The Knowledge Test for Automobile Drivers was administered to 122 repeaters and 137 accident free volunteers. The accident free drivers made significantly better scores than the repeaters. Similar results were found on performance and attitude tests.

Larson, John C., et. al., *The Human Element in Industrial Accident Prevention*,

Center for Safety Education, New York University, 1955, 114 pp.

An excellent digest of studies with glossary and bibliography; treating of selection, in-service education, environment, incentives, and hiring. There is some evidence that some of its sources are based on inadequate facts and poor controls.

Leibee, Howard C., *Liability for Accidents in Physical Education, Athletics, and Recreation*, Ann Arbor Publishing Co., Ann Arbor, 1952.

It is stressed that negligence must be shown by duty, a breach, close causal connections, and damage or injury. Defenses for liability are given as contributory negligence, assumption of risk, and immunity. Liability of various groups is indicated.

National Education Association of United States, *Who is Liable for Pupil Injuries*. Research Division, N.E.A., Washington, D. C., October, 1950, 32 pp.

Principles and legal decisions are cited. Fourteen examples are given of when an act is negligent. The relative liability of board and employees and certain bad legal spots is given.

Rhum, Gordon J. and Woodcock, Bertram L., *Effectiveness of the AETNA Driver Trainer in Driver Education*, AETNA Casualty and Surety Co., Hartford, Conn, July, 1956, 20 pp.

Six hours of driver training and dual control instruction were found to be as good as six hours of dual control alone. Criteria: Iowa Drivers' License Examination and Final Driver's Test.

Rosenfield, Harry N., *Liability for School Accidents, A Manual for Educational Administrators and Teachers*, Harper and Bros., New York City, 1940, 220 pp.

Governmental and proprietory functions of schools are discussed. Cited are duty, relationship claims to liability. Negligence and nuisance are defined and an explanation is given of the likely liability of the board, its members, and employees.

Sanders, J. Edward, *Safety and Health in Organized Camps*, National Bureau of Casualty and Surety Underwriters, New York City, 1931, 133 pp.

Over 600 camps cooperated in determining the most frequent injuries and their causes. Most frequent injuries were associated with boys, hiking, swimming, 14-year-olds. Illness occurred more frequently than accidents. Recommendation was made that camps maintain conditions, provide safety education, and reduce the camp program intensity.

Uhlaner, Julius E., *The Effect of Thickness of Stroke on the Legibility of Letters*, Iowa State College, 1951.

This is an experimental study in which 16 subjects and 1344 observations revealed optimal stroke to be 18.3 per cent of width or height for three inch block letter. Ratio can be generalized to any other size block letter.

REDUCING TRAFFIC ACCIDENTS BY USE OF GROUP DISCUSSION-DECISION

by ABBOTT L. FERRISS

Population Division, Bureau of Census, U. S. Dept., of Commerce, Washington, D. C.

This paper will present the results of an Air Force conference on the group discussion-decision method in traffic safety education. The conference sought to identify additional means for dealing with its highway safety problem.

This paper first will identify the Air Force problem. Evidence will be presented of the effectiveness of group discussion-decision as has been demonstrated by a number of experiments into means for changing behavior. It then will summarize the principle characteristics of the decision method and review some of the conditions necessary for its success.

The conference results concerning driving behaviors likely to be affected by the method, and the kinds of decisions which groups might make to the end of improved safety practices, will be presented. Finally the criteria will be reviewed which could be employed in experiments to test the application of method to the human side of the traffic safety problem. The general outline of the research design will be presented.

AIR FORCE PROBLEM

The educational, enforcement, and engineering phases of the USAF traffic safety program have demonstrated their efficiency in reducing accidents, particulary for government-owned vehicles at bases where the program has strong command support. The Air Force off-base vehicular accident problem differs in several respects from the national problem.

The average Air Force driver involved in a vehicular accident is young, under 25 years old an airman in the lower ranks. The accidents occur off-base in private vehicles within a radius of 50 miles of the base. Particularly dangerous are the evening hours between 9 p.m. and 3 a.m., and the weekends, Friday evening until Monday morning. Rates vary considerably between bases, and base rates have been made to change through command interest in the problem.

Most accidents are accompanied by excessive speeds, and frequently involve the use of intoxicants. Because of a cost to the government in 1955 of 632 deaths and approximately 25 million dollars, the problem of accident reduction in this area is one of major interest to the Air Force.

While the Air Force safety program has been effective in reducing other causes of accidents, it has not similarly reduced the off-base private vehicular accident rate of its personnel. Consequently, steps were taken to identify other means of reducing the accident rate. The success of the method of group discussion-decision in changing other behaviors suggested its possible application to the safety problem.

The conference assembled military commanders who had direct experience in reducing the accident rate of their squadrons and bases, of military experts in ground safety, and of civilian scientists and educators in the fields of safety education, social psychology, group dynamics, sociology, and related fields.

EXPERIMENTAL RESULTS

In 1942, Kurt Lewin and his associates at the State University of Iowa, conducted initial systematic experiments in the process of group decision in changing behavior. The concept, as Lewin expressed it, was that "a free interchange of ideas takes place and that in many respects the initiative lies with the group. No attempt is made to force a decision on the group or to use high-pressure salesmanship.

On the other hand, unlike a mere group discussion, group decision leads to a setting-up of definite goals for action. These goals may be set up by the group as a whole or by each individual in the group setting for himself. It is by no means simple to lead a group discussion within 45 minutes to a conclusion without 'manipulation'."

In one experiment, Ben Willerman compared the method of group decision with a method of request in an attempt to increase the consumption of whole wheat bread over white bread among men in eight cooperative dormitories. He concludes: "The group decision method seems to create a more favorable attitude; the individuals are more eager to succeed; and their wish to cooperate is more dependent of their personal likes and dislikes."

INFLUENCE ON HOUSEWIVES

Another experiment compared the lecture and group discussion methods of inducing 120 housewives to cook and serve kidneys, brains, and hearts to their households. A check-up after seven days found that lectures led to the desired action by 10 per cent of the housewives, while the group decision procedure led to 52 per cent of the housewives following the suggested action.

These were discussions which led to a decision. Methods were not direct attempts at group manipulation nor high-pressure sales talks. The approach to the individual was through a group setting. The group setting gives the incentive for the decision, and facilitates and reinforces it.

Radke and Klisurich tested the different effects of individual instruction and group decision methods upon infant feeding practices of mothers of new-born infants. Four weeks after leaving the hospital, 100 per cent of the mothers who were given the group decision "treatment" on feeding orange juice were following the recommended instruction, as opposed to 53 per cent for the group who received individual instruction. Similar results are displayed for the same mothers in the feeding of cod-liver oil: 88 per cent (group decision) as compared witht 53 per cent (individual instruction).

The same authors compared lecture with group decision in an attempt to increase fresh milk consumption among low income housewives. Fifty per cent of the housewives increased consumption of milk when the group decision method was employed, compared with only 14 per cent who increased consumption under the influence of lectures.

GROUP DECISION SIGNIFICANT

In both experiments, "the group decision method was significantly more effective in leading mothers and housewives to action than were either individual instruction or lectures."

The results from activating group forces through securing participation of group members in designing a new job were significant.

The productive level of a *control group* after the job of hand-pressing was changed decreased. The change only required that the finished product be stacked in boxes in half-dozen lots instead of on flat cardboards. Management set the new price rate, explaining that it was necessary because of competitive conditions.

A more intimate atmosphere was established in the *experimental group*. Each operator was given a chance to participate directly in the design of the new job. The time study man studied each operator. The group approved the plans. After the change the experimental group rapidly recovered its previous level of production. However, the control group did not.

These results are more striking when one considers that individuals in the two groups were the same, the experiments having taken place at different periods of time.

OVERCOME BIAS TEST

Levine and Butler demonstrated the greater efficiency of the group decision method by inducing supervisors in a factory to overcome the bias in their performance rating of the factory workers whom they supervised. There was no difference in the ratings at two points in time by the same group of supervisors before training.

The tendency to give higher ratings to workers doing "higher" grades of work was reduced after the decision sessions. The supervisors who received lecture sessions continued to "bias" their ratings in favor of the "higher" grades of work. This experiment reaffirms the group decision process as a method of overcoming resistance to a change in behavior, even when the individual acts alone as an individual.

Lawrence and Smith repeated the Harwood experiment in another plant with greater control of potentially influencing factors. They demonstrated that discussion with a decision to set a production goal results in significantly greater increases than discussion only.

More recently, an experiment by Edith Becker Bennett demonstrated that the process of coming to a decision regarding future action increases the likelihood that the decision will be carried out. The decision was to volunteer to serve as a subject in psychological and sociological experiments.

Betty Wells Bond has demonstrated that group discussion-decision is more effective than the lecture method in getting women to practice regular self-examination for breast cancer.

GROUP INFLUENCES UPON BEHAVIOR

The results of these experiments in altering behavior have been decisive. But the conditions of the experiment have not been simple to meet. They have concerned relatively small groups. The leader has created a friendly, permissive, democratic atmosphere, wherein a free exchange of ideas has been possible.

A unifying element, if not an already existing group sprit, has been present in each instance. Information has typically been presented, and discussed, particularly discussed with reference to its implications to the behavior of group members.

Decision groups were invited to come to a decision concerning a goal, and were provided freedom to choose or not to choose a goal. The goal was set as a definite and attainable objective. A follow-up was made to determine the result, sometimes with fore-knowledge by the group and sometimes, not. Subsequent goal-setting sessions were held in some experiments.

While there is clear evidence that the group discussion-decision method is capable of changing attitudes and behavior, at least four factors appear to affect the outcome. These require careful consideration in any experiment:

1. Some individuals respond more favorably to influence attempts than do others. All, however, are affected by a general tendency to conform.
2. Involvement in the group process is important in influencing the individual's subsequent actions. Involvement includes participation in the group discussion, identification with the goals of the group, and acceptance of the group-determined goal as his own: that is, accepting the decision.
3. Greater involvement is achieved in more cohesive groups, especially those which function cooperatively in achieving their goals. Cohesive groups appear to provide more effectively rewards and sanctions than less well-constructured groups.
4. Participation is facilitated through assembling smaller groups in which the individual has the greater opportunity to express himself than in larger groups.

GROUP MOTIVATES MEMBERS

One important basis for influencing the individual's behavior rests upon the power of the group over the group member. The group functions to provide a basis for the individual to compare his own judgments and beliefs with those of others. The group provides motivation through supplying the member with acceptance, security, and rewards. These group benefits tend to exert control over the individual's behavior.

Informal groups influence their members through the power which peers exercise over one another. Self-determination of means and ends results from participation and self-expression in groups. The individual expands his sense of achievement through sharing in the group's accomplishments. In the group setting, the individual becomes conscious of and responds to group norms; these, in turn, affect his behavior.

The inter-action between individuals in a group results in a patterning of behavior along specific courses of action. Finally, the group influences the individual's behavior through providing a rewarding therapeutic release from repressions and other inhibiting conditions. An overriding condition for the group to exercise influence through these means is free and uncoerced participation by the individual, along with conditions of self-determination in decision making by the group.

SAFETY DECISIONS

The conference was concerned, of course, with the kind of decisions which would result in changes in driving behavior of Air Force personnel. The conferees early decided that individual adjustments in driving and attitudes relevant to driving situations might be altered through the group decision method.

Several kinds of group decisions were suggested. The conferees assumed, generally, that the group process would extend over a period of time long enough to enable a series of decisions, each relatively limited and capable of achievement.

The decision should concern a specific which the group proposes to adopt, which behavior, in turn, is clearly related to the general goal of highway safety. It should be observable and clearly identifiable by the individual. The decision should be consistent with legal and other regulations. It should be capable of being attained within a few weeks. Objectivity in determining whether the decision has been carried out is important since the participants will most likely be required to report on their own accomplishments.

Examples of the subjects of decisions which various conferees suggested are:

—Restriction of driving hours and length of time at the wheel, to limit the effect of fatigue;
—Decisions concerning the non-use of alcohol while driving;
—Decisions concerning speed with attention to devaluing speed as a norm.

CRITERIA

The ultimate criterion is the accident rate. However, this rate may not be an immediately sensitive and useful criterion for a field test of the group discussion-decision method, since for any group the incidence within a short period of time is quite low. Consequently, the following suggestions were advanced for criteria:

1. Reports by participants of the traffic violations of which they were guilty —non-official, non-incriminating reports.
2. Reports of risks or near-accidents.
3. Official reports of violations, accidents, etc.

DESIGN OF THE TEST

The general design of the field test consists of randomly assigning squadrons of approximately equal safety records to experimental and control groups. Control groups would receive the customary safety education program only. Experimental squadrons, in addition, would be divided into smaller discussion groups. The design would be structured so as to check differences in effects of natural groups and randomly assigned groups, to check the differences resulting from meetings two a month versus eight a month, to check differences resulting from variations in group size. Approximately one year would be required to accomplish the study.

In conclusion, a group of administrators, traffic safety experts, educators, social psychologists and sociologists reviewed the convincing evidence that the careful application of group decision in the learning process effectively alters behavior in a desired direction. They set forth the basis for a test of the method in traffic safety education and proposed that the experiment be conducted.

They thought that the test, even under the best of conditions, might not provide an unequivocal determination of the utility of the method, particularly the initial experiment. But they thought the method sufficiently promising to warrant the test. The experiment itself has not been performed, but it is hoped that the findings here presented will interest others in testing the group decision method.

MEAT, POTATOES AND DESSERT IN YOUR SAFETY MENU

by L. VAUGHN GAYMAN
publicity director, Loras College, Dubuque, Iowa

Of the meat and potatoes of safety, the solid ingredients which go into the scholastic safety diet, all of you are well informed and skillful cooks. However one final course is missing for a complete and satisfying meal. That is the dessert, the topping . . . the flash . . . the *eye and ear appeal*, the proper publicity for the product which brings more compliments on safety cooking than all the basic essentials.

Top your satisfactory safety menu with the attractiveness of an unforgettable publicity dessert and you will accomplish two things. You will show the older generation what you have done for the younger, and indirectly urge the older one to take better care of itself. Many of you parents have stood with one food on the curb and one in the street as your better educated child made you wait for the light to change!

Today's automobile advertising is "dessert minded." Nobody tells us what makes 'em run, or the price. Just load the story with whipped cream, top it with cherries, chopped nuts and plenty of syrup.

The advancements of science have given to modern man more leisure time than any people on earth. Everything has been done to shorten, speed up, condense, concentrate, capsulize, everything we do.

Nobody bothers to read the news any more. We have canned news. We read our favorite columnist and agree with whatever he says simply because it takes too much time to disagree and discover our own reactions to the news he presents.

THE COMPRESSED, PUSH-BUTTON AGE

Digests have become the rage of our time. We look for the shortest articles on subjects we already understand to give ourselves a layer of information we call knowledge. The digests have become shorter and shorter. Now they are filled with pictures because pictures are easier to gulp and quicker to digest.

The radio has been forced into this mad current of public haste. Having compressed fifteen minute news periods into five, radio is now forced to give out a one minute capsule "on the hour" simply because we can't wait.

Televisic.. further reduces our social self-propulsion. I can remember when a visit to a friend's home might include some card playing, a raid on the refrigerator, and a dash of stimulating conversation. Nowadays, this social event consists of a whispered "hello" or "would you clear the picture up a bit as you pass the set?" Even "good night" can not be uttered unless the commercial is on.

Certain Eastern universities now offer summer school courses which consist of tape recordings of the professor's winter time lectures.

Some inventors and scientists even hope to train the students to wear earphones while asleep, with knowledge being piped directly into the subconscious. Thus we reach the ultimate in this frenzy of predigestion . . . we could transfer tape-recorded knowledge from a professor who wasn't there to a labor-saving student who wasn't even awake.

A generation ago we made significant progress in preparing a meal, including dessert. Unlike grandmother who cooked with nothing more advanced than a sharp knife and a large stirring spoon, mother learned to keep the family quiet witth the quick opening of a half dozen cans.

So, today we have constructed a push button paradise . . . one package meals, one package newspapers, one package minds. We are busy saving time, saving effort, saving money. We successfully save everything but one . . . Man himself.

This is a resource which can only be strengthened by self interest in its own preservation. The human body is not as capable of preserving itself as it once was, and is drastically dependent on the inventions and services of science in maintaining an equilibrium of life.

Thus, very suddenly, very undramatically, without glamour, assistance, appreciation, or applause, you and I come in. The schools, the universities, the teachers . . . yep, we're tagged again! For as long as you and I can remember, we've seen articles and heard speeches saying, 'Education, that's the thing. Education will solve it!"

Two things we can do . . . sit and gripe about the job, or, with an inner sense of real pride in the confidence placed in education and our part in it, we can accept the total responsibility and dig into the largest task facing mankind today . . . saving him from himself and the push button machines he has created. Some of you do that on the health front. Others watch for carelessness with chemicals, firearms, and slippery hallways, or a poorly cooked piece of meat in the school cafeteria.

Educators always look for "motivation" to propel people toward desired goals. I have a deep personal motivation in the field of safety, in doing whatever I can to assist its cause wherever found, and I have a purpose in telling it to you, to "motivate" you.

TRAFFIC KILLERS BEGIN ON BIKES

As radio news editor, I covered the city hall, police headquarters, and sheriff's office. For 20 years, I saw the "come and go" of a city of 50,000 as it expresses itself back of a wheel, in the home, on the job, at school and play. I have come to a stern opinion that ANY safety education promotes ALL safety education.

In the city and area, either by visiting the scene in person or reading all official records, I have covered some 30,000 accidents.

May I tell you of a recent few . . . within the past year and a half. At the beginning of each research shows a small deviation from normal, educated behavior. For example, in almost all serious traffic offenses, a check of the offending driver shows him

starting his record with a violation of the bike ordinance.

There was RJB . . . 18, whose record shows: bike violation, bike larceny, motor car larceny, violent assault, back to the reformatory. There was RH . . . one bike violation, next violation . . . dead at the wheel. He was 16.

How about the record of the 26-year old who started at 13 with a bike violation? His story went . . . bike violation, three break-ins including a safe job, disturbing the peace, intoxication, four traffic accidents, 12 moving violations. He has already destroyed more property than he will ever own.

And we'll never forget SC . . . whose first traffic ticket didn't look like much, except that his father and three uncles had notoriously bad records, "attitudes" you call them. When SC's first notation went into the file, officers and reporters alike wondered what was next. We didn't have long to wait; 60 days later, he smashed his car into a hillside cliff well within the city limits, doing 90 on a curve. He burned to death.

This old, old pattern known to every police file clerk isn't just for the highway. Six months ago, DJD didn't show up in police court to answer a routine arrest . . . loud muffler. He drowned the day before the hearing in the careless operation of a motor boat on the Mississippi river below town. The judge listened to the boy's name read . . . and the charge. Then, without any attempt to be dramatic but burdened with the ever-present problem of personal safety, he wiped his eyes and said . . . "Decision referred to a higher court."

NOBODY BOTHERED TO TEACH THEM SAFETY

All of the accident victims had one thing in common . . . they had attended school, years of it. Below the level of these documented cases come thousands of home, school, industrial and business accidents, all happening to "former students" of someone . . . so many of which could have been prevented by a safety minded population. Somewhere along the way, education has so far missed its chance to tell ALL the message of universal safety.

When you teach a girl to handle a stove in home economics class, when you conduct a class in life saving, when you teach boys to look out for oily rags in a closet, when you get children to observe regulations for the safe riding of their bikes, then you have made the big start on teaching all of them to be safe . . . in all ways, at all times.

General Walter Stewart of the National Safety Council in May said at Purdue: "You school people have the individual at the time you can teach safety in all its forms. A college student who is taught to be safe will carry that safety message all his life." The safety director who sees to it that chemistry labs have the best possible protection for eyes and body, the man who insists on relentless fire inspection of off-campus housing, the hard-headed chap who won't give in to student resentment when he enforces campus traffic codes, all are partners in the great campaign.

SPREAD YOUR SAFETY WORD AROUND

There again is where we come in . . . the schools, the universities, the colleges, with the safety problem in their hands, where they can do as they are expected to do by those who say . . . "Education, THAT'S the remedy!"

Since the teaching of safety in one field can lead to an increased awareness of safety in all fields, let us then *multiply* the TOTAL EFFECT of any safety lesson or example by telling thousands more people about it. Pyramid your purpose with publicity.

Your school may already have a publicity department capable of carrying much or all of the load. Your total problem may consist of building a gasket-busting fire under these scribes and lens hounds.

On the other hand, you may find yourself telling your story to an editor. In view of the daily diet of every news editor in the country, as described a moment ago, where do you and your story fit in?

Do you realize that YOU are the only possible bearer of good news? YOU are a person or group "doing something about it." Whatever your safety work or program, tell an editor about it . . . the nearest one will do for a start, your school paper editor. Then, look for a neighborhood paper, a trade paper, a union paper, church bulletins, then your city newspapers, radio and TV stations.

There are forms and ways of doing everything . . . and you'll learn most of them in 60 days. Build up a mailing list, use address plates if you have the machinery, the need, and the area to bombard. At no time will all of the news media respond to your cries, but someone always will. Then the others may feel that they have missed the boat.

If you can't get in print or before the public in any other way, start your own "scoop sheet." There is a marvelous "Do It Yourself Kit" in the safety publicity field. It consists of a ream of paper, a pound of erasers, a sturdy typewriter, and a pair of *well-fitted walking shoes.*

Notice that I said *"You"* are going to tell an editor . . . the same old George or Georgia who did the safety work, the same old teacher, the self same educator on whom the parents and all of society depend.

You are going to sit on the corner of the editor's desk, bombarding him with information in all forms. YOU are going to get the turn downs and the brush offs, the bob-tailed news stories and mangled rewrites.

Meat and potatoes make a meal . . . but Dessert, Publicity, make it an OCCASION!

ADVANTAGES AND DISADVANTAGES OF THE AETNA DRIVOTRAINER AND MULTIPLE CAR PLAN FOR DRIVER EDUCATION

Panel Moderator — CECIL ZAUN
supervisor of safety, Los Angeles Public Schools, Los Angeles, Calif.

Panel Members—PRICE E. CLARK, educational consultant, Accident Prevention Dept., Association of Casualty and Surety Cos., New York City.; PAUL B. CULLEN, superintendent, Public Education Dept., Aetna Casualty & Surety Co., Hartford, Conn.; JOHN B. DENNY, driver education instructor, West Waterloo High School, Waterloo, Iowa; INKS MABARY, director of safety education, Public Schools, Springfield, Mo.; ROBERT O. NOLAN, instructor, Highway Traffic Safety Center, Michigan State University, East Lansing, Mich.; RONALD D. PATTERSON, supervisor, Safety Education, Public Schools, Detroit, Mich.; ERNEST G. PRIEST, supervisor, Health, Physical Education & Driver Education, Escambia County Schools, Pensacola, Fla.

The session started with an over-all view of the driver education problem as it faces schools and the nation today. Mr. Clark gave the following figures:

DRIVER EDUCATION IN THE NATION'S SCHOOLS

Potential schools that could offer driver education	19,848
Schools offering driver education	11,273
Potential enrollment for driver education courses	1,706,500
Students having, presently, classroom training only	473,279
Students presently having practice driving also	649,885

TIME DEVOTED TO DRIVER EDUCATION ACCORDING TO CLASS PERIOD

No. of Schools	*Time Devoted to D.E.*	*Per Cent*
177,419	10 or more class periods	27%
186,050	7 to 9 class periods	28%
263,881	3 to 6 class periods	41%
22,535	1 to 3 class periods	3%

Ronald Patterson—One of the answers in a large city school system is a 200 foot by 300 foot practice driving area containing as many traffic situations as possible. One teacher can then train 12 or 13 students at one time. The cost is relatively low and the student gets more experience behind the wheel. You can also give additional time to those who need it, and students get an opportunity to drive on different types of cars. Skills are practiced more easily on this type of practice driving area than in the street.

Paul Cullen—The Aetna Drivotrainer trains in attitudes, skills and judgment. It is not meant to eliminate but to reduce on-the-road training. Advantages are: training at less cost than using cars; training in actual road situations that could not be duplicated in a few hours on a street near the school: one teacher can train up to 25 students at one time. In a car, only one, two or three students can be trained at one time by one instructor.

PANEL ANSWERS QUESTIONS

Does the teacher have to have a background in electrical engineering to handle the Drivotrainer equipment?

No, the ordinary teacher can perform first echelon maintenance. Otherwise, the school can use its own electrician. If the electrician can't handle the repairs needed, Aetna will service.

The wiring blueprints and all other installation data can be obtained from Aetna at the time of installation. Installations and repairs are now being handled for Aetna by the Automatic Voting Machine Company.

What is the initial cost for Drivotrainer equipment for the average classroom?

Each car can train 60 students a year. A Drivotrainer costs $900. The control tower is priced at $3,000. The films are $500. Delivery and installation charges are additional. At Ventura, Calif., an eight-place unit cost $12-15,000. Schools may finance the plan so that the price can be spread out over several years.

What is the time of delivery after an order has been placed?

Two months.

Are there a series of lesson plans which go along with the equipment to aid instructors in using the equipment?

Yes, a teacher's manual is issued with the equipment. Aetna also will train teachers at a training center, and check back later to see that the equipment is being used properly.

When is a school large enough to justify the purchase of a Drivotrainer?

Before the Drivotrainer can be economically profitable, 200-plus students should be enrolled in the driver education class. At least 600 students should be enrolled before a 15-place Drivotrainer is advisable, according to a study made by Bert Woodcock at Iowa State Teachers College. The maximum number of units is 25. There are no installations of less than five Drivotrainers, except in research installations.

Several schools in Long Island share their Drivotrainer. The Drivotrainer is located in a truck and moves from place to place every day so that various schools are served every week. In another area, Drivotrainers are taken in a truck from place to place and installed for a semester at a time.

What is the teacher supervising in the Drivotrainer? How do you know what your students are doing?

A score-sheet comes with each unit, and the teacher can check the score-sheet. However, the unit can be switched to automatic, so the instructor can circulate around the classroom to observe, and the machine automatically marks the score-sheet for future use of the instructor.

How does the teacher go about correcting a bad habit which may have developed?

Any errors are immediately indicated on the score board. By keeping an eye on the board, the instructor can see which students are having trouble and give those students individual instruction.

What about films?

There are 17 films available now. Thirteen deal with standard transmission, and four with automatic transmission. They are from seven to 20 minutes long.

What is the maintenance cost per unit per year?

Approximately $40 for the first year, after that under $100 for four years.

Doesn't the Drivotrainer tie up two classrooms?

Yes, in Springfield, Mo., we have one room containing Drivotrainers and one room for classroom purposes. Other areas of the curriculum, however, also take up two or more classrooms.

Some schools use the Drivotrainer room as the classroom, and the students sit in the equipment to carry on their class work.

What are the disadvantages of the Drivotrainer?

1. Visual habits — Student watches the driver in the film do everything and doesn't remember to do it himself.

2. The lack of advanced films. It is felt that time is wasted on fundamentals. Aetna is working on this, and five new films will be out in a short period of time.

In Springfield, Mo., the driver education course runs like this: 54 hours in the classroom, 20 hours in the Drivotrainer and six on the street, three of these in observation, and three in driving. The Standard First Aid course is also given as a part of this course.

Do students memorize the films?

They might show up better the second time. We hope so. After all, it's the experience in meeting these situations that we're after.

What is the cost of an off-street practice driving area?

The cost varies according to the size and type of a practice driving area you plan. In Detroit, the cost ranged from $40,000 to $76,000. However, if you use your school parking lot, the cost may be as low as $10,000. In the latter case, of course, cars would be left outside all the time. In general, the cost is from $35,000 to 60,000 and up.

What is the per student cost of the multiple car plan?

In Detroit, at School A, it was $33.24. At School B, cost was $28.33. At School C, per student cost was $22.21.

How is Detroit offering driver education to all boys and girls under 18 in the city's high schools?

Fourteen of Detroit's 22 high schools are taken care of between 8 a.m. and 3:30 p.m. The students in the remaining schools, and those in the parochial schools get their driver education courses between 3:30 and 9:00.

EDUCATION MUST REDESIGN THE "NUT" BEHIND THE WHEEL

by E. R. ABRAMOSKI

coordinator, Safety, Civil Defense and Health, Public Schools, Erie, Pa.

The rapid advance of science has added many new technological devices to everyday living. In the short span of a century, power has replaced muscle to do man's work. But with each new power, and each device man's genius creates, a concomitant hazard is also created.

At one time life was simple and comparatively safe. Today, man's ingenuity has created thousands of technological machines and gadgets to serve mankind. These necessitate a new vocabulary which, in many instances, only the expert understands. At the same time thousands of new hazards have been created that we must learn to control if we are to survive.

We, as Americans, pride ourselves on our high standards of achievement in a highly mechanized nation. But our education has not kept pace with our inventive prowess, and, therefore, we have one of the worst accident rates in the world.

One cannot pick up a paper without reading of an appalling number of persons maimed and killed in industry, in the home, on the farm, and most of all, on our highways. Of all the nations reporting accidents, our country ranks near the top of the list—

40,000 killed on highways
28,000 killed at home
15,000 killed in industry

This record excludes the millions maimed and hospitalized each year, a needless slaughter and waste of our most precious resources. How long can we stand by and see this human and economic waste drained *from our nation?*

SCHOOLS' RESPONSIBILITY

None will deny that engineering and enforcement have made a great contribution to the cause of safety, but education must eliminate this evil. Schools are dedicated to teach our nation's children.

Educational research shows that we must teach the whole child, and logic shows that education is useless unless the child lives. Therefore, the schools must place safety education in the curricula and give it the same prominence as reading, writing, and arithmetic, and all subjects we deem fundamental.

Education teaches skills, habits, knowledges and attitudes, all of which are integral parts of safety education as well. A child learns to live in a safe way through safe living. The challenge to the schools is to give the pupils a safe environment in and about school. Instructional materials should be used to instill in each child an awareness of existing hazards and a method to cope with them.

We are obligated to teach a child moral responsibility toward *himself* and his fellow beings, to avoid useless destruction of life, limb, and property. In other words, we must instill in each youngster an attitude of safety. This means that all our schools must teach safety, and the school boards in making up the budgets must recognize the importance of safety in the curricula. Safety cannot be considered a frill of education. Safety must be an integral and important part of the educative process.

Driver education is merely one phase of the total safety program, and though first conceived by educators, it is fostered by non-school organizations. The program first grew as a fringe activity and was merely tolerated by school administrators. However, driver education received support from outside agencies when the highway death tolls rose to more than 35,000 killed annually.

The first impetus to driver education came from automobile manufacturers and dealers in loaning cars to schools. Education then proved it could do the job. Statistics on the youthful driver was gathered and it was proven that students taught in accredited schools had better highway records than the untrained drivers. Immediately, insurance companies reduced rates for *the trained drivers, and the* driver education program got its booster shot.

However, the educator with vision sees beyond the single phase of safety—driver education—and looks at the whole picture. *He sees the need for safety in the home,* shop, farm, and school, for he realizes that each takes its toll in lives and resources.

SAFETY—A KINDERGARTEN LESSON

He sees that schools must meet every challenge and teach safety as a subject matter from kindergarten through driver education in the high school. To teach the skills, habits, knowledges, and attitudes necessary for safe living, schools must start, not with the driver's permit, but with the birth certificate.

In many of the better schools, safety is taught as subject matter from kindergarten to grade six, from teachers' guides developed by teachers' committees. The instruction includes such phases of safety as—safety on the way to and from school, safety in the home, safety in the school, safe play, safety from atomic attack, pedestrian safety, bicycle safety, safety in the snow and on the ice, hunting safety, safety in the water, safety in the shops, and a myriad of other safety lessons that fit into a year-round safety program.

Although class time for safety education *is in the curriculum, some of the best* teaching is done on the spot. Safety is also integrated into other subjects, such as social studies, vocational education, physical education, science, health, and school activities and games. Thus, the program will differ in each school for the hazards of that school, and still will have general material to serve the child in any situation.

The worth of a safety program in any school is determined by the administration's attitude toward safety education. A safety program functions best when someone is directly charged with the responsibility.

What person in a local school system is better qualified than the driver education teacher?

The driver education teacher has an interest in safety. To qualify for his job, he has had courses in general safety, safety administration, or the psychology of accidents. It is his job to sell himself and his program to the administration.

He may get the objection that the cost is prohibitive. However, safety education is cheap when one considers the man hours lost in industry, the cost of fire protection, the insurance rate of the automobile policy and accident costs of more than $10,300,000 annually.

A well-informed public knows that safety is not a frill of modern education but an integral part of the educational system. Schools must expand their educational horizons. Driver education teachers must supply the leadership for this expansion, for to education has fallen the task to redesign the "Nut" behind the wheel. ▲

An Experiment in the Use of the Smith-Cummings System

"TRAINING YOUR EYES FOR EXPERT DRIVING"

by ELBERT HUGUNIN

motor vehicle administration specialist, Northwestern Traffic Institute, Evanston, Ill.

Last year the Traffic Institute conducted a field experiment to evaluate the Smith-Cummings system of training eyes for expert driving. The evaluation was to determine how the system applied to beginner driver examinations, licensed drivers with bad records, applicants for truck driving positions, remedial and refresher driver training for armed forces personnel, and similar categories of drivers.

The Smith-Cummings system develops a driver's powers of observation and concentration, and lessens the danger of accident-causing distractions. The system teaches beginner drivers to practice expert seeing while driving and aids driver educators. It also checks seeing habits of experienced drivers by a road test.

This system was developed by Harold L. Smith, an experienced driver trainer, and John J. Cummings, a traffic research director in the automobile industry. Both men joined Dr. Reuel A. Sherman, an optical industry authority, and organized the Institute of Driver Behavior, 1380 Penobscot Building, Detroit 26, Michigan.

The Traffic Institute also made a study of "commentary driving," a technique of instructing and testing used successfully by the London Metropolitan Police Driver School to reduce traffic accidents among police drivers. In commentary driving, the driver speaks aloud, giving an impression of his observations, thoughts, and intentions of the car he is driving. Smith and Cummings use a similar technique in training fleet drivers.

WHAT IS THE SMITH-CUMMINGS SYSTEM?

Every driver THINKS he sees correctly in traffic. However, the Institute of Driver Behavior reported four out of five drivers do not use their eyes correctly and can't recognize a traffic hazard soon enough. They are distracted and have accidents, even when driving conditions are safe. In fact, most accidents occur when driving conditions are normal because a driver becomes distracted takes his mind off driving, and operates his vehicle by habit alone. Under these circumstances the expert driver with good seeing habits is protected; but the driver with *faulty seeing habits could* have driving troubles.

