HIGH MOLECULAR WEIGHT EPOXY RESINS

Ref: Your letter of April 30, 1971

All materials in RC-11247 are approved for use in can coatings except the preservative, benzyl trimethyl ammonium hydroxide. Since there is only 0.15% preservative in the resin, solvent cleaning of the reactor and thin tanks would reduce the amount of potential cross-contamination to virtually zero. Therefore, as long as the vessels are solvent cleaned before manufacture of an FDA approved resin, there is no problem with the manufacturing of RC-11247 in the same vessel.
