Subject: Re: Chemours visit Dordrecht

Hi [REDACTED], I told some of my ideas to [REDACTED]: what about air emissions control? (see pollution > 50km away from Dordrecht) What about emissions in Kg/y (not in % of reduction) and data for specific PFAS (no general bullshit). How does this compare to existing env/health/water standards? Proof that water treatment work for short-chain and not possible to extrapolate to high volumes like drinking water processes? What about fluoropolymers production without PFAS as processing aids? (some claim having developed that). Look at workers safety (in particular open processes, or packing, or [REDACTED] to different containers, cleaning operations, etc)

Bonjour [REDACTED],

As [REDACTED] and me are going to Chemours tomorrow I wanted to quickly ask you whether there are specific things you would like us to ask them? I assume we will mainly be talking about their production and how they managed to reduce emissions.

Cheers,
