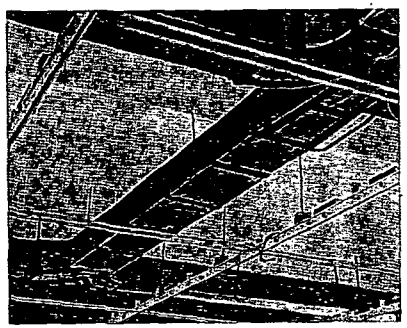
RELATIVE HUMIDITY CONTROL SYSTEMS FOR IDEAL LIVING CLIMATE

1. Maintain safe, healthy humidity.
2. Prevent window steaming.
3. Prevent winter mildew.
4. Prevent wall and ceiling sweating.
5. Prevent paint peeling caused by inside moisture.
6. Allow the insulation to do a better job by keeping it dry.
7. The fan naturally expels cooking grease and holds down cleaning cost and effort.

JOHNS-MANVILLE

22 East 40th Street, New York 16, N. Y.

Offices in All Large Cities



SPINTEX DUCT INSULATION

J-M Spintex®, a super-springy, spun fibre insulation, is an *excellent* insulation for air-conditioning ducts in offices, factories, institutions and commercial buildings of *all kinds*. Produced by a special Johns-Manville spinning process which assures complete uniformity, the fibres possess unusual fineness. This improved *fibrous structure* adds countless heat-blocking dead air spaces per cubic inch to help keep working temperatures precisely the same throughout the structure at *lower operating* cost.

Spintex will not burn or let fire spread along duct *systems*. The fibres are non-absorptive and treated to arrest capillary action, and will neither rot nor mildew. It is not corrosive to any common metal or *building* material.

Spintex can be installed quickly and easily because it is light and "friendly" to handle—simple to cut and fit, even when *ducts are curved* or in difficult-to-reach areas. It is available in rigid, semi-rigid or flexible form.

Spintex is regularly furnished in a variety of special facings to meet any vapor condition, incombustibility requirement or decorative *need*. It *provides* a good base for plaster finish . . . or where no facing is indicated, Spintex presents an attractive appearance with trim, tidy joints.

AIRACOUSTIC SHEETS

J-M Airacoustic® Sheets meet the exacting requirements of air duct sound conditioning. Since they absorb a large percentage of the sound that strikes them, they provide a highly effective means of reducing disturbing duct noises. Composed of mineral wool and a suitable binder, Airacoustic Sheets are completely non-combustible, highly sound-absorbent, moisture-repellent, odorless and vermin-proof. They are supplied 24 in. x 36 in. in ½ in. and 1 *in. thicknesses*.

SPINTEX HOME INSULATION

J-M Spintex® spun mineral fibre insulation is made by the revolutionary spinning process which produces finer fibres. Because of these finer fibres, *Spintex* has more heat-stopping dead air spaces per cubic inch. It is these dead air spaces and the thickness of the insulation which results in greater insulating efficiency.

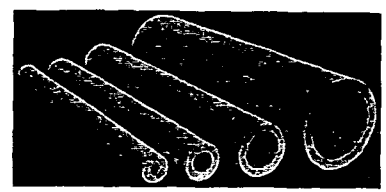
Spintex will not rot or decay . . . is inherently fireproof. It will *not sag or settle* . . . the firmly felted fibres have the resilience to maintain a tight fit between framing members. It assures year-round comfort, protection and savings in fuel and air-conditioning costs.

J-M Spintex Batts and Blankets are fabricated in a variety of thicknesses to meet all requirements. They are light in weight, have greater rigidity and resilience for ease of handling and tight fit, cut clean and sharp *for better, faster, labor-saving* application. Each has an efficient vapor barrier and is carefully manufactured to meet *Federal Specification HH-I-521C*. Blankets are available either Kraft paper-wrapped or aluminum-wrapped.

J-M Spintex Home Insulation is also available in "blown" (nodulated) form for new and existing light construction.

Details on Request

For details on J-M Spintex Home Insulation or the complete line of J-M *Industrial Insulations*, *write* Johns-Manville, Box 14, New York 16, N. Y.



JOHNS-MANVILLE

22 East 40th Street, New York 16, N. Y.

Offices in All Large Cities

JOHNS-MANVILLE INSULATIONS
For Heating and Plumbing Service

FIBROCEL PIPE INSULATION
for service from 35F to 300F

Fibrocel® is a molded silica insulation developed by Johns-Manville for use on hot, cold and chilled water lines, low pressure steam pipes and dual service heating and cooling systems.

No Shrinkage The use of Fibrocel makes objectionable shrinkage negligible. It is not affected by changing atmospheric conditions. Joints stay tight . . . no unsightly gaps with accompanying heat leakage or costly repairs.

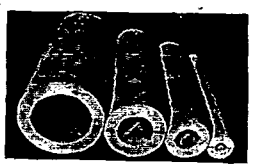
Firm, Strong Structure Fibrocel resists compression and abuse. It gives back-up protection against puncture of jacket or vapor seal. Its smooth hard surface takes abuse in rough *service*.

High Thermal Effectiveness Tiny particles of silica are exploded and expanded to form a cellular structure of heat-trapping dead *air spaces*.

Permanent and Sanitary Fibrocel is impervious to flame, rot, odor and vermin attack. It will not disintegrate in water; original properties are restored after drying.

Easy to Install Fibrocel is light and easy to handle, it readily cuts with a knife. Tight, snug-fitting edges provide better heat control, smooth appearance.

Jacket Styles Type VS—richly creped pure white kraft backed by ½ mil-foil. Type VB—outer surface has same rich creping, inner barrier is full mil thickness of aluminum foil; pipe facing is creped black kraft. Type C—canvas finish.



AEROTUBE PIPE INSULATION
for service from 32F to 200F

Aerotube® is a foamed plastic tubular insulation expressly recommended for heating, plumbing and *air-conditioning* service. Its closed cell structure acts as a "built-in vapor barrier" to stop the passage of moisture . . . obviates the necessity of applying a separate vapor barrier. Its extreme flexibility and resiliency permit quick, easy application, especially on bent tubing and fittings. Aerotube is clean, odorless, durable . . . does not carry flame and is self-extinguishing.

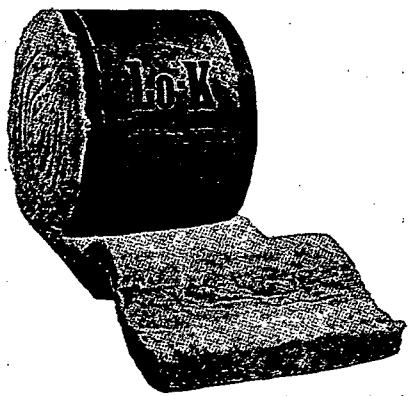
Aerotube is furnished in 6 ft lengths in the following iron pipe and copper tubing sizes: ⅜ in. thick—¼ in. through 2 in.; ½ in. thick—¼ in. through 3 in. It is also available in sheet form for flat surfaces and equipment not adaptable to pipe insulation.

J-M THERMOBESTOS®
For Service to 1200F

Thermobestos is a calcium silicate in*sulation developed for the most rugged industrial service. Strong and rigid,* it will withstand unusual service abuse. It offers maximum moisture-resistance and low thermal conductivity, will not burn or carry flame, and is light in weight for easy handling and fast application. *Pipe insulation furnished in 3 ft sections in nominal thicknesses of 1 in.* (up to 6 in. pipe size only), 1¼, 2, 2½, 3 and 3½ in. Block insulation in 36 in. lengths, 6 and 12 in. widths, 1 in. through 4 in. thicknesses.

Other J-M Insulations

Product	Description	Standard Sizes
*J-M 85 percent Magnesia For service to 600F	Made from hydrated basic carbonate of magnesia bonded with asbestos fibre. Light weight, high insulating value, easily worked.	Pipe ins.—3 ft sections or segments, nom. thicknesses of 1 in. through 3 in. Block—12 and 36 in. lengths; 3, 6, 9, 12 in. widths, 1 through 4 in. thicknesses.
*Asbestocel® For service to 300F	Cellular type insulation for use on pipes conveying low pressure steam and hot water.	3 ft sections in standard thicknesses of 2 to 8 plies, each ply approx ¼ in. thick.
*Rock Cork® For service from −300F to +200F	Moisture-resistant insulation for all refrigeration applications. Sanitary, odorless, fire-resistant.	Sheets: 18 in. x 36 in. thicknesses to 4 in. Pipe Ins.—3 ft sections in Ice Water, Brine, Heavy Brine thicknesses.
J-M No. 201 Insulating Cement	Hydraulic-setting, one-coat application cement for insulating small pipe fittings. Covering capacity, 36 bd ft per 100 lbs.	50-lb bags
J-M No. 450 Insulating Cement	Mineral wool cement with excellent adhesion to either hot or cold surfaces. Covering capacity, 50 lb ft per 100 lbs.	50-lb bags
J-M No. 352 Insulating Cement	Asbestos cement for insulating pipe fittings or for use as finish over other insulation. Covering capacity, 19 bd ft per 100 lbs.	50 and 100-lb bags



* Also available to fit straight runs of copper tubing with nominal diameters from ⅜ in. up.

Lockport Mills, Inc.

Dept. C Lockport, N.Y.

Thermal and Acoustical INSULATION

Lo-K"

Five featured types to meet every insulation need: (1) **OPEN BLANKET** backed by tough, waterproof, asphalt-coated kraft paper to form an effective vapor barrier. (2) **ENCLOSED BLANKET.** Insulation completely enclosed in envelope, asphalt-coated paper on one side, porous or "breather" type paper on other. (3) **OPEN ALUMINUM FOIL.** All the features of Open Type (1) plus the extra value of aluminum foil backing. Effective vapor barrier ... stops 90 percent of radiant heat. (4) **ENCLOSED ALUMINUM FOIL.** Superior in insulation plus values and thermal efficiency. (5) **DOUBLE FOIL,** aluminum foil on top and back, plus superior Lo-K Blanket efficiency for tops in insulating value.

Lockport's TEMP-LO

A New Type of *Semi-Rigid* Insulation

Improved processing makes possible a new and better semi-rigid blanket with greater thermal efficiency and ease of installation. It is light in weight, nonirritating and made in all standard sizes, styles and backings.

Distributing agencies now being established. Write for details.

Thermal Conductivity—The "k" value for cotton is 0.24 Btu/hr/sq ft/degree F/inch. (*See table.*)

Light Weight—Weight of 1 cu ft is ⅞ lb. (*See table.*)

Flame-Proofed—Withstands 1800F blow torch heat.

Moisture-Resistant—Chemical treatment, combined with natural protective coating on cotton fibres, enables cotton to effectively resist moisture. Prevents rot and mildew.

Smooth Texture—No sharp particles to irritate the skin.

Easy to Warehouse and Handle. Offers far more "compressibility." Requires one-third the trucking and warehouse space of ordinary insulation.

Simple and Economical to Install. Saves from 25 *to 40 percent in costs.*

Designed to Maintain Maximum Utility. Resists all types of deterioration. Won't sag or settle. Packaged in Rolls.

INSULATING VALUE OF VARIOUS INSULATORS[a]

The coefficients of conductivity (*k* value) are expressed in Btu per hour per square foot per degree Fahrenheit per 1 in. of thickness.

Type of Insulation	Wgt. per Cu Ft	k[b] Value
Cotton: Insulating Batt	.875	0.24
Rock Wool: Fibrous material made from rock	10.00	0.27
Mineral Wool: Fibrous material made from mineral slag	.....	0.27
Glass Wool: Fibrous material made from glass slag	1.50	0.27
Rigid Insulation made from sugar cane fibre	13.50	0.33
Chemically treated wood fibre between layers of paper	3.62	0.25
Eel grass between layers of paper	3.40	0.25
Stitched and creped expanding fibrous blanket	1.50	0.27
Shavings: Various from planer	8.80	0.41
Corkboard: No binder added	7.00	0.27
Rigid insulation made from wood fibre	15.90	0.33

[a] Compiled from Chapter 9, 1954 Edition.
[b] "*k*" indicates temperature conductivity.

BW ALFOL

Reflectal Corporation

A subsidiary of Borg-Warner Corporation
200 S. Michigan Ave., Chicago 4, Illinois

UNIQUE REFLECTIVE INSULATION

What ALFOL is: ALFOL is a reflective-type insulation consisting of multiple aluminum foil layers in handy blanket form. Designed to combine high thermal efficiency with positive vapor control, ALFOL is ideal for all types of residential, commercial and industrial buildings.