The Institute stated five common distractions in driving. One or more distractions generally is present when a driver makes a wrong move in traffic.

1. *Route problems.* More than half of all traffic accidents occur when drivers are con-

centrating on route problems such as heading into or out of a parking space, turning a corner, or looking for a road sign or street address. They fail to see that they are crowding or blocking traffic.

2. *Mental disturbances.* Drivers look with their eyes and see with their mind. Unless everyday seeing habits are good, they error when hurrying, worrying, or are irritated, bored, tired, or not feeling well. Being slow to see a traffic conflict can cause a driver to swerve blindly or stop in panic and set up another conflict. The hurry habit—a desire to avoid delay in traffic—is another reason for errors in seeing.

3. *Scenery.* This covers anything that excites curiosity and holds a driver's attention too long. At night many drivers fix their eyes on roadside lights too long.

4. *In the car.* A driver sees an insect in the car, turns his head toward passengers, or is distracted by children's actions in the car.

5. *Unfamiliar driving tasks.* Any time you drive above normal speed your normal seeing habits can trap you. City and rural driving, day and night driving, expressway and icy-road driving all take practice. Driving in states where traffic signs and driving customs are different, also can bring distractions.

KEY DRIVING HINTS

The Institute established five key seeing steps for driving. If practiced until they become a habit, they will eliminate the distractions which set up a traffic conflict.

1. *Aim high in steering.* Correct steering is simple. A quick glance ahead to the center of the intended driving path—not the center line—eliminates the tendency to hug the center line. For correct seeing the driver must be behind the steering wheel, sitting erect, back well supported with an adequate field of vision available.

2. *Get the big picture.* Most drivers watch the car just in front of them. This is small picture viewing. Get the big picture habit: see the car ahead as a tiny part of a big roadway scene.

Watch nothing in sharp detail. Never focus on any one object, because your fringe vision makes all judgments of speed, distance, and direction.

With the big picture habit you instantly see any car's changes in speed or direction, and the problems facing other drivers so you can anticipate their actions.

At night this viewing habit tells you whether oncoming cars are staying in their own lanes, and whether the red tail lights are moving forward, standing still, or backing up. In doubt, slow down until you get the full picture.

3. *Keep your eyes moving.* Unless you have the big picture viewing habit you are fixed-stare driving. Your eyes freeze on a conflict you were slow to see and you head blindly for another one. Develop the habit of scanning areas in the rear, near, far ahead, and on both sides. In driving, seeing should be done in quick glimpses.

4. *Leave yourself an out.* After you master the first three steps this is almost automatic. You adjust your pace so you have "an out"—a stopping margin ahead, and an open space—at least on one side—to swerve away from sudden danger.

When you acquire the habit of keeping an out, you pick the line of least resistance in any doubtful traffic situation. You avoid impulsive and hurried moves. You blend well in traffic, which is the acid test of ability to drive. Keeping a safe distance behind the car ahead will not delay your progress in traffic.

5. *Make sure they see you.* Never assume that the other driver will not do something unexpected. Never count on traffic laws to guard you. Give an early warning and be prepared to stop if necessary. Tap your horn or flick your headlight beams.

These are the five steps in expert driving. They may be seen in a film, "The Smith System," an eight-minute, 16 mm, black and white sound film loaned free from the Ford Film Library, American Road, Dearborn, Mich.

WHAT IS COMMENTARY DRIVING?

The driver speaks aloud, giving listeners in the car an impression of his observations, thoughts, and intentions to control the car he is driving.

Four years ago Scotland Yard's deputy commissioner for traffic gave the Traffic Institute staff a successful plan used in the London Metropolitan Police Driver School.

Under this plan, termed commentary driving, either student or instructor behind the wheel describes observations and contemplated actions of operating the vehicle.

The Metropolitan Police Transport averaged one accident every 8,000 miles before the training school for drivers opened in 1935. In 1939 the average dropped to one accident in 35,000 miles; in 1946 one in 63,000 miles; and in 1952 one in 71,300 miles. Evidently drivers learn a lot by talking about what they see, how they evaluate the situation, and what they will do about it. This is an excellent teaching and learning technique.

To teach or test with commentary driving, the driver (individually or in a group) is told how the procedures will be applied. He comments on the things he sees: signs, signals, pedestrians, other drivers, and intersections. For instance:

"I am about to leave this parking space. I have checked the controls. Now I am looking in the rear-view mirror, no cars coming. Now I am turning my head to check. The way is clear, so I am pulling out of the space.

"I am coming to an intersection — no signs. Looking left, right, left again. Way is clear. Sign on right says 25 mph speed limit. My present speed is 30 mph so I ease up a bit. Looking in rear-view mirror. Car coming up behind very close, ease over to let him go by.

"Pedestrian about to step off curb. Letting him go. No cars behind.

"Traffic light block ahead is green. Probably will not stay green long, so I should be prepared to stop if the light changes to red."

The procedure is equally applicable to teaching or testing. Short, unpolished phrases are used to cover the situation before the fact, not after it. These comments indicate what the driver sees and how he evaluates the traffic situation in advance. His statement regarding the possible action indicates his knowledge and driving skills.

Commentary driving can answer these questions for the instructor or tester: Does the driver use his eyes? Can he recognize traffic situations and act accordingly in time? Has he absorbed his training?

The Traffic Institute evaluation project was arranged in cooperation with the Wisconsin Motor Vehicle Department for a series of special examinations of regular licensed drivers. The procedure consisted of a driver test course 1.7 miles in length with traffic lights, stop signs, regulatory signs, turns, unmarked intersections, and other items required on a driver's test.

The drivers were briefed on the Smith-Cummings system and commentary driving, told that an unscored observation of their driving habits would be made, advised the nature of the test route, and instructed to comment on their driving. They were given a brief demonstration of the comments expected.

TEST COURSE SET UP

During the drive, distractions were introduced, such as, the route, comments on the baseball world series, and other matters of mutual interest or pertinent to the observations being made.

During the test the driver was asked the traffic sign just passed, the color of the traffic signal light, or some other item the driver neglected to mention. An attempt was made to determine why the driver missed essential items during the drive, since some could have contributed to an accident, congestion or violation.

Instructions given the drivers were simple maneuvers of normal driving, such as:

"Now drive out of the parking lot, turn left, proceed to High street and turn left, continue on High street."

"Continue straight ahead to Wilson avenue, turn left and park at 1704 Wilson avenue."

After the special examination each driver was briefed on his performance and could ask questions. His comments were encouraged. Whenever possible, the tested driver rode during at least one test. Most drivers remarked that they saw more from the back seat. Obviously, they had learned a lot from the one test experience.

The two Traffic Institute staff members who gave the special examinations did not use a scoring form. Notes were made during the test for later comments. However, a regular scoring form may be used or adapted. A special scoring form for the Smith-Cummings system can be found in the booklet, "Training Your Eyes for Expert Driving."

SURVEY CONCLUSIONS

These specific conclusions were reached from the preliminary survey:

1. Most drivers do not see traffic signs and situations. Along a given route, they can't describe the signs they should have seen. Pedestrians and bicycle riders were not always observed. Many drivers did not watch their speedometers or use the rear-view mirror while driving.

2. Even experienced drivers can't concentrate on the overall requirements of driving without practice. When asked to comment on their driving and at the same time find a street and turn into it, many drivers either turned before the street sign, or missed the sign completely.

3. Experienced drivers do not clearly understand traffic rules and regulations. Several drivers did not know speed limits in urban areas and many could not explain right-of-way laws.

4. Driving of those tested improved by observations and tests. Most drivers believed that they acquired an awareness of more requirements of driving. They had not realized what they were required to do while driving. They never thought in terms of solving driving tasks, overcoming distractions, and practicing good defensive driving.

5. The test is more applicable to experienced drivers than beginners. The driver must have some experience before he can be measured; Smith and Cummings recommended at least 10,000 miles of driving before testing.

6. The Smith-Cummings system and commentary driving could train drivers. Driver education instructors could use the techniques to create an awareness of many problems involved in driving.

7. The test points out inadequacies of inexperienced or unqualified drivers. It could help older drivers who never really learned to drive or have lost their former ability.

While these tests are preliminary and additional development is necessary, commentary driving and the Smith-Cummings techniques could improve driver training and testing.▲

EVALUATING STUDENT PERFORMANCE IN DRIVER EDUCATION

by EARL D. HEATH PH.D.

assistant professor, Education Center for Safety Education, New York University, New York city

In the past several years, considerable attention has been focused on evaluating the driver education program in various sections of the country. A major finding was the lack of recorded information at schools where driver education students received their instruction. About all the information available was that a particular student had taken the course and, where a grade was awarded, his rating for the course.

Naturally, more information is needed on an individual before anything which approaches research can be initiated. For example: Was the course elective or required; what was the teacher-pupil ratio for practice driving instruction; what type of transmission vehicles were used and in what sequence; did the student possess a license prior to enrolling in the course? Other questions are: was there a car available at the home of the student; what physical defects had he and were these remediable; what was the nature of the classroom instruction and the practice driving instruction and in what order were various phases of this instruction presented? These, and many other questions about the student, the course, and the instructor should be answered before investigating to determine the post graduate or continuing values of driver education.

STUDENT RECORD

To provide a minimum of such information for the researcher and the teacher, while still recognizing the time limitations of the average instructor, the *Student Record in Driver Education* was developed. Here are a few experiences reported by teachers who have used the device with several thousand students.

One of these reports relates to the ability to re-arrange the order of presentation of the content of practice driving sessions in accordance with the readiness level of the student. Such re-arrangement was made on the basis of a study of the session-to-session profile maintained on each student.

Another asset of the device for teaching purposes was the support it gave the teacher when a student was not recommended for the licensing examination. In conferences held with parents, the student's record, including anecdotes recorded during or immediately after each session was discussed. Most parents were pleased with the thoroughness with which the student's performance had been evaluated.

Still another value reported had to do with using the profile as a basis for conducting a critique and review prior to recommending the student for the state license examination.

In many schools, the record is retained in the individual student's personal file in the guidance department and is available to enforcement and education officials for research and improvement of instruction purposes.

Each driver education class should develop and use a system of this or another type for recording student progress and achievement, for you cannot operate a program effectively without one.▲

EVALUATING OBSERVATION TIME AS A PART OF DRIVING INSTRUCTION

by LOREN D. CAMPBELL

director, Driver Education, State University Teachers College, New Paltz, N. Y.

A few years ago the Columbia University Metropolitan School Study stated that 50 years elapses before a new subject gets within the fringe of a school curriculum and another 50 years to get established. Yet the growth of driver education in our school programs in the past 24 years has been amazing.

Due to that rapid growth there has been little time or opportunity for research. Consequently, most of the techniques, materials, and methods we use are based on judgment not research, opinion, not proven facts.

Of all the activities in driver education, practice driving instruction in the dual control car has been the most criticized. That is true because parents still conceive of the school as a place where 30 to 40 youngsters sit at desks in orderly rows while a teacher fills their minds with important information.

When youngsters are moved into laboratories, gymnasiums and studios, critics become disturbed. When they are taken away from the school building and grounds out on field trips, art tours, outdoor and camping education programs and conservation projects, the eyebrows raise even more and the voices become louder in protest.

PROTESTS ROAR

Consequently, practice driving instruction has been open to criticism. When the instructor takes three or four students away from the school building in an automobile on to public streets and highways, criticisms cannot help but be heard. Furthermore, 90 per cent of the cost of high school driver education courses is attributed to the practice driving instruction.

However, in teaching practice driving under normal traffic conditions there's no way to increase the number of students and reduce the costs of the program.

One area of practice driving instruction with many unanswered questions is back seat observation. No one knows scientifically how much observation time or what number of observers is the optimum number for best results.

The National Commission on Safety Education published "Policies and Practices for Driver Education" and said about observation: "The purposes and objectives of driver education are the same in the classroom as in the motor vehicle. Practice driving instruction refers to learning experiences in driver education provided for the student as an observer and student driver in a motor vehicle. Additional time for learner observation in the car is advisable."

NO RESEARCH ON OBSERVATION

In the 1956 publication of the National Commission on Safety Education "Research Needs in Traffic Safety Education" only a very slight mention is made of observation. A publication of the Center for Safety Education entitled "Research in Safety Education" said one item needing experimental research was "What are the values and limitations of 'observation' in behind-the-wheel instruction?"

No bit of research has been done on back seat observation in practice driving instruction. The answers to such questions as, "How many observers should there be in the back seat? What length of time in observation will give best results? What are some of the best methods to keep observers' attention, develop interest, and build a challenging situation?" are still being answered by opinions, beliefs, impressions or experiences, rather than by experimental research.

We believe we should have at least two or three observers in the back seat, if, for no other reason than to quiet criticisms of fellow teachers and tax payers who would become vociferous if we rode around with only one student in the car. However, many of us believe there is a value in back seat observation. We would have observers even if no critics existed. Under normal conditions usually the number four student driver in any given lesson does a better job than the preceding three. Consequently, we rotate the positions from lesson to lesson to distribute equally the opportunities.

TEACHERS NEED DOUBLE TALENT

To gain the most for observers in the back seat requires special teaching techniques which unfortunately some teachers do not possess. Under such conditions the values of observation are lost and even certain anti-social actions and attitudes can develop which can harm the program and fail to develop the type of highway citizen we want.

Such actions include inattention, outspoken criticism of the student driver, damaging the interior of the car, throwing refuse out of the windows, horseplay or yelling remarks to passersby. The good instructor realizes his major concern must be with the student in the front seat, but is well aware that he has obligations in the back seat as well. In fact, the better he and the observers meet those obligations, the better the job of each student behind the wheel.

Most instructors believe there should be observers in the practice driving automobile. However, there is disagreement on the number of observers. Two observers in the back seat and one student behind-the-wheel is often mentioned by proponents who feel these two can see better and have more freedom of movement than if there were three observers.

A third observer decreases the practice driving time and increases the observation time with possible results of boredom and lack of interest. Most teachers of driver education feel that beyond 40 to 60 minutes the maximum span of attention and interest is reached and the benefits of observation are lost.

Those persons advocating observers point out that a student can learn by observing the mistakes and correct techniques of others, especially if this learning is guided by a clever teacher. It is necessary to set up this plan as a definite learning situation with record keeping, questions and problems, written criticisms of the driver to show him at the end of the period, a written summary of the things learned during the lesson, and a mental game of making believe you are driving for each driver. Similar procedures are followed in many school classroom techniques in other subject areas. Students recite, explain, demonstrate, and report while the group watches and listens.

Repetition is one manner of learning, and observation provides opportunity for repetition. Properly motivated, each student realizes his responsibilities to observe closely for his turn behind-the-wheel.

TEACHERS' TECHNIQUES

Many teachers feel that too few observers are a waste of teacher time and energy since teachers must repeat the demonstrations, explanations, and criticisms several times. With observers in the car, individual and group questions and comments can be shared by all.

Here are some of the techniques and tricks of driver education teachers use to improve their teaching procedures and learning process, and to make the back seat observation more meaningful.

Homogeneous grouping is important. As near as possible car groups should be formed with students alike in their interests, skills and experience. After a period of two or three weeks, adjustments can be made when necessary and possible.

Develop a glossary of common terms to use in the car. These terms should be given to each student so the instructor and the students talk a common language.

Remember that most of us understand better when we can see it. Therefore, the instructor should demonstrate maneuvers and skills, and also use the blackboard or driving pad to illustrate his points.

The instructor should not concentrate his attention on the student in the front seat excluding those in the back seat. Establish good car group rapport. Teach to all, not just to one.

KEEP OBSERVERS BUSY

Try to improve the observational skills of the observers. Timely placed questions to the group in the back seat will improve the perceptual skills of the group.

Keep observers busy in the back seat by having them keep records, mark check lists, write criticisms, keep notes for after class outlines, and similar activities. Many instructors place the entire responsibility of keeping all car and individual records on the number four observer in the back seat. Also included would be the individual time record of each student driver's time behind-the-wheel.

Limiting the number of observers and the length of observation time prevents boredom and gives freedom of movement. Some people believe that learning by observation has only limited application. Having four students in the car is more economical, but teacher-pupil ratio must be considered in terms of the amount of time each pupil spends behind-the-wheel.

Save time, confusion, and delay by having:

A. A definite system of who is first, second, third and fourth each lesson. Naturally situations arise to change the system.

B. A definite system of seat rotation as each student moves to his turn behind-the-wheel. There are three methods of doing this:
   a. As each driver is through he moves into the left side of the back seat and does not move again during the period.
   b. Similar to one above except that the group in the back seat slides one place to the right each time. The incoming and outgoing students and the instructor step out of the car with the outgoing driver each time stepping over those left in the back seat.
   c. The outgoing driver moves to the left position in the rear seat each time but all back seat occupants move out of the car before he enters. Even though such a plan consumes slightly more time the advantages outweigh the extra time:
      1. Breaks up the monotony
      2. Increases the amount of activity
      3. All receive the benefit of a new and different seat for observation
      4. Better control of the group in discipline and interest.

With so much seat changing, it is important to observe two safety measures. One is to develop the habit never to touch a door handle until the parking brake is fully engaged. The second is to develop the habit of carefully closing all doors to be sure no fingers are caught in the door.

Of course only the curbside doors should be used—never the suicide doors.

Nothing should be placed on the back shelf. This is a safety measure and permits better visibility. Students can either place their books and pocketbooks in the trunk or on the seats behind the observers, thus acting as a detriment to restful in-attention.

Back seat observation can be evaluated in the knowledge gained, habits developed, and the skill shown when performing behind-the-wheel. Many have opinions on the subject, but practically nothing has been done in experimental research. Some of the following questions still must be answered through sound research:

1. Is back seat observation valuable?
2. If observation is valuable, how many observers is the best number?
3. How long should driving lessons be for the student driver? for the observers in the back seat?
4. What are the best methods to hold the interest of the group?

What is needed most in driver education is progress—progress based on research and expert advice rather than change for the sake of change or innovation based on speculation. Unless driver education employs sound educational methods and unless the claims made for it measure up to its avowed objectives, we may find that driver education is not a part of our curriculum any more.▲

DEVELOPING A SUMMER DRIVER EDUCATION PROGRAM

by JOSEPH G. PAWLOWSKI

director, Driver & Safety Education, Maine Township High School, Des Plaines, Ill.

When developing a summer driver education program, several aspects must be taken into consideration: how can it be worked into a summer session program; can the course operate or run like an average school year course; are the proper facilities available for the summer course (cars, classrooms, etc.); is the demand for the course as great as during the regular school year?

The driver education program at Maine Township High School in Des Plaines is integrated into the regular summer session so that a student can take one or two other subjects. Driver education is not a separate course, but is part of the regular curriculum.

To receive state aid we must also meet the requirements set up by the Illinois Department of Education. This means we must give each student 30 hours of classroom instruction and six hours of behind-the-wheel training. Formerly we gave each student approximately 15 hours of classroom instruction and 5 hours of behind-the-wheel training. Each summer course in driver education formerly lasted four weeks; now it lasts five weeks. We found the shorter course to be fairly satisfactory since our percentage of failures was very low—around three per cent.

$30 PER PUPIL

However, under the state aid program, the State of Illinois reimburses the school $30.00 per pupil for each student who has completed 30 hours of classroom instruction and six hours of behind-the-wheel training. That is the standard which we now use at Maine Township High School.

A well run summer driver education program must have adequate facilities to operate properly. At Maine the same facilities are available in summer as in winter. We have a large parking lot which we use for beginning behind-the-wheel instruction when we feel a student should not be allowed on a public street. We have adequate classrooms, visual aids material, cars and instructors.

And we certainly have enough students. The course in driver education has been so successful at Maine that in four years the program has grown from one instructor and one car full time (8:00 a.m. to 3:00 p.m.) to three instructors and three cars, full time. Next summer we plan to use four instructors and four cars full time to meet the demands of the students.

SELECT ON AGE, PRIORITY

The students' demand for driver education is so great that we have had to set up standards for making our selections so that more students have an opportunity to take the course. The minimum age limit is 16. Seniors have first chance, then juniors and so on. Those who need a driver's license to hold a summer job have priority.

We also try to arrange a student's course so that it will not interfere with his parents' summer vacation plans, that is, he has a choice of the first five weeks or of the last five weeks. If after all these requirements are met, there are still a few vacancies in the course, the remaining students are chosen on the basis of who registered first.

We have found that developing a summer training program differs very little from the regular winter program. The total number of students trained is smaller because of the shorter period of time, but each student receives the same number of hours training, and the same careful consideration as those in the regular school year.

I believe this lack of difference is due to the fact that the driver training course is just another unit of the regular summer school curriculum as a whole and is not treated as a separate part.▲

USING THE DUAL CAR PLAN

by J. A. GIBSON

safety coordinator, Clearwater High School, Clearwater, Fla.

School people are constantly trying to find ways of increasing the teacher-pupil ratio in practice driving classes.

One such plan is outlined below:

PURPOSE:

1. To increase teacher-pupil load and
2. Number of hours "behind the wheel" training per student

EQUIPMENT:

1. Minimum number of cars (2)
2. Enclosed area or blocked off street

CAR AND STUDENT ASSIGNMENT:

1. Four students each period
2. Five periods per week
3. One hour periods
4. Each student 30 minutes "behind wheel" each period
5. Each student in car once a week
   a. 90 periods per semester
   b. 30 "in class" periods (30 hours)
   c. 12 "in car" periods (6 hours)
6. Teacher can handle 100 students per semester

PLAN:

1. Instructor checks out each student in car for purpose of grouping. Each group needs two advanced students
2. All lessons at beginning of course are taught on enclosed area or "blocked off" street.
3. Students are taken for road test as soon as they are old enough and ready.
4. (Only one student at a time in the "following car"

ADVANTAGES:

1. Student solo drive is under supervision.
2. Teaches safe following distances.
3. Plan can be used in traffic.▲

The Elementary School Section's Viewpoint

ON SAFETY EDUCATION

by JAMES W. MANN
principal, Hubbard Woods school, Winnetka, Ill.
chairman, steering committee Elementary school days, N. S. C.

Let me review some possible approaches to teaching safety. Consider, for example, what might be called the "*horrible example*" approach. A child is hurt. We use the accident as a proper lesson in safety. This, we maintain, is the only *real* safety teaching. All else is trite and artificial.

Then there's the *controlled environment* approach. The child's surroundings should be so safe that there is no opportunity for accidents. This is our responsibility as adults. If an activity has potential dangers, cancel it. If a piece of apparatus is likely to cause an accident, get rid of it.

Or perhaps we should be *scientific* in our approach. Make a careful and thorough study of all accidents everywhere. From this construct a check list which will constitute the "curriculum" in safety education. Arrange by grade levels, and when each item has been "taught" our responsibility has been discharged.

SEASONAL APPROACH

There are those who believe that all good teaching is *accomplished through precept*. They construct a full list of "thou shalts" and "thou shalt nots." These commandments, memorized by each child, will prepare him to face the future.

Then there's the organized person who believes that safety education must have a *formal place* in the school curriculum. They favor a 15-minute period daily. Definite requirements for the year at each grade level are in a written outline and each teacher is required to complete the outline.

As a variation to the above, let's consider the *seasonal approach*. This takes less time than the daily requirement and utilizes the opportunities presented by well-understood events in the children's lives. We will then observe fire prevention week in October, followed by Halloween which is rich in teaching opportunities. Christmas has its well known hazards, and ice and snow can be stressed in January. After a brief respite we go into spring and early summer with multiple warnings about the dangers lurking in outdoor play, picnics in the woods and the hazards of water and heat.

At this point you may feel I am trying to be cynical about these various approaches to safety education. I have not meant to disparage, but rather to infer that in each one there is something vital lacking in terms of good teaching.

Good teaching of safety education is the same as any teaching we do. The central figure is the child—a growing, developing, experimenting human being. He is not necessarily interested in "learning" about safety. But he can be interested in living safely if we follow the fundamental principles of good teaching.

To teach a child we must first know him as a whole being—we must know his physical self, his mind, his emotions. Then we must involve him physically, intellectually and emotionally in a continuous program of doing, thinking, appraising, revising, and doing again. This must be accomplished using the knowledge that children learn best when they seek to satisfy their inner searchings. This we must recognize as a process of growth, with each stage in the process presenting a new kind of need and seeking a new fulfillment.

GOOD SCHOOL FACTORS

Following is excerpts from some of the literature of our group, published under the title "Desirable Experiences in Elementary School Safety." This document says:

1—Good schools provide safety instruction to *meet the needs of the pupils*. This includes examination of the environment, analysis of accident records, attention to the hazards of special days and seasons and consideration of the individual pupil's problems.

2—Good schools provide for *active participation of the pupils*, including such activities as inspecting and correcting hazards, patrols, monitors, committee work, and pupil evaluation of safety programs.

3—Good schools provide for *a well-rounded program*, covering all safety areas of importance to the child, utilizing suitable materials and fitting the program to the particular school and community.

4—Good schools provide *realistic opportunities for supervised practice* in meeting hazards. The practice of helping a child to identify himself personally with a program of learning is basic to good, modern education.

5—Good schools *keep safety foremost* in the minds of pupils, parents and teachers. This means, of course, that everyone is engaged in safety, not just a committee or safety supervisor or the principal. It means that safety becomes a meaningful part of the life of the school.

6—Good schools *cooperate with other community agencies*. This is civic training in a realistic setting.

7—Good schools provide for *safe environment* and for continuous improvement in the total program. Good education suggests that children have a part in this improvement, for what they share in, they will not destroy.

This philosophy of yesterday is sound today. Perhaps in practice, however, we have relegated that philosophy to second place in our concern of "how-to-do-it." Perhaps in our concern for techniques, we have forgotten to give attention to the personal development of each individual child and to the effect this or that plan will have *on him*.

We have the opportunity to take a fresh start now. The contribution of the Elementary School section will be to help ourselves and other teachers aid boys and girls to gain experiences which will produce safer boys and girls, safer men and women, safer citizens.

This section agrees that we should focus our thinking on a little child, a physical being who must be active, who must sometimes experiment in order to learn, who must live out his aggressions before he can become a mature person, who thinks rationally only after he has had experience to form grounds for rationality, and who must be a child before he can be a man. We must make safety for him, not a series of items to be learned, but the challenge of a life to be lived. ▲

THE CHANGING WORLD IN WHICH OUR ELEMENTARY SCHOOL CHILDREN ARE LIVING

by MRS. CLIFTON M. UTLEY
NBC Commentator & Director, Midwest office, Institute of International Education, Chicago

This past year has seen a dramatic change that has moved us farther into the missile age. The Sputnik circling the earth at more than 18,000 mph and sending its radio messages to the earth marks the beginning of a new era. This earth satellite points up the contradictory aspects of our world and our adjustment to it.

We have adjusted to the fact that the Sputnik is there. It is rapidly becoming as commonplace as an alarm clock. As a people, we are only now facing up to cold reappraisal of what the whirling orbit projector really means. It is a tremendous scientific achievement, but already it has lost its novelty.

But such contradictions seem to be a characteristic of our society today. We have our highest level of physical comfort, but we are full of insecurities. We move from one place to another with the greatest ease, but we are thereby creating problems of health—and even life—that did not exist when we lacked the conveniences. We work a shorter week and a shorter day, but we have difficulty in using our new leisure.

IGNORANT IN USING SCIENCE

We have science as our servant, but we carelessly do not learn how to use it. We create more and more desires for the comforts of home, and send Mother out of the home to earn enough money to help buy them, frequently losing the very characteristics that make home a warm, focal point for the children. We build better homes filled with more comforts and conveniences, and we are the most mobile of all people.

Our social and emotional roots barely have an opportunity to go deep into the neighborhood soil before they are pulled up and replanted to a new spot. The physical dangers and the emotional insecurities of such a life are obvious.

I could go on and on with examples of our pattern of living that show the contradictions. We cannot expect balance and equilibrium in all things. Life would be exceedingly dull if we did and we would probably become as dull intellectually as we become sluggish physically if we live for a long time in a mild climate never frequented with marked changes.

TRAINING SCHOOL CHILDREN

You people are working with elementary school children. You have the most exciting and challenging task in the world. Upon how you and your colleagues help train their mind and bodies and, yes, their spirits, depends the future of our society. This is a bewildering world for these children. The contradictions between word and deed will puzzle them.

The complexity of the decisions to be made will require not only a mastery of facts but also a mastery of self. Let me consider in greater detail some aspects of "The Changing World in Which Our Elemenary School Children Are Living.":

(1) Ballistic Missiles

We have an earth satellite.
Next step—orbit to the moon—25,000 mph.
Then, platform on earth satellite.
Then, platform on moon (un-manned).

(2) Atomic Power

a. Military use.

b. Peaceful uses (fissionable by-product).

(3) An age that is becoming more industrialized and motorized.

a. Learning a trade or profession, we must know something about machinery. It is almost impossible to work at something that does not involve machinery or a motor.

b. Home—electricity and gas equipment. We must learn something about it to operate it safely. I can never understand why people persist in looking for a gas leak with lighted matches.

We live with chemistry, physics, electronics. Even if a child does not plan to be a scientist or a mechanic, as a citizen he will need to know some science, for without it the world he lives in and reads about in his daily paper will have no meaning.

UTILIZE LEISURE HOURS

(4) With this industrialization, and especially with automation, comes more leisure. To you goes the challenge of giving these elementary school children the resources for using that leisure. I hope that you can help them know themselves so they can enjoy being alone, reflecting, or enjoying books, poetry and music. I hope they can find pleasure in a garden of growing things.

Of course there is the necessary vogue of "do it yourself" furniture, gadgets, and even houses. I say "necessary" because the cost of the finished product is often too expensive for an average budget and because it fills the leisure hours that might otherwise be spent in boring idleness. I shall not dwell on the importance of safety procedure in these tasks. That is for you to pursue later.

(5) Another aspect of the changing world in which our elemenary school children are living is the home. The fact that the home has so many modern conveniences means that the mother and housekeeper has more free time. She can use that time for her self-improvement, for civic work (community improvement) or for financial gain.

In ever increasing numbers, women are choosing the latter. This is partly because the pattern for women working in business and industry was extended during the war years when every hand was needed. Both the women and their employers found the result satisfactory.

WOMEN WORK FOR FINANCIAL AID

But usually the force that pushes the woman to work outside her home is financial need. You may not think she needs to buy a piano so Mary can take lessons, a luxury that father's check won't pay for. Or you may not consider it essential that the family have a television set, an electric washer, a new car and furniture, all being paid for in installments at the same time. Whether you agree or not, they made the decision, and Mother works.

In trying to meet inflated prices, they work to buy things and thereby increase the inflation. Sometimes the Mother works because she is the sole support. We are shockingly neglectful in the way we permit husbands and fathers to abandon their families, cross jurisdictional boundaries, and evade any financial responsibility for their families.

No matter what the reason for their working away from home as wage earners, a great many women do it. The impact on the children is obvious. They return to empty homes. They need good judgment, self control. Or they are locked out of their homes after school until a parent returns.

Then the child is faced with a need to know the community and how to defend himself in a variety of situations, from playing in his own street to getting to and from a neighborhood park. Even if Mother is not working but is at a PTA meeting instead, many of these same problems and needs for personal resourcefulness and good training exist for the child.

(6) Another aspect of our changing world that confronts the elementary school child is the mobility of our families. I was recently talking with an American Fulbright student who had returned from a year's study in Austria. He said one of the things that impressed him was the way the Austrians planned and financed the building of a new home.

There were no loans that permitted building the house and then living in it while you paid for it. Instead, they saved enough money to build the foundation one year. The sides would go up the next year, and perhaps the roof. The third year the remaining parts would be added. Then the family moved in to stay a lifetime.

When the Fulbright student explained how we financed our homes, and when the Austrians learned how we would buy a house, then change our job and sell the house and move to the city of the next job, they were incredulous. They could not believe a people would be so mobile.

"WE ARE NOMADS"

But mobile we are. Sometimes I think we are almost nomads. We move from place to place in search of work or health or comfort. Sometimes we move to escape boredom. Sometimes we move to escape facing up to reality. Ask Travelers Aid sometime about the many people they help who are running away from their homes to a new place—any place—where they will not have to face their own weakness, where they can pose in a new setting as the persons they pretend to be rather than the persons they are.

This mobility gives to many of the elementary school-age children a lack of security. No place can they become established before their family moves on. Perhaps it is only from one part of a city to another, but in large cities that can mean new friends, new surroundings as strange as a new town would be.

We can't keep our people from moving, even if we would. But perhaps we can give to the children an inner resourcefulness that will give them self-confidence and composure in a changing scene.

It is a very delicate line you tread as educators. How can you help give the elementary school child self-confidence without a self-deceiving cockiness? As a nation, we are now suffering from the blow of learning that the Russians have surpassed us in

the science of rocketry. We are making all kinds of excuses—all of them based on the premise that our bigness and ability will eventually win.

To readjust to the knowledge that we do not always win will be difficult. Adult Americans are not making the transition easily. It will be equally difficult for our children to understand. For these scientific and psychological changes mean we are entering a new world.

I trust that for the children who are our responsibility, it will be a world where they can enjoy the thrill of new knowledge and the satisfaction of applying it. I hope that it will be a world where science will advance and its basic precepts be generally understood.

But I pray that we will advance, too, in the social sciences of learning to live together in friendliness instead of mutual destruction, and that in this rapidly changing world the dignity of the individual and the human spirit will never be debased.

WHAT ARE THE FACTS OF POPULATION MOBILITY TODAY?

CHANGE OF RESIDENCE

by SCOTT A. GREER
department of sociology, Northwestern University, Evanston, Ill.

People in U. S. cities are on the move. In one year, the average (median) of all people who moved in the cities was 16 per cent. The range was from six to 34 per cent. Some cities have relatively low rates. Among these are Scranton, Wilkes-Barre, Johnstown, and New York. Cities with higher rates are Dallas, San Diego and Miami.

St. Louis represented a fairly average city in 1950 with 13 per cent of its population on the move. In 1957 15 per cent moved and there is no indication of a decline. Los Angeles was near the top in relation to mobility with 25 per cent of its population moving. In 1953 the following figures were found for four middle-class residential areas: in one area 28 per cent had moved in one year; 27 per cent in another area; 28 per cent in another and 15 per cent in another.

The percentage who had moved within three years was 56 per cent in the first area, 52 per cent in the second, 45 per cent in the third and 59 per cent in the fourth. It is noted that whereas the fourth area had a relatively small per cent of those moved in one year, it had the largest percentage of those moved in three years. The median time in residence for Los Angeles was slightly less than three years.

Among the reasons for this mobility is inter-urban migration. In a Los Angeles study less than 25 per cent of those investigated were born in Los Angeles. Only 32 per cent of the Detroit area residents were born in Detroit.

