March 27, 1933

Mr. G. E. Sanford,
General Electric Company,
1 River Road,
Schenectady, N.Y.

My dear Mr. Sanford:

I am greatly obliged for your letter of February 27. I have incorporated many of your suggestions with those from other members of the advisory group in the enclosed draft and I am at this time sending this draft to Cameron in the hope that any further changes necessary may be made by him or by the executive board.

I can not feel that it is quite practical to omit all reference to the word silica but have modified the statement somewhat in order to remove all possibility of misunderstanding. I do not believe that we can go into the general questions of dust control in the foundry since we have no basis in the form of an organized study of this problem. We have been dealing only with air pressure blasting and can not very well combine other subjects with it. As to the substitution of an air flow of 2 cubic feet per minute in the pressure helmet, we could scarcely do this in view of our definite experimental proof that 6 cubic feet are essential for safety.

Yours very sincerely,

Enc.

C.-E.A. Winslow