How ALFOL works: Utilizing the reflective insulating principle, the patented ALFOL blanket effectively resists all 3 forms of heat transfer. (1) Self-spacing sheets of pure aluminum foil reflect 95 percent of all radiant heat. (2) Convection is blocked by these same foil layers. (3) Multiple "captive" air spaces hold conduction to the minimum. The result is a combination of benefits that is totally unique.

PRINCIPAL ADVANTAGES OF ALFOL

High year-round efficiency: In resisting up-flow (winter) and horizontal heat transfer, ALFOL efficiency is comparable to that of normal bulk insulation. In resisting down-flow (summer) heat transfer, ALFOL is decidedly superior. The result is an overall efficiency profile that is truly outstanding. NOTE: See Chapter 9, Table 3 for characteristics of aluminum insulation.

Extra air-conditioning economy: Low heat storage capacity, combined with the decided summer advantage cited above affords substantial savings in air conditioning.

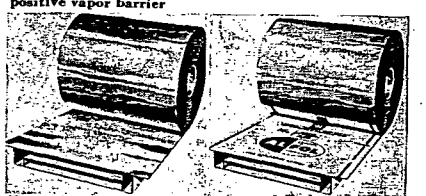
Reliable condensation control: A separate vapor barrier (consisting of polyethylene lining, foil or duplex-backed kraft) is a component feature of all ALFOL types. This positive, continuous vapor barrier guards against condensation.

Rapid, positive application: Self-spacing action of the unusual ALFOL blanket makes installation virtually fool-proof, and its speed of application means low installed cost.

Additional advantages: ALFOL is clean, permanent, odorless ... and completely uniform in quality. With 9 ALFOL Types to choose from, you specify what you need ... and get what you specify.

AN ALFOL TYPE FOR EVERY PURPOSE

(A) Standard ALFOL Types: for normal insulating requirements. Available in various combinations to provide 2, 3 or 4 reflective air spaces. Designations: Type 1, Type 1A, Type 2, Type 3, Type 4.



(B) Heavy-duty ALFOL Types: for utmost insulating performance. Similar to Standard Types, but with heavy reinforcing for extra rigidity and "box-type" end-design for full edge-to-edge coverage. Designations: Types 22F and 22 (with polyethylene backing), Types 44F and 44.

All ALFOL Types are available in widths to accommodate 12-in., 16-in., 20-in. and/or 24-in. framing centers. Blankets are packaged in continuous-length rolls of 500 or 250 sq ft.

FREE Data Book. For complete technical data and specifications, write for 28-page ALFOL Data Book. This colorful manual is available free to architects and engineers.

Standard ALFOL blanket **is available in 5 types for varying thermal needs. Type 2 (*shown*) has 2 aluminum foil sheets that expand automatically to deliver 3 reflective air spaces. Duplex-lined kraft backing provides positive vapor barrier**

Heavy-duty ALFOL **blanket is heavily reinforced, has "box-type" design for edge-to-edge fit. Type 44F (*left*) provides 4 reflective air spaces for maximum performance. Type 22F (*right*) features polyethylene lining for extra condensation safety**

Ideal for *sidewall* installations, ALFOL combines high thermal value with the vital protection of a positive, continuous vapor barrier.

Installed (*shown here*) in residential ceiling, ALFOL provides normal efficiency in winter, decidedly superior *efficiency in summer.*

Industrial "exposed ceiling" installation of ALFOL. Here, Type 44F (shown) provides full insulation plus a semi-finished ceiling.

American Flange & Manufacturing Co. Inc.

30 Rockefeller Plaza, New York 20, N. Y.

Plaza 7-2200

Ferro-Therm

Reg. U. S. Pat. Off.

METAL INSULATION

FULLY PROTECTED BY U. S. AND FOREIGN PATENTS

Ferro-Therm is stapled permanently in place

Ferro-Therm Reflects 90–95 percent of All Radiant Heat

Ferro-Therm Metal Insulation, available from sheets or coils of aluminum or steel with a special alloy coating, reflects 90 percent to 95 percent of all radiant heat. This high reflectivity, combined with extremely low heat storage capacity, provides maximum insulating efficiency in a minimum overall thickness.

Reflects Heat From Either Side

Ferro-Therm's high reflectivity enables it to resist the penetration of heat from either side. During the winter it reflects heat in; during the summer it reflects heat out—assuring year 'round comfort and a considerable saving in fuel.

Reduces Fuel Costs 25–30 percent

Installed in ceiling (or roof) and exterior walls, Ferro-Therm reduces fuel costs by an average of 25 percent to 30 percent. In ceiling (or roof) alone, Ferro-Therm will reduce fuel costs by 15 percent to 20 percent. During the summer, the installation of Ferro-Therm metal insulation will reduce temperatures in the house by 10 F. to 12 F.

Gives the Protection of Metal

Because Ferro-Therm is metal (1) It is not only noncombustible; it is an effective fire stop for wooden framework; (2) It prevents the penetration of termites, rodents and insects; (3) It does not absorb moisture or convey any wood-rotting moisture in framing members; (4) It does not settle or pack down, as the sheets are stapled permanently in place; (5) It is absolutely permanent.

Ferro-Therm Is Easy To Install— and Economical

Ferro-Therm takes up considerably less space than mass insulation of equivalent efficiency. Laboratory tests and thousands of applications have demonstrated that a wall of Ferro-Therm will provide insulating efficiency equivalent to mass insulation approximately twice as thick. And Ferro-Therm can be installed easily, quickly and economically. The sheets take up considerably less space than mass insulation. And they are light—easy to transport and handle. One man can install 1000 to 1200 sq ft of Ferro-Therm in a day.

‡Each space is reflective, & parallel, with at least 1 surface of aluminum foil of 3% emittance. †Calculated on basis of limiting thermal values cited in Fed. Specs. LLL-I-521b; HH-I-585; HH-I-521c; HH-I-551a. *Determined by method of National Bureau of Standards in H.H.F.A. Research Paper 32. ●Average installation rate is 2000 sq. ft. per day per man.

Scientific construction of multiple layers of aluminum, fiber and air spaces minimizes condensation on or within the insulation. There is slight capacity for absorbing water. These insulations, with a long and continuous (up to 500 ft.) non-porous vapor and water barrier on top as well as on bottom, made of genuine non-perforated metal of almost zero permeability, help protect against *dripping* condensation from above if any, timber rot, peeling paint, wet plaster, crumbling masonry, rust and insects.

For additional information and a free copy of Housing Research Paper 32, write to Infra Insulation Inc., Dept. G-9, 525 Broadway, N. Y. 12, N. Y.

Reflectal Corporation

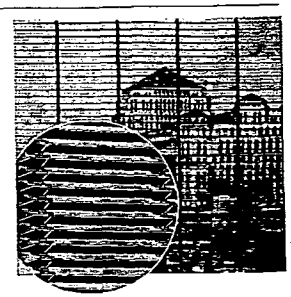
FOR UNDEVIATING CONTROL OF SOLAR HEAT

What KoolShade is: KoolShade Sunscreen is a sun control device consisting of tiny horizontal louvers permanently interwoven with tough vertical warp wires (see illustration A). Functional and attractive, the result is a durable solar screening that combines optimum shading efficiency . . . with minimum possible obstruction of light, air and view.

How KoolShade works: Operating like a tiny venetian blind installed outside the window, KoolShade intercepts the sun's rays *before* they reach the glass. Illustration B shows how its tiny louvers (spaced 17 or 23 to the inch, depending on the type) screen out up to 100 percent of the direct solar rays.

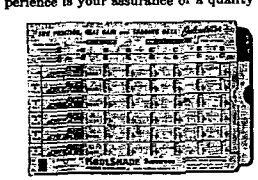


PRINCIPAL ADVANTAGES OF KOOLSHADE

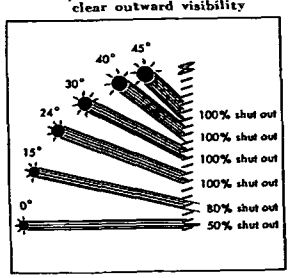
Reduces air conditioning costs: The ideal adjunct to air conditioning, KoolShade can sharply reduce initial tonnage requirements. (By rule of thumb, each 100 sq ft of KoolShade replaces the need for about 1 ton of cooling capacity . . . at substantial savings in cost.) Also, KoolShade increases the efficiency of the cooling unit . . . hence cuts operating and maintenance costs.

Balances winter heating load: By eliminating solar "hot spots" (a major cause of system imbalance), KoolShade promotes more efficient winter heating. Cuts costs by reducing the need for excessive adjustment of thermostats.

Eliminates eye-straining glare: Widely used for daylighting control, KoolShade moderates sun and sky glare to improve lighting balance, minimize fall-off . . . guard against eyestrain. Yet the extra open area afforded by KoolShade's exclusive woven design admits ample light and air . . . and 83 percent clear outward visibility.



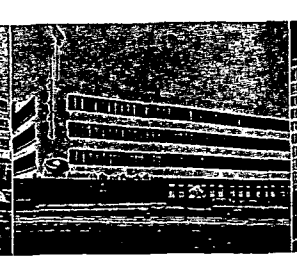
Weather resistant . . . never needs painting: Electrostatically coated with weather-proof nubelon enamel, KoolShade requires virtually no maintenance—less by far than ordinary insect controls. And it enhances architectural appearance.



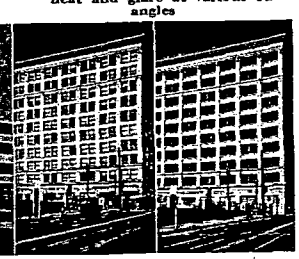
(A) Magnified view (*inset*) shows how KoolShade louvers are literally woven in place. Background photo (screen shown actual size) demonstrates 83 percent clear outward visibility

KOOLSHADE FRAMING AND INSTALLATION

For peak efficiency, durability and appearance, KoolShade is installed in KoolFrame aluminum extrusions designed exclusively for use with KoolShade. Custom-fabricated to accommodate fenestrations of any type or shape, KoolShade screens are sold and installed only by Franchised KoolShade Distributors. Their specialized experience is your assurance of a quality installation every time.



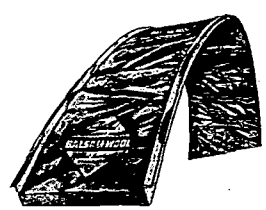
FREE Shading Data Calculator available on request to engineers and architects. Convenient slide chart—with handy inserts for 4 different latitudes—provides sun position, heat gain and shading data at a glance for any window orientation, any season. An invaluable tool for figuring solar heat loads



(B) Side view of louvers (Type LSA, magnified) illustrates KoolShade efficiency in screening out solar heat and glare at various sun angles

Air conditioned, Savannah (Ga.) Memorial Hospital reduced cooling load by 74 tons with KoolShade. Net savings in cooling tonnage alone amounted to $50,300

Installed after air conditioning, KoolShade was used at North American Life Building (Minneapolis) to eliminate solar "hot spots," cut operating costs



Used as adjunct to air conditioning at Los Angeles County Engineers Building, KoolShade reduced solar heat load 72 tons, saved $13,300 in equipment

WOOD CONVERSION COMPANY

Dept. 220-9, First National Bank Building, St. Paul 1, Minnesota

New York Chicago Boston Kansas City Detroit Atlanta
Buffalo St. Paul Minneapolis San Francisco

For many years a leader in the insulation field, Wood Conversion Company manufactures a complete line of flexible fiber and rigid insulation for industrial and domestic purposes. Basic product categories include Balsam-Wool blanket insulation, Nu-Wood structural insulation and Nu-Wood interior finish board. Balsam-Wool insulation is the product of scientific research, and is especially designed for insulating efficiency and positive application.

BALSAM-WOOL® BLANKET INSULATION

WITH REFLECTIVE LINERS—The wood fiber insulating mat of this newest Balsam-Wool insulation is bonded with asphalt to reflective liners. Both reflective surfaces reduce heat transfer by radiation across the wall, floor, or ceiling air space. Balsam-Wool thus reduces heat transmission three ways by conduction, convection and radiation. Application spacer flanges assure an effective insulating air space or reflective surface on each side of the Balsam-Wool blanket.

