Dr. D. L. Block

Attached is the draft of a letter which you requested to a Saline hourly employe exposed to an excessive level of asbestos in the air.

As I indicated yesterday, if the intent of the law is to correct the situation, then we would certainly prefer not to send the letter since we have already effected the engineering changes and the problem no longer exists.

I am concerned about the effect a letter to the employe might have. It would appear to be an unnecessary reminder of past problems to the Union even though management has taken prompt corrective action.

Dear Mr. Schultz -

As part of a continuing program of monitoring employes exposed to specific materials, we have learned the results of samples taken February 13, 1973 indicate that the concentration of asbestos in air was above the established threshold limit value for this material.

You are aware of the modifications that were instituted in the handling and disposing of empty asbestos bags. The present method will assure that the concentration in air will remain within established safe limits.

Sincerely,

J. P. McCallum