There is also an intra-urban movement. Forty-three per cent of the suburban population in St. Louis, lived previously in St. Louis.

One reason for movement within the metropolitan area is congenital mobility, that is there are some people who are just always on the move.

In other cases it is an adjustment to change: in-migrants to the cities have not yet found or been able to afford homes in the neighborhoods they prefer. There is also migration which comes as changes in life cycle. Whereas schools and playgrounds are extremely important in the selection of a home at one age level, they are not at another. Changes in social or economic level and income also may furnish a reason for mobility within the metropolitan area.

Populations flow to the cities and between them and selection of residence within the city is related to urbanization, ethnicity and social rank.

From 1950 to 1955, the population of metropolitan areas increased by 11,500,000; that of the rest of the country, by 300,000. The increase was almost entirely due to suburban growth: the central cities increased by 3.8 per cent, the suburban area by 19 per cent. Almost all (but a negligible part) of the tremendous population growth forecast for America in the next few decades will be (1) metropolitan and (2) within the metropolitan areas—that is, suburban in nature.

AGRICULTURAL MIGRANT WORKER

by NAOMI HIETT
executive director, Illinois Commission on Children, Springfield, Ill.

Agricultural migrant workers move so frequently in following the harvest they have little chance to improve their own conditions. Therefore, many migrants each year find themselves, through community neglect or indifference, having to work and live under unfortunate and even deplorable conditions. There are numerous communities and individual employers representing marked exceptions to this pattern, but unhappily, there are many others to which this statement is only too applicable.

Our whole country's economy is tied up with a bountiful harvest. A bountiful crop wouldn't be of much value if it couldn't be harvested and processed. Because agriculture is such a big and important business more workers are required for harvesting and processing crops than are locally available. Therefore, migrant workers are recruited from states which have a surplus or from states where the harvest season differs. When they finish with the crops in one place they move on to crops in another.

REPORT ON MIGRANTS

This places a moral as well as an economic responsibility on citizens, employers and official agencies to make certain that our harvests are not reaped at the expense of the migrant laborer and his family—that they be afforded the same protection, opportunities and responsibilities as are afforded local residents.

In a report given by Paul E. Blackwood, specialist of Elementary Education, U. S. Office of Education, he reported there are more than 875 counties in the United States in which at least 100 agricultural migrants reside at peak seasons. The counties are widely scattered. For instance, 157 counties are in 10 east coast states; 401 counties in the central states; 139 counties in Texas and 181 counties in 11 western states.

Hundreds of these counties have from 500 to 3000 migrants. These people are absolutely necessary to our economy but when it comes to providing services for them, too frequently the remark is "They don't pay taxes," "They aren't here long enough," "They aren't our responsibility," or, "Why doesn't the place where they come from take care of these needs?"

These same people fail to realize that the money which these migrants make for the growers and the canners is what helps pay for the schools, the hospitals, the parks and the social services with which the local residents are provided. But the migrant, whose labors are necessary to provide the money to these land owners or large employers, do not realize any benefits from them. In addition, the migrants spend a large amount of the money which they earn in the community while they are there.

The United States Office of Education recently referred to these migrants as the largest single reservoir of illiterates in our nation today. They have estimated that 600,000 of these children are being denied the privileges of a public school education.

Many of these children are retarded from two to four grades. In a spot check of

children in one area in Illinois, 18 of the 28 children were educationally retarded from one to four grades.

In a survey made by the Wage and Hour Contract Division of the United States Department of Labor, an analysis was made of 4,182 of the 4,285 children their investigators found working during school hours. Forty per cent of these children were migrants. Sixty-two per cent of them were educationally retarded.

In many places the children were not accepted in school. In others, provision isn't made to accommodate them or to plan for them. Sometimes they have a language handicap. They may be in a community for 2 weeks or for 3 months. Frequently local leaders express the opinion that it isn't worth the extra effort or expense to get these children in school.

On the school's side is the problem of additional children in an already full load; having children added to a class at a late date when they have not accomplished the earlier year's work and the lack of records as to what the child's level of attainment and school history has been. Experiments have been attempted on the east coast and in other areas to develop an accumulative School-Health Card for the family to carry with them.

MIGRANT HOUSING PROBLEMS

In addition to education there are housing problems. In some places employers have gone to great expense and made special efforts to provide good housing. But in other places they move the farm machinery from a barn, pitch tents or have shacks or converted farm buildings, at times even converted chicken coops.

The problems of sanitation and personal cleanliness are overwhelming. In one sample 20 of the 30 migrant families had no bathing facilities except a nearby pond. In discussing with the father what he saw as one of the biggest needs, he mentioned bathing facilities for the three year old—it seems he was too little for the pond and too big for the dishpan.

In health the family and the children are rarely included in local health preventive services unless the community happens to have a special "health drive" such as for polio. Even in these situations the child is likely to receive one shot and not any of the subsequent injections.

Several children in one camp had tuberculosis and were placed in a sanatorium. The harvest season ended but the children were not ready for release. The dilemma was the family had to move on without them—or stay without any income—or take the children with them and risk the chance they might die.

In another instance, a youngster died because none of the migrants in a particular crew knew how to use a dial telephone. By the time the father went in from the farm to obtain a doctor and the doctor arrived, the child was dead.

MEDICAL CARE NEGLECTED

These children also work in fields, many times with dangerous implements. For instance, a child's finger was almost whacked off with an onion knife.

A pregnant woman on the move is not likely to bother with prenatal care as long as she doesn't feel badly. If a baby is born with some deformity or handicap, it is difficult for him to get adequate medical care in order to avoid permanent damage, not because it isn't available, but because it takes time and many operations with careful planning and spacing, and careful aftercare.

If a mother works in a field, she takes the baby with her, and may lay him in a convenient shady spot. There he could be the dinner for insects, exposed to rats or run over by farm equipment. Or if he has older sisters and brothers, they take care of him, as best as they are able, during the mother's absence.

Nutrition is another problem as it is often difficult to secure balanced food, plus the time it takes to cook, and the cooking facilities are the open fires built by the migrants themselves. The milk supply and safe water is also a problem.

TRANSPORTATION DIFFICULTIES

A problem which lately has been given much consideration is the transportation of these workers. There have been no laws covering the vehicles, the number of people who could be crammed into a truck and the length of time that they could travel, including the driver, without sleep or rest.

A law has been passed in the last session of Congress which regulates this. It is Public Law No. 929. The Interstate Commerce Commission has just released a pamphlet setting forth regulations on the new law. It is entitled "Title 49 Transportation Motor Carrier Safety." There will be much opposition to this law and much resistance to compliance with these regulations. This is a place where concerned and informed people may do a good job of interpretation and support, if they so wish.

These people are a part of our country, of our citizens. They not only have a contribution to make in our economy, but they are essential to it. Therefore it would seem that we have a moral responsibility—and even a selfish interest in helping these people better their living conditions, their educational opportunities and their general well being.

"Wisdom is knowing what to do
Skill how to do it
Virtue in doing it."

THE MILITARY FAMILY

by BRIGADIER GENERAL ROBERT W. HALL USAF
staff director, Military Personnel Policy Div., Dept. of Defense, Washington, D. C.

The military family is probably the largest family known to man. There are approximately 3,015,400 dependents of military personnel throughout the world—slightly more than one dependent for each military person on active duty. Of these, almost 521,000 are located in oversea areas. The remaining two and one half million are scattered widely over the United States.

The dependents of military personnel include wives and children, as well as mothers and fathers who receive more than half of their support from service members, and, in rare instances, even husbands who are in fact dependent upon their wives. There are roughly 1,632,700 children in this large family—enough to create headaches for a number of school teachers not to mention baby sitters!

Since you are particularly interested in the school age children of military personnel, I shall discuss three main points—where these offspring receive their education, the numbers involved and an outline of the migratory nature of the families to which, in military jargon, the children are assigned for logistic support.

EDUCATION SIMILAR TO CIVILIANS

Children of military families are exposed to education in much the same manner as those of our civilian friends. Here at home, the children of military personnel attend schools—generally the public schools, although many attend private institutions—in the areas where their parents are stationed. In localities where there are insufficient school facilities, schools are operated by the Armed Forces on the military reservations.

The Army operates 10 such schools throughout the States and Puerto Rico with a total enrollment of approximately 13,000 children. In addition there are 39 schools built on Army reservations with Department of Health, Education and Welfare funds which are operated by local school jurisdictions.

The Navy, including the Marine Corps, operates four schools in Virginia and North and South Carolina with a total enrollment of 2,973 children.

In Alabama, Florida and Puerto Rico, the Air Force operates seven schools with 3,615 students enrolled. Like the Army, they too, have schools built by Department of Health, Education and Welfare funds on their reservations.

Thus, there are 21 schools operated by the Armed Forces on military reservations and 60 built with Health, Education and Welfare funds on military reservations but operated by local school jurisdictions.

In the overseas areas there are 276 schools run by the Department of Defense—144 by the Army, 21 by the Navy and 111 by the

United States Air Force. The teacher-pupil ratio in schools located outside our country and its possessions varies from a low of one to 10 to a high of one to 50. The average is probably in the order of one teacher to 25 students.

Lest you draw the conclusion that we are too well off in this respect, may I point out that conditions in overseas areas are, in many cases, most difficult. The shifting of military personnel and the age spread of children at the smaller installations are two of the important considerations. The schools are found in the areas of American military concentration and vary from quite small units to those comparable with our schools here in the States.

Sometimes supplies and equipment are difficult to obtain at the far end of the pipeline. A very insignificant number of the children who attend the oversea schools are dependents of civilian government workers or those of other civilians on a fully reimbursable basis.

MARRIED SERVICE MEN

Now, as to the numbers involved, you may be interested in the distribution of the married male military personnel by number of direct dependents. There are 1,221,091 married males in the Armed Forces, 424,804 have no children, 325,906 have one child, 266,726 have two, 132,999 have three and 70,655 have four or more little income tax deductions.

The 1,632,700 children I mentioned previously are divided by service in the following manner:

Army	569,992
Navy	326,501
Marine Corps	78,910
Air Force	657,293

Geographically 1,326,833 are located within the United States and 305,865 are outside the continental limits.

Included in the foregoing figures are children of all ages. We do not have figures separating out only those children of elementary school age. These would be most difficult to obtain because of the difference in local school systems. However, here is the breakdown by age groups:

In the United States—

Under 6	776,258
6 but not to include 12	402,720
12 but not to include 18	125,978
18 but not to include 21	16,081
21 and over	5,796

Overseas—

Under 6	176,409
6 but not to include 12	96,956
12 but not to include 18	28,443
18 but not to include 21	2,944
21 and over	1,111

If we take the elementary school ages to be six to less than 12 we find that there are overseas about 96,956 and in the United States 402,720. If we subtract those in schools operated by the military in the United States, it may be concluded that about 388,220 are attending schools even as your children are.

INCREASE IN ENROLLMENT

An Army report said the Army schools overseas show a 20 per cent increase in secondary school enrollment this year, while reporting a total enrollment increase of seven per cent per year for the past several years.

The national estimate in the United States has been a four per cent increase in total school enrollment. This year the Air Force schools overseas have 423 students in the twelfth grade and 5,797 in the first grade. It would appear from these facts that the World War II baby boom is now reaching high school while that of the Korean War is just now entering school.

I am sure that my final point does not come as a surprise—that the military family is quite transient. This is caused by many factors, the most important of which are an annual turnover rate in excess of 20 per cent; the increase and decrease of the active forces to meet the changing times; the requirement for all to share the not-so-good as well as the choice assignments; and formal professional education and experience as one progresses throughout a career.

FAMILIES UPROOTED

A normal tour of duty would lie somewhere between two and four years, although there are examples of much shorter duty—such as schools, or much longer—such as professors at the military academies which sometimes extend for many years.

One result of this constant shifting of the military family is the frequent uprooting of the dependent child from his social and educational environment. Although the military departments make reasonable efforts to avoid moving personnel with school age children during the school year, you can see that military considerations must always take precedence. Many people must be moved at inconvenient times. Consequently, the children must adjust and readjust to changing educational standards and practices.

In addition, there is one facet of military service which is not very prevalent in the non-military. This is the matter of family separations. There are literally thousands of families which are "fatherless" for months—even years. There are places—such as Thule Air Force Base in Greenland where dependents are not permitted.

In other areas there may be no housing available—either government or on the civilian economy. Sometimes the cost of living is so high in a particular place that the "little woman" takes the kids home to Mother until her husband gets another duty assignment where she can join him.

But, whatever the cause, frequent change of duty station or family separation, much to the credit of the service children, they by and large make the adjustments required. ▲

RESPONSIBILITIES OF COLLEGES FOR SAFETY PREPARATION

by EVA M. DRATZ
director, Department of Elementary Education, Western College, Oxford, Ohio

"We do our best only when we are doing our best," says Lincoln Lippincott of Yale. Are we doing our best when we find that of the 42 Departments of Education in the 411 colleges, which offered courses in Safety Education, only six colleges stress methods? These figures are taken from 1956 "Safety Courses for Teachers." Forty per cent of the 768 courses were in safety and driver education. Relatively few teacher-education curricula require students to take a foundational course in safety education.

However, in a number of instances, students may elect such a course. Tremendous progress has been made in preparation of safety specialists. The college student who does not expect to teach or major in a field which must stress safety techniques is exposed to very little safety education.

A number of colleges include safety knowledges and skills in the regular courses. There is no definite procedure and the results can be attributed to pre-college experiences or to supervision.

Driver education is 303 of the 768 safety courses offered by 411 colleges. The students in the ninth grade are given a six weeks course in driver education before taking the driver's test. Yet, the cross country study of accidents, showed that the accident total for the first six months of 1957 was 11 per cent higher than the comparable period of 1956. Speed and the related evils of drivers in a hurry are the principal causes of highway accidents. Has education failed? No!—the percentage could have been 90 per cent.

The community must have united action in developing a sound safety program. Have the safety programs been cooperatively evaluated?

TEACHERS SHOULD KNOW SAFETY PROBLEMS

Industry asks why college students are not alert to safety procedures when they enter the productive world. Yet, how many workers in the productive world have attended college? The instructors in elementary and high schools must stress safety in service courses or work shops and be required to attend the National Safety Congress to realize the problems in the industrial world.

Pedestrian safety regulations must be established. Chicago, which has an unenforceable anti-jay walk ordinance that conflicts with a more liberal and superseding state law, has recently cut its accident toll more sharply than any other city except Detroit.

In New York city studies show that 78 per cent of the 18,363 injured in 1956, were "normal" cases. "Normal" means that their cure was not obstructed and the individuals were not handicapped or pronounced.

The pre-college safety program begins in kindergarten with the usual major emphases on "living together in the school and in the home." The problems are more where the child is first in school. He already knows mechanical devices at home, in transportation and recreation. How have the parents aided in teaching Johnny? For three weeks, I conducted an informal Gallup poll to see how young mothers, who are college graduates, protected their children from dangers of electrical appliances.

The answers were varied and enlightening. None of the 60 adults interviewed had ever heard of a safety course in college. Their majors were education, nursing, art, theater, science, business, English and psychology. I observed some "safety" procedures with their children, and only once did I hear a quiet "no" from the mother which was understood. An explanation followed. In other situations the word "don't" was loudly voiced and when the Mother's attention was diverted, the child experimented and was burned.

GRADE SCHOOLS STRESS SAFETY

At the beach, the "don'ts" were many and without reason. The five year old must learn the safest route to and from school, how the school patrols protect him, how he is helped by traffic signals, what he does in a fire drill—and why and how he can be a cooperative member in a large group. Has every kindergarten child mastered these objectives? No. The backgrounds are too varied and the personal desires for recognition are too prevalent.

In the first grade, the objectives of the kindergarten continue and the needs of this age are recognized. Each needs special guidance in working with the school patrol. On the playground, new problems arise for a safety code must be in play as well as work.

In the second grade, the teacher knows the experiences of a child's first two school years. She observes which objectives need stressed. This group learns the work of the policeman and fireman. They learn how they can be real helpers in the community. (Some teachers can profit by reading Disney's Jiminy Cricket.)

The third grade emphasis varies. Usually their area expands beyond the immediate neighborhood to include the many communities in the city and its environs. The pupils are often introduced to the city health department and to the various safety devices in the industries. In the fourth grade, the curriculum includes understanding the state and its various physical regions. For the first time, the pupils compare work and recreation with activities in world communities and appreciate the advantages the usually took for granted.

The emphasis in the fifth grade is the United States. Understanding the nations health and safety program and appreciating our nation's contributions to the safety of other countries are discussed.

Life in the Western Hemisphere and Western Europe is the theme for the sixth grade. These pupils appreciate their environment more when they realize how much more secure the Americans are because of the many departments in the nation which emphasize safety.

Every elementary child has six years of safety education. Every ninth grade pupil is required to take a course in driver's training. Why should one eastern county have 4,528 serious traffic accidents and 28 fatalities?

At Western College for Women, safety is a "must" in every department. Even English majors emphasize safety procedure in their department. Articles are presented to the Student Government association which acts on the safety measures suggested. The student head of each dormitory selects a committee which decides what safety "laws" should be enacted.

The civic clubs and the PTA's should participate in a safety campaign and every adult should set a good example for youth.

All educators must continually evaluate their programs to see if they keep pace with the demands of the age. Teachers should use the services of the National Safety Council.

OCCUPATIONAL SAFETY—A CHALLENGE TO THE COLLEGES

by WALTER A. CUTTER

director, Center for Safety Education, Division of General Education, New York University, New York city

We have a normal human tendency to departmentalize experience. At one time we are drivers, with one group of associations; at another workers, voters, swimmers, or students. In each of these activities, we consider the one we are performing at the moment as preeminent, and we do not always think of the constant threads running through all of these and other activities performed in our waking hours.

Take the college commencement, for example. We were accustomed in earlier days to think of the commencement as the time when living began. There was the implicit suggestion that for four years the students had been on ice, and now the thaw had set in and they were melting into living experience.

A cartoon in the New Yorker not long after the war showed the silliness of this viewpoint. At an outdoor commencement, the students in caps and gowns were grouped in a center section. Surrounding them were their wives, each of whom was holding one or more children on laps, or shepherding them in prams. The orator was saying, "You are about to step out into life's problems, etc., etc." Both students and wives looked a little flabbergasted.

The fact is that each day is a commencement. We are always in the midst of living experience. Our task in this paper is to appraise safety experience in the collegiate institutions, and the relationship of that experience to contemporary or later experience, away from the institution.

COLLEGE'S CONTRIBUTION

The major contributions the college makes to the continuing thread of human safety are threefold.

- To add the college experience to former experiences directed at the development of a positive attitude towards safety in everyday living.
- To assure that in the total college experience, classroom, laboratories, shops, recreation, athletics, and normal traffic, safe standards are known and followed.
- Insofar as the specific college experience permits, to prepare the students for later specialized experiences as, for example, industrial.

Numerous studies reinforce a fact of observation that, as safe and unsafe behavior are part of the whole problem of human behavior, attitudes play a conspicuous part. It is hardly necessary to dwell long on this point. A person performs an unsafe act. Why? He may not know how to do the particular task.

This means that his attitude was not oriented to wanting to learn to do it right, or that someone's mind was not oriented to teaching him. In both cases there is evidence of faulty attitude. Or he might know, but might not do it right, or he might be indifferent to how it was done, or most anything else.

In any case the attitude is deficient, and the attitude, right or wrong, will direct the action. Actions are symptoms of deeper functions within the mind, and it is in this deeper area that education must be effective. Attitudes dictate not only opinions and verbal expressions, but actions.

This means that wherever in the college curriculum, subject matter lends itself to the inculcation and fostering of constructive safe attitudes, the occasion should be used. There are few subjects which do not lend themselves to such an emphasis, and, where the emphasis can be introduced adroitly, there is one more stimulus provided. This suggests a further step which must be taken to make these emphases and applications meaningful.

A course in economics could well use the information given in *Accident Facts*, for example, the publication of the National

Safety Council, and develop the significance economically of the immense personal and property losses. In the attitudinal aspect of the college experience, there should be an organic wholeness to the student's experience.

The student should be convinced that intelligent safety is a good thing and he should conform, as an intelligent person, to its requirements. Stress should be laid on the fact that safety is the intelligent reaction and practice, and further, that does not mean a series of don'ts or prohibitions. Rather, attention to the requirements of safety, frees the person to do what he needs to do, or wants to do, without the threat of injury or property damage.

The actualities of the college experience itself should convey a sense of the importance which the college administration attaches to safety.

The proper attitude toward the concept of intelligent safety and safe practices is the essential basis of safety.

TOTAL COLLEGE EXPERIENCE

Some years ago, I wrote a pamphlet in a series which the Center for Safety Education developed for the public schools entitled *The School as a Center of Safety.* What was said about the public school may be said with equal force about the college, the technical school, the school of engineering.

The college is a community, with a government, a staff, (faculty, administration, building and grounds supervision and maintenance), traffic movement, dining and cooking facilities. The college has varied equipment, laboratories, shops, and many places of student assembly for both curricular and extra curricular activities.

Safety in this total environment and these numerous activities is as essential as in motoring, plant work, or doing anything else. Instead of dwelling on the many inadequacies which we find at present in the colleges, let us consider certain suggestions as to programing related to the student's present experience and later industrial experience. These suggestions are applicable to an arts college, an engineering or technical school, an agricultural school, or chemistry or physics courses, and premedical education.

When we factor out the elements common in accident causation and accident experience, we find we are left with only the superficial qualities of a given activity, and of the particular environment in which the activity is carried on. There are more common elements, insofar as types of accidents and safety are concerned, in a college and an industry than there are different elements. True, the difference in environment is frequently dramatic, but movements and actions of the person are sufficiently alike to give us a common ground of action, as well as a period of preparation for later experience.

DIRECTOR OF SAFETY

It is quite essential that one person be designated, whatever his title, to assume the leadership and responsibility for coordinating the safety program. Even though the institution may have a safety committee, it is necessary that one person be designated to spark the program.

Without aggressive leadership, a committee may become an organized attempt to evade individual responsibility. An important point, in relation to this person, is that he is not appointed to make the institution safe himself. He is to coordinate the efforts of all departments, activities and personnel in keeping themselves safe.

Safety is literally everybody's business and the heads of all the departmentalized activities, as well as the special and normal activities, must see to it as a continuing and normal responsibility that persons under their control know the safe ways of performing all their tasks and assignments. Safe practices must be taught as inseparable from the concept of true efficiency.

A final important consideration is that, by appointing a director of the safety program, the head of the institution should not feel he has now "taken care of" safety. One of the most potent and indispensable factors in successful accident prevention is the knowledge that the head of the enterprise is sincerely and actually interested, and maintains a posture of continuing leadership.

This visible leadership is worth a thousand directives. There is no less reason to view the absence of such "top management" leadership in our colleges as a weakness than there is in industry. In fact, the strength of such industrial leadership can be discussed when industrial representatives visit the institutions to speak to faculties and students.

SAFETY COMMITTEE

The most effective method of coordinating an institutionwide safety program, exemplifying both good institutional practice and good industrial practice, is to form a safety council (committee).

The committee membership is easy to determine. Whoever is responsible for the safety of personnel, faculty, students, office, service and maintenance personnel including student representatives, should be on the committee. If this would result in too large a committee, committees can be formed by departments and major activities, with a smaller executive committee functioning at the top.

However, as safety programing must be comprehensive, it is much better to have one committee, so that everyone can see the problems as a whole, can see where he fits in, and, moreover, can make useful suggestions from his own experience.

It is the major function of such a committee to oversee, through the specific accident prevention activities of its members, the complete safety program.

Major General G. C. Stewart (U.S. Army Retired) stated in his paper, "Applying Industrial Safety Practices in Colleges and Universities," given at the Fourth National Conference on Campus Safety, almost the complete list of activities for such a council. The list is practical and comprehensive.

- The top levels of management, starting with the senior official, must be personally determined to prevent accidents—make this determination evident by use of authority, support and personal participation.
- There must be a qualified safety engineer (in institutions, where this is not practicable, such assistance may be had from insurance companies and industrial safety personnel) to direct the efforts of management and supervisors.
- There must be a delegation of authority and responsibility for safety at all levels of management and supervision.

There must be safe places to work.

- There must be every practicable safeguard on the tools and machines employees use.
- There must be training in safe procedures.
- There must be enforcement of practices and methods established to prevent accidents.
- There must be accurate determination of conditions and acts that cause accidents.
- There must be developed a record of causes of accidents to direct intelligently correction action.
- There must be a correction of conditions, attitudes, habits, and causes of accidents.

The successful functioning of such a committee will be related directly to top leadership interest, definition of functions, and discharge of same. A suggested agenda for such a council meeting will suggest both the importance and the scope of its functions.

1. Reading and approval of minutes.
2. Review of accident experience since the last meeting. Trend of accident experience and reasons therefor.
3. Review of outstanding recommendations (for corrective action) on which action is incomplete, and why.
4. *Major* accident investigations made since last meeting. The purpose is to show major hazards, reveal possible effects of such accidents, and indicate the direction of corrective action.
5. Major inspections made, and conditions and actions rated.
6. Has any "safety" training been given? Is any needed?
7. What promotional activities have been carried on during the period? What is planned? Is attention given to publicizing hazards in new activities, seasonal hazards, recreational hazards, shop, laboratory, gym, swimming pool?
8. What new recommendations for greater safety are necessary? These may take the form of physical modifications, engineering revision, guarding, new procedures.
9. New activities planned. Type and scope of cooperation needed from council members.
10. Appointment of individual council

members, or committees to make studies of hazardous situations which need fundamental study.

11. Any general relevant discussion.
12. Adjournment.

THE INSTRUCTIONAL PROGRAM

When discussing the instructional program which will keep the college community safe, and prepare its students for later experiences, certain fundamental viewpoints must be restated and reaffirmed.

● The first is that we are dealing with a continuum of experience. The individual is an individual, doing certain things. If the college has been successful, for example, in developing an intelligent attitude towards the many things that people do, and has implanted the idea that there are standard methods by which we perform these various activities, more than half the battle is won.

● The second consideration is that courses should be related directly to present experience, while preparing insofar as is practicable, for the specifics of later experience. While it is true that experience is continuous, it is also true that intelligence permits men to anticipate experiences which they have not had.

Therefore, the course program can stress the elements common to both college and later industrial experience, and anticipate elements specific to subsequent industrial experience. To what extent this latter function can be discharged will depend upon the presence of elements in the college program which are industrial in nature, and on including in the college program, visiting lecturers from industry, slides, exhibits and demonstrations, which will enlarge understanding of the industrial climate.

THE GENERAL COLLEGE, ARTS AND SCIENCE

Here, the most that may be hoped for is a course in general safety, a type of survey of the general accident areas. It may be possible also to include an optional course in driver education because of the immediate participation of all in traffic, and because of the dramatic and public nature of this problem.

This course is designed to provide an overview of the field of accident prevention in its several divisions, industrial, traffic home and farm, public accidents (other than motor vehicle) and recreation, and to show the role of safety education both broadly and specifically conceived in meeting the accident problem.

A. *The Philosophy and Aims of Accident Prevention Education and Practice*

1. The nature of accident prevention and safety.
2. The significance of the accident problem.
3. Aspects of the problem of importance to education.
4. Social values, moral imperatives, and self preservation.
5. Industrial and technological efficiency.
6. Socially desirable manpower utilization.

B. *Major Accident Areas and Problems*

1. A brief history of the major accident divisions: industrial, traffic, transportation, public (accidents) and home and farm.
2. Nature and extent of the problems today in each of these major divisions.

C. *Special Problems in Our Consideration of Accidents*

1. Inadequate recognition of the depth of the problem.
2. Inadequate understanding of the nature of the accident and the preventability of accidents.
3. Uneven emphasis on one or another of the major corrective measures.
4. Inadaquate evaluation of the role of education in meeting the problems of accidents.

D. *Accident Facts, Their Collection, Analysis and Use*

1. The nature of accident facts.
2. The value of accident facts.
3. Their collection: accident investigation, inspection, observation (sustained) of operations, job methods study, analysis of past accidents, and discussion with personnel.
4. The uses of accident facts.

E. *Accident Investigation*

1. The purposes, methods and values of accident prevention.

2. Inadequacies in accident prevention.
3. Desirable standards for investigation.
4. Illustrations from the major accident divisions.
5. Near misses, first-aid cases, injuries.
6. Analysis of investigation data.

F. *The Nature and Application of Corrective (Preventive) Measures. The "Hazard Through Track."*

1. Techniques: engineering revision persuasion, appeal, instruction, personnel adjustments and discipline.
2. Illustrations of the application of these methods to selected examples in industry, traffic, transporation, and the home.

G. *The Major Corrective and Preventive Measures (Organizational)*

1. The nature and scope of the concept of organization to the accident problem.
2. The implementation of the safety program through application of the techniques of organization with illustration from industry, traffic, recreation, and farm.

H. & I. *The Role of Education in Meeting Accident Problems*

1. Education in knowledge, skills, attitudes.
2. The significance of education throughout the educative process, beginning with the first school year.
3. The public schools—primary, junior high, high school, colleges and universities.
4. The place of safety education in the curricula of colleges and universities.
5. Special university centers.
   a. Yale University—Bureau of Highway Traffic. Traffic Engineering.
   b. Northwestern University. Traffic Institute. Enforcement.
   c. New York University. Center for Safety Education.
6. Educational programs of special groups.
   a. Association of Casualty and Surety Companies.
   b. National Safety Council.
   c. Local Safety Councils.
7. Industry: types of training and educational programs in industry.

J. *A Survey of Leading Organizations Concerned with Accident Prevention*

Department of Labor
National Safety Council
National Commission on Safety Education
National Fire Prevention Assoc. and National Board of Fire Underwriters
American Society of Safety Engineers
American Museum of Safety
American Industrial Hygiene Association
American Mutual Alliance
American Automobile Association
Association of Casualty and Surety Companies
Presidential and Gubernatorial Conferences

K. *Some Psychological Considerations Related to Accident Occurrence*

1. The role of attitudes.
2. The specific problems of: the accident repeater, "accident proneness" and the chronic violator.
3. Rehabilitative education. Traffic court schools.
4. Rehabilitative education. Adult Training.

L. *The Evaluation of Safety Programs*

1. Establishing a check list for Appraising the efficiency and comprehensiveness of safety programs.
2. Supplementary material: "Appraising the Quality and General Effectiveness of the Safety Program."

M. & N. *A Survey of the Present Status and Future Outlook in the Accident Prevention Field*

1. Industry.
2. Traffic.
3. Home.
4. The outlook for increased education participation.

O. *Examination.*

● A third phase of the instructional program has been suggested, namely the inclusion of pertinent aspects of the accident problem in certain courses. This is essential . . . and feasible.

Here are some examples of accident prevention areas which lend themselves for inclusion in various fields of study.

Economics: effect of human loss on production level, purchasing power, standard of living, "double losses" of accidents.

Engineering: physical layouts of plants for maximum efficiency (safety); inplant traffic of men, goods and services; ventilation, illumination, noise control, color dynamics, biomechanics (the relationship between man and machine) and others.

Medicine: accident prevention may be considered a form of preventive medicine; the physician can advise parents on child protection as well as counsel his patients on activities during convalescence or while under medication; moreover, he can be of invaluable aid in rehabilitation of the handicapped worker.

Management: the values of a sound accident prevention program can be stressed and loss control can be developed as a major objective of management programs.

The Sciences: relating individual capabilities to demands of various tasks, tolerance levels for individuals on various tasks, problems of selection and placement.

Personnel Administration: a study of preemployment, hiring and post-employment practices designed to assure maximum efficiency in selecting and placing workers, problems of employee morale and communication.

Education: the establishment of training and re-training programs including the psychology of learning and problems of motivation for various age groups.

AGRICULTURAL, TECHNICAL SCHOOLS

In such schools, there are a number of interesting instructional possibilities. The first is the introduction of the broad survey course. The second option is the inclusion of a basic course in industrial safety presenting the basic philosophy and methods of industrial accident prevention and applications made, through specific examples, to agricultural accident causes and controls, and industrial.

In such schools, the same type of safety director, and safety organization should be included. Particular attention should be paid to shops, laboratories and other hazardous exposures. Regular inspection schedules should be established. Operating methods should be studied so that usual hazards in operations may be anticipated and controlled.

The instructor should have the same responsibility for the safety of personnel, machines, equipment, layout, movement, handling and storing of tools as an industrial supervisor or foreman.

The aggregate safety experience of any institution will be the sum of the experience of the different units. Each teacher, supervisor, shop or laboratory instructor must understand safety as a normal and inseparable part of his responsibility.

As far as is possible, the types of conditions, hazardous exposures and practices which students will face in work should be anticipated and discussed as part of the whole educational experience. Above all, the safe standards observed in educational institutions of any type should compare with the best industrial practice.

THE ENGINEERING COLLEGE

Many institutional shops, laboratories and other exposures could serve best for the study of hazards, rather than for the study of safe practices. It is rather less than convincing to emphasize safe practices and conditions in an unsafe climate.

As a peculiar aspect of their work, agricultural schools have a special opportunity to teach and further safety through some cooperative relationship with this country's largest adult education enterprise, the agricultural extension service of the U.S. Department of Agriculture.

The engineering college has an unusual opportunity to qualify students for intelligent participation in industrial safety. The question of precisely how safety instruction is to be handled in the curriculum is a complicated one. If engineering students are to be qualified as safety directors, a much broader training than the basic engineering curriculum is suggested. Here are other suggestions:

1. A *required* course for all engineering students, preferably in one of the early years. Such a course has been developed (1949) by the Committee on Cooperation with Engineering Colleges of the American Society of Safety Engineers.

The course outline is as follows:

		Time Allotment
a.	Introduction to course	1 hour
b.	History of industrial safety	1 hour
c.	Accident costs	1 hour
d.	Appraisal of safety performance	1 hour
e.	Circumstances of accidents	1 hour
f.	Fundamentals of accident prevention	3 hours
g.	The physical plant	2 hours
h.	Plant inspection	1 hour
i.	Job safety analysis	2 hours
j.	Preventive maintenance as related to safety	1.5 hours
k.	Handling and storing material	1.5 hours
	Fire prevention	
l.	Hand tools	0.5 hours
m.	Low-voltage electrical hazards	0.5 hours
n.	Machinery safeguarding	3 hours
o.	Health hazards	3 hours
p.	Personal protective equipment	1 hour
q.	Employee placement, training and education	2 hours
r.	Sources of technical information	

2. Such other courses as may be indicated: industrial safety management; industrial safety directors and other full-time personnel: their training, responsibilities and duties.
3. Integration of safe practices in all appropriate courses.
4. A full-scale college (safety) council on the discovery and control of hazards in the entire plant and all its parts, in operating methods and job analyses, in teaching and student practices.
5. A systematic program of plant visits for observation, and, conversely, a series of special lectures by industrial safety, and management personnel.