WITH ASPHALT LINERS—Regular Balsam-Wool is identical to the reflective liner type except that liners are formed of asphalt saturated and coated kraft. The warm side barrier protects the wood fiber insulating mat from condensing moisture; cold side liner reduces convection through the insulating mat and reduces air infiltration. Balsam-Wool insulating mat is uniform in thickness. Proper application is assured by built-in spacer flanges along blanket edge which are stapled to framing members.

PRODUCT ADVANTAGES

- Integral continuous vapor barrier.
- Provides air spaces on both sides of blanket.
- Fire-resistant insulating mat.
- Low thermal conductivity-value.
- Resists settling or shakedown.
- Blanket and air spaces correctly positioned by spacer flanges.
- Wind-resistant liners.
- Rugged product construction . . . stands up under rough handling.

NU-WOOD® INSULATING BOARD PRODUCTS

NU-WOOD SHEATHING—A strong, structural insulating sheathing in ½-in. and $^{25}/_{32}$-in. thicknesses; asphalt impregnated for moisture protection.

NU-WOOD ROOF INSULATION—Will fill all requirements of federal specification LLL-F-32 lb. Furnished in various thicknesses in plain and asphalt impregnated types.

SIZE DATA

BALSAM-WOOL	Reflective Liners—Standard (1 in.) and Double-Thick (2 in.)—16 in. and 24 in.
	Regular Liners—Standard (1 in.) and Double-Thick (2 in.)—12 in., 16 in., 20 in. and 24 in.
	Regular Liners—Type E (Economy) ($^{5}/_{8}$ in.)—12 in. and 16 in.
NU-WOOD SHEATHING	$^{25}/_{32}$ in. Thick—2 ft. x 8 ft. Shiplap Edge; 4 ft. x 8 ft., 9 ft. Square Edge
	½ in. Thick—2 ft. x 8 ft. "V" Joint Edge; 4 ft. x 8 ft., 9 ft. Square Edge
NU-WOOD ROOF INSULATION	½ in., 1 in., 1½ in. and 2 in. Thicknesses—24 in. x 48 in. or 23 in. x 47 in.

Distributors and Dealers in Principal Cities

AUTOMATIC EVAPORATIVE ROOF COOLING

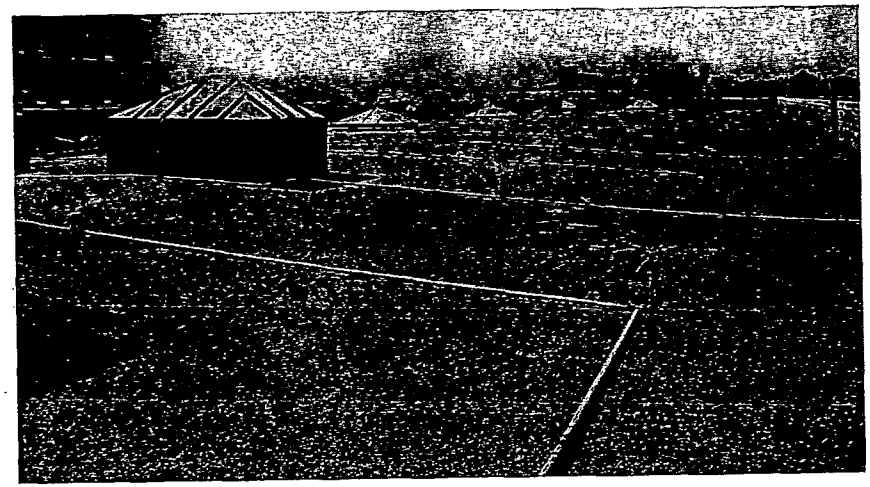

Illustration shows typical April Showers installation

AUTOMATIC EVAPORATIVE ROOF COOLING SYSTEMS

Spray Method

The April Showers Automatic Roof Cooling Systems are designed to stop solar heat at its source by evaporative cooling. They have been used extensively since 1934 for under-roof cooling of industrial and commercial buildings or to reduce initial and operating costs where a true air conditioning system is contemplated or in use. In the latter case, total tonage requirements are substantially reduced and operating costs cut an average of 25 percent.

April Showers Systems are completely automatic. The control thermostat is set to turn the system on at about 10 degrees above designed wet bulb temperature. A four degree drop shuts off the spray, holding the roof surface temperature at about 8 degrees above wet bulb temperature. This lowers under-roof temperatures 8 to 15 degrees. Not only is the roof temperature affected, but all supporting upright members and walls since the heavy, cool air spills down over them thus cooling them, too.

It is important to note that the April Showers Spray-head is scientifically designed to produce a fine DROP-LET—not a mist. This produces a fine film of moisture on the roof which permits excellent evaporation; the action that creates lowered temperatures.

April Showers operate on average city water pressure or utilize well or condenser waste water. Consumption is low, each Spray-head uses about 0.4 gpm and covers about 200 square feet. They operate an average of one minute in five; usually 15 or 20 seconds per spray period.

Today, there are over 25,000,000 square feet of roofs that are cooled by the April Showers Automatic Spray Method Systems. They are operating on many of the country's leading industrial plants and commercial buildings with gratifying results.

April Showers fit all shapes and sizes of roofs, help prevent roof fires, act as lightening arrestors, add longer life to composition roofs and there is no run-off. Estimates are made without charge; however, certain pertinent data is necessary to establish the factors that govern each individual installation. Ask or write for *Form E-102*. Our Engineering Staff stand ready to give you every assistance.

Patent Nos. 2,069,150—2,266,321—2,554,409. Other Pats. Pending.

FANJET—The certified automatic Thermo-Controlled Non-Clogging Roof Cooling System

(Approved by Leading Roofing Companies)

—Delivered anywhere in the U. S. or abroad—

Reduces Inside Temp 8–15 Degrees.
Reduces Roof Temp 40–60 Degrees.
Reduces Air Cond Operating Cost.
Reduces Air Cond Initial Cost.
Reduces Personnel Turnover.
Reduces Production Rejects.
Increases Employee Efficiency.
Increases Life Of Air Cond. System.
Lessens Radiant Heat Rays.
Lessens Solar Heat.
Eliminates Pipe Clogging.
Increases Roof Life.
Lessens Roof Dust.
Provides Cooled Area Over Workers.
Acts As Lightning Arrester.
Prevents Thunderstorm Shock To Roof.
Promotes Good-Will Towards Management.
Absorbs Internal Heat Up Through Roof.

GUARANTEED Protection For The User.
GUARANTEED Spray Orifices (**NON-CLOG**).
GUARANTEED Workmanship (FIVE Years).
GUARANTEED Intermittent Operation.
GUARANTEED Materials (FIVE Years).
GUARANTEED **UNION** Manufactured.
GUARANTEED Non-Ferrous Materials.
GUARANTEED No Water Wastage Or Runoff.
GUARANTEED Spray Coverage.
GUARANTEED To Use **HARD** Water.
GUARANTEED Trouble-Free.
GUARANTEED To Operate On 20 psi.
GUARANTEED To Have Pipe Supports.
GUARANTEED Sweat Fitted.
GUARANTEED Line Drainage.
WARRANTY Of Manufacturers For Thermostats, Humidity And Timing Devices.

CERTIFIED PLAN with every PROPOSAL AND ESTIMATE

Some USERS: TUNG-SOL ELEC.—FEDERAL TELECOM. LAB.—LOCKFORMER CO.—MARCAL CO.—LAVEZZI MACH. WORKS—CARTER PRODUCTS CO.—SOLA ELECTRIC CO.—AMERICAN NAMEPLATE CO.—OKLAHOMA TIRE & SUPPLY CO.—KAILER YOUNGQUIST CO.

WHY WE GUARANTEE OUR SYSTEM WILL NOT CLOG BECAUSE DURING the "patented" PIERCING operation, the copper tube immediately surrounding the opening being formed, becomes dished. Such dishing is automatic and is concomitant of this method of forming the opening. The depth of the dishing may be varied by modifying the physical characteristics of tube or tool. Immediately concentrically surrounding opening at the tube is dished radially inward. Because of the self-cleaning action produced by the flow in passing through the Frusto-Pyramidal opening, this opening may be extremely small while yet avoiding the clogging tendencies of the openings now found in other spraying devices.

DEPENDABLE LOW COST EVAPORATIVE ROOF COOLING

THE AMERICAN SOCIETY OF REFRIGERATING ENGINEERS

234 Fifth Avenue
New York 1, New York

AVAILABLE

The ASRE Data Books have been completely redesigned and rewritten to fit the needs of the greatly expanded refrigeration and air conditioning industry.

NEW FORMAT

- Larger 8½ x 11 in. Page Size
- Larger and More Legible Charts and Tables

GREATER ACCURACY & COVERAGE

All Material Organized, Prepared and Checked at Each Stage of Production Before Publication *By*

ASHRAE Journal

Successor to Refrigerating Engineering including Air Conditioning, and incorporating the ASHAE Journal. As an outcome of the voted merger of The American Society of Refrigerating Engineers and the American Society of Heating and Air-Conditioning Engineers to form the American Society of Heating Refrigerating and Air-Conditioning Engineers, Inc., the monthly publications of these two organizations have been combined.

Thus, the ASHRAE Journal becomes the primary source of authoritative information upon current progress in all aspects of the engineering of equipment and facilities for the heating, cooling, conditioning, ventilating and refrigeration of living, working, industrial processing, commercial, recreational, transportation and warehouse areas.

ASHRAE Journal is larger in content and essential coverages than were predecessor publications. It has a circulation of approximately 20,000.

Feature content includes reports and discussions upon research, design, engineering, development and tests of equipment and upon the properties, performance, characteristics of materials, refrigerants, products and parts.

As the official publication of the Society, the ASHRAE Journal presents outstanding papers sponsored at Society meetings by members and invited authors.

Included is news of the ASHRAE Chapters; of Standards, Codes and research projects, and other matters of interest to the membership.

Members of ASHRAE receive the Journal without additional charge.

Non-member subscriptions to Refrigerating Engineering are being continued to the ASHRAE Journal to the limit of the subscription interval.

CODES AND STANDARDS

ASRE further contributes to refrigeration progress by establishing Codes and Standards in the industry. These Standards cover approved methods for testing and rating various types of air conditioning and refrigerating equipment. Also included is the B9 Safety Code for Mechanical Refrigeration. Sold separately, or a complete set for $10.

REFRIGERANT TABLES, CHARTS, AND CHARACTERISTICS

A handy 6¼ x 9 in. volume containing the thermodynamic properties of all refrigerants now in use (reprinted from ASRE Data Book), forms a convenient reference for design and application engineers, contractors, professors and students. $3.50, cloth bound.

DESIGN VOLUME—ASRE Data Book

The last edition (1957–58) of the old series, this volume will not be revised until 1961. It is a standard reference work containing fundamental data, refrigerant tables, description of the different cycles, systems, and component parts. A must for the design or application engineer. $10.00 the copy.

Coal-Heat

Published at

20 W. Jackson Blvd., Chicago 4, Illinois

Phone Wabash 2-9464 New York City, MUrray Hill 8-6380

To Get the Facts

about heating and fuel requirements, heating costs, operating and maintenance problems, the equipment situation, personnel, performance standards, fuel economics, sales and service—this is what we are trying to do, here at **COAL-HEAT:**

These are the fundamental factors that affect the market, the use and sale of fuel and equipment, one's job, or business.

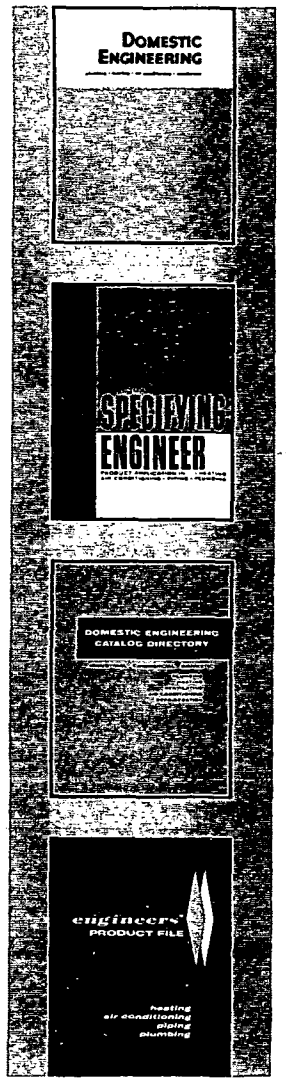
So, it is our aim to get and print "the low-down" on these in each of the following markets:

1. **Apartment houses**
2. **Churches**
3. **Dept. & other stores**
4. **Dairies**
5. **Greenhouses**
6. **Hotels**
7. **Hospitals**
8. **Institutions**
9. **Laundries**
10. **Municipal & govt. bldgs.**
11. **Mfg. plants**
12. **Office bldgs.**
13. **Residential**
14. **Schools**
15. **Theaters & other bldgs.**

To find out what each of us concerned should know about the particular needs, problems and possibilities in each of these fields, and to help make more of the facts known where they will do the most good—this is our purpose!

