

INTER-OFFICE CORRESPONDENCE

To: Project Engineers & Designers

Subject: Asbestos Product

From: P.H. Stibbe

Copies To:

Date: June 13, 1979

Mobil Chemical is one company in particular which does not want asbestos products in their dryers. We will be facing more in the near future when we do jobs involving films, etc. for food processing. We have done jobs in the past where our air bar gaskets were changed or left out entirely due to non-compatibility. The important point is we must search out new gasket materials for our applications in critical drying processes.

Secondly, attached is a memo concerning asbestos in general. We certainly will have to replace these materials as well. The difference is most of the first applications will not have to seal and live at 500 to 600°.

The intent of this is to caution you about the first area. If you are on a job where you may question the acceptability of asbestos let's discuss it.

Finally, I'm looking for a volunteer to search out or conceive new ideas for sealing air bars to heads, duct connections, etc. for all areas. If one is so inclined please step forward -- if not I'll still find a volunteer by my methods.