The engineering student should, by the nature of his training, be a leader in industrial safety.

There are specific activities which can condition the student for industrial experience.

1. The similarities, i.e., the basic common hazards and preventive measures, between the institution and the industry can be emphasized.
2. The industrial-type activities of the institution can be discussed.
3. Classes can be taken to industries to study the methods of hazard detection and control.
4. Specialists in operating methods, where hazards are named and control methods indicated; specialists in accident prevention procedures; industrial hygienists; in short, numerous "titles" from industry can be brought in for special lectures.
5. Class assignments can take the form of studies of various phases of the industrial safety program.

What can be done in these directions is limited only by the imagination and ingenuity of instructors, coordinators of safety, and institutional safety councils. Both basic and specific conditioning for industrial experience can be given the modern student.

All types of educational institutions and systems are being reminded constantly of their responsibilities. There is a constant drive from many quarters to push material into the schools.

SAFETY COVERS ALL AREAS

Accidents are in a very special category. A student may be of the caliber of a valedictorian, yet if he flunks safety, all his accomplishment, all the expense of his training, all his aspirations and his family's hopes are needlessly and tragically destroyed.

The majority of men and women must work, and so this paper has dealt chiefly with conditioning the student for industrial experience. It could as well have dealt with traffic safety, home safety, recreational safety. We need the whole person safe whatever he may be doing. We cannot, in the deepest sense, departmentalize safety. A safe swimmer may fail as a worker. A safe home dweller may fail as a driver.

Of course, it is impossible to reproduce all these experiences in our colleges and universities. We can, however, and we should recognize the moral imperative which says that training a man's mind is only part of the total task of education. Training that mind in the methods of survival in a world filled with hazards, is of equal importance. No body—no mind.

When the colleges and universities recognize their responsibility for the efficient adaptation of well-trained minds and well-developed bodies to all the conditions which must be faced, and faced successfully, we will have progressed not alone in industrial safety but in the total safety of men and women.▲

PROPOSED ASSE PROGRAM FOR COLLEGES AND UNIVERSITIES

by **FRED R. TEMPLE**
chief safety engineer, Convair, Fort Worth, Tex.

Safety education conditions our attitudes, interests, and motivates us to safe performance with good social results. For example, a courteous driver is the product of proper safety education. Secondly, safety training is a specific and limited function with known objectives. Through safety training we can make a skillful driver. Safety education may produce courteous drivers, but a courteous, skillful driver must also have adequate safety training.

Safety education is a process which begins shortly after birth and continues through all of life. Here are the objectives of safety instruction and the major influencing agencies of each arbitrary age group:

	OBJECTIVES	INFLUENCING AGENCIES
Infancy to Age 6	Avoid pain, suffering, suffocation, falling, fire, water, other environmental hazards.	Mother Father, members of family, neighbors.
Age 6 to 12	Traffic hazards, water safety, simple tools, poisons, sanitation, foods, heat, cold.	Family, school, organized groups such as Scouts, Camp Fire, Red Cross.
Age 12 to 18	Fire hazards, chemicals, impact, speed, power tools, life saving, introduction to vocational preparation, team work in fire, water rescue.	Family, junior and senior high school, newspaper, magazine, protective agencies.
Age 18 to 25	Formal vocational preparation, apprenticeship, special courses. Non-college "on the job" trained.	Trade school, colleges, industrial plants, commercial organizations, safety agencies.
Age 25 through adult life	Economic and social value of safety conserving property, life, health, time; aid to others, social benefit for family group and the community.	Organized safety agencies, industrial organizations, community and state protective agencies, clubs, press and public opinion.

The organized safety agencies include the National Safety Council prominent in elementary and secondary school education. The 65 local chapters of the American Society of Safety Engineers also assist in their local areas.

The principal concern here is with group 4, the college or young adult group, and what the American Society of Safety Engineers proposes for their training. The typical 1957 young adult has many characteristic traits. Here are a few:

1. Full of energy, can't wait.
2. Likes to live about twice as fast as the clock turns.
3. Knows more, been more places, seen more things.
4. Feels new freedom (not tied down by family).
5. Not easily convinced by adults.
6. Suspicious of advice by experienced.
7. Is less secure and more emotional.
8. Enjoys limelight—sometimes seeks it poorly.
9. Is less aware or concerned about public opinion.
10. Often lets group control actions.

The curriculum and physical plants of all colleges and universities are terrifically taxed, and likely to get worse. However, courses in safety education, industrial accident prevention and safety engineering are badly needed to prepare college graduates.

COURSES FOR COLLEGE GROUP

1. Safety education for all students, preferably in the first two years of the curriculum.
2. Fundamentals of accident prevention for all technical, engineering and science majors. This is in addition to specific safety training required in some courses.
3. A major in safety engineering should be available in more colleges for safety engineering as a profession, or for the major in engineering or science who feels he needs further safety preparation in his field.

SAFETY EDUCATION

1. Present day college or university is big business.
2. Needs a safety organization within its own administration.
3. Needs the organized mechanics and means of evaluating its own safety performance.
4. Through participation, student, faculty and non-faculty employees can learn value and results of safety efforts.
5. The general course in safety education:
   - A. The safety movement.
   - B. Causes of accidents.
   - C. Developing safety attitudes.
   - D. Using safeguards.
   - E. Safety inspection.
   - F. Accident reports and records.
   - G. Fire prevention.
   - H. First aid.
   - I. Personal protective equipment.
   - J. Safety in the community.

ACCIDENT PREVENTION

Basic industrial safety courses now being taught in the United States:

1. History of industrial safety.
2. Toll of accidents in the United States.
3. Circumstances surrounding accidents.
4. Fundamentals of accident prevention.
5. Accident analysis.
6. Job safety analysis.
7. Safety inspections.
8. The mechanical-physical hazard.
9. Mechanical safeguards.
10. Health hazards.
11. Personal protective equipment.
12. Safe use of hand tools.
13. Material handling.
14. Employee placement, training and education for safety.
15. Appraisal of safety performance.

COURSES FOR SAFETY ENGINEER

1. Basic industrial safety (industrial accident control).
2. Industrial safety engineering.
3. Industrial fire prevention.
4. Design of industrial safety program.
5. Engineering control of health hazards.
6. Design of machine safeguards.
7. Industrial safety standards.
8. Safety administration.
9. Casualty and liability insurance for industry.
10. Research problems in safety engineering.

A recent survey of the National Safety Council indicates 54 colleges and universi-

ties teach industrial accident prevention and safety engineering. Many other colleges and universities have a safety course in their curriculum. At least twice this number teach some form of safety education. Some emphasize specific areas such as first aid. Of the colleges and universities in the survey, nine offer degrees with a major in safety engineering. The degree is usually in the industrial engineering or mechanical engineering school. Our 6,500 professional safety engineers in the United States believe:

First, a basic course in accident prevention should be in all colleges and university curricula, particularly those having science, engineering or other technical fields of instruction. An insight into industrial safety will aid in getting safer tools, machines, vehicles, homes, schools, commercial plants and highways in America.

Secondly, such a course will significantly increase the safe use of all the good things in America in this age of abundance.

All students, faculty and non-faculty members should have an active interest in accident prevention in their local plants and their campus safety problems. There should be available at least one course in safety education for all students, and for our technical, engineering and science students, a basic industrial safety course. Finally, a major in safety engineering should be available in a limited number of colleges for professional preparation.▲

WHAT ARE THE STANDARDS FOR OFF-CAMPUS HOUSING?

by WILLIAM J. HOLLAND
Sanitarian, Environmental Health Dept., Health Service,
University of Michigan, Ann Arbor, Mich.

Problems in student housing have existed since the first institutions of higher education. In some instances protectiveness in residential colleges approaches the level of parental solicitude. By the same token student housing has also been the object of complete disregard.

Today, large enrollments, high construction costs and the increased desire of students to select their own housing have made it impractical to house all students in university residence halls. This underlines the importance of off-campus student housing.

Such housing will remain an integral part of the college community. However our society will not tolerate a disregard of the social, health and safety implications of this mode of housing.

Student housing should provide an environment in which the student will not merely survive his four years of college but will thrive physically, morally and intellectually. In other words, a sound student housing program is necessary. The components of such a structure are many, but its cornerstone is strong health and safety standards.

SURVEY TAKEN

The Environmental Health Department of the University of Michigan Health Service sought information on health and safety standards from several national agencies and associations. Among other responses was a request by the American College Health Association and the School and College division of the National Safety Council to combine this information with standards used by other colleges and universities. The following are brief comments from the survey. These comments are not to set precedent nor to judge what standard is correct, but rather to organize the information and stimulate interest in this field of college community life.

Survey data in this report were obtained from 39 university and college housing administrators, deans, environmental health, housing and safety officials. Also utilized was information from the American Medical Association, the Michigan Housing Law, the National Fire Protection Association "Building Exits Code," the National Safety Council, the New York State Building Code, and the Proposed Housing Ordinance of the American Public Health Association.

No law, code or ordinance reviewed specifically stipulated all the safety items listed in the questionnaire. In several codes and ordinances requirements were implied, and some referred to other codes that covered the item thoroughly.

Few states have a housing law, and therefore only a small percentage of schools have the benefit of such a tool. State building codes are prevalent, but mostly relate to new construction. The value of building codes in off-campus housing is decreased because most of this housing is in older homes.

The standards utilized by the majority of the schools are a combination of state building codes, city housing ordinances and university or college standards. When the housing standards are of university origin only, they are not actively enforced. However, when they are a combination of state or city codes and college standards there is active enforcement. Less than one-third of the institutions reported active housing programs, but several will be initiated in the near future.

STRUCTURAL REQUIREMENTS

For the purposes of this report problems of building location, availability of fire protection and related factors are ignored. Wooden structures are usually restricted to three stories high and about 50 per cent of the schools are striving to use fire walls and fire resistant materials. Little attention, however, is given to the location of garages relative to the house. In most cases if the garage location was considered they were permitted to be attached, often without a fire wall required.

Wiring in compliance with the National Electrical Code is required by about 50 per cent of the institutions. In most instances if complying with the Code is not specified there is no wiring requirement. A small percentage of the schools do require one convenience outlet plus one overhead light in each room.

A few institutions specify the number of required convenience outlets as a function of the area of the room. Electrical wiring warrants strong consideration for safety due to the tremendous load from the many electrical appliances used by students.

Less than one-third of the universities have minimum lighting standards for the various areas of buildings.

BASEMENTS AND CELLARS

Requirements for both basements (50 per cent above the outside ground level) and cellars (50 per cent below the outside ground level) are much the same. Most of the institutions recognize the potential fire hazards in these areas, and specify safeguards. They also agree however, that study and recreation should be permitted in basements and cellars.

More than half of the standards permit sleeping in basements and about one-third permit it in cellars. As a rule if sleeping is permitted in basements or cellars, two independent means of egress are required.

A high per cent of the institutions specify two independent means of egress from each floor. Safety features of these means of egress however take many different patterns. Less than 50 per cent of the schools require lighting on inside stairways, varying between five and 10 foot candles. There is also disagreement whether or not inside stairways should be enclosed, and if so at what floor levels. Only a very small per cent require the undersides of staircases to be covered with fire resistant materials.

Three-fourths of the returned questionnaires said outside fire escapes are required, mostly the metal stair. Next most popular is the vertical metal ladder. Wooden outside stairs, wooden ladders and ropes are permitted to some extent. Only a small per cent require fire towers, however, no distinction was made between new and old construction.

FIRE PROTECTION DEVICES

Fire warning devices are required by less than one-third of the institutions, and few require the automatic type. All institutions require fire extinguishers at least one for each floor with several schools specifying additional ones for the kitchen and furnace rooms. For the most part, problems in-

volved with the use of carbon tetrachloride extinguishers are recognized, and most prohibit such extinguishers.

Fire drills are required in less than one-fourth of the standards and less than 10 per cent require the presence of the fire chief or representative at fire drills.

A definite space requirement for each individual student is specified in most standards, ranging widely in the amount of space required. Few of the standards establish a specific distance requirement between bunks, single or double. The safety problems from the students use of his room as a study, living and sleeping room and perhaps even as a laboratory need investigation.

Although a high per cent of questionnaires indicated that special storage areas for combustible materials are required, few specify that these areas be fire resistant. Requirements for storing poisons and dangerous tools have been neglected.

MARRIED STUDENT HOUSING

Answers received from the few questions allocated to married students' housing indicated that consideration of safety is necessary in this field.

In indicating whether a provision was felt essential, desirable, or not desirable for inclusion in a housing standard, opinions were mixed. Desirable was checked twice as often as essential. These opinions indicate a degree of enthusiasm for the importance of the item. Most respondants feel these safety provisions are necessary in off-campus housing standards.

A student spends more time in his room than any other place while at school. His room is his home, his study and work area. Our safety standards, actively enforced, can protect him physically and educate this future community leader to the importance of health and safety in housing.

RECOMMENDED OFF-CAMPUS FIRE PROTECTION PROCEDURES

by FRANCIS J. QUINLAN

fire inspector, Cornell University, Ithaca, N. Y.

To dwell under the same roof with others has always been economical and has become widespread, both as a transient and permanent mode of living. But with the benefits of economy, we must have certain assurances of safety. There must be sufficient light, ventilation and sanitary facilities to safeguard our health. Even more important are the precautions to minimize hazards of fire. Therefore, the most important elements which determine the desirability of an off-campus property are those which involve the personal safety of the occupant.

Each spring 2,000 Cornell men must find living accomodations in private rooming houses. Many men are prior off-campus residents and merely recontract for their rooms. However, approximately 150 freshmen and 1,000 upperclassmen in dormitories must, with little or no experience with off-campus housing, seek such accomodations annually.

The ever increasing number of married students, both graduate and under-graduate, many new to the community, find themselves with a similar problem in apartment house hunting.

This situation has led the university to maintain contact with off-campus housing through establishment of the administration of housing policy, as the responsibility of the Off-Campus division of residential halls. The responsibility for the program concerned with fire and safety has been delegated to the safety division.

INSPECTION PROGRAM

Our inspection program started on a limited scope in the early 1950's and our first objective was to cover a number of the larger rooming houses in an area adjacent to the campus called "Collegetown." Due to limited time and personnel, it was possible to inspect only 68 dwellings. Each succeeding year the number of inspections has increased and at the present time we cover not only rooming houses, but apartment houses, as well as single family units.

Our most recent inspection program began in April of 1956 and to date has covered more than 1,000 dwellings not inspected previously. Even with this greatly expanded program, we covered only Ithaca proper and the areas adjacent to the city.

Preceding our initial inspection of every private dwelling, unless it is an immediate family dwelling, an explanatory letter is sent by the Off-Campus housing division to every owner, tenant, or lessee. This letter states the reason and purpose of our proposed inspection and also encloses a small mimeographed form to be filled out and returned.

This form gives the owner, tenant, or lessee an option whether or not they desire to be inspected, and if so, their preferred time and date. This formality absolves the university of any liability during the actual inspection. If the person fails to return the form, or states they do not desire inspection, the dwelling is removed from the housing list and is not re-listed until they are inspected.

QUESTIONNAIRE FORMS

The returned forms are surveyed by both divisions with regard to location, preferred time and date of inspection. A more adequate inspection can be made if experienced inspectors from both divisions operate as a team, and if the maximum number of inspections per day does not exceed 12 units.

The preliminaries completed, the inspectors can now begin operations. We use a single page mimeographed fire inspection report sheet to compile the information. The following eight major items are covered:

1. Construction
2. Occupancy
3. Egress facilities
4. Inside protection
5. Light and power
6. Housekeeping
7. Heating system
8. Observations and recommendations

The inspectors have proper identification and most important, are neat, courteous and prompt when making the inspection. Many conditions can be corrected while making the inspection—if a little time is spent explaining the hazards. It is not a good policy to make statements on the possible rating of the building at this time. After the inspections, we go over the forms for corrections, additions, or deletions. Only then are the ratings attached to the form. Here is our rating system:

A—Designates approval by both divisions and immediate listing.

A Qualified—Partial approval by both divisions but no listing, until minor hazardous conditions have been corrected. A re-inspection is usually held in 30 days and if corrections have been made, an A listing is given.

B—Designates disapproval and no listing given. Buildings in this category do not have two means of egress from the third floor, have poor housekeeping, major electrical hazards, or are structurally unsound. The only time a B listing is re-inspected is by request of the owner subsequent to all corrections. They too, are then listed as A.

The off-campus housing division maintains an up-to-date approved list in the office of residential halls and a mimeographed copy of the list is mailed to all incoming upperclassmen and graduate students by the Admissions office.

It is still permissable for students to live in buildings not inspected and approved but two serious fires in off-campus apartment houses not inspected may help to correct this condition. It was fortunate that no lives were lost in either fire and I would like to describe briefly the most serious one.

OFF-CAMPUS FIRE

A number of years ago a small frame hotel, just beyond the incorporated city limits, was converted into a six unit apartment house. On April 29th at 11:30 a.m. a student occupant in a second floor apartment smelled smoke and found the hallway heavily charged with smoke. He only had time to call the fire department and evacuate the building.

The fire department was confronted by an intense interior fire, propagated throughout the building, and could do little but protect the surrounding property. The building and contents were a total loss and the gutted shell was torn down. Investigation showed that the owner had failed to provide even the mihimum fire or safety standards, and had allowed inadequate wiring to become heavily overloaded, which had finally caused the fire. I dread to think of what might have resulted if this were only 12 hours later.

The fire and safety program in all of Cornell's fraternities, sororities, associations, and cooperatives has been the responsibility of the safety division for the past 10 years. Each September, we mail to each house two copies of our fire service contract, which the house president signs and returns to our office. The cost of the contract varies for each house, and is based on the number and type of fire extinguishes which our fire service men service and recharge.

In addition to servicing first aid fire appliances, we provide the house with fire prevention literature, conduct fire drills when requested, advise on plans for new construction or remodeling, and inspect the building in the fall and again in the spring each year. We always follow-up on the correction of a hazardous condition.

Our fall inspections usually begin about the first of October, and again, we use a single page mimeographed fire inspection report designed especially for this type of building. We cover not only the eight major items for off-campus housing, but also vertical and horizontal openings, fire prevention activities, fire drills, and others. Whenever possible an officer of the fraternity and the head resident of each sorority accompanies us while we make the inspection.

PERSONAL CONTACT SUCCESSFUL

This presents the opportunity to discuss, first hand, any hazards. We have found that the correction of most hazards is much faster when explained to a responsible person. Upon completion of inspection, the forms are returned to the office and are checked similarly to those of off-campus housing. Copies of the completed form are sent to the house, to the Inter-Fraternity council, Pan-Hellenic council, and the Alumni advisors. The inspection conducted in the spring is practically the same except it is more of a follow-up.

Buildings on or off-campus occupied as dormitory units are inspected monthly. We are still making changes and alterations to comply with the State of New York Multiple Residence Law. We work very closely with the local authorities, especially the building commissioner who has the final jurisdiction on the compliance of that law.

A look into the future is still not a happy one. The inspection program is a never ending problem, but this is no time to sit back and rest on our laurels. At almost every college and university in America, thousands of new students will have to live off-campus, and every effort must be made to have safe housing for them.

SCHOOL RESPONSIBILITIES FOR SKI SAFETY

by WILLIAM R. JUDD

director, National Ski Patrol System, Denver, Colo.

A public address system echoes across the crisp mountain air: "Patrol on Trail 8, Patrol on Trail 8!" Seconds later, skiers wearing bright rust-colored parkas and a badge with a blue triangle and orange cross, grab the handles of an unusual-looking toboggan, swish downhill and halt near a prone figure crumpled in the snow. In less than one minute, the patrolmen have their skis off, and quickly but carefully examine the crumpled figure. Then they unstrap first aid belts from their waist and less than 10

minutes later renew their downhill run, this time cautious and bump-avoiding as the toboggan bears precious cargo!

This scene is repeated several thousand times in more than 350 ski areas in the United States, Alaska, and Southern European U. S. Army Command each winter. For within these geographical limits the Ski Patrol, officially known as the National Ski Patrol System, operates. The slogan of this group of 5,000 professional and voluntary, men and women is "Service and Safety."

The first concern of the N.S.P.S. is to evaluate the size of the ski safety problem. Therefore, it is necessary to establish accident rates. Each ski area reports its accidents and the number of skier man-days for the season ("skier man-days" are the number of skiers using the area during the season). Generally, the magnitude of area use is important in analyzing safety problems. Therefore, with the man-day as a base, the areas were grouped and their accident rates per 1,000 skiers computed. Rates are indicated below each area grouping; these figures are the number of accidents expected per 1,000 skiers on the slope.

ACCIDENT RATES ANALYZED

The lowest rate occurs at the areas having more than 100,000 man-days. The large areas generally have well-maintained chair lifts, excellent ski schools, well-manicured slopes (free of rocks and stumps and often planted in grass), voluntary and professional ski patrols well-supplied with equipment, and their skier population generally stays two or more days at a time. The intermediate areas may have similar facilities but depend on voluntary patrols only on weekends. Finally, the ski business being what it often is, these areas must hold expenses to a minimum.

This means use of modest cost ski lifts such as T-bars, pomas, or ropes. Here there's a potential hazard because (1) these move great numbers of skiers rapidly, and are built close to the snow and (2) the skier can obtain more uphill rides and acquires more muscle fatigue from the frequent downhill runs. Because manicuring slopes is expensive, these smaller areas may manicure at inadequate intervals, and, to cut the payroll, the size of the operating staff may be below safety standards. In addition, the majority of skiers at these areas are there only for one or two days and therefore in poorer physical condition. Also, the lack of sufficient downhill facilities may result in over-crowded conditions on the slope. These reasons cause the relatively high accident rate of 5.2 per 1,000 skiers for the small area.

THE VICTIM IN SKI ACCIDENTS

Age. Our crumpled body could be a boy or girl although records slightly favor the male sex. This boy is between 10 and 17 years old—with odds being closer to 17. However, the results from sampling about 7,000 average skiers showed an average age in the middle to late twenty's. Therefore, there is a higher percentage of accidents in teen-age groups than in the majority age group on the hill.

Experience. Usually it is the skier's first winter on skis. Probably, he had skied six or eight times and was just beginning to consider himself a member of the 1960 Olympics! If accident statistics had been available to him sooner, he probably would have realized that skiing is not as easy as it seems. Another accident-prevention lore is that lessons from qualified instructors reduce his chances for injury.

However, the beginner leads the accident ratings by only a slight margin. Nudging him for first place is the skier with at least two full seasons of experience and several ski lessons. We expect the beginner to be more accident-prone, but why are a higher and higher percentage of injuries occurring to the experienced skier? A tentative answer: "Too much confidence in his ability, and too little safety knowledge." But, there are other contributing factors to the problem.

Equipment. Proper equipment is essential to the skier's safety and his proper enjoyment of the sport. Of most concern is the contraption that keeps the skis on the skier's boots, a "binding." Equipment manufacturers have developed various types of bindings with safety valves that release when the pressure gets too high and before the pressure is transferred to a leg bone.

Because it is not foolproof, this type is correctly termed a "release" type binding, or sometimes erroneously and disastrously referred to as a "safety" binding. A con-

siderably lower percentage of accidents occur to skiers wearing release-type bindings.

One binding termed "long thongs" deserves its own niche in the hall of accidents. This was developed primarily for competitors to fix the ski firmly to the boot; the rigid connection provides the split second control of the ski for high speeds, or hairline control required in the intricate weaving of a slalom. The recreational skier, in an attempt to emulate his idols, ignores the fact that he lacks the physical condition and the ability of the competitor. When he falls the "long thongs" keep his boots—and feet—firmly implanted in his skis, and the Ski Patrol uses more first aid supplies.

The conventional binding, while not quite as "binding" as "long thongs," does a pretty good job as far as the manufacturers of plaster are concerned! Incidentally, the ski boot fit is of prime importance also in accident prevention. Too loose a fit results in lack of control of the skis. For example, the skier may try to turn, but when only the foot turns in the boot without a resultant movement in the ski, an accident can result.

TIMES OF SKI ACCIDENTS

Most accidents occur about 3 p.m. when traffic is heaviest on the slope. At one time we thought that because most accidents occurred in the late afternoon, fatigue was a major factor. But, considering traffic density and the short amount of time the average victim was on the slope, fatigue does not appear to be an important cause. In fact, records show the skier was on the slope less than an hour when he needed the Ski Patrol. In addition, the percentage of accidents actually decreases with an increase in time actually skied, so fatigue is not the cause.

Type of Injury. The first thing the Patrolmen examine — providing there is no blood on the snow or the skier's clothing— is the condition of the victim's legs. The chances are nine out of 10 that a leg or ankle was injured. Furthermore, he had a 50-50 chance of having a sprained ligament. These guesses were based on logic as well as statistics. After all, what part of the body is under the most strain in skiing?

Secondly, what is most likely to give way first under the strain? If the boot does not release from the binding in the fall, the entire body weight pulls against the skis firmly held in the snow. This pull is focused in the legs where most flexibility is at the ankles; the ankle joints will bend until the stretching or tensile strength of the ligaments or tendons is overcome by the pull. If this pull is so severe or in such an awkward direction that both the ligaments and the bones are overstressed almost simultaneously, then a fracture will occur.

Secondly, 1.3 per cent are impaled on their own ski pole. This often could be avoided by proper pole length, holding the pole strap loosely so the pole flies free in a fall, or if the pole points were blunted and slightly bent. The Ski Patrol Manual, for example, points out that if the snow is so hard that sharp points on ski poles are required, then your skis should be replaced with ice skates!

Or, what about our third largest category of accidents, the 10 per cent that tried to determine whether their hide was tougher than the steel edge of their skis? This injury is increasing, and the reasons are more evident. For one thing, there is an ever-increasing use of offset edges on skis. (An offset edge is a steel edge protruding on the outside of the bottom of the ski for better turning control.)

The increasing use of release-type bindings has brought with it "flailing" skis. That is, when the ski comes loose in a fall, it flails the air and the skier before coming to rest. The skier can reduce this 10 per cent rate if he adopts an "Arlberg" strap, a long leather strap wrapped snugly around the ski boot and the binding. When the binding releases, the ski is kept close to the foot to prevent the sharp edges from flailing around. Unfortunately, many skiers wear a long and very loose strap or even a shoe lace to connect their boots and binding. On the other hand, some skiers feel: "If I can just keep the ski far enough away from me, it won't hurt me!" and do not use any strap. The only thing wrong here is that a loose ski sailing downhill about 40 mph under its own power can be terribly damaging for an unwary bystander!

Another type of injury is in the 1.9 per cent "Miscellaneous" catchall. Several cases of carbon monoxide poisoning have occurred in and near ski areas. Skiers, or more particularly spectators, protect themselves from the chilled air by closing all car windows and keeping the heater and motor running. Modern automobiles still leak carbon monoxide. Eliminating this accident by education is not difficult.

CAUSES OF ACCIDENTS

Patrolmen hear many complicated alibis. The victim says he caught an edge, or another skier appeared out of the blue and scared him, or he hit a hole, or he hit a bump, or his tips crossed.

Unfortunately, there are such things as practically unavoidable accidents. For example, 3.6 per cent of these injuries result from skier-skier collisions. A capable skier may be coming down a slope, when a novice skier at high speed crashes into him! The remaining 4.4 per cent of this category were skier-object collisions involving stumps, rocks, or trees. If the object protruded above the snow, the skier can only blame himself for not avoiding it. However, if he hits a buried object under the snow, there may be some justification in blaming an area operator. Whether such an accident is unavoidable is questionable. Just as the motorist should drive cautiously on a strange highway, so should a skier proceed with caution in strange terrain.

Another accident in the "preventable" category has to do with ski lifts. An inexperienced skier should receive a little quick instruction before grabbing hold of a fast-moving rope. If the chair lift operator had kept his equipment up to top safety standards, that chair or its hanger cable would not have dropped several feet into the snow or rocks. Proper safety gates should be provided at the top of the rope or the T-bar to stop the skier.

Skiers might not break legs if the operator smoothed out the tow track ruts so they would not catch a skier's binding. And then, there is the happy lad that jumps off a T-bar, swinging the bar high in the air. He skis safely away unconscious of the unconscious body in the snow behind him— the skier riding the next T-bar that could not duck quickly enough.

Lastly are those skiers using long wool or silk scarves or loose sweaters when riding a rope tow, or even a T-bar. Capital punishment can be inflicted by clothing entwined in a fast-moving rope!

SKI SAFETY EDUCATION

The basic fundamentals of ski safety, and the results of a lack of safety are known. The student must correlate these two factors. However, one thing must continually be emphasized in any ski safety program. We must not destroy the student's confidence. On the other hand, we must not build up overconfidence. This factor of overconfidence is of particular importance in sports of speeds 60 to 70 mph, and where nature does her share to throw in hazards.

Ski safety education must concentrate on first aid instruction, physical conditioning, ski instruction, good equipment, survival training, and psychology. For many of you, meeting this problem for the first time, here are a few trail makers:

PHYSICAL CONDITIONING

The physical exertion in skiing is as demanding on the human body as football, track, or any other strenuous outdoor sport. The stresses and strains on the muscular system and the human bones in a high-speed spill, or even a slow fall, are almost unbelievable. The principle of the lever explains this; the skis are firmly held in the well-packed snow, whereas the body still moves forward with the same acceleration it had when the skis stopped. Good physical condition minimizes the results of such accidents, but it cannot eliminate them.

Proper physical conditioning must be directed toward three goals: strengthening muscles, tendons, and ligaments, quickening the reflexes and expanding lung power. As for any sport, body conditioning should begin before the skiing season starts. During ski season, they should be continued if the skier is just a week-end skier. Daily repetition of these exercises is absolutely necessary: ten minutes a day often is sufficient.

Following are a few exercises that also can be used as a guide for developing others: (1) Deep knee bends, (2) rising up and down on the ball of the foot, (3) placing the toes on a book laid on the floor and then rising up on the toes, (4) long hikes interspersed with occasional jogging or slow trotting, (5) attaching an inner tube to the wall and stretching it with the hands or feet, (6) frequent swimming materially aids the lung capacity although some ski coaches say it has a tendency to

weaken the ankle muscles. The important thing is to stress daily repetition of these and similar exercises prior to the ski season, and their continuation during the season.

First Aid Instruction. As experiences in industry prove that industrial accident rates are reduced if employees are trained in first aid, so in skiing. First aid training makes the student aware of the consequences of an injury and is less apt to take chances. This training is a part of the curriculum of many schools. Where it is not, classes outside school can be assembled through the local American Red Cross chapter.

SKIING INSTRUCTION

Skiing differs from some sports, in that a beginner needs a competent teacher before trying it. The greater percentage of skiers have not had competent instruction. As a result, they never learn to ski properly and are always potential candidates for Ski Patrol service.

At one time, skiers *had* to learn by the "by guess and by gosh" method. Today, however, most ski areas have schools supervised by certified instructors. This certification requires the candidate to pass rigid oral, written, and field examinations on his teaching and skiing ability. The cost of instruction is nominal. The Patrol often warns the novice that he can choose between ski lessons or an X-ray, as they both cost the same! The important thing is that the instructor be certified and that the lessons be continued.

It also is important to stress that the novice should not learn from his friend unless that friend happens to be a certified instructor. Lest "commercialism" rears its ugly head, it should be explained that certified instruction was instigated by your ski associations and ski patrols as a safety measure; it is endorsed by the United States Forest Service who administers most of our ski areas. For example, no ski school is permitted on Forest Service land unless it is run by certified instructors. Ski instruction will permit greater enjoyment of a wonderful sport, and reduce the chances of an accident.

Ability Analysis. We now come to what is probably the most important single contributing factor to accidents. How do we teach the skier the limitations of his ability? He has to realize his limitations from the first time he puts on skis, right up through many years of lessons, and even into competition. It is a factor that all too often is under-emphasized. Unfortunately, because of the ease in making turns many ski schools teach their students on packed slopes. The skier may learn the proper weight distribution and body movement for a turn on a packed slope, but, all too often when he attempts these in soft, deep, or crusty snow his turn comes to a disastrous conclusion. This analysis ability could be effective in a ski school. Forewarning can be given. The skier must try his skill in all types of snow conditions and on all slope gradients.

An important adjunct is to teach the skier the limitations and dangers inherent in certain terrain and climatic conditions. For example, in the early part of the season, the snow may be deep but without a firm base and the skis may break through and hit a hidden rock or stump.

The expert, for instance, avoids skiing close to a tree trunk where snow has been continuously in the shadow; he knows that this snow may be extremely soft. On the main slope during the day, the snow softens and offers little resistance to the skis. But by late afternoon, the surface begins to freeze *into hard ridges that snag ski* edges. These are factors learned by experience, and the beginner should be cautious when skiing through strange terrain or in bad weather.

In addition, 0.5 per cent of the accidents are caused by poor visibility. When it starts to snow hard or a fog settles over the slope, the overly enthusiastic skier refuses to give up, and trees, deep holes, or other skiers, completely invisible because of a blizzard, become hazards. "Flat light" is another dangerous visibility condition that often occurs above timberline. A complete overcast with a bright sun behind the clouds causes the snow surface to blend into the sky. *Thus, it often is impossible to determine* terrain contours. A skier may be thinking *he is going downhill, but unexpectedly rapidly rise* uphill because a snow bump appeared to be part of the sky. This light condition is extremely dangerous and the skier should leave the slope immediately.

SELECTING SAFE SKI EQUIPMENT

Now comes the third important educational problem—selecting proper ski equipment. The choice of equipment is controlled by cost, style, the skier's ability, the advice of his friends and the sporting goods salesman.

The most important purchases are skis, boots, and bindings. There is an old but accurate saying that "the foot should fit the boots, the boots the bindings, and the bindings the skis." If this is complied with, the skier will be unable to wiggle his ankle or his foot without also causing the same amount of movement in his ski. A loose boot or loose equipment means lack of control and a resulting accident.

Boots. These should have a snug but not a tight fit to avoid freezing the feet, a stiff sole that does not buckle when the binding is tightened, a stiff toe to prevent constriction of the toes, and at least one pair of heavy wool sox worn when fitting the boots.

Bindings. The bindings should be a release-type. Considerable emphasis must be given to the binding adjustment. Adjustment of a release-type binding should be done only by an expert. Most of the 35.7 per cent accidents on release-type bindings were caused because the victim thought his binding was too loose; he proceeded to tighten it so much that it could not release. A long and strong leather strap should connect the binding to the ski boot to prevent loss of the ski in a spill. The best strap is one that winds around the boot and the binding so that the ski will not flop around in the air when released.