Together, these groups represent some. 20-million plants, buildings, homes, 160-million tons of coal annually—the nation's largest fuel market, in either number of tons or customers. See "Heating-Fuel Markets"—$1.00 a copy.

Many of these plants and buildings are old, the equipment is in poor condition, operation leaves much to be desired, costs are excessive.



Since most janitors, building owners, members of school and hospital boards are not well informed about heating or the proper use of fuel, we face a tremendous educational job—a job that rests largely on the retail dealer and the salesmen because they alone come in periodic contact with these 20-million fuel users. To help provide the essential educational sales and service tools—that's what we're trying to do.

To help keep more customers happy, get into more of the new buildings, help develop new business—these are the objectives of **COAL-HEAT.** It can help you get more business!

FUEL AND HEATING EQUIPMENT—SALES AND SERVICE

DOMESTIC ENGINEERING COMPANY

1801 Prairie Avenue, Chicago 16, Illinois

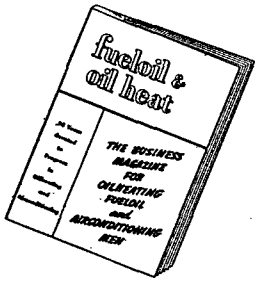
DOMESTIC ENGINEERING MAGAZINE

Editorially keyed to the total business interests of qualified plumbing-heating-cooling contractor-dealers who specify, *sell, install and service. DE covers every* phase of the contractor-dealer's business: engineering, servicing, merchandising, research, financing, new products, legal, news, legislation. Winner of 16 out of the 17 national editorial awards presented to publications in its field by Industrial Marketing since 1939, DE holds the loyalty and confidence of "buying core" contractors who do more than two-thirds of the industry's total annual volume—loyalty and confidence that pays dividends to Domestic Engineering *advertisers. Member,* Audit Bureau of Circulations. Published monthly, $5.00 per year.

ACTUAL SPECIFYING ENGINEER

The only business publication written specifically for the engineer who actually specifies products into heating, piping, plumbing, ventilating and air conditioning systems. Editorial formula and performance are completely geared to the subject of specifications and product choices and to the application of products in various systems. Circulation is *made up of men who design systems* and specify products, and includes: independent consulting engineers specializing in mechanical systems; consulting engineers; engineers associated with architects; and specifying engineers associated with large industrial companies, institutions and commercial chains, big contractors and distributors, government (in all categories), utilities, etc. Published monthly, $5.00 per year.

DOMESTIC ENGINEERING CATALOG DIRECTORY



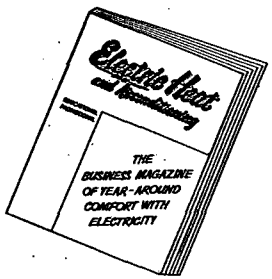
Published annually as a buyers' guide for large contractor-dealers and wholesalers. Contains 6 sections of MANUFACTURERS' CATALOGS on: Boilers, Burners, Furnaces, Controls, Air Conditioning, Refrigeration, Insulation, Pipe, Valves & Fittings, Pumps, Tanks, Appliances, Water Heaters & Softeners, Brass, Drainage Pipe, Tools, Compounds and Oil. PLUS . . . CLASSIFIED DIRECTORY OF PRODUCTS with 3,000 main classifications and 4,600 cross references. TRADE NAMES, an extensive list of over 10,000 with *corresponding manu*facturers' names. NAMES AND ADDRESSES of approximately 5,000 manufacturers in the Industry. TECHNICAL ENGINEERING DATA, complete array of easy-to-read, easy-to-use charts, graphs and tables. $12.50 per year. $25.00 for three years.

ENGINEERS' PRODUCT FILE

Published annually for engineers who *specify* Heating-Cooling-Plumbing. Contains 8 sections MANUFACTURERS' CATALOGS: Heating, Air Conditioning, Ventilating; Heating-Cooling Controls, Specialties; Tanks, Heat Transfer Equipment, Water Heaters, Water Treatment; Piping, Tubing, Valves, Fittings, Fire Protection Equipment, Pipe Hangers, Pipe Insulation; Pumps, Lawn Sprinkler Systems; Plumbing Fixtures, Accessories, Plumbers' Brass, Specialties; Plumbing Drainage Products. CLASSIFIED DIRECTORY of thousands of products, names, location of manufacturers. TRADE NAMES, lists thousands with product, manufacturer. MANUFACTURERS' NAMES, ADDRESSES, thousands whose products are specified. TECHNICAL, ENGINEERING DATA, 160 pages, basic tables, rules commonly used in systems layout, design.

Heating Publishers, Inc.

2 West 45th Street
New York 36, N. Y.



FUELOIL & OIL HEAT

Now in its 37th year of publication; is edited for all oilheating and airconditioning men. Covers installing and servicing of all oilheating and airconditioning equipment, selling and merchandising from the dealer level. Technical articles, exclusive market reports on oilheating, airconditioning and fuel oil. The regular monthly *Commercial-Industrial Section* covers installing and servicing of heavy oilheating equipment, boilers, large capacity oil-fired air movers and heavy fuel oil. Member Audit Bureau of Circulations and Business Publications Audit of Circulation. Published monthly. One year $3.00—3 years $5.00.

GAS HEAT AND COMFORT COOLING

The complete heating and cooling magazine covering the use of equipment which uses gas as a fuel exclusively. Covers all forms of comfort heating and airconditioning; commercial-industrial, residential, etc. Technical articles, sales and merchandising, exclusive monthly report on gas heating and airconditioning retail equipment sales. Covers all equipment using gas for a fuel, airconditioning, water heaters, incinerators, furnaces, boilers, conversion burners. Edited for the retailer-installer, serviceman, contractor. Many readers are utilization engineers with gas utilities. Now in its 9th year. Member of Business Publications Audit of Circulation. Published Monthly. One year $3.00—3 years $5.00.

ELECTRIC HEAT & AIRCONDITIONING

A new magazine devoted to a relatively new art—comfort heating with electricity. Covers both residential and commercial applications. Electric heating is coming fast, particularly in areas where the air conditioning load has given the electric utilities a very large, peak summer load. When this peak presents a non-profit imbalance, the utilities create comfort heating rates and push hard for electric heating to build a winter load. It has zone control possibilities. In some areas insulation is recommended to make electric heating competitive. **Electric Heat & Airconditioning** covers all phases of this growing industry including heat pumps. No engineer in heating and air conditioning should ignore this new art. This is the only publication 100 percent devoted to electric heating. Member of the Business Publications Audit of Circulation. One year $2.00—3 years $5.00.

BOOKS OF PARTICULAR VALUE:

"Fundamentals of Year-Round Air Conditioning Controls with Oil Heating" ($2.00 a copy).
"Summer-Winter Air Conditioning Controls for Gas Heat & Comfort Cooling ($2.00 a copy).

"Modern Gas Heating"

The first compilation of information devoted to gas heating installation and service work. Close to 100 pages with many illustrations—$3.00 a copy.

"Better Oil Heating"

A service guide for operation and maintenance of oil burners. Bound in attractive paper cover 8¼ × 11. Nearly 100 pages, 125 illustrations, tables and service hints. $2.00 a copy.

International Heating & Air-Conditioning Exposition

Permanent Address—480 Lexington Ave., New York 17, N. Y.

EXPOSITIONS HELD

Philadelphia, 1959; Chicago, 1957; Philadelphia, 1955; Chicago, 1953; Philadelphia, 1951; Chicago, 1949; New York, 1948; Cleveland, 1947–1940; New York, 1938; Chicago, 1936; New York, 1934; Cleveland, 1932; Philadelphia, 1930.

FUTURE SCHEDULE

2nd Southwest Heating & Air-Conditioning Exposition in Dallas—1960; scheduled for Chicago in 1961.

UNDER AUSPICES OF A.S.H.A.E.

These Expositions have been and will be held coincident with the annual meetings of American Society of Heating and Air-Conditioning Engineers, Inc., and under their auspices. Management is by International Exposition Company with permanent headquarters at 480 Lexington Ave., New York 17, N. Y.

EXHIBITORS

Comprise leading firms in each phase of the industry; number has varied from 150 to more than 400 exhibitors.

EXHIBITS

These range from and comprise all the types of articles discussed or advertised in this copy of THE ASHAE GUIDE.

1. *The* COMBUSTION *Group:*
Furnaces, burners (coal, oil and gas), grates, stokers, boilers, radiators (various types), refractories and auxiliaries.

2. *The* OIL BURNER *Group:*

3. *The* HYDRAULIC *Group:*
Water feeders, water heaters, pumps, traps, valves, piping, fittings, expansion joints, pipe hangers, etc.

4. *The* STEAM HEATING *Group:*
Vapor heating, steam specialties.

5. *The* HOT WATER HEATING *Group:*

6. *The* AIR *Group:*
Warm Air furnaces and stoves, registers and grilles, cooling towers, air filters, motors, fans, blowers, conditioning equipment, ventilators (room and industrial types), unit heaters, etc.

7. *The* AIR CONDITIONING *Group:*
Equipment which circulates and filters the air, in summer dehumidifies and cools; in winter heats and humidifies, and does all these in proper season for complete, all year-round air conditioning.

8. *The* CONTROL *Group:*
Instruments of precision for indicating, controlling or recording temperature, pressure, volume, time, flow, draft or any other function to be measured.

9. *The* REFRIGERATING *Group:*
Compressors, condensers, cooling apparatus, contingent apparatus and refrigerants.

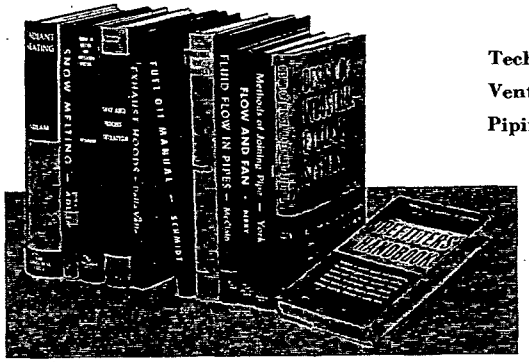
10. *The* CENTRAL HEATING *Group:*
Apparatus and materials especially designed or adapted to the uses of central heating and central heating station supplies.

11. *The* INSULATING *Group:*
Structural insulators (refractory and cellulose materials), asbestos, magnesia clays and combinations thereof, pipe and conduit covering, etc., weather-stripping, adhesives etc.

12. *The* MISCELLANEOUS *Group:*
Electric Heaters, boiler and pipe repair alloys, liquids and compounds, tools of all kinds, and equipment not specifically included in the above groups, but related thereto.

13. *The* MACHINERY AND GENERAL EQUIPMENT *Group.*

14. BOOKS AND PUBLICATIONS



VISITOR ATTENDANCE

Attendance is by invitation and registration only, thereby presenting a selected audience. Included are contractors, dealers, jobbers, supply houses, home owners, industrial users, professional and service organizations, public utilities, real estate management concerns, etc. A detailed analysis of registered attendance is available on request.

Industrial Expositions in America lead the expositions of the world in style, business effectiveness, industrial influence and educational value. This Exposition stands among the leaders in Industrial Expositions in America. It is an educational institution which brings together the research developments and improvements in equipment and materials for use in heating, ventilating and air conditioning all types of buildings.

THE INDUSTRIAL PRESS

93 Worth Street, New York, 13, N. Y.

Technical Books on Heating, Ventilating, Air Conditioning, Piping and Plumbing

DESIGN OF AIR CONDITIONING SYSTEMS by F. W. Hutchinson
115 full-page charts solve problems of air conditioning system design involving cooling load, duct design, psychrometrics, solar energy, comfort conditioning, panel cooling, etc. For each chart the engineering and mathematical background plus design example and solution are given. 336 Pages, 118 Illus., $7.00.

