 CWG File

After providing the local Division Engineer of the Penn-Central R.R. with a sketch of our side tracks in the South Plot where VCL cars are now switched, along with the specifications for the proposed 38,500 gallon tank cars, we have been informed that we cannot operate these extra large cars through the No. 6 turnout, (frog), where Track 7 joins Track 9 at the northwest corner of Bldg. 85C.

This would limit the use of such cars to a straight run along Track 5, just south of Bldg. 92.
