Dear Charlie:

Enclosed herewith is a copy of the paper entitled "Carcinogenic Effects" describing and discussing potential carcinogenic effects of dioxin, 2,4-D and 2,4,5-T. This is the first of the papers from the Agent Orange Science and Medicine Series which I will be sending to you. I am hoping to comment on the various papers and describe the applicability of these to the case at Nitro.

Page Two

The case of basal cell skin carcinoma (Stanley) may be related to the promoter effect of dioxin. Promoters are known to cause basal cell skin carcinoma in various animal tests. In addition, the squamous cell carcinoma seen in Samples may also be directly related to the effects of dioxin on the skin.