DESIGN OF HEATING AND VENTILATING SYSTEMS
by F. W. Hutchinson
96 full-page charts solve problems of heating and ventilating involving load determination, duct design, panel heating, solar heating and combustion analysis. Companion book to Design of Air Conditioning Systems. Same methods to explain and solve problems are used. 320 Pages, 96 Charts, $7.00. By mail order, Canada and overseas, $8.50. SET OF BOTH, $12.50.

DESIGN OF INDUSTRIAL EXHAUST SYSTEMS by J. L. Alden
How to design, build or buy an exhaust system that will meet the requirements of law and industry. Covers flow of fluids—hood forms—air flow through hoods—pipe resistance—piping design—dust separators—low pressure conveyers—centrifugal exhaust fans—structural details—field measurements and their interpretation. 252 pages, 122 Illus., $3.50.

ELECTRICAL TESTING AND TROUBLESHOOTING by Philip Green
Simple, straightforward, time-tested procedures show how to locate and correct faults in circuits of all kinds including controllers, motors, transformers and transmission lines. Most tests described are performed with the equipment isolated from the power line. Written by an expert in electrical troubleshooting. 160 Pages, 34 Tables, $5.00.

EXHAUST HOODS by J. M. DallaValle
Practical hood design; latest principles of air handling, contaminant dilution and transport velocities; design of hoods for control of dust, mist, fumes, vapors, gases. Simple formulas and diagrams show exact procedures. 130 Pages, 127 Illus., $4.00.

FLOW AND FAN by C. H. Berry
Covers the flow of gas through ducts, and fan performance and control; moving air through ducts, fan selection and control, duct arrangement, system characteristics, flow analysis. Basic data and methods used to calculate system resistance. Practical information for selecting a fan for any duty. 232 Pages, 84 Illus., $4.00.

FLUID FLOW IN PIPES
by C. H. McClain
How to solve problems involving the flow of liquids and gases through pipes. How to handle viscosity, friction, heat, and other factors expressed in various dimensional systems. Worked-out problems show applications of principles. 124 Pages, 18 Illus., $4.00.

FUEL OIL MANUAL—2nd Edition by P. F. Schmidt
Covers characteristics and uses of every type and grade of fuel oil. Explains the meaning of each oil property, and shows how this information is applied in selecting, handling and burning fuel oil. A special chapter on fuel oil additives and another on troubles and remedies. 176 Pages, 34 Tables, $4.50.

HIGH TEMPERATURE WATER SYSTEMS by O. S. Lieberg
A thorough explanation of the principles, design, selection of equipment, operation and economics of high temperature water systems. Contains original design data used in actual systems designed by author. Features design of typical system based on principles set forth in this brand new book. 224 Pages, 109 Illus., Tables, $6.50.

HANDBOOK OF AIR CONDITIONING, HEATING AND VENTILATING
Edited by Clifford Strock
Completely new book containing thousands of facts, figures, data and principles on: Air Conditioning, Air Handling and Ventilation, Fuels and Combustion, Heating and Heat Transfer, Piping and Plumbing, Motors and Motor Starters, Mathematical Data and Drafting Room Symbols. Contains section on Terminology and complete cross-index. 1094 Pages, 7¾ in. x 10¾ in., 598 Charts, Maps, Illus, 518 Tables, $15.00.

INDUSTRIAL HEAT TRANSFER by F. W. Hutchinson
Provides 123 time-saving working graphs for the direct solution of most commonly encountered problems. Graphs are equal in accuracy to the equations from which they are derived and help eliminate errors in calculation. 336 Pages, 136 Charts and Illus., $7.00.

METHODS OF JOINING PIPE
by J. E. York
The most detailed information available on standard and special joints for all types of metallic, glass, tile, plastic and concrete pipe. Data on joints designed to take up movement due to expansion and contraction. 236 Pages, 249 Illus., $4.00.

PIPEFITTERS HANDBOOK—2nd Edition by F. R. Lindsey
Original tables enable pipefitters to solve problems of pipe bending, mitering, layout, threading, etc., either in the shop or in the field. Handy size, durable binding. 282 Pages, $6.00.

PLANT AND PROCESS VENTILATION by W. C. L. Hemeon
Design factors and data that can be applied to any situation. Principles are clear, logical. Shows how to estimate exhaust characteristics of any cold, multi-directional process; and obtain exhaust requirements for such a situation. 448 Pages, 172 Illus., $9.00.

RADIANT HEATING—2nd Edition by T. Napier Adlam
Latest developments, basic principles, facts, practical working data on applications of radiant energy for heating and cooling. Facts, figures, design data can be applied directly in designing and installing radiant heating systems without calculations. 504 Pages, 337 Illus., $6.00.

Prices slightly higher in Canada and overseas; write for catalog.

KEENEY PUBLISHING COMPANY

6 North Michigan Avenue, Chicago 2, Ill.

Heating, Piping & Air Conditioning is the one monthly publication that adequately serves the field of industry and large buildings. It is devoted to the design, installation, operation, and maintenance of heating, piping and air conditioning systems in plants, commercial, institutional and public buildings.

Each January issue includes a complete directory of commercial and industrial heating, piping, and air conditioning equipment, which lists all products, their trade names, and the manufacturers' addresses. It is the one established buying and specifying guide of the industry.

Heating, Piping & Air Conditioning is read by consulting engineers and architects . . . contractors . . . and engineers in charge of heating, piping and air conditioning in industrial plants, and other large buildings, federal, state, and city governments, school boards, and public utilities. Most of ASHAE members are subscribers.

Such coverage means, for the advertiser, consideration at all points in the selling of a heating, piping, or air conditioning product . . . consideration in its selection during the preparation of plans and specifications; in its actual purchase for installation; in its year-'round buying for operating and maintenance requirements. Without waste, the manufacturer of air conditioning products and equipment can reach through **Heating, Piping & Air Conditioning** those from whom he is seeking the necessary engineering acceptance.

SUBSCRIPTION PRICES—U. S. A. $3.00 a year.

AMERICAN ARTISAN is truly THE magazine of central residential air conditioning, warm air heating, and sheet metal contracting. Its readers are warm air heating and sheet metal contractors, dealers, jobbers, and manufacturers.

Special features of each issue have been devoted to air conditioning since 1932, when it first became apparent that air conditioning for homes was to be along the lines of the central forced warm air heating system. As a result of the ready adaptability of this type of heating system to all air conditioning factors, hundreds of thousands of homes today have winter air conditioning—supplied through forced warm air heating with air cleaning and humidification. Cooling apparatus can be attached to these systems readily whenever year-'round air conditioning is desired.

Each January issue includes the only complete directory of central residential air conditioning, warm air heating, and sheet metal products and equipment, which lists all products, their trade names, and the manufacturers' addresses.

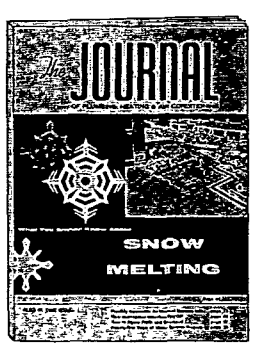
The key man in the central residential air conditioning picture is the warm air heating and sheet metal contractor—the one man experienced in "treating air" at a central place and getting it properly distributed. And **American Artisan** is the key publication—because it reaches these key men with information that has made it the recognized authority on correct practice in residential air conditioning, warm air heating, and sheet metal contracting.

SUBSCRIPTION PRICES—U. S. A. $3.00 a year

Canada, $5.00 a year. Spain, Central and South America—$6.00 a year. Elsewhere $7.00 a year.
(Prices subject to change without notice due to impending increases in postal rates.)

MEMBER OF THE ASSOCIATED BUSINESS PUBLICATIONS AND THE AUDIT BUREAU OF CIRCULATIONS

Scott-Choate Publications



92 Martling Avenue, Tarrytown, New York

Subscription rates—$4.00 per year U. S., Canada and Pan America. Foreign, $6.00. Advertising rates on request.

HEATING & AIR CONDITIONING CONTRACTOR (formerly *Sheet Metal Worker*) is the leading magazine in the warm air heating, packaged air conditioning, ventilation, and sheet metal contracting industry. Its editorial scope includes not only residential heating and cooling work, but non-residential air conditioning and air distribution for comfort and process control.

HEATING & AIR CONDITIONING CONTRACTOR editorial content is directed primarily at the management and planning levels of the heating, air conditioning, and sheet metal contracting business. It covers not only the technical aspects of this field, but also marketing, merchandising, business management and legal problems. It is also the only publication in the field to devote regular monthly space to labor relations.

Subscription rates—$4.00 per year U. S., Canada and Pan America. Foreign, $6.00. Advertising rates on request.

THE JOURNAL OF PLUMBING, HEATING & AIR CONDITIONING is the recognized editorial leader in the plumbing and heating contracting industry. Through the use of intensive editorial research it has developed a unique formula for building effective readership. A key factor is consistent editorial balance among the various aspects of reader interest: technical, marketing, business management, overall industry issues.

In technical editorial, The **JOURNAL** has consistently been a pioneer. Among the subjects on which it has published the most comprehensive information ever produced are the following: baseboard radiation; submersible deep well pumps; hydronic air conditioning for residences and small non-residential structures; water conditioning for domestic and industrial use; etc.

The **JOURNAL** is also the only publication in its field with a regular monthly section devoted to the labor relations problems encountered by large mechanical contractors in their day to day operations.

Snips Magazine

5707 W. Lake St. Chicago 44, Ill.

PUTS A REAL PUSH BEHIND SALES

A friendly, close-to-the-reader periodical published for those contractors who handle Warm Air Heating, Air Conditioning, Sheet Metal Work, and Ventilation.

The Snips Magazine is preferred as an advertising medium by many notable industrial advertisers year after year, and many prominent jobbers and wholesalers who know their market well. It's a unique periodical which helps you put a real push behind sales.

LIVE STORIES IN SNIPS

SNIPS is packed each month, from cover to cover, with hundreds of live news stories and exclusive pictures including practical applications of latest advancements of the Sheet Metal, Heating, Air Conditioning and Ventilation trade. No long contributed stories. It's all field gathered material, secured the hard way, rubbing shoulders with the readers. Such work gets for the periodical a reader interest seldom found in a trade publication. You'll find this feature the basis of the sensational inquiry pulling power and sales producing value of advertising space in SNIPS.

MOST ADVERTISERS SELECT SNIPS FOR PAST 6 YEARS

When your copy appears in SNIPS, it is in the periodical which has carried more advertising accounts than any other magazine in this field for the past six years. This is in exclusion of the hundreds of listing ads carried each month. This continued preference for our magazine, as an advertising medium, is something of which we are extremely proud. The accomplishment challenges us to do a continually better publicity job to maintain this continued preference for our periodical as an advertising medium.

SNIPS HOLDS THE LINE ON RATES

To "hold the line" on our present advertising rates we did everything possible to reduce our costs. As a result there has been no rate increase since April, 1957. We were extremely happy that we wouldn't have to increase the rates as most trade papers have had to do, due to the recent postage increase and increases in the cost of paper, printing, cuts, etc. In fact, as a result of the drive made to get around these increases we came up with lower costs than before.

EXTRA COVERAGE AT NO EXTRA COST

We were able to put some of these savings into extra coverage. The final result was that while we promised a thirteen thousand coverage we have been able to give advertisers an extra thousand copies per month and still keep the rates the same.

TOP INDUSTRY COVERAGE TO CONTINUE

Even without this above mentioned coverage increase, we continued during the year past, to provide for you, the top coverage of the magazines serving the sheet metal, warm air heating, cooling and allied industries. No effort has been made to increase coverage promiscuously. Instead, every reader added has been a known, responsible buyer of the kind of goods you sell.

ABOUT SNIPS' MAILING LIST

It's truly a select group that gets SNIPS. They are the outstanding firms and individuals in the trade whom the better supply houses are selling or trying to sell. They are the contracting and installing concerns whom the principal jobbers and distributors of the industry—people who really know their territories best—consider worthy of cultivation by mail, promotion and salesmen's calls.

MUCH TO MERIT USE OF SPACE IN THIS PERIODICAL

There is much to merit your selection of the SNIPS Magazine as one of your advertising mediums in the coming year. It will be our constant endeavor to continue to give you the best trade paper advertising value available anywhere at any price.

