Tremolite in Los Angeles Products

Confirming our telephone conversation today, a procedure for insuring that products containing tremolite are not shipped to our customers is outlined below.

1. Do not ship any product until it has been cleared for tremolite by lab test results.
2. If test results indicate that tremolite is present, isolate the material and re-sample each pallet. This should be done by taking a small sample from every other layer on the pallet and making one composite sample. Send this sample to the Cyprus Research Laboratory in Los Angeles for re-testing.
3. If tremolite is detected in the composite or second sample, arrangements should be made with Harris Transportation to have the material hauled back to the mine for dumping.
4. If the material is cleared by test results from Cyprus Research, it can be shipped. Under no circumstances should material containing tremolite be shipped to a customer.

As mentioned during our conversation, the new Panamint Mine Superintendent, Mike Toelle, will be starting shortly, and crude will be tested prior to its shipment to the plant.

Please call me or Mike Lorang if you have any questions or problems.