Skis. These must be selected according to the weight and height of the individual —the heavier the person, the longer the ski. The amount of flexibility will depend upon the use and the skier's ability. The beginning skier needs a ski with medium stiffness. Too much flexibility causes control difficulties on a hard packed slope; too stiff a ski may be hard to handle in deep snow.

Ski Poles. As far as accident prevention is concerned, a long pole is preferred. Too short a pole may jab into skier during a spill. Too long a pole may be too difficult to handle. A pole of proper length will reach from the ground to somewhere between a hand's width above the belt line and the arm-pit. The points on ski poles should be blunted and bent slightly to reduce their ability to penetrate the body. The poles should be made of a material such as cane, fiberglass, hollow metal that will bend rather than break if the skier falls on them.

Misc. Equipment. The remainder of the skier's equipment—clothing, goggles, hats, mittens will depend on the weather conditions in the area and his predilection for local fashions. Clothing should be selected on three basic principals: (1) an inner layer of absorbent material, (2) a center layer for insulation, and (3) an outer layer that offers wind protection, some water repellency, and will not allow snow to adhere to it. To prevent perspiring and subsequent danger of freezing, it should be easily opened when the skier becomes too warm.

SURVIVAL TRAINING

Our final topic is to be taught only by an expert. It is vital to a skier who intends to do winter-mountaineering or touring, or in anyway get off the beaten path. As a matter of fact, it is important knowledge for anyone in snow country in the winter time.

First and most important is never travel alone in the mountains or woods; stick to the rule of four. Then, if someone gets injured, one can stay with the injured person and the other two can go back for help. Secondly, anyone traveling across country in the winter should have and be able to read a compass and a map. Third, whether skier or motorist, they should have a minimum of first aid supplies, edequate clothing, some basic food rations, and know how to build a fire and construct emergency shelters in the snow. In the high mountain areas, a basic knowledge of avalanche recognition is absolutely necessary. Much of the detailed knowledge on these subjects is given in the Ski Patrol Manual which can be a basis for brief courses on winter safety.

Teaching Aids. It probably is apparent by now that much of the material discussed is as technical as any course in algebra, geology, or English. This poses the question: "Where can the teacher acquire the necessary knowledge for proper safety instruction?" There are many aids at his disposal. For example, members of local ski

patrols and certified ski instructors volunteer their time as lecturers. American Red Cross chapters provide first aid instruction. Members of local ski clubs encourage beginners. Finally, there are such written materials as the Ski Patrol Manual, safety posters, USFS Avalanche Training Handbook, various mountaineering handbooks and many books on skiing. Ski movies available with little or no charge show the beginner the advantages of proper training. The services of a divisional ski association, the National Ski Association, and the National Ski Patrol System always are available for the promotion of ski safety.

As was previously emphasized, the ski safety campaign is practically a year-round job. Physical conditioning should start in the summer and the "book learning" in the fall immediately prior to the season and continued from time to time thereafter. This training often can be combined with the advanced course in Red Cross First Aid.

One point recently considered the most important contributing factor to ski accidents is "Overconfidence." Whereas the skier must develop confidence, he must not be taught to be so confident that he thinks he can do anything. The one that thinks he can do anything, often does, much to the benefit of local orthopedists, X-ray technicians, and hospitals.▲

MAKING STUDENT ACCIDENT RECORDS WORK

by NORMAN V. STEERE
assistant director, Dept. of Public Safety, Michigan State University, East Lansing, Mich.; chairman, Committee for Standard Accident Reporting in Colleges & Universities, N. S. C.

Most colleges and universities do not prepare reports of student accidents. The few who do report student accidents depend on their college hospital or health service for the reports on student accidents, a practice which is not universally satisfactory.

The question might be asked, should an effort be made to obtain reports of student accidents in colleges and universities? For three reasons I believe the answer should be yes.

First, records can furnish concrete proof that a real problem exists.

Second, accident records can determine the frequency and severity of student accidents to show progress of safety programs within an institution or to compare with accident rates at other institutions.

Third, records can provide necessary information for a planned safety program. Accident records are the foundation of a scientific approach to accident prevention.

Student accident reports to demonstrate the magnitude of the problem could be fairly simple and relatively brief. Brief student accident report forms can be obtained most readily through the cooperation of the medical and nursing staff of the hospital or health service at your college or university. If you can obtain the assistance of your institution's student health service in obtaining simple reports of student accidents, you have taken a large first step toward an intelligent prevention program and a safer campus for your students.

EVALUATE STUDENT EXPOSURE

Determination of student accident rates for comparison with other universities is a problem considered by the committee for standard accident reporting in colleges and universities. John Hill, Director of Workmen's Compensation Insurance, for the Texas A & M College system, outlined the problem as follows:

"To determine an accident frequency and severity rate for students in their pursuance of academic studies, it is recommended that we establish a uniform exposure procedure.

This exposure will necessarily require consideration of the total number of students enrolled in the institution.

"Provision should be made to evaluate student exposure on the following basis:

A. Students residing in dormitories on the campus
B. Students residing in approved off-campus housing
C. Day students who commute to the campus
D. Part-time students (those registered for less than a normal semester or term load)

"Exposure for students must consider the total number of full-time students enrolled. This will mean converting part-time students into full-time. It must also consider total credit hours or semester hours for the basis of arriving at a full-time student. Suggested formulas for computing frequency and severity rates for students are as follows:

- Student frequency rate is the number of accidents resulting in a student's being absent from class for 1,000 full-time students enrolled.
- In determining a full-time student, it is recommended that we consider 30 semester hours or 45 term hours for one full-time student year. For this we can determine the total full-time students registered for 12 months period in our institution.
- Student severity rate is the number of academic days lost by students who are unable to attend because of injury per 1,000 full-time students enrolled. In determining student days for severity, it shall mean a student's being disabled from attending class for one full day.

$$\text{Student frequency} = \frac{\text{Disabling injuries} \times 1{,}000}{\text{Total full-time students enrolled}}$$

$$\text{Student severity} = \frac{\text{Full days missed from class} \times 1{,}000}{\text{Total full-time students enrolled}}$$

Further details as to what constitutes a disabling injury and a full day missed from class must be considered."

John Morris, safety coordinator at the University of Illinois, suggested that days in the hospital per 1,000 students would be a significant figure readily determined, and that student accident rates not be based on classes missed. He said that days missed from class due to injury would be difficult to find, and further, that students will be going to class with disabilities which would not permit them to work at any job, such as the intrepid skiers who carry a fractured arm or leg to class for weeks.

DISCUSS ACCIDENT REPORTING

Within reasonable limitations on man power available for accident investigations, and the amount of responsibility which college students accept voluntarily, there may be possibilities of getting the injured student to fill out his own accident report.

Although we have not gotten off the ground at Michigan State University on a student accident reporting system, our public safety department has held a meeting with a dozen student leaders and received a number of suggestions on ways in which reporting student accidents by students could be implemented.

The suggestions were (1) to explain the reasons for student accident reporting at registration time as a part of the registration process and (2) to use various other means of soliciting cooperation of the students. It was suggested that a simple, card stock, check-type accident report form which could be key punched for sorting and analysis, be developed. This could be sent to the safety department through campus mail with no postage required.

It was suggested that copies of the student accident report forms could be available to students waiting for treatment in the college hospital, dormitories, fraternities and sororities, and to umpires at intramural soft ball games. The student leaders accepted fairly readily the idea of reporting all accidents to students regardless of whether they occurred on or off campus or during or after instruction periods.

Thelma Reed, chairman of the Standard Student Accident Committee, gave the reasons for colleges' and universities' gathering information on injuries occurring to students while they are not in school. In her article "Using Student Accident Re-

ports" in the January, 1957 issue of *Safety Education* magazine, Thelma Reed said "if the school administration is to have complete information on which to base its safety effort, information on student accident experience cannot be limited to those injuries resulting from participation in the school's program." Thelma Reed's observation applies equally well to colleges and universities.

I hope that within the next year Michigan State University will be able to try out some suggestions of the student leaders to determine the type of form, how the form stands up in handling, and what kind of cooperation to expect from the students. I would like to encourage other colleges and universities which might be interested in a similar program to go ahead so we can compare results and see if we can develop recommendations from our mutual experience.

EMPLOYEE ACCIDENT RECORDS

Most colleges and universities report work injuries only in the detail required for the State Workmen's Compensation Commission. Most colleges and universities do not analyze their employees' accidents for prevention programs. In addition, most colleges and universities don't know how their accident experience compares with other colleges or universities or with comparable industries.

Colleges and universities could compare employee accident rates both within departments and with other institutions by determining their frequency and severity rates. In most cases you can be guided in determining the frequency and severity rates for your institution through the use of American Standards bulletin Z16.1 entitled "Recording and Measuring Work Injury Experience."

The standard method, briefly, is to determine how many lost-time injuries occur for a given number of man hours worked and the total number of days lost for the number of man hours worked. These rates are expressed as a certain frequency or severity per 1,000 man hours.

DETERMINE FREQUENCY

If you decide to try to calculate the frequency and severity rates for your institution, you may encounter one problem that we did at Michigan State University. The number of man hours of exposure in industry is commonly determined by adding the total number of hours worked by the men employed by the plant.

Our University Business Office informed me that because of our payroll set-up, it would be difficult and time consuming for the Business Office to determine the number of man hours of exposure. At the present time, we are considering an approximation of the man hours of exposure by dividing the payroll expenditures in dollars calculated by the Business Office by the average hourly rates determined by the Personnel Office.

After you determine the frequency and severity rates for your institution and decide that you must do something about safety, the next question is, what should you do? A haphazard safety program is costly and liable to be ineffective. You need accident records.

If you set up a separate form for reporting accidents to your newly organized safety department and possibly even a different procedure than is used for reporting work injuries to your business office, you will have the business office and everyone of the operating departments hopping all over you. You can achieve reporting of the information you want with the least frazzled tempers by working with your business office and operating departments to amend the forms for the reporting of accidents which must be reported to the State Workmen's Compensation Commission to include additional appropriate questions and by extending the use of such forms to all employee accidents.▲

SAFETY IN DORMITORY LIVING

by MAVIS HOLMES

dean of students, Southeast Missouri State College, Cape Girardeau, Mo.

As important to a consideration of the values of safety and safety education in college dormitories as the problems of accidents and accident prevention is the nature of the dormitory itself—the setting in which this education and safe living take place. What kind of living is done in a college dormitory? What are its characteristics? What do we expect dormitory living to do for our students? What are the values inherent in dormitory living? How does the life of a college dormitory contrast with that of other types of living?

To view dormitory problems or conditions in the same manner and with the same perspective as other problems is to overlook entirely the distinctive features of dormitory life. In its atmosphere of relaxation, for example its informality, and its emphasis upon the personal needs of students, it is completely foreign to the atmosphere a student faces elsewhere on the campus.

When he attends classes, in student activities, even in the relatively informal atmosphere of the college snack bar, the student is living with the public. He is on guard, aware of his actions and their effect on others. But when he reaches his dormitory he has the feeling that he has come home. He expects to relax, be careless in his habits and less watchful of their effects.

As a matter of fact, he can even be less mature. Whereas on the campus he is an adult and acting as an adult, in the dormitory he is likely to become the young adolescent he was in his home. For example, in a men's dormitory there would be a good deal of wrestling, fighting, and general horseplay. Furniture may be knocked about, bed springs may give way and almost any sort of damage may be done to the room or to the person. Although less vigorous, girls may occasionally indulge in the same sort of thing and accidents may result.

TENSION IN DORMS

On the other side of the scale is the tension of dormitory living which does not exist in a home situation. It is more difficult for dormitory residents to find privacy; they are living in large groups and almost never are they without people near them. Although it is home, it is not quite home, and as a result students are living in an accident-producing tension.

Dormitory living has other characteristics which make it unique in the educational setting. As in a home in one single unit all features of living are combined. As a setting for accidents and their prevention, we can not think in terms of a single type of accident. The laboratory provides certain definite problems with which certain preventive measures will be effective. The class room provides others.

In a dormitory, however, all types of living are combined in one. In the same dormitory, residents will be using bathing facilities; they will be studying and congregating in the same room; they may even be cooking with appliances connected in many devious ways. They will be visiting neighbors in adjoining corridors and traversing long halls which are in themselves semi-public. They might even be carrying on athletic activities.

All of these activities will be carried on under one roof, and, therefore, prevention of accidents will have to take into account the fact that all types of accidents may occur. We must be prepared for anything. We must even be prepared for the invasion from the outside.

Thus, it is apparent that dormitory living is not simple type of living. It offers the student opportunity for relaxation, but also presents problems which he does not have in other college situations. It presents him a home situation, but at the same time multiplies the tensions of a home and the number of its activities.

HOUSING IS CROWDED

Another factor to be considered in student housing situations is the nature of dormitory structures. In the past, college and university campuses have been able to provide

living units of a relatively small size. It has been assumed that a unit of 75 or not over 100 was highly desirable, and if possible, even a smaller unit was provided. Now it is quite evident that such units are not feasible. The greatly expanding enrollments make it impossible to spread our housing over the wide area necessary for these small units. Instead we are building higher and higher dormitories holding greater and greater numbers of students.

As buildings become larger they intensify the problems of dormitory living. As size increases, monotony also increases; standardization of structure and procedure increase. Many times, of course, that adds to the structural safety of a building, but for the resident of the dormitory the homelike atmosphere of the small unit has gone and he is less of an individual as he lives there. Where safety education exists it must become more and more of an activity for the group rather than for the individual.

Part of the understanding of the dormitory setting also lies in the goals we seek for student housing. What do we expect dormitories to do for our students? Since we usually expend large sums of money to provide housing for students, we obviously consider it to have desirable values in their educational development. Students are learning to live in a community, one that is larger than their home, larger than their immediate home neighborhood.

DORM LIFE—MATURING

They are developing a sense of responsibility for their own actions and those of others. They are maturing, developing independence. This may come through a well organized student program in the dormitory or it may be merely a part of the living process. In any event, the room, the corridor and entire dormitory become the setting for the growth of the individual in responsibility and maturity. It is in the living situation that a student can see more closely the results of his actions, and can also practice his skill in cooperation with others.

Here too, however, we must recognize a difference among dormitories. In some dormitories student responsibility may be very great and in others almost negligible. The manner in which his education is being given must be considered before we can plan the type of educational program in safety or any other area successfully. In fact, this is implicit in all we have said about the setting of the dormitory. The type of education in any activity may vary from dormitory to dormitory as well as from campus to campus. What we do must fit the particular setting in which we operate.

Moreover, we may find ourselves concerned not only with safety and safety education in dormitories alone but extended throughout the campus into all types of housing. In these days of crowded housing very few public-controlled institutions can afford the luxury of dormitory housing for all of their students. Increasingly they are forced into using off-campus housing. Some institutions make these units an integral part of their housing program—arranging for frequent inspection and close supervision of the conditions under which students live.

OFF-CAMPUS HOUSING

Such a system is, in fact, so successfully operating at the University of Minnesota that off-campus living standards are nearly equal those in college housing units. Here, of course, safety education can be a very real part of all housing units. In some of our units, however, where we are obliged to use any type of respectable housing available, we can carry on only rudimentary safety education.

All of this is a preface to the assumption that what we know of dormitories and dormitory living determines the type of accidents that will occur in a dormitory, the type of safety education necessary, and even the type that will be most effective. Preface, indeed. It is the very basis of everything we can possibly say on the subject. Our next problem is to determine how to make the best use of this knowledge in the development of a safety program for college housing.

Some years ago a committee of personnel administrators, member colleges of the AACTE made a study of safety practices in college dormitories. The committee had as its aim, "the development of educational techniques in the safety area, some experimentation with those techniques, and an evaluation of them to the end that they might serve as a basis for general use in college programs of residence hall education and counseling."

The committee did not anticipate making a definitive contribution to the field of college safety education, but merely aimed "to develop additional possibilities for education in this area, to exchange ideas, and to observe procedures critically, giving them enough practical use so that they could be evaluated."

VARIETY OF PROGRAMS

Actual experiments in this area of education were carried on in six colleges and they varied from embryonic attempts to publicize the need for such education and the elimination of fire hazards to some well developed programs for the inculcation of desirable habits and attitudes in the area of safe living. The report on this initial experiment indicated that regardless of the extent of the experiment they all had common features: They were planned and carried out by student groups; they all included an emphasis upon the problem of safety in the college plant as well as with education itself, and they all used some sort of check list to arouse in the dormitory residents a consciousness of their own practices in the area of safe living.

A major factor evident in the final analysis of the study is the tentative nature of its results. In fact, no final results in any direction were obtained. Experiments were all student initiated, directed, and evaluated, but the best methods by which such student participation and leadership could be secured for a continuing attempt at self-study and evaluation were not made evident.

It was also apparent that in every one of the experiments the dormitory phase of it was a part of the larger campus whole, and that in nearly every case the interest and leadership for the program lay outside the dormitory in some student group representing the student body as a while.

PROGRAM MUST CONTINUE

The fact that most of these experiments were incomplete indicates, I believe, that any program which is to be successful must be contingent upon the use of a considerable length of time. It must be a developing program conceived with the idea of continuance. Just as education in any of the desirable habits and attitudes necessary to successful dormitory living is a continuing process and as general education for safety is a continuing process, so will it be in the college dormitory.

No single plan will be the only desirable one. Many will need to be tried and some discarded because of their unfitness for the surroundings. Each type of dormitory and campus and each student body will require a different approach.

Here, then, is the setting. It is with this type of living and this background of experience and experimentation we have to work. To develop adequate safety measures in college housing, therefore, the plan we adopt must be variable, flexible, and unique. It must utilize every principle we have learned about safety education elsewhere, and yet it must apply those principles to a unique situation characterized by problems not be found in any other situations.

CONSIDER PHYSICAL LAYOUT

Before an educational program can be developed, however, some real consideration must be given to the physical plant—the actual plans for safety in the dormitory building itself and the maintenance of the completed building. Fire safety has been given a great deal of attention in building planning and certainly it has priority there. Perhaps little can or needs to be done to prepare against accidents of another nature in building plans.

Experience has shown, however, that glass in interior doors, for example, provides an opportunity for residents to injure themselves, that shower stalls placed too near long halls have proved dangerous to those residents who ran quickly from them onto the smooth tile floors of corridors, that unmarked shower knobs may provide a hazard, that loose light fixtures can cause accidents and that sharp-cornered funiture carries its own hazard.

Many dormitory accidents could be prevented by the removal of hazards that have no place in the structural phases of the building—hazards placed there by the carelessness of individuals. Spilled food on the dining room floor, slippery corridor floors, poorly-wired appliances in dormitory rooms, loose rugs, loose light fixtures, stair treads that are worn, or stairs that are uncovered and worn and cooking or ironing facilities

in use in dormitory rooms—all these and many more are the result of the care or lack of it with which the dormitory maintenance staff and the residents treat the furnishings and fixtures of the dormitory. With proper forethought and attention these can be eliminated in building plans or they can be cared for by proper attention to maintenance.

EDUCATE RESIDENTS ON SAFETY

The crux of the problem of safety in this area, however, lies not primarily with structural considerations, but with the extent to which dormitory residents are made aware of their own responsibilities in maintaining safety—the extent to which attitudes, skills and knowledge are and can be developed which will lead to safe living within the dormitory. General principles of safety education are of value here, but only when they are adapted to the peculiar nature of the dormitory.

For example, developing attitudes that predispose the students to adjust properly to their environment is assuredly one of our goals. And in a college dormitory the primary attitude of respect for authority, both college and group authority, is our responsibility. But we must recognize first of all that in developing such an attitude we are dealing with an adolescent who is at the moment at the peak of rebellion against that authority.

The rebellion may and often does alternate with a recognition of his great need for a source of authority, and the resulting uncertainty gives an emotional quality to this whole problem that needs to be taken into consideration in developing a sense of responsibility for authority. Rebels there will be—rebels to flaunt authority, and because so many of them live together, the rebels will have followers. Petty rules may be disobeyed merely for the sake of rebellion. Reckless acts may be the next step. Panty raids, though in themselves no accident, can and do cause serious injury.

EMOTIONAL RELEASES HAZARD

Unrestrained emotion can cause accidents and dormitories are full of examples of that type of action—the endless scuffling that freshmen—and often sophomore—men engage in even though they are aware of the disapproval of house directors and their own contemporaries, and are only too experienced in the damage caused—the initiations both men and women carry on in their dormitories usually held under circumstances which include every sort of hazard—darkness, stacked rooms and blindfolds.

True, any formal programs of this sort have probably disappeared from nearly every campus in the country, but occasionally in a reckless mood students can and do carry out some of their features informally. Hence, to develop attitudes of responsibility, respect for the rights of others, adjustment to the needs of the group—attitudes which will be conducive to safe living—we must be constantly aware of adolescent attitudes toward authority and heightened sensitivity provided by the group in which he lives.

Developing skills in safe living is also a function of safety education. General habits that alert the student to hazards and protect him against them and against all manner of circumstances are a part of his educational equipment and must be our responsibility in the best dormitory living. Students who, at home, took for granted habits leading to safe living now need to be taught to develop those habits in the group.

Appliances used in common need to be checked, for example, before using—at home, one could be reasonably sure they were put away in good order. One's own appliances and light bulbs need to be used with care. One needs to use care in one's personal habits so that hazards are not placed in the way of others using the same facilities. One needs to learn to walk instead of run.

GOOD HOUSEKEEPING ESSENTIAL

But above all, I believe, habits of good housekeeping need to be developed. Cluttered and disorderly rooms are the centers for accidents. Carelessness in the use of bathrooms and halls can constitute hazards. Fewer accidents will occur in neat tidy rooms where the residents are aware of their responsibilities for maintaining order and where good housekeeping skills are established.

After these have been developed, however, after desirable attitudes and skills toward accident hazards and prevention are a part of the student's equipment, we must see that he goes beyond that and acquires the knowledge to deal adequately with an accident situation when it does occur.

In education for fire prevention we realize that in spite of all we have done a fire may still occur, and so we prepare for it with fire drills. Here we must do the same. Accidents will still happen but their effects may be reduced to a minimum by the proper behavior on the part of the students. To give them that knowledge is our responsibility.

These accidents may be predictable or they may be of the purely fortuitous sort that seem to have no direct relationship to dormitory living, that are not in any way connected with the type of activity being carried on there. Such an accident, for instance, is that caused by the sudden falling of plaster in a dining room during meal time, an accident causing some rather serious injury to several students.

Accidents of this sort may also occur because of the nature of dormitories—the centers of community attention and perhaps the subject of irresponsible vandalism. For example, our women's dormitory often becomes the center of attention for teen-agers driving around at night. Usually they confine themselves to whistling, screaming and singing, but one night last summer a bottle crashed through a bedroom window and seriously injured a girl sleeping near the window.

DORMS ENCOURAGE ACCIDENTS

All of these serve merely to point up the fact that accidents may occur simply because a dormitory is a dormitory— and especially a women's residence—and that although they are in a sense a community responsibility, they are primarily the responsibility of the college. Dormitory residents must be prepared against them. Panic can become a very effective stimulus to further accidents. Organization must be set up, education provided so that students are assured and confident of their ability to handle a situation of this kind effectively when it occurs.

How is all this to be done? How are these attitudes, skills, and knowledge to be developed? Full and free discussion of accident hazards, of individual habits that contribute to accidents or to the panic that may follow accidents, and of means of prevention is a first step in enlisting the interest and support of house residents. To arouse this discussion we may have to make use of an accident which actually occurs, or to play upon the obvious structural or housekeeping problems which catch attention immediately. But from that beginning—endless possibilities for discussion present themselves.

From discussion and the development of interest in the problem, the next step is some democratic action. At this point, of course, autocratic house government can provide some learning situations in safety, but the democratically controlled house unit will be most significant in developing group cooperation, group responsibility, setting group standards and providing group leadership.

Conformity is a distinctive feature of our campus life today, and conformity to definitely established group standards in the safety area can be secured if group action is sincere and genuine. Students who provide their own authority are the best reply to the demand for mature, responsible individuals who are aware of accident hazards and can produce the skills and knowledge to prevent them.▲

DEMONSTRATION OF TELEVISION TECHNIQUES FOR DRIVER EDUCATION

by FRANK BURROWS, CHARLES MICHALSKI, JOHN TUCKER
Citizens Traffic Safety Board, Chicago

Seven and a half solid hours in front of live cameras televising traffic safety educational programs were mighty illuminating—and the results encouraging. Summarizing the most important lessons gleaned from producing the 15-week series "The Man Behind the Wheel" the *Citizens Traffic Safety Board* found out that:

- Creating a series of television shows is different from producing spot announcements or interview programs. The interest of the audience must be captured and sustained for 30 minutes. Programs must be "theatre" in the best sense of the word.
- Illustration, not elocution, must be used to make the message come alive. Dramatize. Demonstrate. Even startle the audience now and then. Emphasize and re-emphasize important points.
- Each program should be developed around a single thought to avoid confusing the viewers on what they are to learn during the show. Further, each program should add to the cumulative reaction you hope to get from the audience.
- The programs should be directed at as many members of the home viewing audience as possible. Often include a feature for each age group.
- A great majority of the audience which tunes in your program is interested in learning how to improve their driving knowledge and ability. Don't abuse the opportunity to educate them. Keep this interest alive.

Throughout the series, the CTSB leaned heavily for guidance on the WTTW production manual, written by Colby Lewis, the station's production manager. The practical working knowledge and interest of the WTTW staff made possible frequent use of tricks of the television trade.

For example, to illustrate the difference between day and night visibility, the camera picture was darkened electronically to a shadowy outline. In another program, one camera (two were used) shot a close-up while the second focused on another action. The two images were combined on a "split-screen" to show correct wheel handling via the close-up while the far shot showed a learning driver turning a corner.

ORGANIZING THE PLAY

In writing a story, or a play, an author tries to establish an identity between his audience and the characters in his plot. This creates a valuable personal association. Featured cast members in "The Man . . ." were three non-drivers learning the hows and whys of scientific driver education. Through this trio's eyes and ears the audience shared in a personal experience.

After the plot and story line had been set, and "casting" arrangements made, props, materials, and guest experts who could teach with authority and showmanship were found.

Outline scripts and time cues then established a dramatic high point at places where audience interest usually sags.

There is good reason why a play-wright tries to build a climax on his second act curtain. About two-thirds of the way through any story there is an "interest lag" whether the audience is in the theater or at home in front of their TV set.

At about 20 minutes through each half-hour show an "interest booster" was planned. Sometimes this was just a loud noise, a brake detonator explosion, a police whistle —something jarring—or, perhaps, a transition was bridged at this point with a promise of exciting things to come in the last ten minutes of the show.

DRAMATIC TOUCH HOLDS VIEWERS

"This type of dramatic treatment kept audience interest high," said James Robertson, WTTW's general manager. "The program had been aired twice when we realized we had a 'sleeper' on our hands. I knew it was going to be one of the best series we'd ever put on when I heard our stage and camera crews—usually laconic—discussing vigorously the merits of the show."

Audience reaction was a pleasant surprise to both station personnel and the CTSB staff. Mail response, queries and requests for free educational material offered, continued throughout the entire series at a weekly average of 100 letters and post cards.

"This steady response is sure proof that "The Man . . ." gained new viewers for every program," said Chalmers Marquis, promotional manager for WTTW. "Based on authoritative estimates it is reasonable to say that the programs reached a total audience of 1,500,000 to 2,000,000 persons with a message . . . in depth . . . on safe driving."

Films were used liberally. Some were taken specifically for "The Man . . ." by Sergeant Joseph Casey, head photographer for the Chicago police department. These were filmed against neighborhood backgrounds familiar to the audience. Another film was a sequence in the county morgue. Clips from films such as "Don't Skid Yourself," on winter driving produced by the Aetna group of insurance companies and the National Safety Council were used.

PROPS FOR VIDEO

Among props which illustrated methods of scientific driving instruction were the Aetna Drivo-trainer, psycho-physical devices and blow-ups from pages of "Rules of the Road," produced by Illinois' Secretary of State Charles F. Carpentier, which contains hints. The "Rules . . ." book was state traffic laws and good driving offered free to correspondents along with the driver evaluator test sheets created by the Shell Oil Company originally as full page newspaper ads.

Other props; grim accident photographs were used with the morgue film to illustrate the tragic consequences of inexpert driving; stopping and sight distance charts and simple demonstration devices. (For example: corrugated cardboard was accordion pleated, compressed and expanded to illustrate the Doppler principle of sound waves in explaining how radar works.) A Tinker Toy made a fine demonstration of how power is transmitted through piston, crank shaft, clutch plates and transmission to the rear wheels.

The teaching job was done by guest experts whose authority was unquestionable. Behind the wheel instruction was given by Royal Brown, driver training instructor at Lane Technical High School; Maury Lindquist, chief examiner of the drivers' license division of the Illinois Secretary of State's office and Officer Archie Hignett, director of the police department's safety education unit.

EXPERTS AID PROGRAM

Cleve Wallace, top instructor from the General Motors training school in Hinsdale, Ill. and Carl Dalke, automobile expert of Chicago Better Business Bureau told how to buy a used car. Illinois' Secretary of State Charles F. Carpentier discussed the operation of the central driver's record file.

Judge Alfonse Wells, Chief Referee Francis X. Poynton of Chicago's Municipal Court and Deputy Chief Pierce Fleming of Chicago's Park District police talked about enforcement by police and courts. Charles S. Michalski, CTSB traffic engineer was a frequent guest expert to explain technical points. Other experts: Officer James Casey of the Safety Education Unit, who demonstrated school safety education and Park District Officer Julius Watson, drunkometer technician.

All of these experts, teachers for the day, were able with *films, demonstrations,* and simple devices to make their discussion dramatic and living. Actual driver training behind the wheel was demonstrated by the learning trio in convertible automobiles which permitted the television cameras to examine closely the correct techniques in steering, shifting, braking and clutching.

From time to time, the audience with the three learners saw a demonstration of expert driving. In one such demonstration, Robert Eck, a steel truck driver from the Willett company, dramatized the almost unbelievable ability of an expert driver—he was runner-up in the 1955 state truck competition—piloting his 45-foot long tractor-trailer combination through a maze of tennis balls, traffic cones and one egg, stopping the mammoth combination on a designated pin-point.

Cameras tight on the egg as the huge truck wheel approached while the audio picked up the roaring of the diesel motors was enough to make one viewer comment: "It nearly made my breath stop. I felt like that truck was going to roll right over my stomach."

In another expert driving exhibition, Arthur Henderson and Ed Closson of the Country Mutual Insurance company demonstrated stopping distances. A radar unit focused on their car, combined with the "split-screen" technique, illustrated the point so often preached—so rarely proved—"No One Can Stop On A Dime."

FILMS INCORPORATED IN SHOW

When bad weather made it advisable to stage the programs in the studio, films were used if the rains came without enough warning to arrange an inside show. The films, "Day In Court" produced by International Harvester Company, and "A Closed Book," produced by the Farm Bureau Mutual Insurance company, emphasized the message —SAFE DRIVING IS A WAY OF LIFE.

When possible, studio shows were guest expert panels answering correspondent's queries. On one panel program, the audience was asked to phone in questions while the show was on the air. The switchboard was swamped. About 75 calls were taken by operators while a probable 200 or 300 more callers got the "busy" signal.

Mail and phone questions covered such items as: "What is a safe passing distance on the highway?"—"Should a violator bring his own lawyer to court?"—"What should you do when a tire blows?"—and a great variety of others ranging from: ". . . How hard do you hit at 40 mph?" to "What do traffic police gestures and whistle signals mean?"

Answers to such questions were dramatized. Toy automobiles, large drawings done "live, on camera," a current series of newspaper advertisements, and a demonstration of "The musical virtuosity of the Chicago traffic policeman on his little whistle" all figure in fulfilling the operating maxim: "Use illustration, not elocution."

The experience of producing "The Man Behind The Wheel" can be summarized in this statement:

"Make no mistake about it—a great number of people are lamentably uninformed about the basics of safe, expert, law-abiding, *good* driving practices. Most of them want to learn to be better drivers. The opportunity should not be abused by improper presentation of driver improvement education. Particularly is this true on television which offers so much to the safety education.

Aim your presentation at the group which wants to learn. Make use of all dramatic techniques at your command and the wide possibilities of television production."

PROTECTING SCHOOL BUS PASSENGERS THROUGH EDUCATION

by A. P. SMITH, JR.

supervisor of transportation, State Dept. of Education, Jackson, Mich.

Two persons play an important part in protecting school bus passengers in Mississippi. They are the bus driver and the bus patrol. Education is essential to the safety of the passengers on the bus. I shall deal first with the training of the bus driver.

BUS DRIVER TRAINING

The program for the training of bus drivers had its beginning in Mississippi during the summer of 1945, under the direction of the State Department of Education. In June of 1945, representatives from the American Automobile Association, The National Safety Council, the Illinois Central Railroad, General Motors Corporation, Highway Patrol, State Department of Education met with County Superintendents and 25 or 30 school superintendents for a Bus Driver Trainer's School. During a four day meeting some 25 school superintendents were trained, and plans were made for training school bus drivers over the state.

The demand for trained bus drivers increased year by year. The Division of School Building and Transportation and the Division of Vocational Education have worked in close co-operation in planning, scheduling and supervising training schools with the Vocational Department, providing funds for conducting the schools until July 1, 1954. During the extraordinary session in 1953, provision was made for the State Board of Education to formulate training courses for school bus drivers and for financing such courses.

Every other year bus drivers are required to take the training course and secure a driver's certificate. The training course consists of two and one half days or 20 hours of training, approximately 12 hours in classroom instruction, and eight hours of open road and obstacle driving.

The driver certificate may be renewed the second year for one day or eight hours attendance. During the past two years more than 8,000 bus drivers have taken the training and received certificates. School Superintendents with special training instruct the bus drivers in the local counties and school districts during June, July, and August, under the direction of the State Department of Education.

The value of education and training for the school bus driver is reflected in the fact that during the past 10 years only two passengers have been killed while riding the bus, and four others were killed in an attempt to cross the highway before or after alighting from the bus.

SCHOOL BUS PATROL TRAINING

Under the Mississippi Code of 1942, it is required of the Superintendents of Schools with Transportation to select from members of the student body a safety council for each school bus. The Superintendent of Schools is also responsible for instructing the safety council. The State Board of Education assumed the responsibility this year for training bus patrols.

The bus patrol training course consists of four hours of training. Approximately two hours are spent in the class room reviewing safety regulations, rules of road and slides in correct loading and unloading procedure.

Approximately two hours are spent on the road going through the correct procedure that patrols follow in directing passengers across the highway to and from the bus.

There is no record of passengers killed while crossing the highway when the bus patrol was in action.