Special Issues

January Annual & Winter Market Number—March Anniversary & Spring Market Issue—September Fall Market Issue—December Holiday Greeting Issue—Further information gladly sent on request.

ENGINEERS OF HUMAN COMFORT

The Heating, Ventilating and Air-Conditioning Engineers through their work and research bring to our homes, schools, offices, factories, theaters, hospitals and other public buildings in both summer and winter, that climate best suited to our comfort and health. These men realize the basic importance of heating, ventilating and air conditioning as a primary element in the well-being of civilized mankind, living and working mostly indoors. They are truly *Engineers of Human Comfort.*

MEN WITH VISION

The professional status of this form of engineering today can be largely attributed to the AMERICAN SOCIETY OF HEATING AND AIR-CONDITIONING ENGINEERS (ASHAE). Founded in 1894 by a handful of men determined to elevate the dignity of their profession and provide the public with more than perfunctory service, the Society represents an organization of more than 12,087 members. It includes 74 chapters throughout the United States and Canada plus members in many foreign countries.

On August 2, 1894, Hugh J. Barron, the acknowledged founder of the AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS (ASHVE), L. H. Hart, William M. Mackay, and 15 other interested men met in Mr. Hart's office in the World Building, New York City, to discuss the need for developing and disseminating technical advancements to heating and ventilating engineers. These men stimulated sufficient interest to obtain 75 charter members who met on September 10, 1894, in the Broadway Central Hotel, New York City, and adopted a name, by-laws, and constitution for the new Society.

Consistent with the increasing amount of activity by members in designing air-conditioning systems, in 1954 the Society changed its name to AMERICAN SOCIETY OF HEATING AND AIR-CONDITIONING ENGINEERS.

SOCIETY SCOPE AND OPERATION

The three major activities of the Society are: Membership service, Publication, and Research, the records of its accomplishments being permanently recorded in the annual TRANSACTIONS.

The Society membership now includes engineers, educators, scientists, physicians, architects, contractors, and leaders of industry. Membership consists of Honorary, Life, Presidential, Fellow, Member, Associate, Affiliate and Student Grades.

The management of the Society is entrusted to 4 elected Officers and a Council of 13 elected members. Continuity of policy is insured by electing 4 men annually for a 3-year term and retaining the retiring president on the Council for 1 year.

Two Society meetings are held each year—the Annual Meeting during January or February, and the Semi-Annual Meeting usually in June or July. Every 2 years the *International Heating and Air-Conditioning Exposition* is held in conjunction with the Annual Meeting under the auspices of the Society.

The MEMBERSHIP STATUS as of January 26, 1959 was as follows:

Honorary	4
Presidential Members	19
Life Members	255
Fellows	9
Members	4,989
Associate Members over 30 yrs	3,712
Associate Members under 30 yrs	699
Affiliates	2,226
Students	174
TOTAL	12,087

HEADQUARTERS AND LABORATORY

The Society headquarters is maintained at 62 Worth St., New York 13, N. Y., and the ASHAE Research Laboratory, devoted to the study of fundamental principles of heating, ventilating and air conditioning, is located at 7218 Euclid Ave., Cleveland 3, Ohio.

ASHAE DEDICATED TO RESEARCH

From the day of its inception, a primary purpose of ASHAE was and still is research. For the first 25 years such research activity had been confined to individuals or committees utilizing available equipment or facilities.

In January 1919 the Society approved the establishment of a permanent research laboratory located in the U. S. Bureau of Mines, Pittsburgh, Pa. The Laboratory was moved in 1944 to limited quarters in Cleveland, Ohio and in 1946 the Society acquired its present large, permanent quarters in Cleveland. The Society is justly proud of the fact that it is the only professional engineering society that maintains and operates its own research laboratory.

All research activities are planned and supervised by the Committee on Research of 15 elected members, assisted by various Technical Advisory Committees of the Society. Since 1919, approximately $2,500,000 has been expended on research, which has helped guide the industry to better practice and equipment. In addition to work at the Society's laboratory, a substantial part of the research program has been carried on through the medium of cooperative agreements with leading educational institutions of the United States and Canada. Together with the cooperating institutions the Society has, during the last year, conducted 22 research projects including work on Air Distribution, Fan and Air Noise, Hot Water Heating, Industrial Ventilation, Insulation, Odor Control Comfort, and Physiological Factors. The research activities are financed from Society funds, of which a portion comes from membership dues and from its publications, and these funds are amplified by contributions from friends in the industries engaged in the general field of heating, ventilating and air conditioning.

SOCIETY PUBLICATIONS

TRANSACTIONS—The first Society publication established in 1895 provides a permanent record of Society activities published annually, containing scientific papers, proceedings of meetings, discussions, reports of meetings. Distributed to members as part of membership service; and to others for $6.00.

JOURNAL—Contains advance publication of technical papers, the reports of Society and Chapter meetings, and other items of general interest. The JOURNAL was published from April 1915 to October 1919 as a quarterly; 9 times a year from 1920 to 1924, then monthly from January 1924 to April 1929, and as a section of *Heating, Piping & Air Conditioning* magazine from May 1929 to December 1958.

THE GUIDE—A distinctly new service was inaugurated by the Society in 1922 when it established the HEATING VENTILATING AIR CONDITIONING GUIDE. Now in 1959, as the 37th Edition makes its appearance, it is notable that THE GUIDE has served effectively not only the membership but the entire profession and the allied industries, and has received world-wide recognition as a reliable and authoritative compendium of useful heating, ventilating and air-conditioning data.

Throughout the 37 years of its service THE GUIDE has become a reference book of unchallenged position in its special field of engineering. The intention of its founders, to provide an instrument of service containing reference material on the design and specification of heating, ventilating and air-conditioning systems and containing essential and reliable information concerning modern equipment, has been carefully safeguarded by those responsible for the compilation of each Edition.

THE GUIDE exerts today one of the most positive influences tending to elevate, improve and extend the whole Art of Heating, Ventilating and Air Conditioning. It is universally recognized as the most useful and authoritative work in its field, being used by practicing engineers, educators and manufacturers in all parts of the world, and as a text book by a growing number of the world's principal engineering institutions.

REGIONS AND CHAPTERS OF THE SOCIETY

Under the Regional Plan adopted in 1956 the 72 Chapters are divided into 7 geographical regions, with regions headed by a regional director who is chairman of the Chapters Regional Committee for his respective area. The regional directors are MEMBERS of the Council, and also comprise the Regions Central Committee of which the Second Vice President is chairman.

Each Chapters Regional Committee meets once a year between February and May to discuss Chapter problems and select a member to represent the region on the Society Nominating Committee.

Individual Chapters average eight meetings a year between September and May, which are distinct and apart from Society Annual and Semi-Annual Meetings.

REGION 1—Connecticut, Delaware, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont.

REGION 2*—Illinois, Indiana, Michigan, Ohio, Wisconsin.

REGION 3—Colorado, Iowa, Kansas, Minnesota, Missouri, Montana, Nebraska, North Dakota, South Dakota, Wyoming.

REGION 4—Arizona, California, Idaho, Nevada, Oregon, Utah, Washington.

REGION 5—Alabama, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, West Virginia.

REGION 6—Arkansas, New Mexico, Oklahoma, Texas, and Shreveport, La.

REGION 7—All Provinces of Canada.

*Includes Iowa-Illinois Chapter.

F. PAUL ANDERSON MEDAL

In 1930 an endowment fund for the award of The F. Paul Anderson Medal was created by the late Thornton Lewis and Rules of Award were prepared by a special committee appointed by the Council. This award is in recognition of outstanding work in the field of heating, ventilating, and air conditioning. Since 1932 there were 16 awards:

1932 Willis H. Carrier*
1936 Dr. Arthur Cutts Willard
1939 Prof. Frank B. Rowley
1942 Dr. Frederick E. Giesecke*
1944 Comm. Ferry C. Houghten, U.S.N.R.*
1946 Capt. Alfred E. Stacey, Jr., U.S.N.R.
1947 James H. Walker*
1950 Dr. Charles-Edward A. Winslow*
1951 Samuel R. Lewis
1952 Homer Addams*
1953 Everett N. McDonnell
1954 Walter L. Fleisher
1955 Charles S. Leopold
1956 Robert W. Keeton, M.D.*
1957 Prof. M. K. Fahnestock
1958 Prof. George L. Tuve
1959 Prof. Constantin P. Yaglou

*Deceased

* Fall Meeting

** Regional Meeting

ASHVE AND ASHAE MILESTONES

1894–1959

1894 Organization meeting September 10, at Broadway Central Hotel, New York, with 75 Charter Members.

1895 First Annual Meeting, January 22–24 at 12 West 31st Street, New York. Incorporation under laws of New York State, TRANSACTIONS established.

1896 Society Emblem adopted at 2nd Annual Meeting—Dr. J. S. Billings, First Honorary Member.

1897 First Semi-Annual Meeting held at the Windsor Hotel, New York, June 18.

1906 First Chapter organized in Chicago.

1907 Membership reached 301.

1911 Membership totaled 405. New York Chapter formed. Society established Headquarters in Engineering Societies Building, 29 West 39th Street, New York.

1914 Charter amended.

1915 Journal first published in April as a quarterly; later issued monthly.

1916 Full time Secretary employed.

1918 Members in Armed Services—64.

1919 After several years of consideration and planning the Society established its Research Laboratory, in the United States Bureau of Mines, at Pittsburgh, Pa., having determined a preliminary *modus operandi* and provided an operating fund. The Society is justly proud that it is the only professional engineering organization which maintains and operates its own Research Laboratory.

1922 The 1st edition of the ASHVE GUIDE published in September.

1923 Comfort Zone Established by ASHVE Research.

1925 Dues raised to $25.00 and 40 per cent of dues of Members and Associates allocated to Research Fund.

1927 Membership of Council increased from 12 to 17.

1928 Appointment of Technical Secretary and completion of Code for Minimum Requirements for Heating and Ventilation of Buildings. Benjamin Franklin honored as Patron Saint of Society.

1929 Journal incorporated as a Special Section of *Heating, Piping and Air Conditioning*. Society Headquarters moved to 51 Madison Ave., New York, N. Y.

1930 Endowment created by Thornton Lewis for the F. Paul Anderson Medal. First International Heating and Ventilating Exposition held in Philadelphia.

1932 First Award of F. Paul Anderson Medal to Willis Haviland Carrier.

1933 New Constitution and By-Laws adopted—Membership dues reduced.

1938 Membership passed 3000.

1941 Society requested to do Research for U. S. Navy.

1944 50th Anniversary celebrated in New York.

1945 Members serving in Armed Forces—416.

1946 New Charter approved.

1950 New By-Laws adopted January 26, 1950.

1954 The name of the Society was changed to American Society of Heating and Air-Conditioning Engineers by vote of the members at a Special Meeting in New York, N. Y., November 22, effective December 8.

1956 The Honorable Herbert Hoover, Dr. Milton S. Eisenhower and Dr. Charles F. Kettering* were elected Honorary Members.

1957 Dr. Arthur Cutts Willard elected an Honorary Member.

1958 Membership total of ASHAE passed 12,000.
On December 1 the members of ASHAE and the ASRE, at simultaneous meetings held respectively in Chicago, Ill., and at New Orleans, La., voted to approve an agreement for consolidation.

*Deceased.

