USG

FORESTRY BLEND

SHINGLES

Before selecting the shingles for your new roof, consider the color scheme of your home and the type of architecture; then picture in your mind a new roof of Forestry Blend Shingles, either of the Standard Hexagonal type, illustrated here, or in one of the other popular shapes — Pontiac, Treblestrip or Thatch. Your imagination will immediately carry you to a new realization of the beauty that may be added to your home by interesting use of color.

UNITED STATES GYPSUM COMPANY
LOS ANGELES SAN FRANCISCO SEATTLE

Beautiful, Blended Roofs

Forestry Blend Shingles bring you one of the newest developments in the roofing industry—a color design in shingles that permits the contractor to lay your roof in beautiful color blends, exactly as worked out by a color expert. Forestry Blend roofs reflect interesting variety and color change from one part of the roof to another without the color scheme being broken into or encroached upon by the shingle

design. Design need not follow the shingle pattern.

You do not have to depend upon grouping shingles with individual solid colors to get your color blends. Color variety is built right into the shingles themselves.

Design is not left to chance, nor does it depend upon the judgment or color sense of the men laying

the roof. Shingles are arranged in bundles so as to produce the correct effect when laid consecutively.

USG Forestry Blend Shingles are available in five types of USG roof coverings, Standard Hexagonal Shingles, Super Hexagonals, Treblstrip Shingles, Pointab Shingles and Thatch Shingles.
