Subject ASBESTOS AREA SAMPLESFILE: LINDE GAS PRODUCTS
CENTRAL REGION

The attached table contains the results of area samples collected on October 18, 1984 and analyzed for asbestos.

These samples show very low concentrations of airborne asbestos (4 out of 5 samples below the detection limit of 0.01 fibers/cc) in the specific areas monitored. Personnel exposure should reflect these results unless employees are engaged in activities causing the suspension of fibers into the air.

If you have any questions, please call me.