AMERICAN SOCIETY OF HEATING AND AIR-CONDITIONING ENGINEERS

Headquarters: 62 Worth St., New York 13, N.Y.
Tel. BArclay 7-6262

OFFICERS and COUNCIL
1959

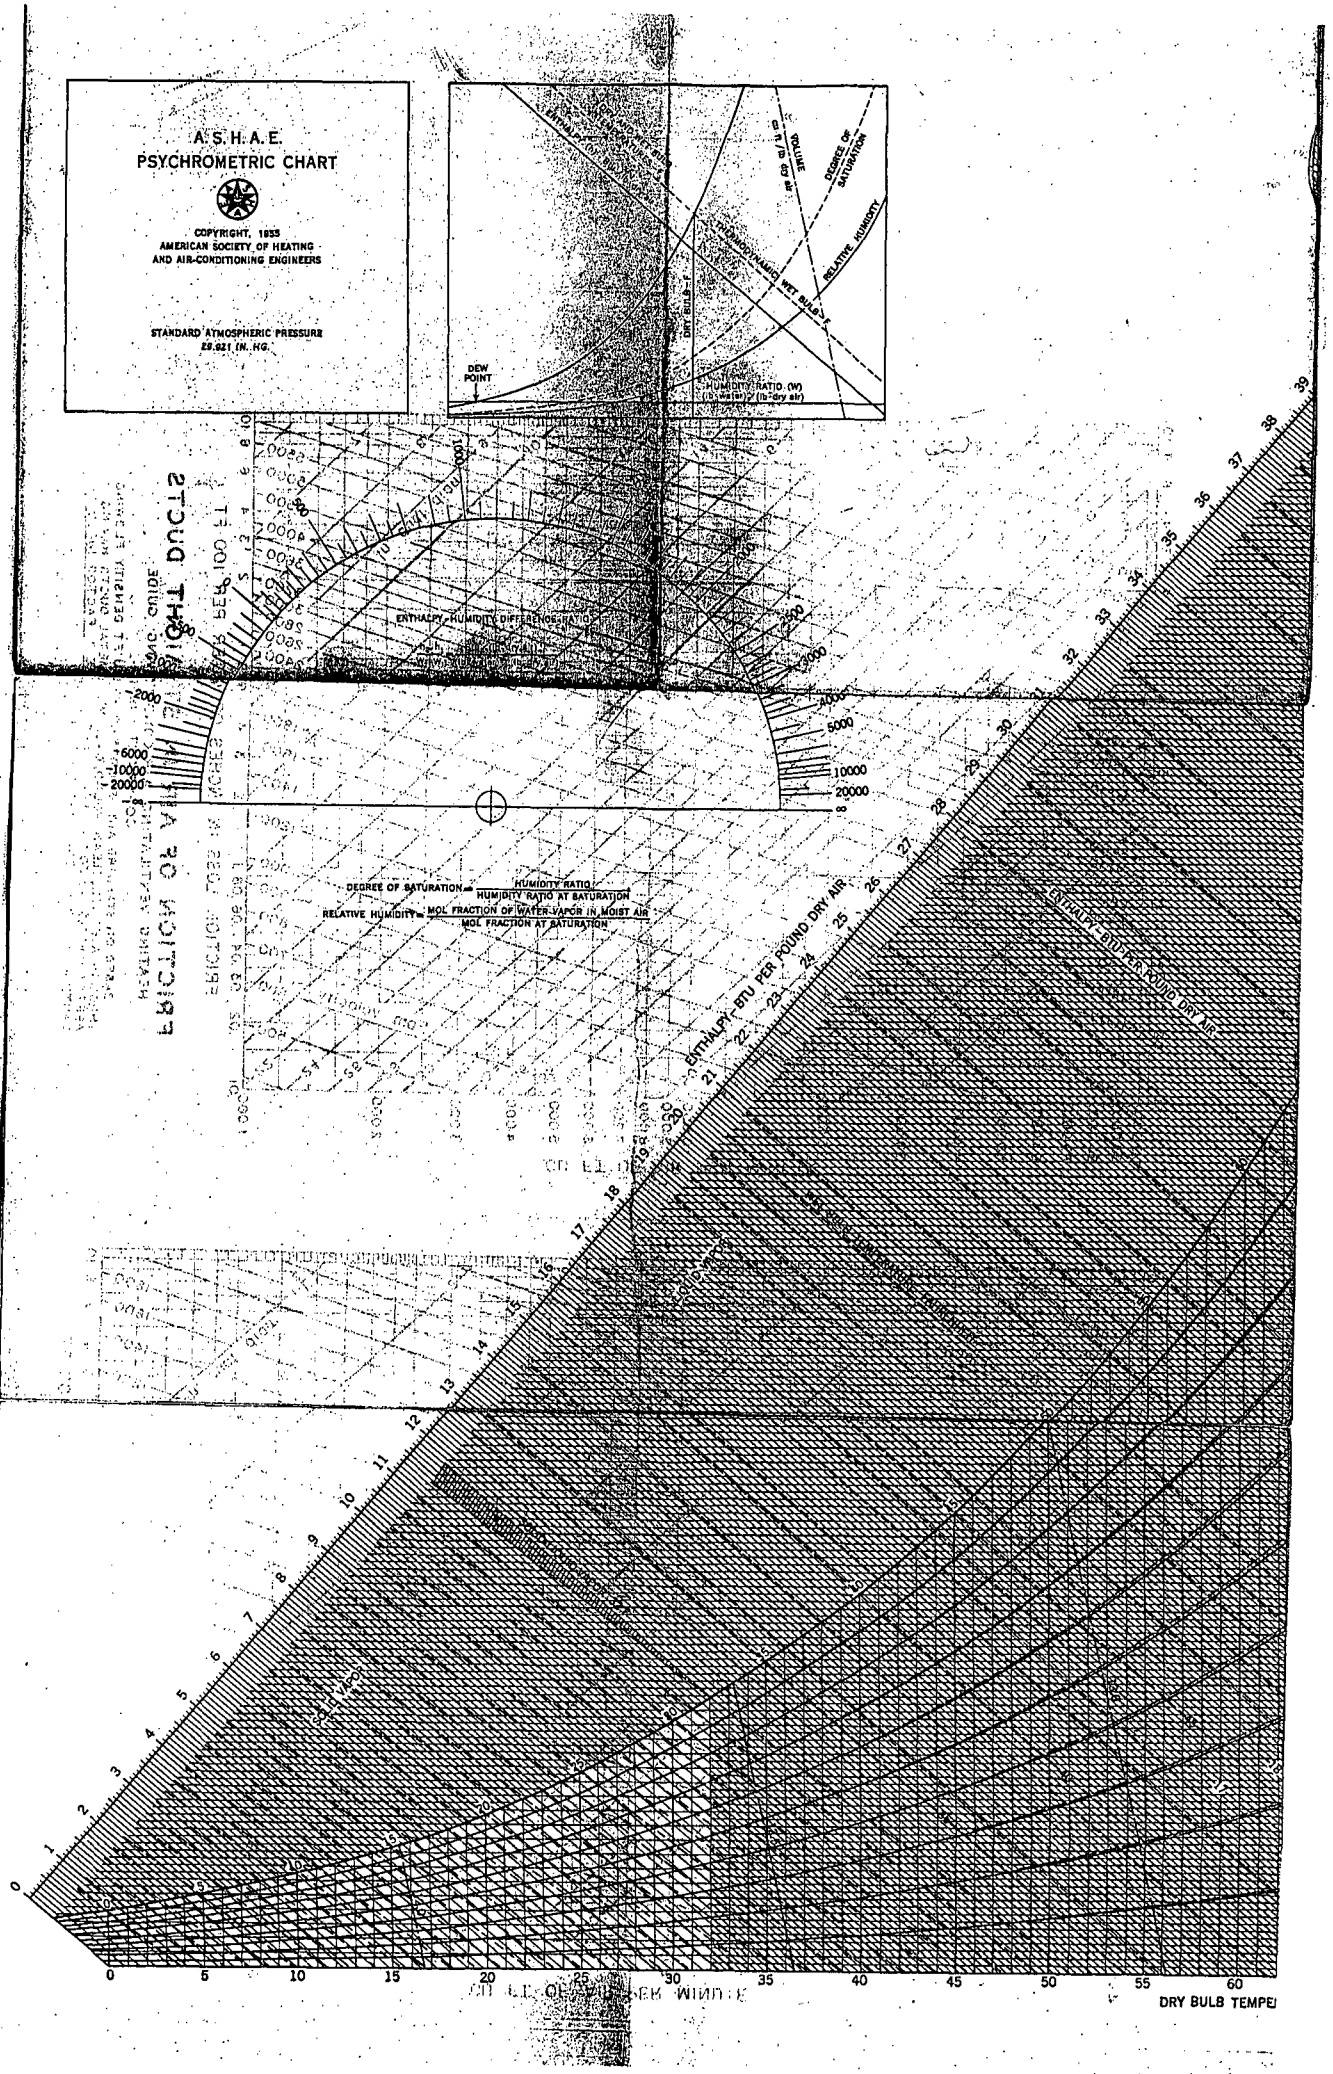
President.....A. J. HESS
First Vice President.....WALTER A. GRANT
Second Vice President.....JOHN EVERETTS, JR.
Treasurer.....J. H. FOX
Executive Secretary.....A. V. HUTCHINSON
Three years: WILLIAM J. COLLINS, JR., HAROLD A. LOCKHART, GEORGE W. MYERS, ROLLAND S. STOVER
Two years: F. H. FAUST, FRED JANSSEN, J. W. MAY, G. B. PRIESTER
One year: W. G. HOLE, P. J. MARSCHALL, E. R. QUEER, W. O. STEWART, P. N. VINTHER

