FROM: L. A. GLIATTO, JR. *LA*

STATUS REPORT - PULMONARY ABNORMALITIES

We have completed the first phase of this program here at Clinton. This phase consisted of the following:

1. Identification of all employees and pensioners who might have been exposed to asbestos dust levels as a result of their work assignment. Initially, this screening process consisted of present and former members of the site Mechanical and Service groups - about 50 people in all.
2. Examination of pertinent X-rays by the site physician and by a board certified radiologist. Questionable cases were reviewed by Wilmington Medical Division staff as well.
3. Announcement to the site that Clinton was undertaking an asbestos control medical program. In addition to the usual announcement format, a series of meetings was held with all employees in the Mechanical and Service groups to better explain the program and answer questions. Copies of the publication package are attached as Appendix A.
4. Thirteen employees (eight exempt, one non-exempt and four wage roll) and two pensioners were identified as having pulmonary abnormalities, such as pleural thickening, and those results were discussed with the affected employees. At the same time, the future medical program was outlined for them. A list of these employees is attached as Appendix B.
5. Further pleural evaluation of fourteen affected employees was done at the University of Cincinnati Medical School. One of the pensioners declined to take part in further testing. A summary of the test program is attached as Appendix C.

When results were available, the site physician reviewed them with the affected employees and
