CUSTOM MADE PROPS
at standard production prices

OVER 80,000

custom-made prop blade combinations are available from Lau. Lau maintains a die inventory, allowing quick and economical production of quality and precision balanced, lightweight propellers for many of your applications. Lau engineers will test your prototype or production run product in Lau's extensive testing facilities to determine the best possible prop for your application. Production of prop orders is accomplished quickly and to exacting tolerances. Economical dies change quickly for flexible production scheduling. Here are just a few of the quality control features which assure a quality, precision prop. Every prop manufactured by Lau is continually hand inspected and aligned by experienced operators. Slinger rings, when applicable and blades are straightened to the proper plane and prop depth is accurately measured and maintained.

As a final production check, every prop has a running balance performed on a electronic balancer. Props are correctly balanced at this point and sent to the final inspection department where every prop undergoes a visual check by trained inspectors. Inspection for dimensions, bore sizes and general conformance to print specifications is conduced on a sampling basis.

The next time you have an air handling problem, call an experienced Lau sales engineer for personalized assistance in determining the most practical and economical prop for your application.