PROTECTING SCHOOL BUS PASSENGERS THROUGH EDUCATION

by BILL LEMON

director, School Bus Safety, New Mexico Western College, Silver City, N. M.

In New Mexico we have the school bus "Stop Law" which requires motorists to stop when approaching a school bus from either direction that is loading or unloading children on the highways. We know, however, that any school bus driver who depends on all motorists to adhere to the law is headed for real trouble. Therefore, we feel that training school bus drivers in the procedures and precautions dealing with this operation is our best solution.

At our annual School Bus Drivers Institute, held the first week of August on the campus of New Mexico Western College, Silver City, the loading and unloading of school bus operation is a part of each class whether it be First Aid, Child Behavior, or any scheduled classes in "Uniform Bus Regulations" and "Traffic Law Enforcement." Prior to the Institute a meeting of all instructors is held so that a uniform understanding and presentation can be worked out.

All new drivers must attend the Institute and others at least once each three years. Many drivers attend every year. Enrollment annually is about two-thirds of our 1,200 drivers. We follow this up with schools and

meetings with drivers in counties, cities and towns over the entire state during the year.

This past year our open highway speed limit was raised to 70 mph. This, coupled with increased volume of traffic, new construction, and our accident experience, led us to revise "stop" procedures.

On divided highways, we have no control over traffic in the opposite roadway. We never unload children if they must cross these multi-lane highways to reach their homes; unload only those children living on the side of the road on which the bus has stopped. This, of course, necessitates some doubling back on the part of the driver, but we feel the additional cost and time is worthwhile.

We do not load or unload in a traffic lane but on the parking apron adjacent and do not use flashing lights or stop arms thus permitting traffic to continue. We also follow this procedure on two-lane highways where speed, volume of traffic, and available shoulder space are conducive to this type of operation.

This is uniform over the state and requires the motorist to remember only that he is expected to stop when a school bus is stopped on the travelled portion of the highway and lights and stop arm are in operation, otherwise he is free to continue on his way. We believe motorists will be more willing to comply when they feel we stop them only when essential to the pupil's safety, and, too, when we are getting out of their line of fire when possible.

PROTECTING SCHOOL BUS PASSENGERS THROUGH INSTRUCTION

by EARL HEATH

adjunct assistant professor of education, Center for Safety Education, New York University, New York city

In presenting the case for educating the pupil passenger, it may be well to begin with an examination of the limitations of legislation and enforcement in providing protection for the pupil.

Legislative and enforcement measures were designed to protect the pupil passenger and it is only indirectly that they serve to educate him. Such protection may be said to reach a climax when the motorist who approaches the school bus stops his vehicle at or beyond the distance prescribed by law.

At this point, we may ask: "What happens if he does not stop?" The answer is that he has committed a moving traffic violation and is subject to a warning or an arrest. We then may ask: "What is the effect on the pupil crossing the roadway?" It may be a near-miss, or it may be injury or death.

An individual who attempts to cross the roadway prior to entering or after alighting from a bus is concerned with a myriad of complex external variables, most of which are under neither his control nor that of school or community officials.

CROSSING POLICIES

The several pupil crossing policies may be summarized as falling into one of two categories:

1. Crossing in front of the bus (after approaching traffic supposedly has stopped) as an individual or as a part of a group with or without an assist from a bus patrol member, the driver, police officer or auxiliary crossing guard, and

2. Waiting at the side of the road until the bus has pulled away and accumulated traffic cleared before proceeding across the road under the pupil's own direction.

Experience in the field of pupil transportation and traffic safety education has led me to favor the practice of having each student decide for himself as to the most appropriate time to cross the traveled thoroughfare.

Having pupils cross in front of the bus involves assumptions which are too numerous and too presumptive for a situation involving human lives—assumptions involving the condition of oncoming motor vehicles and their drivers, knowledge on the part of the motorist of the local school bus law, the condition of the school bus, the driver's use of warning lights, and his ability to see that traffic in both directions has stopped, to determine when all pupils have crossed, and to stop pupils about to cross in case of an emergency situation.

STUDENT MUST LEARN FOR SELF

Perhaps the best way we can look at what can be done to educate the individual student as to safe and efficient roadway crossing practices is to dis-associate ourselves from the school bus medium. Since the child throughout his lifetime exercises pedestrian and passenger practices outside the context of the school bus routine, it is believed essential that he be grounded, as early as possible, in practices basic to his welfare where traffic situations are involved. A thorough and effective traffic safety education program for the pupil should include, among other items, the following:

1. Instruction in walking to and from the bus stop site on the left side of the street facing traffic and in making maximum use of sidewalks and shoulders of the roadway.
2. Instruction in crossing streets at right angles and at an alert walk.
3. Looking carefully left and right to determine whether a vehicle is approaching. The determining factor should not be the green light, nor the motion of a safety patrol member, police officer, or auxiliary crossing guard. The determining factor is—are there vehicles to the right and/or left and have they stopped. Then, and only then, should a pupil cross the roadway.

   In most, perhaps all, instances, the patrol member, police officer, or auxiliary guard will direct the students to cross once the path is clear. However, the student should be trained to rely on his estimate of the situation as well. This is good practice because the youth will be crossing many other roadways not associated with pupil transportation.
4. Instruction in evacuating the vehicle in drills similar to fire protection exit drills conducted at the school.
5. Instruction in desirable passenger practices including waiting on the curb and in line for the bus, having fare or identification ready to show to the driver, moving quickly to his assigned seat and remaining there until the bus has stopped either at the school or at his home stop.

Pedestrian and passenger instruction, properly conducted, can be beneficial to the pupil throughout his entire life and will also supplement legislative and enforcement measures designed for his protection.

SCHOOL BUS ACCIDENTS: How Much Do We Know About Them? How Can We Find Out More About Them?

by HALLIE L. MYERS

executive director, Indiana Traffic Safety Foundation, Indianapolis, Ind.

As members of the National Safety Council we seek its opinions. Since the source of much of National Safety Council's information is in its membership, we often have our own opinions fed back to us with the weight of "National Safety Council says" attached to them. One of the purposes of this paper, therefore, is to promote

a healthy skepticism on your part of many opinions that are advanced, and a strong dissent with some things you may have been accepting as truth.

It is fairly easy to dispose of the first part of the assigned subject "How much do we know about school bus accidents?" It could be answered in two words—"Very little." We know so little about any kind of accidents that it is tragic.

The National Safety Council has little information on school bus accidents and only the composite picture of 38 reporting states. Apparently the 10 non-reporting states have even less information.

Someone in each state must know how many school buses are operated. Some others know how many miles they travel per day; how many pupils are carried. Someone else knows how many buses are involved in accidents each year and how many persons are killed or injured in these accidents, but seldom are all of these things assembled in one summary—and beyond this there is little information.

DOESN'T BELIEVE FACTS

It is possible to get a bleak picture of school bus accident problems in Indiana from the published figures. I don't believe these figures, for I am sure we don't have all the facts. I am sure that no one in our state knows how many school bus miles are traveled each year, and I am convinced that, beyond mere totals, no one knows much about accidents involving these buses.

This is not surprising, because even with the best of reporting, our information is always colored by individual prejudices, and biased opinions. The information is always presented to put the blame on the other driver or on the child. It makes little difference to me whether the person or persons killed or injured are in the school bus or in the other vehicle. We cannot assume that the other fellow is always wrong—and even when he is, there are often extenuating circumstances.

In my experience with bus operation I have seen many buses hit in the rear by automobiles with the fault being that of the bus driver. I find it difficult, also, to consider accidents to children crossing highways to board or after alighting from a bus as being anything but school bus accidents, but they may go into the books, in some states, as pedestrian accidents instead.

ONE ACCIDENT RECORD PICTURE

As an example of two ways of presenting the little information we have, consider this statement issued by an official department: "During 1956 the public schools of Indiana operated 6,233 school buses, 200,000 miles per day, transporting some 300,000 pupils. Not a single bus passenger was lost and only one person—a 17-year old driver of a passenger car in collision with a bus—was killed. Only 77 persons were injured in 247 accidents; only 36 were school bus occupants, including 17 drivers, 12 pupil passengers and 7 adult passengers. The remaining 41 were drivers or occupants of other vehicles."

This statement sounds reassuring. It is a tribute to school bus drivers, school administrators and state school authorities—every one has done a good job—a good job, that is, if we don't consider the occupants of other vehicles. But we can't pass lightly over deaths and injuries merely because they did not occur on the bus.

DIFFERENT PICTURE PRESENTED

Now, see how the picture is changed when we add to the above statement the following paragraph based on these same facts. "This performance record shows that accidents involving school buses are occurring in Indiana at the rate of 1.4 each school day; that their accident rate per 100 million miles of travel is 690 compared to 554 for all traffic; their injury rate is 215 compared to 193 for all traffic; their fatality rate in 1956 was 2.8 compared to 6.1 for all traffic and in 1957 will equal or exceed the state fatality rate. 1956 was the third straight year showing an increase in number of school bus accidents."

This sheds a new light on the same picture, and, I fear, not a very rosy light either. I do not vouch for the correctness of either of these statements—in fact, I think both are wrong—but if the first is correct, as we are told it is, then, the second is also correct.

The reason I am inclined to discount them is that school authorities report mileage as the total number of daily route miles, whereas buses make many special events and many drivers make two round trips to accomplish one round trip movement. Accidents on these off-route trips and on deadhead miles are included, of course, as accidents involving a school bus. Perhaps a true report of mileage would bring the rates down.

In any case, these two statements point up two conditions that should be corrected —incomplete information and some apparent tendency to "play down" the record. Our school bus safety program needs some attention. Perhaps yours does, too.

ADMINISTRATORS' NEGLECT

It may be that those in charge have been too close to the trees to see the forest. It may be, also, that they have received too little help from public support groups in getting needed reforms and funds.

It seems that each school corporation has such a small part of the problem that the administrator finds it easy to believe that accidents can't happen to his schools because they never have. In this he becomes much like the man who drowned in a stream that averaged only 3 inches in depth or the average Indiana motorist who, hearing that we have six fatalities per 100 million miles of travel, still knows he will not be one of them because in his lifetime he will not drive even one million miles.

With 247 school bus accidents last year in Indiana, scattered over a fleet of more than 6,000 buses, no local school authority could be much impressed with his share of the total and none could even attempt an analysis of causes. This points to the need for a very careful investigation of every school bus accident and for prompt and complete reporting of all facts to a central agency for analysis on a state-wide basis.

QUESTIONS NEEDING ANSWERS

If I were trying to track down the causes of school bus accidents and devise ways of preventing them—in other words, if I were Fleet Safety Director of School Buses for any state—I would want much more information on each accident than is now available. I would, for instance, want to know: Did the accident involve an empty bus? Was it on a multiple lane highway? Was the bus stopped and standing at the time of the accident, and for how long had it been stopped? Did the accident occur during hours of darkness? Or on a special trip? What were weather and road conditions? Was the stop location a factor? Age and sex of the bus driver? Other driver injured? Experience and training of bus driver. Was a substitute driving the bus? Did the accident involve no other driver? What injuries were suffered, and by whom? Did the bus meet published safety equipment requirements? Was safety equipment used? What was the passenger load at the time?

All of these questions, and more, I would want answered to provide a factual basis for attacking bus accidents. Our best existing source of information on school bus accidents may come from the records and practices of commercial bus fleets. I have found in my experience that commercial vehicle operators have made more progress in reducing traffic accidents than any other group. This probably results from the fact that for many of these operators the costs of accidents are greater than the total net profit of the company.

ACCIDENT REDUCTION PROGRAM

Increasing or decreasing this total represents the difference between profit and loss. They have good records of accidents and drivers. Analyzing their activities further we find that the succesful ones nearly always follow a definite nine-point program of traffic accident reduction which includes:

1. A well defined set of rules and safety practices
2. Careful selection of drivers
3. Thorough training of drivers
4. Accurate records of accidents and drivers
5. Close supervision
6. Regular and thorough vehicle checks and maintenance
7. Removal of hazards
8. Incentives and awards for drivers
9. Penalties

In this batting order "penalties" are in 9th place, which is their proper position. The need for penalties comes only after all the other eight have been used. This list contains exactly what is needed in a public safety program; however, the public inclination is to pass laws as outlined in number one, then skip over the other seven, lightly, to get to number nine—the enforcement of penalties. Experience has shown that we cannot achieve traffic safety that easily. We

must bring the other seven points up to par. Let's take it point by point.

1. In many states there is a more or less concise set of rules for school bus drivers. It is doubtful, however, if many of them tell the driver what his duties are.
2. We have not even begun to do a job of driver selection. There must be some better way devised than the process of letting bus routes to the lowest bidder, as is now required by law in our state. In my opinion, there is no more reason for this than to hire teachers or janitors or superintendents on bids.

DRIVER TRAINING

3. School bus driver training has followed closely the pattern of selection—little done. True, we have, in our state, as in some others, a requirement that each bus driver attend a safety-training meeting each year. These last about 1½ hours. Sometimes these are held before school starts—usually after. This puts drivers in service before the safety-training session is held. In our state, these are conducted by state police officers. Without disparaging the splendid efforts of the police, may I suggest the following:
   a. We used three weeks, at an estimated $300 per man to train commercial bus drivers. It seems likely that one week and $100 per man could be spent profitably for a one time course for a school bus driver. If we can invest several thousands of dollars in a bus, surely we can spend $100 to train its driver.
   b. There is little in the training of a police officer that qualifies him for the specific job of operating or training some one to operate a bus. Such training is done much better by a school which specializes in training commercial bus drivers.
4. School bus accident records are not given sufficient attention. Rarely is enough information secured to permit proper analysis. A high standard of accident reporting *is the principal prerequisite for the* use of accident records. If the original accident reports themselves are poor, the analysis and results from them will also be poor. Since the number of such accidents is small we should be able to get each one investigated by competent persons and collect accurate and complete *information on most of the points* mentioned earlier.

   Such information must then be carefully analyzed and presented to each school administrator in such a way as to be of use in the hiring and supervision of drivers, the maintenance of equipment, the laying out of routes, the location of stops and in developing sound operating practices. Such information as we have now is probably the best kept of all accident statistics—kept, but not used. Its value for historical purposes is small. Let's use it.

SUPERVISE, CHECK FLEETS

5. Close supervision is not practiced in many school bus fleets. It is doubtful if one school corporation in 50 has made any one person responsible for supervision of school bus operation; yet, commercial fleets find it economically sound to use riding supervisors.
6. *In our state and in many others there* is no requirement for periodic vehicle checks or any required maintenance schedule. School buses must be inspected once a year. Commercial fleets give a better inspection every week or 10 days.
7. Removal of hazards. Most school bus route hazards are fixed. It is often impossible to remove the hazard from the bus line, but it is seldom impossible to move the bus line from the hazard. Careful *selection of stops, turn arounds,* routes and schedules with hazard elimination in mind can work wonders. Here it would be well to utilize the services of a skilled bus operations man, rather than a school official. It would be better to use the two together.
8. Incentives and awards are used in few states. Indiana and Virginia, use the National Safety Council Safe Driver Award. This plan provides regular monthly mailings to bus drivers, keeping driver accident records and presentation each year of Safe Driver Awards to those qualifying. The cost of this program in Indiana is paid by an insurance company. This is the highest driver award in the land. Bonuses for accident free operation could be given also as incentives to more careful operation.
9. Whatever penalties are given—and their value is a debatable question—must follow consistent pressure on the other eight points. In fact, unless we believe that a driver deliberately has an accident it is difficult to conceive many situations where a penalty would do more than save face for the administrator. One penalty must be used occasionally. You must remove from service any *driver who cannot* be helped by the other eight points forcefully and faithfully applied.

SEAT BELTS HELPFUL

I want to touch on the use of seat belts in school buses. The present policy of the National Safety Council recommends the use of seat belts on all motor vehicles. This means all school buses, too. I am personally sold on the value of seat belts in motor vehicles. I use them in my own car. In the interest of getting first things first, however, I would recommend that, in our separate areas, we concentrate first on providing a seat for every passenger. We have too many thousands of overloaded buses to even consider seat belts at this time.

The following are specific recommendations for your careful consideration:

1. Provide a course of training for all school bus drivers, given by persons skilled in bus operations, preferably by a commercial bus fleet school.
2. Provide a better selection method than letting bus routes to the lowest bidder.
3. Make each contract contingent on the driver's successful completion of a pre-determined course of training.
4. Adopt and print a clear-cut set of rules and safe operating procedures that define clearly the driver's duties and responsibilities. Be sure he knows what his job is.
5. Adopt and print a clear-cut set of rules for bus passengers and distribute to parents of children using the bus. Let the parents know in advance what the rules are.

SELECT SAFE ROUTES

6. Make a careful selection of bus routes to get as little mileage as possible on high speed roads and as much of the loaded mileage as possible during daylight hours.
7. Select bus stops carefully to get as many as possible off the traveled way and to avoid stops just over the brow of a hill. Turn arounds should also be carefully studied to avoid hazards.
8. Have each school bus accident investigated by the county superintendent of schools and the area State Police Officer. See that a complete report is sent to a central state school official for record and careful analysis.
9. Require periodic vehicle checks of all buses, preferably by a commercial bus fleet garage.
10. Appoint some one person, either full or part time, as School Supervisor of School Bus Transportation and have this person make frequent observations to see if rules are obeyed. Appoint also a State School Bus Supervisor.
11. Provide National Safety Council Safe Driver Award.
12. Send, from a central state agency, an annual summary and analysis of school bus accidents to every school administrator and use the results of such analysis in bus driver training schools.
13. It goes without saying that authority must be given to drivers and must be exercised by them to maintain order on board and in entering and leaving buses.

REQUIRE PHYSICAL SPECIFICATIONS

14. Finally, both school and licensing authorities must put into effect at once procedures and practices that insure physically qualified drivers. An Indiana accident last year which injured six or seven school child passengers involved a bus driver with only one arm. He used a hook for the other hand. This bus collided with a bread truck. It does little for public peace of mind to know that he is driving the same route again this year. In another recent case, the parents of school bus passengers worked through an insurance company to influence a township trustee to remove a 74-year old driver who used a hearing aid. The trustee is paying his

wages for the remainder of the school term.

These 14 points may or may not make sense to you. I know I have wandered far afield from the assigned subject. If they seem visionary to you, just remember they do not seem visionary to hard headed business men whose profit or loss depends on freedom from accidents. They merely outline a standard of performance you have grown to expect from the public transportation that you use.

Are you willing to settle for second class transportation for your children?

SCHOOL BUS ACCIDENT IN THE COURTS

by HARRY N. ROSENFIELD
Washington Counsel & Agent, National Safety Council, Washington, D. C.

The law courts are neither the customary nor the best place for school people to find out ways of improving their school programs. Nevertheless, liability suits arising out of school accidents are to safety and accident prevention programs what an autopsy is to a preventive health program.

The law suit is both a possible sign of failure and an opportunity for possible improvement. Out of the facts disclosed in the trial we can often learn a great deal of what has gone wrong in school safety programs and what needs to be corrected to prevent future accidents.

It has been estimated that the automobile generates over half of all the general personal injury cases in our courts. And to our already overcrowded courts, there are unhappily being added an increasing number of cases arising out of public school pupil transportation.

PRINCIPLES OF LIABILITY

First, let us consider the ground rules of the game. Perhaps it will be helpful if at the outset we compile a glossary, defining some words that will recur in this paper. *Liability*—this must be discussed under two headings:

SCHOOL BOARD LIABILITY—The predominant rule of law in the United States is that a public school board is not liable for accidents except where so required by statute. This is the remnant of an ancient rule that the sovereign cannot be sued unless he consents. Some states have found this rule of governmental immunity from liability for accidents so harsh, unfair and anti-social that they have enacted statutes repealing the rule in whole or part.

Some states, such as California, have an all-embracing waiver of immunity so that California school boards are substantially on a par with private corporations and individuals and are liable when they, or their employees, are negligent. Other states, such as New York, New Jersey and Connecticut, do not in terms waive school board liability, but provide that the school board will pick up the tab wherever one of its teachers has been held liable for negligent performance of duty.

Still other states have a more limited waiver of governmental immunity. In some such states, as Connecticut, Idaho and North Carolina, there is a waiver of immunity for school bus transportation. Many others have repealed immunity, in effect, by authorizing school districts to use public funds to purchase liability insurance for bus transportation. Still others, as Kentucky and Tennessee, have sought to deal with the situation by requiring the bus driver to carry insurance or furnish indemnity bonds.

But it is basic that unless the State Legislature has decreed otherwise, a school board is not liable for negligence. A corrolary of this rule of law is that, unless authorized by statute, such a school board may not purchase liability insurance—the reason is obvious—if there is no liability, there can be no public money spent to insure against such non-existent obligation.

TEACHER LIABILITY—A teacher gets no protection from his employer's immunity. When a teacher is negligent, like any other negligent person he may be liable. And when the teacher is not negligent, there is no liability even if there be a major injury. One point further, a teacher who works for a school board protected by government liability, cannot be reimbursed by the board for the liability judgment and cannot be covered by insurance, for reasons already indicated.

Negligence—the failure to act as a reasonably prudent person would act under the circumstances. What is "reasonable prudence"? If one could, or should, anticipate trouble or some untoward development under the particular circumstances, failure in attempting to avoid such trouble or prevent such untoward development, is not reasonable prudence. The key issue is one of fact, and the question of fact which must be answered is whether in the ordinary exercise of reasonable prudence, the teacher—or his driver—should have anticipated danger in the specific instance. If "yes" and nothing was done about it, the teacher was negligent.

Remember, not every accident means someone has been negligent. Furthermore, even if a teacher is negligent, she may be freed of liability because of certain applicable defenses to liability.

SCHOOL BUS ACCIDENTS

How do these principles of law work out in school bus cases? By and large, the cases seem to revolve about three factual situations:

1. the condition of the bus,
2. the driver's negligence,
3. improper supervision of pupil transportation.

CONDITION OF BUS—Safe design, good condition and proper maintenance of the school bus are important in avoiding law suits. Only a relatively small proportion of the school bus accidents in courts today are due to the defective condition of the bus itself. In some of the earlier cases, pupils had to sit with their feet over the running board, were exposed to the elements without protection, or fell out of a bus because of the disrepair of the door latches. And— an otherwise safe bus may become unsafe due to overcrowding.

DRIVER'S NEGLIGENCE—Most school bus accidents occur because of someone's negligence, often the driver's. Take, for example, the Georgia driver who drove his bus up a narrow but unobstructed road at 30 mph passing so close to a tree that its protruding limb hit a child in the bus and put out his eye. Then there was the New York driver whose failure to maintain proper order in the bus resulted in a pupil's putting out another pupil's eye by shooting paper clips with a rubber band.

A North Carolina driver failed to pay attention to the location of a pupil who had just alighted and the child was sideswiped by the bus when the driver abruptly pulled it onto the road. When an Illinois driver suddenly started his bus, the resultant lurch threw a rider standing in the aisle against another pupil.

In Louisiana, a bus driver was on the left side of the white line on a curve, and failed to pull over to his own side of the road because he thought the other driver—who was also on the wrong side of the road—would get out of his way.

Excessive speed, recklessness, driving on the shoulder of the highway instead of on the road itself, parking in the path of a known path of children sledding down a hill—these are other examples of driver negligence that lead to accidents and injuries—and to liability. What can a liability judgment amount to? In the Louisiana case, three pupils were killed and there was a verdict against the bus driver and the other driver totalling more than $75,000.

LOADING AND UNLOADING BUSSES

Perhaps the most frequent kind of school bus accident to reach the higher court occurs while pupils are getting on or off the bus.

GETTING ON BUS—In a New York case the school bus backed onto the school property to the place where the pupils were waiting, and killed a child. Here, the school board was held negligent (but not the driver) for failing to provide supervision of pupils waiting for a school bus on school grounds, and for failing to promulgate and enforce rules and regulations for their safety while so waiting.

In a Virginia case, it was common knowledge that the students shoved, pushed and rushed to get into the bus. The driver was negligent for failing to stop his vehicle; here a 13 year old boy was pushed and shoved under the wheels of the slowly moving bus. However, in a Utah case where there was no disorder among the waiting pupils, it was not negligent for the bus to be drawn within two or three feet of the end of the line of waiting pupils, even although in this instance a child was also shoved and fell under the wheels.

ALIGHTING FROM BUS—The most common school bus accident case is the one where a child is injured or killed while crossing the highway after alighting from the bus. Of the 30 school bus passenger deaths reported in 1956, 25 involved pupils crossing highways.

The courts in these cases have often held the school bus driver liable. Although the normal rule of law is that one is not guilty of negligence if he uses ordinary care, in school bus cases the courts have often expressed and applied a more rigid standard of care.

Because of the inmaturity of the riders and the surrounding circumstances, a special kind of obligation is attached by courts to school bus drivers, to exercise "the highest degree of care." The courts of many states have repeatedly ruled that school bus drivers must exercise "extreme" or "extraordinary" care.

Would there be much question about the negligence of a school bus driver who left his pupils off at an unsafe place in the dark or stopped his bus on the wrong side of the road? With other than school bus transportation, the driver's duty ends when he deposits his riders at a safe place, even if the riders are school children.

DRIVER'S RESPONSIBILITY EXTENDS

But a different and more stringent rule is often applied to drivers of school busses. Many courts have ruled that the school bus driver's responsibility extends to and includes the safety of the path which the driver knows such child will have to take homeward immediately after alighting from the bus. Such courts impose on the driver the obligation of ascertaining whether it would be safe for the child to cross after leaving the bus.

For example, in Louisiana and California school bus drivers were held negligent for permitting seven and eight year old children to alight without the drivers first assuring themselves that the road was clear for the children to cross.

Other courts have required school bus drivers to warn their riders of specific known danger on alighting and even, under some circumstances, to protect their charges by refusing to permit them to get off. So, when a bus driver in the state of Washington did look and saw that the child would be endangered by approaching cars, the court said that the circumstances required the driver to warn the child of the danger.

DRIVER MUST AID CHILD

For a Tennessee court such circumstances required the driver to keep the six year old child from alighting altogether. And a Georgia court, faced with such facts, found the driver negligent for failing to aid the nine year old pupil to get to a safe place. "Whether or not," said the court, "a place of deposit is a place of safety cannot be determined solely by whether or not one would be safe if he remained on the spot."

In addition to the general rules of negligence law, a school bus driver must comply with his employer's instructions. For example, the North Carolina State Board of Education promulgated rules requiring school bus drivers to supervise pupils alighting from the bus "until they have crossed the highway in safety or are otherwise out of danger" and to refrain from starting the bus "until pupils are seen to be out of danger." Noncompliance with such safety rules is a long step toward legal negligence.

These are some of the lessons that come out of the school bus accident cases that have gone to court. Court records are by no means the best way of learning how to improve a safety program, but the litigated cases can and should alert us to matters which need attention.

NEW SAFETY PROBLEMS FROM THE EXPANDING USE OF SCHOOL BUSES IN URBAN AREAS

by ROBERT G. HAYES

assistant superintendent in charge of transportation,
Cook County Public Schools, Chicago

Role of the Cook County Superintendent of Schools in Providing A Safe School Transportation Program.

The Boards of Education in the State of Illinois operate the pupil transportation program. In Illinois we have a non-centralized school system of education. This means that each local school district operates its own program of pupil transportation.

Responsibilities of the School Board:

1. Provides, by purchase or contract, safe, comfortable, and convenient transportation facilities.
2. Designates school transportation routes.
3. Makes all contracts and bonds, keeps in force adequate insurance, and provides licenses for district owned buses.
4. Purchases only transportation equipment which is approved and meets the standards required by the superintendent of Public Instruction.
5. Selects fully qualified drivers in whom the parents have confidence and employs only school bus drivers who have been duly approved by the county superintendent of schools.
6. Makes the school executive responsible for the management of the transportation system.

The County Superintendent of Schools is the *supervisor* of school transportation in all of Cook County. The Cook County Superintendent of Schools plays an important role in providing safe school transportation for the children in this county. He supervises school transportation and assists in enforcing all regulations adopted by the State Superintendent of Schools.

Responsibilities of the Cook County Superintendent of Schools:

1. Checks vehicles used for pupil transportation to see that they have passed a semi-annual safety inspection before being put into service.
2. Approves all new applicants for school bus driver positions and arranges for a school bus driver examination with the official State Examiners of the Office of the Secretary of State. This exam consists of a written and road test.
3. Checks all persons operating a vehicle used for pupil transportation to see that they hold an Illinois School Bus Driver's Permit.
4. Plans a special training safety program for the school bus drivers. An active training program is now in operation to assure the safety of the many children who ride the school buses in Cook County.
5. The Safety Training Program includes the following:
   a. Annual standard first aid courses are offered in four sections of the County. These courses are planned in cooperation with the American Red Cross and are usually held during September.
   b. Fifteen hour safety course. This course has been planned and conducted by the County office and includes the following:

UNIT I. Understanding and Appreciating the Job of the School Bus Driver.
UNIT II. Regulations of the Office of Public Instruction Governing School Transportation.
UNIT III. Preventive Maintenance.
UNIT IV. Illinois State Motor Vehicle and Traffic Laws.
UNIT V. Psycho-Physical Testing, Scoring and Interpretation.

   c. Five hours practical First Aid Training.

This safety course is not compulsory but is an added service of the County office to enable the bus drivers to do a better and safer job of transporting children to and from school.

GROWTH OF SCHOOL TRANSPORATION

It is the purpose of this paper to show the tremendous growth in school transportation in Cook County and to pinpoint more or less some of the safety problems faced by the Boards of Education, Office of the Cook County Superintendent of Schools as well as parents of the children who are transported.

Boards of Education in Cook County are constantly being petitioned to provide more and more transportation.

Twice a day, in the morning and in the afternoon one traveling on the highways in Cook County will find a vast fleet of yellow buses transporting one out of five children now attending schools in suburban Cook County.

Not only is it a vast fleet, but it is a growing one. The school bus fleet must keep pace with the school population, which is enjoying the highest rise in the history of suburban Cook County.

Right now according to our statistics, more than 40,000 pupils in the elementary schools are transported. This is a record. Still, this is only the beginning.

More than 500 vehicles are used to transport these children.

Here are some of the reasons for this tremendous increase in school transportation in Cook County:

—The enrollment in the elementary and secondary schools has increased 75,000 pupils during the past five year period, from 1950-51 school year to 1955-56 school year.

—Illinois law requires consolidated and community consolidated school districts to transport all children living over one and one-half miles from school.

—The increased traffic on the highways in the suburban areas as well as the truck traffic has increased the hazards of walking on highways.

—In many parts of Cook County, the rural areas have developed at an unprecedented rate, but the pace of local improvements such as sidewalks and good roads has not kept up with this growth.

—Parents in the suburban areas no longer make their children walk great distances to school through rain, mud and snow. School bus transportation does give added protection against inclement weather, danger of highway traffic to pedestrians and the hazard of careless driving. It is understandable why the parents make demands for school transportation.

—Undoubtedly, the emphasis given to safety in all aspects of pupil transportation has had tremendous influence in its growth.

If we thought we had safety problems 10 years ago, today it is much worse. Thousands of cars, traffic congestion and crowded road conditions have made Chicago and suburban areas of Cook County one of the most hazardous areas in the middle west for a school bus or any vehicle for that matter.

This tremendous development of school transportation has involved the local boards and our office in some rather serious safety problems. Some old long recognized problems have taken on a new significance and then some new safety problems have presented themselves for attention.

NEW AND OLD SAFETY PROBLEMS

The present extent of school transportation and its continuous expansioning indicates the need for a general review of some of the major problems now confronting those responsible for safety in this operation.

Careful selection of school bus drivers

We must continue to select only the best people to operate our school buses. Drivers must hold a current chauffeur's license, have a first aid training, must pass a rigid health exam annually and must participate in safety training programs.

Shortage of School Bus Drivers

Carrying daily 40,000 jumping, red-blooded kids from kindergarten through high school has become a nerve-shattering encounter for many bus drivers without proper training, exposure and disposition, so that many new drivers quit their jobs within a short time.

The school bus driver is the most important factor in safe school transportation. Yet, we employ people who are too old or part time workers. About one-third of the bus drivers in Cook County are women. Women seem better bus drivers.

To insure a supply of good bus drivers we should have a good driver education program in our high schools. If we are to produce good bus drivers, we must teach our high school students to operate buses. If we have such a program, we can assure ourselves a potential group of safe bus drivers. They must know the meaning of safety and understand driving regulations.

Safe vehicles

All school buses in service must meet and exceed, current standards as set up by the Office of the Superintendent of Public Instruction.

Continuous maintenance program should be set up by all boards of education and private and public operators. This involves complete inspection, daily checks by operators of such items as brakes, windshield wipers and tires. Any vehicle in an unsafe condition should be promptly removed from service.

When should a school bus be retired from service? It is the general opinion of many specialists in this field that a school bus should be retired at the end of eight years, 10 years, or perhaps longer. It is not possible to say definitely when this should be done. There are many factors which enter into the picture, such as, maintenance, road conditions. Some districts in our County operate buses 10-12 years old.

Who should be transported? In determining who shall be transported to and from school the following factors should be considered:

Distances between home and school.

Dangers to child incident to foot traffic.

Ages of children.

Their physical fitness for walking the distance encountered.

Traffic hazards and climatic conditions have some bearing on the determining of reasonableness of walking distance.

"DISTANCE LIMITATIONS"

For many years, the State of Illinois authorized local school districts to provide free transportation. It was not mandatory for any school district to provide this service.

The "one-and-one-half" mile distance was a qualifying factor for State Aid. Many school districts which provided school transportation used this distance to exclude those who lived less than a mile and one-half.

It was not until June 16, 1953 that the Illinois State legislature enacted a law which required school boards of community consolidated districts, community unit districts, consolidated districts to provide free transportation for pupils residing at a distance of one and one-half miles from school unless such school board could certify to the Superintendent of Public Instruction that adequate transportation for the public is available.

1½ MILE DISTANCE

Since common school districts were exempt from this law, the Boards of Education of these districts, continued to use the one and one-half mile distance to determine who would be transported to and from school.

As many small children were required to walk to school often along State and National highways carrying heavy volume of high speed traffic, many parents began to question the wisdom of such regulations and demanded that their children be transported to school.

Often these parents offered to pay part of the cost of transporting these children, however, Boards of Education were prohibited by law to charge any fees as the law specifically stated that boards may provide "free" transportation only.

Finally, on June 21, 1957, the State legislature approved a law authorizing school boards to provide transportation for those living less than one and one-half miles from school and boards of education now may make a charge for such transportation in an amount not to exceed the cost per pupil. The new law also provides for a transportation tax not to exceed .02 per cent without referendum.

