Mr. W. J. Schreibeis:

There are many people throughout the Bell operating companies who collect environmental samples and then mail them to Bell Labs for analysis. As you are aware, many of these samples are collected improperly negating our ability to interpret results. We believe that this problem can be easily corrected by making videotape and graphic materials available to people to serve as a refresher for concepts learned during the Bell System course, "Recognition and Evaluation of Occupational Health Hazards." We propose to develop four videotapes and or picture books dealing with the following subjects:

1. Calibration of personnal sampling pumps;
2. Calibration of combustible gas meters;
3. Use of detector tubes; and
4. asbestos sampling procedures.

We would appreciate receiving comments and suggestions associated with these proposals before we proceed further.