ADVISORY BOARD

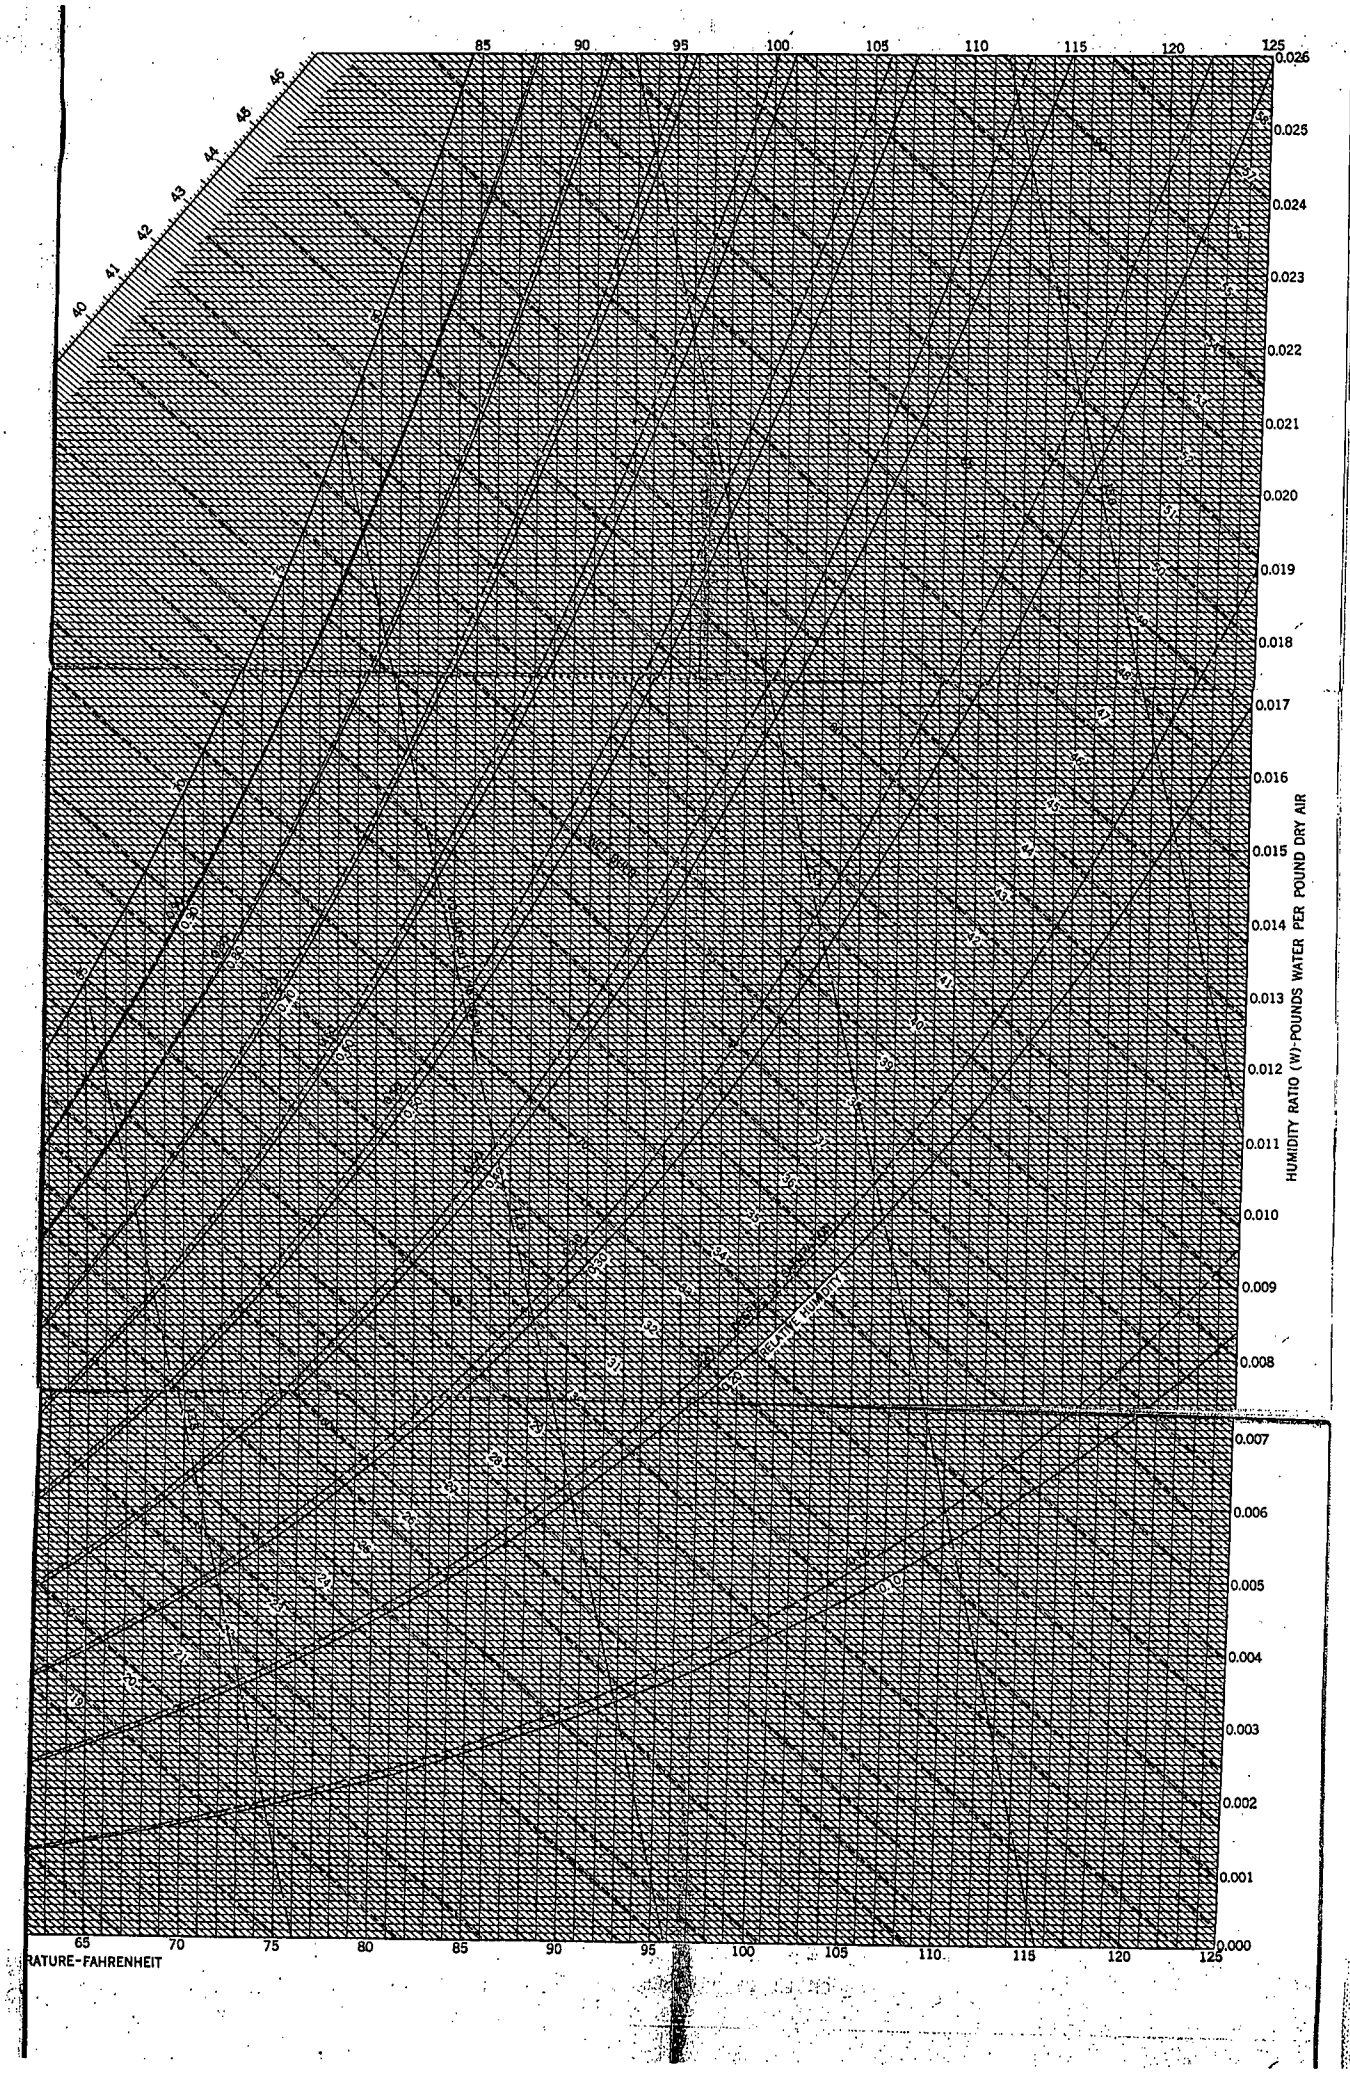
E. R. QUEER, *Chairman*; LESTER T. AVERY, M. F. BLANKIN, S. E. DIBBLE, S. H. DOWNS, E. O. EASTWOOD, W. L. FLEISHER, H. P. GANT, P. B. GORDON, JOHN E. HAINES, H. M. HART, C. V. HAYNES, L. N. HUNTER, JOHN W. JAMES, S. R. LEWIS, A. J. OFFNER, F. B. ROWLEY, L. E. SEELEY, A. E. STACEY, JR., REG. F. TAYLOR, G. L. TUVE AND A. C. WILLARD.

COMMITTEE ON RESEARCH

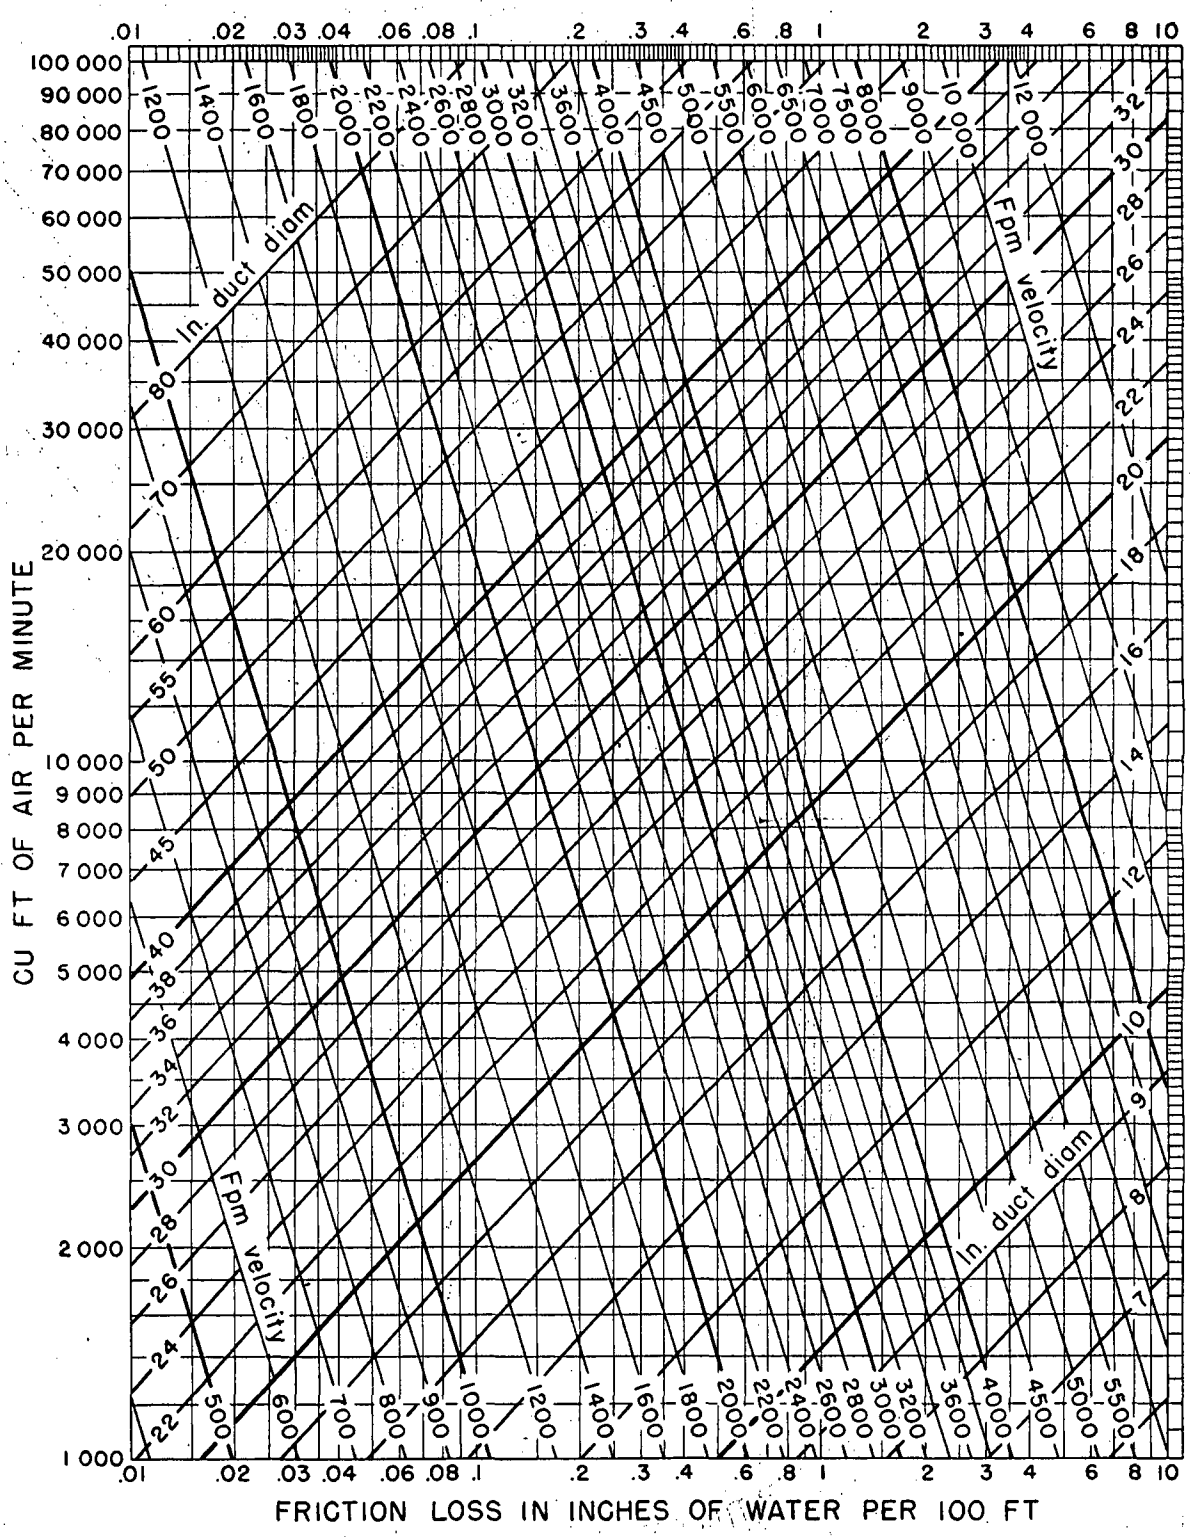
R. C. JORDAN, *Chairman*



ASHAE Research Laboratory, 7218 Euclid Ave., Cleveland 3, Ohio



Director of Research.....B. H. JENNINGS
Assistant Director of Research.....C. M. HUMPHREYS
Assistant Director Industry Relations.....J. E. LOUCKS



ST. LOUIS PUBLIC LIBRARY
APR 16 1959

HEADQUARTERS STAFF

Technical Secretary.....CARL H. FLINK
Editor.....C. H. B. HOTCHKISS
Public Relations Director.....W. M. VIDULICH
Assistant Secretary.....FREDERICK W. HOFMANN
Technical Assistant.....CARL W. MACPHEE