The fact that highway traffic is becoming increasingly heavy and that highway accident rates continue to climb has resulted in many school systems in our county trans-

porting pupils who live relatively close to the school.

In fact, the minimum distance requirement for providing transportation service is no longer a fair standard in many areas. Needs for the service in congested areas and along busy highways cannot be determined equitably on the basis of distance. For children having to walk a mile to and from school along a busy highway the basic problem is not distance, but safety. Recognition of this has resulted in greatly expanded transportation services by many school systems of Cook County.

CUSTOMARY ROUTE OF TRAVEL

In determining the one and one-half mile distance as a qualifying factor for state aid, the law states that it shall be measured by the customary route of travel. The law does not, however, define how this shall be done nor who shall have the authority to define the customary route of travel.

Many school districts in Cook County are small in area in terms of square miles. There are many children transported to school who live less than one and one-half miles as the "crow flies." Therefore, the Boards of Education and the Office of the Cook County Superintendent of Schools have often a real problem to determine the "customary route of travel." This may not be a problem in rural counties, but it certainly is in an urban county such as Cook County.

In defining the customary route of travel, the Office of the Cook County Superintendent of Schools does so in terms of safety and the general welfare of the pupils.

PARENTS DEMAND PICK UP, UNLOADED AT HOME

The school board has the legal right to make reasonable rules and regulations concerning the transportation in the school district. It is not legally required that the vehicle used in transporting pupils shall go to the home of each child in the district.

We cannot afford to spend public money to pick up children at each home and to unload them at each child's home. It is recommended that the vehicle go to the *nearest entrance* along the route of travel. It is suggested that in such cases the pupils may be required to meet the vehicle. If the distance is too great, the board may employ the parent or some other person (under contract) to transport the children to the transportation line. However, such supplementary transportation service is not compulsory.

OVERLOADING SCHOOL BUSES

From time to time we receive reports of overloading. Upon immediate investigation, we find that these complaints are true.

A state regulation requires no more than 54 seated pupils shall be carried except with the approval of the Superintendent of Public Instruction. School bus bodies shall have their maximum seating capacity painted upon the outside left and inside front and in no event shall be loaded beyond that limit.

In the interest of safety we must all insist that no vehicle used in Pupil Transportation shall at any time transport more than the rated capacity of the vehicle. All pupils must be seated while the vehicle is in motion.

Same specialists in the field tell us that 10 per cent more than the seated capacity of the vehicle is generally considered OK in overloading. Others point out that it is not considered overloading a school bus if a child stands at each row of seats.

LOADING AND PICK-UP STATIONS

The general increase in the volume of vehicular traffic throughout Cook County, points to the need for a continuing revision of all school bus routes and careful selection of "loading zones," at which pupils enter or leave school buses.

All loading and unloading locations must be clearly visible to on-coming traffic and all school bus drivers must give adequate notice of their intention.

A new Illinois law requires every school bus to be equipped with visual signals which shall be actuated by the driver whenever the brakes are applied. This new law requires signal lamps to be connected to the brake pedal by means of a toggle switch and to be disconnected when pupils are not being transported to or from their homes or school.

A bus driver is also required to actuate the bus signals whenever the vehicle is stopped to receive or discharge children, when children are unloading to cross a street, highway, or road, or whenever the bus is stopped to load children who must cross a highway, street or road to board the bus.

FREQUENCY OF BUS STOPS

On June 2, 1955 the Illinois State Legislature enacted a law which requires the motorists traveling upon a highway outside of a business or residence district to stop from either direction upon approaching a school bus stopped to load or unload children upon a highway. Therefore, a motorist traveling in Evanston, Oak Park or Chicago Heights is not required to comply with this law.

The frequency with which buses are permitted to stop on the highways needs careful consideration. Some people feel that loading and unloading stations should be spaced at greater distances. However, parents of some children affected feel that the heavier the traffic, the more frequently should the school bus stop in order to keep to a minimum the distance pupils are required to walk along the heavily traveled highways.

TRANSPORTING PUPILS TO CITY

More and more school buses bring children to special schools in the cities, hence giving rise to new problems.

In general the "stop law" applies only upon highways "outside of business or residential areas." However, on June 7, 1957 the city council of Chicago enacted an ordinance which requires motorists traveling within the limits of the city of Chicago to stop from either direction when a school bus has stopped to load or unload children and said motorist shall not proceed until the school bus resumes motion, or the visual signals are no longer actuated. This creates situations confusing to motorists traveling in Cook County.

SUPERVISION OF VEHICLES

There are a large number of vehicles used in pupil transportation by public school districts, private schools and private operators on non-reimbursable routes.

Since the jurisdiction of the County Superintendent of Schools in supervising school transportation is limited to those programs reimbursed by the state, we find there is no other state agency that can exercise supervision and control over these vehicles.

It is true that these vehicles are required to pass a "truck inspection" but there is no state agency to check to see that this is done.

In many cities including Chicago, we find charter bus service provided by a private or common carrier for a fee on an individual basis. This is not school transportation but it is so viewed by many parents. They fail to see why the County Superintendent of Schools does not supervise them. It is essential that these operators be required to meet the standards established for regular school transportation.

CITY PASSED RULING

Since the state of Illinois has failed to control these carriers, the City of Chicago decided to do something about it. On June 7, 1957, the City Council passed an ordinance which requires registration of all vehicles used in transporting children to or from any school, day nursery, day care center, day camp, play group or any regularly conducted public or private educational, religious, recreational or care program within the limits of the city of Chicago. Any vehicle used in the above programs must be properly registered with the Public Vehicle License Commissioner.

Among other things, this new city ordinance:

Defines "School Vehicle." This is not the same as the legal definition of a school bus. The Illinois School Code defines a school bus as every motor vehicle of the second division operated by or for a public or governmental agency or by a private or religious organization solely for the transportation of pupils in connection with any school activity.

Requires registration of all such vehicles. This will prohibit the operation of a school bus at all unless it is registered with the Public Vehicle License Commission and a certificate of registration issued therefore by the Commission. We objected to this section of the Ordinance because we felt that school buses operated by a board of education and supervised by the County Superintendent of Schools should be exempted from this requirement.

Provides a registration fee. Can the City of Chicago thus tax a school district? If so, is payment of registration fee good public policy?

Provides for inspection of school vehicles in order to determine the capacity. Public school buses are checked by other procedure and under regulations by the State Superintendent of Public Instruction. Regulations of the governing bodies will be in conflict.

Safety requirements. Every school vehicle shall have four doors and be equipped with a device or devices by which each door may be locked from the inside. This is in conflict with the rules and regulations of the Superintendent of Public Instruction. It would outlaw the standard, conventional type of school bus which has only two doors, and would violate the safety standards by having doors locked while transporting pupils.

Requires inspections by the Public Vehicle License Commissioner prior to the issuance of certificate or registration and at such other times as he selects. This would have the effect of duplicating inspections and expense in connection therewith.

We believe that the action taken by the City Council in controlling these vehicles was necessary and we hope the State will do likewise. However, it seems the ordinance should have omitted references to buses or vehicles operated by the public schools or by a driver employed by the public schools.

Transportation of school children is all regulated by State Law and rules and regulations issued by the Superintendent of Public Instruction. Many of these features included in this ordinance will lead to duplication, confusion and additional expense to the Chicago Board of Education and other suburban school districts.

RECOMMENDATIONS

A continuous program of traffic safety education is needed including proper conduct in entering, leaving, and riding the bus.

1. We recommend that parents be advised of the school's bus safety program and they should understand what is expected of their children.
2. We recommend that bus transportation safety be frequently mentioned at P.T.A. meetings.
3. We recommend to the school authorities that they should explore the possibility of providing a proper bus loading point at the school, preferably a platform, or raised surface bounded by a curb. It should be located so that the bus does not stand with any part of the main traveled portion of the roadway and, if possible, away from the path or area usually traversed by children on foot.
4. The Superintendent and Principal should ride buses occasionally to check personally on the efficiency of bus and patrol operation.

SAFETY PROGRAM IDEAS

5. In teaching safety in schools we suggest that the following be included in the safety program:
   a. Class discussions of school bus safety rules is one of the best ways to impress pupils with their part in the safety program.
   b. Clear explanations of traffic regulations and how they affect school bus safety should be given in classroom courses.
   c. Outline the rules which the individual should observe while going to and from the bus, and while traveling on it.
   d. Review these rules over and over until the pupil is thoroughly familiar with his part in the safety program.
   e. Every step in the training should be planned as carefully as is a regular course, with study assignments and classroom discussions.

PRACTICE ON BUSES

   f. Practice in getting on the bus and leaving the bus. Carelessness in leaving the bus can counterbalance the most stringent vigilance by the driver.
   g. Failure to observe proper safety procedures in the bus can cause serious accidents. Pupils must be constantly alert for their own protection; they must be reminded again and again that safety does pay.
   h. Bus safety will be considered important by the children only if teachers continuously show interest in and give proper emphasis to the subject.

Transportating safely 40,000 children to and from school daily is a tremendous responsibility. It is too big a job to be assumed by any single group of authorities.

Roads and vehicles improve continually, but there is no way yet devised to engineer the danger out of human carelessness and thoughtlessness on the highways. These are human factors which every law enforcement agent, school official, teacher, parent, pupil and motorist must constantly strive to eliminate.

Providing safe school transportation requires "teamwork." We need the earnest cooperation of the local Boards of Education, Highway Departments, parents, the general public, State and Local Police Officials.

Most of all, when you have cooperation of students with the bus driver, you are on your way to achieving your primary objective—safe school transportation.

THE NATIONAL SCHOOL BUS PROGRAM

WHAT IT IS

by RAY PRINCE
secretary, School Bus Advisory Committee, National Safety Council

This paper deals with the newest activity of the Motor Transportation Division, the national school bus program.

We feel that the school bus driver is an important person in any school administration. He spends only a few hours a day at his job and most of that time he is away from the school grounds. But he plays a vital role and deserves more help and recognition for the job he does play.

The ability to drive a motor vehicle safely is regarded as a pretty ordinary skill. Practically every adult is familiar with the motor vehicle and can operate it satisfactorily. Most of us have learned to drive from our fathers or from a friend and in most cases that training consisted only in learning how to make the car go and stop and how to steer the thing.

DRIVING SAFELY TAKES SKILL

We picked up a knowledge of traffic rules and regulations more or less by chance. As a result we think driving is easy and driving skill is taken more or less for granted.

But the ability to make a car go, turn and stop is one thing. The ability to drive safely is quite another. Last year while practicing the common ordinary skill of driving, we killed 40,000 people in this country. Driving is easy, yes. Driving safely apparently requires something extra.

It is that something extra that our motor transportation service for school bus operators is designed to give.

The most important thing about our program is a point of view. For an example, "What do you mean by safe driving?" Some of you might say that it means knowing and obeying all the traffic rules and regulations. After all, these regulations were made in the first place with safety in mind. So all we have to do is obey them and we'll get along fine.

But is it any guarantee that we will get along fine? You and I both know that it is no guarantee at all. We get the green light and proceed through the intersection. We are obeying a traffic regulation. But the other driver, who thought he could go through before the yellow changed to red, smacks into us. We have an accident, or our school bus has an accident.

Our driver is legally in the right, but that is small consolation if children are injured or killed as a result. We can be

legally right and still have fatalities and injuries and big repair bills. The other fellow may not have any insurance or any money to pay the damages.

If that is our concept of safe driving, to be legally right, we are covering only part of the problem. We are leaving our school buses and our school passengers exposed to the whims of the other fellow. He may not know or care about traffic regulations.

Our point of view toward safe driving has got to be bigger and broader. It must take in not only the operation of our vehicle but the operation of the other vehicle as well.

You may ask—"How can we drive the other fellow's vehicle for him?" The answer is that of course we can't drive the other fellow's vehicle. But we can drive our vehicle always in relation to his so that he can't run into us. That is the concept of defensive driving.

DEFENSIVE DRIVING

A defensive driver obeys the green light, yes. But he also looks both ways to make sure that intersecting traffic has stopped and obeyed its light before moving.

A defensive driver comes to a stop at a stop light as the law requires, yes. But he also takes care to slow down gradually before coming to a stop so that the vehicle behind him will not run into his rear end.

A defensive driver uses the correct procedure in making a left turn. He positions his vehicle in the left lane and puts his arm straight out or uses his left turn blinkers. But he also looks to the rear to make sure that traffic behind has seen and is obeying his signals.

A defensive driver keeps to the right as the law requires, but he also is alert for persons getting out of parked cars on the street side or children running out from between parked cars.

CUTS OWN SPEED LIMIT

A defensive driver obeys the speed limits. But if the streets are slippery from rain, snow, or ice, he keeps his speed down even further so as to be able to stop in time if an emergency arises.

This is the concept that we teach through our booklet "For Experts Only," through the monthly Safe Driver magazine, our monthly driving letters, and other training materials.

Our program also provides a means for keeping score, the safe driving score for each individual driver. It works like this. We require that a driver make out a complete report of every accident he has, and by an accident we mean "any contact between our bus and another vehicle, person, or fixed object which results in death, personal injury, or property damage. Such contact must be reported as an accident regardless of who was hurt, what property was damaged or to what extent, where it occurred, or who was responsible."

We require a report of every accident that fits this definition. Now you might say that this is carrying the thing to extremes to require reports of every little dent, nick, and scratch. You may say, I am not too concerned about those, but I am afraid of those major collisions. Those are the accidents I want to prevent. The others we can take in our stride.

REPORT MINOR ACCIDENTS

The reason we require reports of every accident, even the little ones is this. It is not the size of the accident that concerns us. It is the unsafe act that caused it. The same unsafe act can cause a minor accident or it can cause a fatality.

The unsafe act of barrelling up to a stop light and coming to a sudden stop may not cause an accident the first time or the second time, but eventually there may be a heavily loaded truck following you with bad brakes and he may plow right into the back of our bus.

You can't pick out the size of accidents you are going to prevent. The severity of the accident is up to chance factors alone. You can, however, control unsafe acts. And requiring a report of every accident, even the minor ones is your most important means of controlling these unsafe acts.

Let us say that your driver comes in to you with a report of this kind of an accident. He was driving along the highway in a downpour following another vehicle which suddenly stopped. Our driver slammed on his brakes but ran into the vehicle ahead doing very slight damage.

DEALING WITH ACCIDENT VICTIM

He has had the accident; he has made up his report and comes to you with it. Now what do you do? Do you bawl him out and tell him to drive more carefully, or do you look at the slight damage involved and say, "Well Joe, luckily it wasn't a bad accident. Try to be more careful next time."

Neither bawling the driver out nor dismissing it as a minor matter does any good in improving the safe driving ability of this driver. The only reason you want this driver to come in and talk with you is so that you can help him prevent this kind of accident from occurring in the future.

This interview between you and the driver is a mighty important one for him and for the safety record of your school bus fleet. And for this occasion, our program also provides you with a point of view.

TWO TYPES OF ACCIDENTS

I said that our program provided a means of keeping score. We do it by grading accidents either preventable or non-preventable. A preventable accident is simply one in which our driver failed to do everything possible to prevent the accident. A non-preventable accident is one in which the driver did everything he could reasonably be expected to do to prevent the accident, but the accident occurred in spite of all these precautions.

Our Safe Driver Award is based on the ability to drive without having preventable accidents. We don't charge against the driver those accidents he did everything he could to prevent. That would simplify the administration of the Safe Driver Award plan, but we think it would be unfair and poor psychology.

If drivers were charged for every accident regardless of whether they were practicing the principles of defensive driving or not, we feel they would soon lose interest in your safety program. However, if they realize that their driving is going to be graded on a fair basis, they are going to strive to stay out of accidents.

In the interview, you will discuss the accident from the point of view of whether he could have done anything to have prevented the accident.

In this case, he ran into the rear end of another vehicle. He may claim that the weather was bad and that his windshield wipers were not working too well. You must point out to him that bad weather is no excuse. A lot of driving must be done in bad weather. A defensive driver adjusts his speed to these weather conditions so that he can stop in time.

As for the windshield wiper, he is required to check these items at all times and see that they are in good operating condition. If it was not in good operating condition at the time he took the bus out in the morning, he should have had it repaired immediately or, if this was impossible, adjusted his driving accordingly.

During this interview, you should have before you the record of this driver's past accidents. These may reveal that the driver has had the same bad habits in the past, carelessness about inspecting his vehicle before taking it out—not allowing enough distance between his vehicle and the vehicle ahead.

If you are like most administrators, you would call this accident a preventable accident and charge it against this driver's record. That means that he will not get his Safe Driver Award for this year. For not practicing the principles of defensive driving, you are not penalizing the driver, you are merely withholding a reward.

NSC DRIVER AWARD RULES

The special features of the National Safety Council award are that a driver must drive one school year without a preventable accident for a one-year award. He must drive two consecutive years without a preventable accident for a two-year award, and three consecutive years without a preventable accident for a three-year award.

Up to the time the driver earns his three year award he is in what is known as the proving period phase of the award program. Any time he does have a preventable accident, he must start from scratch and try again at building up a record of three consecutive years without a preventable accident.

Once he has earned his three year award, however, he is on a plateau known as the penalty period. Now if he has a preventable accident he is charged one school year for it. In other words if he normally would

be eligible for a four year award on June 1, 1958, and he has an accident in December, he must drive without a preventable accident until June of 1959 in order to win the four year award. If he has another preventable accident before he reaches this point, the date of his award is moved up still another year to 1960.

AWARDS IMPROVE DRIVING

Do driver's drive differently when they are under an award plan like this than they would if your school had no award program? Experience in motor transportation fleets indicate conclusively that they do. And those school administrators who have used this program will agree.

The program involves more than the provision of a small piece of jewelry. Just remember that it based on a standard of safe driving performance that your drivers come to understand. They know that you understand this standard also. You are both speaking the same language. You both understand what is meant by the principle of defensive driving.

The driver also knows that you are keeping score. He likes this, because he knows that while you keep a record of his accidents, you also are keeping a record of his safe driving time and if he meets the requirements of the award he will be recognized for it.

He knows also that the award he receives is universally recognized as the badge of an expert driver—it is the emblem of the professional driver in all branches of motor transportation — and that includes truck drivers, city bus drivers, inter-city bus drivers, taxicab drivers, police in state and municipal police car fleets, drivers for public utilities, and in many other branches of driving. More than 100,000 of these awards are earned annually by such drivers. For that reason it is universally recognized.

You in the educational field know the value of accreditation. You would not go to a non-accredited school, because your credentials might not be universally honored after you had completed your study. We feel that this award plan, because it is sponsored by an agency that is chartered by Congress and because it is so universally used, has that kind of accreditation.

Yes, drivers will strive to earn this award and to do so, they know they must practice the principles of defensive driving — that something extra which means the difference between operating a vehicle and operating a vehicle safely—the difference between getting your pupils back and forth to school safely day after day.

WHAT IT MEANS TO A STATE DEPARTMENT OF EDUCATION

by C. WESLEY DANE

director, Division of School Traffic Safety Education, Indiana State Department of Public Instruction, Indianapolis, Ind.

Perhaps the greatest value of participation in the National School Bus Program is the rather obvious one—by being a part of this program one achieves "status." It is conceivable that a local unit or a state organization could develop a creditable program of recognition and plan of award distribution. But when one becomes part of a plan which is national in scope, the benefits to be derived are immediately enhanced.

School bus drivers in Indiana know that they are a part of a program which recognizes fleet systems and individuals all over the United States and that their awards are of the highest caliber. Our school bus drivers know that their record has been established in a central repository and that it will remain cumulative for all time.

Experience as a college professor and service in a branch of the state government has convinced me that the demand for work never catches up with the supply of available time. Therefore, it seems to me that another advantage of national affiliation is the outside stimulus toward achievement.

NATIONAL AWARDS GET NOTICE

You have heard it said that "The wheel that squeaks the loudest, gets the grease"; and I fully believe this to be a truism. It is conceivable therefore, that in the press of events certain things, many worthwhile things, may be delayed or denied because of the pressure of some other demand. When national leadership is involved, as it is in the giving of a Safe Driver Award, there is constant supervision, encouragement and assistance which preclude procrastination or failure.

While the Safe Driver Award is in itself prized by the recipient, it is a means to an end as far as a Department of Education is concerned. It makes necessary the keeping of records and submitting reports. Its administration gives the department a contact with national leaders who serve as frequent reminders of organization needs. The introspection occasioned by these frequent contacts stimulate self-appraisal and encourage new avenues of approach.

Since we are in our second year of participation, we cannot provide data and would not presume to offer statistics. Whether this program has influenced drivers to make and maintain accident-free records is not known. It would be entirely presumptive to maintain that any change in record is due to any one cause.

CONTACT WITH DRIVERS

We firmly believe that accident records are the result of many causes and that to achieve an accident-free record requires effort and emphasis along many lines. However, participation in a National School Bus Program establishes a regular contact with bus drivers which might not otherwise exist and this contact bears positive results.

One would not ordinarily think of a school bus driver as a correspondent, yet ours write us often and it is gratifying to receive their voluntary contributions. It is an evidence of their interest and their acceptance of our leadership.

From the evidence of interest on the part of school bus drivers, from our conviction that the program is sound, from the impetus that it gives toward improvement, we are grateful. We are most appreciative of the support of the Farm Bureau Mutual Insurance Company of Indiana, without whose financial backing the program would not be at all possible; but more than this, we appreciate the unselfish cooperation of the Farm Bureau Safety Engineering Department and the program it helps us conduct.

While the National School Bus Program may not be the total answer to safety problems involved in transporting school children, such a program is an excellent cornerstone on which to build.

WHAT IT MEANS TO A STATE MOTOR VEHICLE DEPARTMENT

by WALLACE N. HYDE

chief, Records & Driver Improvement Section, Dept. of Motor Vehicles, Raleigh, N. C.

In discussing this topic, I think that it is appropriate that I should first explain the Department of Motor Vehicles' responsibility to pupil transportation in North Carolina. In addition to the usual responsibility of certifying school bus drivers, we also have the major portion of the responsibility of training drivers. Inasmuch as approximately 90 per cent of the 8,000 school bus drivers in North Carolina are student drivers, the training of drivers represents a tremendous job.

To carry out this responsibility on the level that the importance of the job demands, the Department has employed 35 teachers on a full-time basis who spend approximately 80 per cent of their total time training school bus drivers.

To answer the question "What the National School Bus Program Means to the

Department of Motor Vehicles?" I would like to discuss it in three separate phases. There are three major areas in a sound accident prevention program; namely, selection, training, and supervision of drivers.

ARE MORE SELECTIVE

In respect to selection of drivers, I would say that the Accident Prevention Service of the National Safety Council offered a splendid opportunity for us to be more selective in picking drivers for our school buses. It has become increasingly more difficult for us to encourage the better qualified students in our public schools to become applicants for a school bus driver's position. This has resulted, primarily, from the inadequate pay scale in our state.

The state salary scale for school bus drivers is now $25.50 per month, and in the heavily populated areas of North Carolina, it is not difficult for an energetic high school student to find after-school employment that will earn him a salary superior to the monthly school bus driver's salary on a weekly basis.

Inasmuch as the award presented by the National Safety Council represents achievement and is internationally recognized, we believe that it will stimulate interest in some of our better qualified students to become school bus drivers. Moreover, we believe that it will add sufficient dignity and prestige to the position to attract many girl applicants who are not otherwise interested in becoming a school bus driver.

HELP FROM IN-SERVICE TRAINING

In terms of driver training, we have found that materials provided by this program will contribute a great deal to our training program. This is particularly true of in-service training. The news letters and pamphlets distributed monthly to each driver can be used to a great advantage for monthly driver meetings.

However, this program can make its greatest contribution in the area of supervision. We all know that many accidents would not have happened if the supervisor or the person who trained the driver had been present on the bus at the time the accident occurred. Since it is neither practical nor possible to provide this type of supervision, some stimulus is needed to encourage the driver to remain alert at all times while operating his vehicle. The fact that the driver recognizes that he must maintain an accident-free record to be eligible for an award will help keep the driver's attention focused on his driving.

During the 1956-57 school term, 35 counties in North Carolina purchased a membership to the National Safety Council Accident Prevention Service. Primarily, because of my interest in this program, I have observed closely conditions pertaining to school bus operation in these counties during the past year.

NEEDS PROPER ADMINISTRATION

The results have been what you could have expected—in the counties where the program was properly administered and emphasized—there has been a definite improvement in the overall efficiency and safety of the operation. In counties where the program was given little attention and no special emphasis, there was little or no appreciable change in the operation of the pupil transportation system. This program, like all other accident prevention program, will not produce results unless it is given the proper administrative attention.

We believe that this program, from the standpoint of cost, represents the best buy that we know of in this field. In fact, many of the counties in North Carolina are paying more for pins that do not compare in quality to the pins provided by this service, than the entire Accident Prevention Service costs.

Most significent of all—these awards do not offer the prestige and international recognition that is associated with the award provided by the Accident Prevention Service of the National Safety Council.▲

NEW HIGHER EDUCATION SECTION

By official action of the School and College Conference on October 20, 1957, and by the Board of Directors of the National Safety Council on October 21, 1957 a Higher Education section was created within the framework of the conference as a means of expanding the Council's activities in safety education and accident prevention in all colleges and universities of the country.

Activities at the level of higher education are not new to the School and College division in view of the Campus Safety committee which has been devoting its attention to practical problems of safety in and about the college community for a number of years. This committee was activated as a formal part of the Council structure in 1956, the forerunner of a section.

The new Higher Education section in addition to the Campus Safety committee will also include committees on research, and higher education. The Research Group will devote its attention to the promotion of educational research in the field of safety in colleges, and to the preparation and release of materials to indicate research which has been done in the past, is needed, and suggested techniques of conducting research studies.

The Higher Education committee will be concerned with curricula and course construction in safety, as well as the integration of safety in other courses of instruction at all levels of education and suggestions for teaching methods.

The new structure of higher education reactivates the Higher Education committee which was placed on inactive status in 1952, due to curtailment of programs, but also expands activities in view of the heightened interest and participation at the university level. John W. Hill, director of personnel insurance and safety for the Texas A. & M. College system, College Station, Tex. has been one of the active proponents of expanded activity at the higher level of education, and was instrumental in the creation of the new Section in which he serves as interim chairman.

Clayton W. DeMent, safety engineer for Purdue University is chairman of the Campus Safety committee, while Dr. Herbert J. Stack, program associate of the Center for Safety Education, New York University, New York, heads the Research Committee.

OFFICERS OF THE

SCHOOL AND COLLEGE CONFERENCE

NATIONAL SAFETY COUNCIL 1957-58

Vice-President for Schools and Colleges—LOWELL B. FISHER, state chairman, North Central Association for Colleges and Secondary Schools, University of Illinois, Urbana, Ill.

Chairman of the Conference—ZENAS R. CLARK, administrative assistant, Wilmington Public Schools, Wilmington, Del.

Vice-Chairman for Elementary Education—VICTOR E. LEONARD, principal, North Mianus School, Greenwich School District, Riverside, Conn.

Vice-Chairman for Secondary Education—NORMAN GORE, assistant superintendent of Schools, Decatur, Ill.

Vice-Chairman for Higher Education—JOHN W. HILL, director, Workmen's Compensation Insurance, Texas A & M College System, College Station, Texas.

Vice-Chairman for Driver Education—AMOS E. NEYHART, administrative head, Institute of Public Safety, Pennsylvania State University, University Park, Pa.

Vice-Chairman for Supervision and Special Areas—IVAN J. STEHMAN, chief, Div. of Highways and Safety Education, State Dept. of Public Instruction, Harrisburg, Pa.

Secretary—WAYNE P. HUGHES, director, School and College Division, National Safety Council, Chicago, Ill.

1957 CONGRESS PROGRAM COMMITTEE

Chairman—DALIBOR W. KRALOVEC, Philadelphia, Pa.

Secretary—ALVIN E. HOUK, University, Ala.

Members—CLAYTON W. DE MENT, West Lafayette, Ind.; O. J. DORR, Fond du Lac, Wis.; TOM S. GABLE, Pittsburgh, Pa.; JAMES J. GRIFFIN, Chicago, Ill.; JOHN T. HAACK, Davenport, Iowa; FRANK B. JEWSON, Superior, Wis.; RICHARD K. KLEIN, Bismarck, N. D.; CHARLES J. KRAFT, Jr., Brooklyn, N. Y.; W. D. McCLURKIN, Nashville, Tenn.; HELEN MANLEY, University City, Mo.; PAUL W. SEAGERS, Bloomington, Ind.; LESLIE R. SILVERNALE, E. Lansing, Mich.; FRANK O. STANGEL, Milwaukee, Wis.; MARTHA C. STEVENSON, Philadelphia, Pa.; JOHN L. VICKERS, Frankfort, Ky.; MARY MAY WYMAN, Louisville, Ky.; W. C. YEAGER, Sioux City, Iowa.

Staff Representative—VIVIAN WEEDON, National Safety Council, Chicago, Ill.

1958 CONGRESS PROGRAM COMMITTEE

Chairman—J. DUKE ELKOW, Madison, Wis.

Secretary and Staff Representative—MARIAN TELFORD, National Safety Council, Chicago, Ill.

Members—MARK J. DONDERO, Cambridge, Mass.; FITHIAN S. FARIES, Lexington, Ky.; LONNIE GILLILAND, Oklahoma City, Okla.; DEVONA L. GRIFFITH, Dayton, Ohio; JOHN T. HAACK, Davenport, Iowa; EARL D. HEATH, New York City; RALPH M. HENDRIX, Columbia, S. C.; JOSEPH INTORRE, University Park, Pa.; STANLEY McKEE, Highland Park, Ill.; MARY RAPPAPORT, Albany, N. Y.; J. J. SMALTZ, Manhattan, Kans.; A. P. SMITH, JR., Jackson, Miss.; MARY E. SPENCER, Malden, Mass.; JOHN TAMMERYN, Tampa, Fla.; VIRGINIA WHEELER, Louisville, Ky.

1959 CONGRESS PROGRAM COMMITTEE

Chairman—MAY HAZARD, Hamtramck, Mich.

Secretary—A. L. CUNNINGHAM, Gary, Ind.

Members—HOMER ALLEN, West Lafayette, Ind.; FITHIAN S. FARIES, Lexington, Ky.; HARRY D. FLETCHER, University Park, Pa.; JOSEPH GIBSON, Clearwater, Fla.; R. W. JONES, Keokuk, Iowa; HELEN K. KNANDEL, Washington, D. C.; RUTH JEWELL, Raleigh, N. C.; HAROLD A. SEEKAMP, Jeffersontown, Ky.; GLENN F. SHUPE, Springfield, Ohio; DARLEEN BELL STEPHENS, Nashville, Tenn.; BERTHA TRUNNELL, Louisville, Ky.; LESTER C. WINDER, St. Louis, Mo.; ELIZA CALLAS, Kensington, Md.

Staff Representative—DANIEL P. WEBSTER, National Safety Council, Chicago, Ill.

DRIVER EDUCATION SECTION

General Chairman—AMOS E. NEYHART, University Park, Pa.

Immediate Past General Chairman—EDWARD R. ABRAMOSKI, Erie, Pa.

Vice-Chairman—RUSSELL I. BROWN, Des Moines, Iowa.

Secretary—THOMAS A. SEALS, New York City.

Staff Representative—IVAN L. ELAND, National Safety Council, Chicago, Ill.

ELEMENTARY SCHOOL SECTION

Chairman—VICTOR E. LEONARD, Riverside, Conn.

Vice-Chairman—STANLEY W. McKEE, Highland Park, Ill.

Secretary—THELMA STOKES, Ajo, Ariz.

Staff Representative—VIVIAN WEEDON, National Safety Council, Chicago, Ill.

HIGHER EDUCATION SECTION

General Chairman—JOHN W. HILL, College Station, Texas

Staff Representative—DANIEL P. WEBSTER, National Safety Council, Chicago, Ill.

SAFETY EDUCATION SUPERVISORS SECTION

General Chairman—IVAN J. STEHMAN, Harrisburg, Pa.

Immediate Past General Chairman—CECIL G. ZAUN, Los Angeles, Calif.

Vice-Chairman—HAROLD K. JACK, Richmond, Va.

Secretary—VIRGINIA WHEELER, Louisville, Ky.

Staff Representative—CHARLES A. FRENCH, National Safety Council, Chicago, Ill.

AMERICAN INDUSTRIAL ARTS ASSOCIATION-NATIONAL SAFETY COUNCIL SAFETY COMMITTEE

Chairman—DONALD PETERS, Arlington, Va.

Staff Representative—WAYNE P. HUGHES, Director, School and College Division, National Safety Council, Chicago, Ill.

AMERICAN VOCATIONAL ASSOCIATION-NATIONAL SAFETY COUNCIL SAFETY COMMITTEE

Chairman—J. E. TE POORTEN, Madison, Wis.

Staff Representative—WAYNE P. HUGHES, Director, School and College Division, National Safety Council, Chicago, Ill.

CAMPUS SAFETY COMMITTEE

Chairman—CLAYTON W. DE MENT, Lafayette, Ind.

Vice-Chairman—ARTHUR F. BRANDSTATTER, E. Lansing, Mich.

Secretary—JOHN MORRIS, Champaign, Ill.

Staff Representative—DANIEL P. WEBSTER, National Safety Council, Chicago, Ill.

HIGHER EDUCATION COMMITTEE

Interim Chairman—JOHN W. HILL, College Station, Texas.

Chairman, Steering Committee—J. DUKE ELKOW, Madison, Wis.

Staff Representative—DANIEL P. WEBSTER, National Safety Council, Chicago, Ill.

NATIONAL SCHOOL SAFETY HONOR ROLL COMMITTEE

General Chairman—ALFRED L. PAPILLON, Chicago, Ill.

Judges—MRS. P. D. BEVIL, Sacramento, Calif.; RUSSELL I. BROWN, Des Moines, Iowa; A. L. CUNNINGHAM, Gary, Ind.; MAY F. HAZARD, Hamtramck, Mich.; RUTH JEWELL, Raleigh, N. C.; WALTER D. LADD, St. Joseph, Mo.; FORREST E. LONG, New York City; GEORGE P. SILVERWOOD, Green Bay, Wis.

Staff Representative—IVAN L. ELAND, National Safety Council, Chicago, Ill.

RESEARCH COMMITTEE

Chairman—HERBERT J. STACK, New York City.

Staff Representative—DANIEL P. WEBSTER, National Safety Council, Chicago, Ill.

SCHOOL PLANT PLANNING COMMITTEE

Chairman—THOMAS J. HIGGINS, Chicago, Ill.

Staff Representative—MARIAN TELFORD, National Safety Council, Chicago, Ill.

