TO: A. E. Leisy

Confirming our discussion concerning the information to be forwarded to Versar as a result of their October 8 plant visit, the following information may be forwarded to Mrs. Contos:

1. Effluent data - chemical analysis and flow rates of the "bathtub" process discharge and the same for the PCB incinerator effluent. A statement that suspended solids and metals are not present in the discharge should satisfy her curiosity concerning other pollutants. This data would then constitute the process effluent discharges.

2. Incinerator applications made to the State of Illinois for disposing of PCB's only.

3. Short paragraph stating that a single scrubber system is utilized on the total gas stream.

4. A paragraph stating that: (1) the PCB Dept. effluent is discharged with the entire Village waste stream to a primary treatment plant operated by the Village of Sauget, (2) the Village plant is undergoing expansion to a secondary chemical treatment facility scheduled for 1978 completion, and (3) evaluations are being conducted for the inclusion of the Village discharge in a potential regional biological treatment facility.

I will handle the Clark, Dietz Secrecy Agreement directly with Versar, and I understand that you have forwarded the product samples as cleared by W. Papageorge.

This should conclude our dealings with Versar on this matter.

M. A. Pierle