SCHOOL TRANSPORTATION COMMITTEE

Chairman—W. T. EDGREN, Des Moines, Iowa.

Staff Representative—MARIAN TELFORD, National Safety Council, Chicago, Ill.

STANDARD STUDENT ACCIDENT REPORTING COMMITTEE

Chairman—THELMA REED, Kansas City, Mo.

Staff Representative—MARIAN TELFORD, National Safety Council, Chicago, Ill.

SECONDARY SCHOOL COMMITTEE—Inactive

LEARNING TO LIVE . . .

Learning to live—safely—was the drawing card which brought more than 13,000 men and women from the United States and 27 other countries to Chicago for the 45th National Safety Congress. These people gathered to exchange the latest ideas in safe attitudes, safe methods and safe equipment. Through speeches, panel discussions and symposiums, they acquired new ideas for helping others—and themselves—to live, work, and play safely.

This was the reason the National Safety Council was organized less than half a century ago, a time when man's thoughts barely kept pace with the industrial revolution. Since then, man has introduced an atomic age which is bringing the continents closer and has made the earth a smaller world. And now man anticipates inter-space travel!

Through science and technology, man is progressing to increasing speeds in travel and production, and increasing dangers—new dangers never before encountered. These, in addition to the everyday hazards of life, occupied the thoughts of the safety people at the Congress.

To encourage more widespread knowledge of the various fields of safety, the National Safety Council publishes the Current Safety Topics—30 volumes of condensations of Congress speeches and exchanges of ideas. Each volume is a handy reference to different phases of accident prevention. The complete set of volumes are listed on the back page of each volume.

Since the proceedings have been edited and condensed for reference purposes, the complete original manuscripts with any charts or illustrations used, are available in the National Safety Council files. Views expressed at the Congress or in any volume of Current Safety Topics are those of the Congress participants, and not necessarily those of the National Safety Council.

THE TRAFFIC SECTION

This volume is a record of the sessions held at the 1957 National Safety Congress by the Traffic Section. The conduct of these Congress sessions each year is only one of the many cooperative activities which the Traffic Section carries on in behalf of its members, and for the benefit of accident prevention work in public safety generally. The Section gives guidance in the preparation of a great variety of technical and educational material useful in day-to-day safety.

The activities of the section are under the direction of its executive committee, the members of which are listed in the close of this volume.

A CONGRESSMAN LOOKS AT TRAFFIC SAFETY

by HON. KENNETH A. ROBERTS

member, U. S. House of Representatives, Washington, D. C.;
member, Committee on Interstate & Foreign Commerce;
chairman, Special Subcommittee on Traffic Safety

The United States Congress is concerned with all problems confronting the nation and its citizens. Certainly the horrendous number of traffic accidents, injuries, fatalities, and property losses clearly places highway safety in the national picture. Automobiles have long since ceased being an article employed solely for Sunday afternoon amusement. They have become essential to the operation of daily life Americana.

Today, many automobiles traverse several state boundaries each day. Thus, the driving habits of the citizens of one state are important to the drivers of other states. In today's living, such widely traveling vehicles are a matter of *inter*state concern and not just *intra*state.

I have a very good example of this type of interstate travel. In correspondence the Subcommittee on Traffic Safety had with the New Mexico State Police, there was enclosed a description of a three-car accident which left in its wake five dead and two critically injured. The accident occurred at 3:13 p.m. on U. S. Highway 66 just 19½ miles west of Gallup, N. M.

The three drivers of the cars were all legal residents of California as were all the remaining eight passengers involved in the accident. This graphically illustrates that the accidents throughout the 48 states and the drivers of each state are of concern to the entire nation and not just to their own states.

NATION'S LOSS ALSO

Epidemiologists term the annual slaughter upon the bloody altar of the U. S. highways as epidemic and a national health problem. I am also sure that I need not point out that in addition to the great personal loss suffered by the families of the 40,000 killed on the highway each year, there is a loss suffered by the nation—a loss of talent and potential future earned income.

This will give you just a thumbnail sketch of why your Congress is interested and is concerned about the nation's highway safety so much so that this problem is now being investigated by a special subcommittee, of which I am chairman.

The Special Subcommittee on Traffic Safety was first appointed in June 1956 after the House of Representatives adopted a resolution to provide that a Congressional committee investigate the causes of automobile accidents to determine what action could be taken to reduce such waste of human lives and property.

The subcommittee held its first hearings in July 1956 and when Congress adjourned, the subcommittee took to the road to learn what was being done in different local areas to halt one of the nation's leading killers—the automobile on the highway. The subcommittee also made an inspection of the facilities of American Motors, General Motors, the Chrysler Corp. and the Ford Motor Co.

SUBCOMMITTEE CAN AID

Because of the tremendous scope of the study, the subcommittee was appointed again in the present 85th Congress and is continuing its investigation. In terms of age, the subcommittee is a fledgling compared to the organizations which have been doing excellent work in the field of traffic safety for many, many years. While at this time it is not anticipated that the subcommittee will undertake any original research, I do believe that the subcommittee can serve a valuable function in the field of safety.

The subcommittee is a body vested solely with the public interest. The function which the subcommittee can perform, and which I think is highly valuable, is that of bringing together in one place, before an impartial forum, all the work and research done in the many areas of traffic safety.

This past session of Congress, we had a good example of this function of the subcommittee in the hearings which the subcommittee held to determine the crashworthiness of [redacted] were held [redacted] of the [redacted]

[redacted] subcommittee [redacted] sideration [redacted] ented at the hearing, also filed a report which contained its own opinion on this safety device. In its report, the subcommittee stated its conclusion "favoring the installation and use of this safety device." This is an example where the subcommittee, I believe, has performed a valuable service though immediate legislation was not its purpose.

I would like to state, however, that I have personally sponsored a bill in the House which would provide that any automobile seat belts shipped in interstate commerce meet certain specifications established by the Bureau of Standards, so that when the public does buy a seat belt it is assured of purchasing one which will truly provide safety. It is my hope that the subcommittee will have an opportunity to give careful study to this legislative proposal in the next session of Congress.

Another legislative proposal I hope will become law in the next session of Congress is the bill to provide Federal funds to assist the individual states in establishing driver education courses. The subcommittee held hearings on this bill in the last session, but a shortage of time prevented the subcommittee from taking any further action.

In my opinion, the inclusion of driver education in the school curriculum can be of considerable value in teaching future drivers good habits and good manners as well as developing their mechanical skill in handling today's powerful machines. This training would naturally contribute to greater highway safety. As one witness testified, we do not challenge the value of driver education without also challenging the value of education itself.

I would also like to point out that several studies made of young people who had had driver training indicated a substantial reduction in accidents and traffic violations. Realizing this fact, some insurance companies now do not raise the rates in families having young persons driving the family car, during the young persons have had driver training. Several states by law also now require that young persons seeking driver licenses must take a driver education course first.

Due to the fact that some states can not afford to establish such education courses, and because I believe that such education will be of great value in increasing safety on the Nation's highways, I expect to work hard in the next session of Congress to have this legislation adopted.

PROMOTES STATE COMPACTS

Another bill which is pending before the Special Subcommittee on Traffic Safety and which I think would be valuable to safety if enacted, is House Joint Resolution 221, sponsored by my able colleague and member of the subcommittee, Congressman John V. Beamer of Indiana. The purpose of the bill, sponsored by Congressman Beamer, is to grant the consent of Congress to the several states to negotiate and enter into compacts for the purpose of promoting highway traffic safety.

In supporting his bill, Congressman Beamer told the subcommittee: ". . . It is essential that the laws regulating traffic safety be brought up to date. It is of equal importance that there be some method of making these laws more standard among the many states in order that people traveling distances will have a better understanding of the laws and rules governing the flow of traffic."

The enactment of Mr. Beamer's resolution would grant the consent of Congress to the several states to join in the formulation of a body that would have authority to legally prepare and promulgate legislation and regulations, if needed, to meet the serious problem of such losses in human life and property now occurring on the nation's highways.

Through such an interstate [redacted] states could act jointly and [redacted] solve a considerable portion [redacted] problem and would not [redacted] state sovereignty or [redacted] or jeopardized. The [redacted] interstate compact is [redacted] was established by the [redacted] pact and the Interstate [redacted] Prevention, both of [redacted] successfully.

Considerable interest [redacted] Beamer's proposal has [redacted] number of the states' [redacted] hope that the subcommittee [redacted] study and consideration to [redacted] and act on this bill in the [redacted] Congress.

LABEL AUTO FITNESS

Congressman Abraham Multer of [redacted] York has introduced legislation known as the "General Motor Vehicle Act of 1957," which is now pending before the Traffic Safety Subcommittee. One section of this bill provides that automobiles shall bear a Certificate of Fitness label. The label would insure that the vehicle had been inspected and found in good working order and in complete accord with all specifications as set forth in descriptive and advertising matter, as well as that the vehicle had been road-tested and found in good operating condition after such a test. It is my hope that this bill, also, will have the further study of the subcommittee in the next session of Congress.

In addition to these bills, in the next [redacted] the subcommittee [redacted] investigation and work, [redacted] problems of traffic [redacted] the human [redacted] enforce- [redacted] ing to [redacted] of [redacted] ver [redacted] o. [redacted] c- [redacted] ile. [redacted] inue [redacted] coming [redacted] Subcom- [redacted] sonal hope [redacted] included vol- [redacted] manufacturers in [redacted] that they are essential to the [redacted] health, but that if such action were not taken voluntarily, I would urge Congress to enact the necessary legislation.

The sole purpose of the Subcommittee on Traffic Safety is to work for greater traffic safety. It is our sincere desire to join efforts with established safety groups in making greater traffic safety a reality for all persons wherever they may live or travel.

This past session of Congress, we had a good example of this function of the subcommittee in the hearings which the subcommittee held to determine the crashworthiness of seat belts. These hearings were held as it came to the attention of the subcommittee that many conflicting reports had been carried in the press and much confusion existed in the public's mind regarding the true value of seat belts.

The subcommittee sat as an impartial forum and invited testimony from persons, both proponents and opponents, who had done work relating to this safety device. Also, any persons who requested the privilege of testifying on this matter before the sub-committee were heard. The witnesses included researchers, medical experts, government officials, and representatives from each of the five leading American automobile manufacturers.

FAVORS SEAT BELTS

The complete text of these hearings soon should be available, free of charge, to the public, so that anyone who wishes to read the data exactly as it was presented to the subcommittee may do so and may form his own opinion on the value of seat belts. The subcommittee, after careful study and consideration of all the testimony presented at the hearing, also filed a report which contained its own opinion on this safety device. In its report, the subcommittee stated its conclusion "favoring the installation and use of this safety device." This is an example where the subcommittee, I believe, has performed a valuable service though immediate legislation was not its purpose.

I would like to state, however, that I have personally sponsored a bill in the House which would provide that any automobile seat belts shipped in interstate commerce meet certain specifications established by the Bureau of Standards, so that when the public does buy a seat belt it is assured of purchasing one which will truly provide safety. It is my hope that the subcommittee will have an opportunity to give careful study to this legislative proposal in the next session of Congress.

Another legislative proposal I hope will become law in the next session of Congress is the bill to provide Federal funds to assist the individual states in establishing driver education courses. The subcommittee held hearings on this bill in the last session, but a shortage of time prevented the subcommittee from taking any further action.

In my opinion, the inclusion of driver education in the school curriculum can be of considerable value in teaching future drivers good habits and good manners as well as developing their mechanical skill in handling today's powerful machines. This training would naturally contribute to greater highway safety. As one witness testified, we can not challenge the value of driver education without also challenging the value of education itself.

I would also like to point out that several studies made of young people who had had driver training indicated a substantial reduction in accidents and traffic violations. Recognizing this fact, some insurance companies now do not raise the rates in families with young persons driving the family car, providing the young persons have had driver training. Several states by law also now require that young persons seeking driver licenses must take a driver education course first.

Due to the fact that some states can not afford to establish such education courses, and because I believe that such education will be of great value in increasing safety on the Nation's highways, I expect to work hard in the next session of Congress to have this legislation adopted.

PROMOTES STATE COMPACTS

Another bill which is pending before the Special Subcommittee on Traffic Safety and which I think would be valuable to safety if enacted, is House Joint Resolution 221, sponsored by my able colleague and member of the subcommittee, Congressman John V. Beamer of Indiana. The purpose of the bill, sponsored by Congressman Beamer, is to grant the consent of Congress to the several states to negotiate and enter into compacts for the purpose of promoting highway traffic safety.

In supporting his bill, Congressman Beamer told the subcommittee: ". . . It is essential that the laws regulating traffic safety be brought up to date. It is of equal importance that there be some method of making these laws more standard among the many states in order that people traveling distances will have a better understanding of the laws and rules governing the flow of traffic."

The enactment of Mr. Beamer's resolution would grant the consent of Congress to the several states to join in the formulation of a body that would have authority to legally prepare and promulgate legislation and regulations, if needed, to meet the serious problem of such losses in human life and property now occurring on the nation's highways.

Through such an interstate compact, the states could act jointly and cooperatively to solve a considerable portion of the highway problem and would not have any of their state sovereignty or state's rights usurped or jeopardized. The idea for such an interstate compact is not new. Precedent was established by the Interstate Oil Compact and the Interstate Compact for Crime Prevention, both of which have worked successfully.

Considerable interest in Congressman Beamer's proposal has been expressed by a number of the states' governors. It is my hope that the subcommittee will give serious study and consideration to H. J. Res. 221 and act on this bill in the next session of Congress.

LABEL AUTO FITNESS

Congressman Abraham Multer of New York has introduced legislation known as the "General Motor Vehicle Act of 1957," which is now pending before the Traffic Safety Subcommittee. One section of this bill provides that automobiles shall bear a Certificate of Fitness label. The label would insure that the vehicle had been inspected and found in good working order and in complete accord with all specifications as set forth in descriptive and advertising matter, as well as that the vehicle had been road-tested and found in good operating condition after such a test. It is my hope that this bill, also, will have the further study of the subcommittee in the next session of Congress.

In addition to these bills, in the next session of Congress the subcommittee expects to continue its investigation and work, and will study specific problems of traffic safety in the general areas of the human factor in accidents, vehicle design, enforcement, and legislation.

Studies of human factors contributing to traffic accidents will include the effect of alcohol on safe driving, the licensing of drivers and further consideration of driver training.

Vehicle design, safety research and medical research projects will be gone into also. I was very pleased to note in a recent magazine article that the Cornell accident injury research statistics do show a reduction in injuries due to improved design in certain safety features of the automobile. This is encouraging news to your subcommittee and I hope that time will continue to show greater progress in this area.

I have frequently stated, since becoming Chairman of the Traffic Safety Subcommittee, that it was my deep personal hope that safety features would be included voluntarily by automobile manufacturers in their cars as I feel that they are essential to the public's health, but that if such action were not taken voluntarily, I would urge Congress to enact the necessary legislation.

The sole purpose of the Subcommittee on Traffic Safety is to work for greater traffic safety. It is our sincere desire to join efforts with established safety groups in making greater traffic safety a reality for all persons wherever they may live or travel.

REPORT ON PLANS FOR

1957 PUBLIC OFFICIALS TRAFFIC SAFETY CONFERENCE

by BURTON W. MARSH

chairman, Planning Committee for the 1957 & 1958 Conferences, President's Committee for Traffic Safety

"Time for Decision" indicates that by 1966 traffic will have increased by almost one half and if accident rates continue unchanged—54,000 will be killed in traffic crashes and 1,900,000 will be injured per year.

"Highway traffic and traffic fatalities in 1975" by S. T. Hitchcock, chief, Div. of Highway Transport Research, Bureau Roads, analyzes various growth factors and trends and comes up with a projection of 51,000 fatalities. But this statement ALSO recognizes that "T'AINT NECESSARILY SO" (apologies to the writers of "Porgy and Bess"), if certain things are done, then a better fatality record will result.

It's going to take a lot of doin' but if we and others do what we're capable of doing, not only can the fatality rate continue to reduce but the 1966 fatality toll can be less than it is today—substantially less! I'd say ⅓ less; one whom I greatly admire says ½ less!!! And at the same time, traffic can and will be more orderly and flow can be expedited.

But against the anticipated continuing rapid growth of traffic and an at-best too slow "catch up" program of highway improvement (despite the great expanded program now getting up full steam) reducing traffic injuries and fatalities will be a big, challenging job. It's up to us to get on the job.

NEW KNOWLEDGE WANTED

There is much that we don't know but need to know about doing this job. That's one reason we have high regard for the potential of the Robert's Committee work—and why we enthuse over the Bureau of Public Roads Highway Safety Study (under capable Charles W. Prisk.) as called for in Sec. 117 of the Federal Aid Highway Act of 1956. That's why we are encouraged to learn of plans for a group of highly intelligent specialists in non-traffic fields who are going to take a fresh new look at this overall problem in an intensive one-week "brainstorming" idea discussion get-together. Yes, these and numerous other new analyses, new researches, new approaches and experiments are fine—and much benefit will be derived!

PRESIDENT'S COMMITTEE DECISION

Yet we already know enough about what many of the main measures are which need to be taken. The President's Committee for Traffic Safety's action program contains excellent program proposals.

Our great need now is not in the what-to-do line but in two other "areas":

1. Which to do next.
2. How to get sound needed known measures effectively applied.

WHICH? I say which next advisedly, because one of our troubles is that there are so many needs that a priority schedule is called for.

HOW? I would also emphasize the point that we must give great attention to how to get sound measures into continuing effect. We would do well to stop quibbling about details and technicalities (except in our professional inner councils) and get into high gear on how to get results.

These or somewhat similar views impressed the President's Committee for Traffic Safety (of which Harlowe Curtice, president, General Motors Corp. is chairman) and the executive committee of its advisory council (under the vigorous leadership of Joe Mattson, President, Automotive Safety Foundation) who it should be stated is enthusiastically backed by advisory council chairman, William Randolph Hearst. Indeed so impressed were these leaders and the other key National leaders associated with them in the President's committee and its advisory council that they set up a special committee to plan actions which would help on the which and the how problems.

First, they decided, the various national organizations of public officials should be called upon to give important information and answers. Then, based on what the public officials proposed, civic leadership should be mobilized to get most needed jobs done.

By what mechanism could these objectives, involving on the one hand, public officials, and on the other, civic leaders be best advanced, considering limitations of staff, time, and funds, and the need for country-wide coverage? The planning committee proposed a program which would be tied into and lighted by:

1. A public officials traffic safety conference in December 1957, and
2. Four regional traffic safety conferences for civic leaders in the spring of 1958.

The President's Committee approved the proposal.

Let me hasten to state (without disparaging conferences) that the conceived program goes far beyond the holding of the indicated five conferences. Preparatory and follow-up work such as has never been done before constitutes one of the reasons why I am convinced that uniquely favorable results will be achieved in this program.

It's not only the fact that much new work of preparation and follow-up is being and will be done, which enthuses me, but it's also the caliber of the persons involved and to be involved!

THE TOP COMMAND

I have already mentioned these national figures: Harlowe Curtice, Bill Hearst, Joe Mattson. Let me now go to the top and tell you that the President personally will participate, as will his aide, former Governor Howard Pyle. While we shall miss Admiral Min Miller, long conference director, there will be key leaders as directors or chairmen of all five conferences. Bill Bethea has been advanced and is now executive secretary of the President's committee (and its advisory council). Bill will give great staff leadership.

PUBLIC OFFICIALS CONFERENCE PLANNING

Let, me tell you a bit about the program tied into the Public Officials Conference in Washington D. C. on December 9 and 10, 1957.

First, all planning work is and has from the start been under the direction of representatives of organizations of public officials. Charles Schwan of the Council of State Governments, is chairman of that planning committee. Vice chairmen are representatives of county and municipal officials—Keith Seegmiller, National Association of County Officials and Wilber E. Smith, American Municipal Association. Other committee members are representatives of police, educators, motor vehicle administrators, highway and traffic engineers, judges, etc. As consultants, they have Tom Boate, Norman Damon and Bill Johnson. John Gibbons, of ASF is chairman of their publicity committee and Sonty Sontheimer of ATA and Bill Simon of NHUC are co-chairmen of a committee on arrangements.

PREPARATION OF REPORTS

That this is not going to be just another conference will I think be clear when the preparatory steps are understood.

More than 30 national organizations of public officials and in addition a group representing federal government agencies have been invited to participate actively in unique preparatory measures. All are invited to prepare (or cooperate in preparing) a report covering four matters which are to constitute the purpose of the 1957 Officials Conference. These are:

1. To assess the status of traffic accident prevention in relation to recommendations of the Action Program.
2. To establish (or identify) immediate and long-range needs to control traffic accidents.
3. To recommend practices for these needs.
4. To indicate those for which public support is particularly needed.

"Fact Sheets" have been sent out to organizations of officials providing main needed information—and material has also been sent as to the type of report and style desired. Thus, each group is asked, of course, to deal primarily with its own primary area of interest and responsibility.

However, each group is also invited to present any comments and proposals it wishes, on any aspect of traffic safety. In particular, each group is requested to present views and proposals on accident records, public information and research which subjects apply to all groups and aspects of the traffic safety field.

Various groups will report under most subject headings. Take engineering as an example. The following organizations have been invited to submit reports: American Association of State Highway Officials; Institute of Traffic Engineers; Highway Research Board; American Bridge, Tunnel and Turnpike Assn.; American Public Works Association; American Society of Planning Officials.

Attendance at the December 9-10 Officials Conference will be exclusively by invitation —and exclusively officials (with exception of a few staffing aides who will take no part in the decisive action or voting). Each organization of officials will nominate up to 20 representatives—and if the organization contains officials and non-officials, only those who are public officials will be eligible. Thus this is to be an exclusively public officials conference.

CONFERENCE WORKSHOPS

At the conference the groups will quickly break up into subject workshops at which will be hammered out decisions as to major findings, proposals, priorities etc. to submit to the final general session.

To aid conference participants in doing this important highlighting job in the time available, copies of the reports will be sent out in advance.

It should be understood that the plan is to have, for example, enforcement persons in each workshop—so that all groups of specialists will know what the others are deciding and will have an opportunity to make amendments, suggestions, alternate proposals, etc.

The plan is that in the final session, decisions will be reached as to major points—these to be assembled promptly as a highlights report. However, additional matters which are approved in workshops, will not be lost but will be included in summarized materials which will be prepared after the conference.

It was realized by the planning committee that a few matters should be covered in the Public Officials Conference, which are not within the scope of public officials' duties—such as safety engineering of the motor vehicle, safety education in non-public schools, and organized public support.

Steps are being taken to have these matters treated so that reports concerning them can be brought before the Official's Conference.

BASIS FOR REGION CONFERENCES

What then will be done with the material resulting from the Officials' Conference? Many follow-up procedures will be employed. The reports will be widely disseminated. Many national oragnizations will want to study them. Newspapers, magazines and other public information media will use them. Legislators will be greatly interested.

And of course, these materials will constitute the main bases for the programs of the four regional conferences of civic leaders in the spring of 1958. It is of course planned to get at least summaries from the Officials' Conference into the hands of the civic leaders invited to participate in regional conferences, sufficiently in advance so that their contents may be known, and their impact and implications realized.

But even more important, it is planned that prior to the regional conferences each state will determine its own top priority needs (adapting or modifying the overall proposals) from the Officials' Conference, and that those materials will also be placed, well in advance of the regional conference in the hands of invitees.

While work is under way for the 1957 Officials' Conference, I want you to know that advance planning has long been in progress for the 1958 regional conferences.

Again, permit me to stress the high quality of the planning leadership and of the teamwork involving all the major national organizations active in traffic safety. Indeed, as an aside, I regard this spirit of teamwork and of mutual understanding and respect, as one of the highly valuable by-products of this undertaking.

Here is the planning talent:

Program Committee: Norman Damon, V. P. of ASF, Chairman; Dick Bennett, NAA MIC, Vice Chairman

Program Presentation Committee (on methods of effective programing—to sell civic leaders): Bill Johnson, NSC

Arrangements Committee: (Hotel meeting rooms, etc.) Co-Chairmen Sonty Sontheimer, ATA; Bill Simon, NHUC

Attendance Committee: M. R. ("Bud") Darlington, I-IHSC

Publicity Committee: Harry Martin, American Red Cross

Finance Committee: Vestal Lemmon, N. Assn. Independent Insurers.; Tom Boate, ACSC,; Ray Ashworth, IACP,; Charles Schwan, CSG, also member of Exec. Committee

WHEN and WHERE

The regional conferences are scheduled as follows:

Chicago, Ill.—April 1-2, 1958

San Francisco, Calif.—April 8-9, 1958

Atlantic City, N. J.—April 15-16, 1958

(Perhaps needs reconsideration—conflict)

Miami Beach, Fla.— May 29-30, 1958

The purpose of these conferences is broadly the stimulation or motivation of effective public support for sound, top-priority traffic safety measures—based on findings and proposals of the Officials' Conference. The need for effective organization and administration will be stressed—and there will be discussion of how to go about these jobs back home.

TOP CIVIC LEADERS WANTED

Great emphasis will be given to measures to get top civic leaders to participate in the regional conferences. It is hoped to have a field representative of one of the majorly interested national organizations assigned to each state to work with one key civic leader (or a few) selected by President's Committee for Traffic Safety in developing the invitation list and then in taking suitable steps to get definite acceptances.

Let me emphasize that these are to be invitation affairs—and that the objective is not huge numbers, but selected quality. About 1,000 at each conference is the objective—and with about 12 states per conference, that's an average of less than 100 per state.

Also, let's remember that these are conferences especially tailored for civic leaders who are so greatly needed to take really active parts in state and local traffic safety programs. These are not conferences where traffic safety folk should talk to themselves. Nor are they conferences which should be too loaded with public officials.

Of course a limited number of chosen representatives of public official groups will be on hand to present the top priority needs of their respective states. Such state priority listings will be requested from governors early in 1958. These state priorities will thus be important companions to the overall nationwide appraisals.

The few traffic safety professionals invited will be for staffing purposes.

FORMAT OF REGIONAL CONFERENCES

How will these regional conferences be programmed? Here's the pattern:

a. Opening breakfast and opening session—to be called perhaps the President's breakfast.

b. Break-up to separate meetings by groups—agriculture, business and professional, labor, media, civic and fraternal, military, religious, women, public officials, organizations.

c. Meet by state groupings morning of second day.

d. Concluding general luncheon session.

These regional conferences cost plenty—and in addition to the federal government share, there are about 15 National organizations which are joining together in financing them.

The planning committee is determined that these conferences shall pay off in results. Consequently, the most careful and by far the best preparatory work ever done is being carried out for these conferences. The advice of top experts in how to get best results in such meetings, is being obtained, Weiss Kulp of Kudner Agency, N. W. Ayer.

Appropriate advance materials will go to invitees. At the conference, the best presentation methods will be used in carefully planned, fast-moving, highly summarized manner.

Delegates will have "take home" materials —check-lists, graphic charts, etc. They will be impressed with needs and with practical action steps they can take, without unduly loading themselves up.

Well, now, there you have it, except for one point. Can you help? Yes, you can—and your help is wanted. Here are some things you can do:

- Study the reports which come from the Public Officials' Conference. Counsel *with your own officials about the findings* and proposals. Then, still cooperating with your officials, develop some specific action steps which you and your organization can take. Then go to work.
- Counsel with others active in traffic safety in your state or local community. Agree among yourselves who the few top civic leaders are who would be likely to be willing to devote their personal time and attention to a greatly improved traffic safety program. Write out who these few leaders are, what their past performance has been, and why your group believes they are the ones to lead in traffic safety.

  Send such information to J. W. Bethea, Executive Secretary, President's Committee for Traffic Safety, Washington, D. C. Do not approach or contact the civic leaders. Send your suggestions in time so they can be studied and compared with others—to the end that the best possible civic leaders will be invited to attend the regional conferences.
- Promote the regional conferences for what they are—not general open-to-all meetings, but highly selective, specialized conferences with very specific objectives.
- After the regional conferences, offer your help to the delegates from your state or local community.

THE HIGHWAY SAFETY PROGRAM OF THE GOVERNOR'S CONFERENCE

by FRANK SMOTHERS

director of publications, The Council of State Governments, Chicago

In government and politics there are few subjects so sacrosanct that they are above controversy. I might even go so far as to say that if we didn't have controversy we wouldn't need government. When everyone agrees, we don't need a law, we don't need a referee, and we probably don't need enforcement.

Some may say, when they first think about it, that safety, including safety on the highways, surely is a safe and uncontroversial subject—for government, governors, legislators and everyone else. And in the abstract they will be right. We are all for safety. It's like the sanctity of the home, the dignity of motherhood and the glory of the flag.

But as a matter of fact quite a few battles have been fought, in legislative halls and elsewhere, as you'll recall, when someone has proposed doing something specific even for those things—about the conditions of homes, for example, or the things mothers need to be dignified, or the measures required to defend the flag. It is the same with traffic safety. When you get down to specifics it is full of controversy.

For it isn't uncontroversial to send people to jail. It isn't often agreeable to take away their licenses. You don't change the courts without an argument. And you can get a big debate on your hands when you propose to limit speed, or even to control access to the public ways.

THE CONFERENCE

So, ever since the governors and the Governors' Conference began to come to grips with what they recognized as a crisis of mass carnage on the roads, there have been some fights in this area. There probably will be more. But there is no program on which our governors are more united in their determination to get results than they are on their highway safety program. What is more to the point, they are getting results.

The turning point in highway safety action by the Governors' Conference came in 1956. Year after year the governors had recognized the growing problem. They had exchanged views and experience about it and had adopted resolutions calling for state action that bore good fruit. As early as 1949, at the direction of the Governors' Conference, the Council of State Governments undertook a study of the subject, and the following year published an extensive report. Its recommendations were reflected in many helpful legislative and administrative acts thereafter.

But, meantime, the problem took on new dimensions—the vast increase in the number of cars on the road, the vast increase in miles driven on a network of highways that hadn't kept pace with needs. By 1956 the governors knew that the situation amounted to a national emergency. At their conference that year they decided that it called for entirely unprecedented measures.

In that 1956 meeting, held at Atlantic City, several things stood out:

1. The discussion was comprehensive as regards facets of the problem examined. The governors pointed up not just a few but a long series of factors. They dealt with licensing, vehicle inspection, driver education; with engineering, limited access, road surfaces; with the uniform vehicle code and reciprocal arrangements. They discussed the effects of speed—of fatigue—of drunken driving. They looked at "the horsepower war" among automobile manufacturers—concerning the effects of which there was some disagreement, and at competitive advertising that emphasizes speed—concerning the ill effects of which there was no disagreement. They pointed up the role of the courts. And they put heavy emphasis on enforcement.

BALANCED PLAN NEEDED

2. Out of that discussion came a consensus that a balanced program was needed. No one, two or three approaches among those discussed would do the job. The causes of accidents were complex. A broad program had to be developed to deal with it, when developed it had to have public support, and the features requiring enforcement had to be enforced.

3. The discussion, the spirit in which it was conducted, the wide participation and intense attention of the governors in it, all testified to a determination on their part to give leadership. One of the governors, summarizing his view of the session, said he had been coming to the meetings of the Governors' Conference for six years, and "this," he said, "has been the most practical and informative session that I have attended." He spoke, certainly, for a great many there.

As a result, the governors decided that they needed a special Highway Safety committee, and they created it there at Atlantic City—a committee that would set to work immediately to study and draw up specific recommendations; a committee, we can now report, that has led the way to the widest and most promising state action—by legislatures and by administrators—that the country has ever had in one year for highway safety. And the work continues.

THE PROGRAM

The committee was—and is—a strong one, under its Chairman Governor Ribicoff of Connecticut. He had led an exceptionally effective traffic safety program in his own state, and he has given the work of the committee unstinting time and energy. Working with him as committee members are eight other governors, representative of all sections of the nation.

The committee set to work rapidly and intensively in the summer of last year—rapidly and intensively because it knew that early results were essential, that many of *these results would require legislation*, and that if the committee was to give effective leads to the legislatures in the big legislative year of 1957, it would need to have its report in all the state capitals well in advance of those sessions, most of which began in January.

Furthermore, although the committee recognized that much remained to be learned about the ingredients of traffic safety, a great deal was known right then. Continued study had to be pursued. But, meantime, leadership and action were required at once. The people who might die on the highways in 1957 couldn't be saved by research addressed to 1960.

And so, using the staff services of the Council of State Governments for fact find-

ing and assembling, and taking the counsel of organizations long qualified in the traffic field—prominently including the National Safety Council—the Governors' Conference committee held a succession of meetings, weighed the relevant proposals, and reported in November, 1956. Its report—a tersely written brochure—went to every governor and, through the governor, to every legislature in the country. It presented a series of specific proposals. Many of you have examined the report, and I shall not go over the whole program here. But I shall emphasize some guide lines.

TWO COURSES OF ACTION

The report presented, in fact, two sets of recommendations—one for immediate action, the other a long-range program. The committee recognized that they overlapped, that many of the recommendations labeled "immediate action" had long-range aspects, and that some of the "long-range" proposals could be put under way very promptly in some states. Nevertheless the distinction was in general a valid one.

The program for "immediate action" had several types of proposals—all of them addressed to every state in the Union.

Certain recommendations dealt with machinery to coordinate traffic safety programs at the state level, under the governors' leadership, and involving the action of other state executives and legislatures. Proposed also were annual conferences of judges, prosecutors and police concerned with traffic cases.

Heavy emphasis went to means for improved enforcement. These included enlargement of highway patrols, use of modern devices such as chemical tests for alcohol and radar for speed, better investigation of accidents, use by the state police of the uniform no-fix traffic ticket, suitable minimum fines and penalties for all serious violations, review of license suspension and revocation procedures, and interstate exchange of information so that action could be taken in one state as to drivers who violate traffic laws in other states.

Closely allied with enforcement were recommendations to improve state records of accidents and violations. And the need for better organization, qualifications and procedures in traffic courts received attention.

Drivers' licensing procedures, the committee underlined, should meet or exceed the revised 1957 standards of the American Association of Motor Vehicle Administrators.

Recommendations were set forth both for development of sound driver education courses in the high schools and a driver improvement program for those whose need for special attention is indicated by accident records.

A broad program of uniform legislation was proposed—on rules of the road and vehicle equipment, in line with the Uniform Vehicle Code, and so was legislation to enable cities to adopt a uniform traffic ordinance by reference.

The committee suggested means of obtaining informed and effective public support. And finally it proposed that the states "provide the funds necessary to implement all the elements of a balanced program."

Such, in general, was the "immedate action" program, summarized in eighteen recommendations and spelled out in the text. The long-range program—similarly summarized, and similarly spelled out—proposed among other objectives that each state:

—thoroughly study its highway patrol—its organization, selection, training and operation

—strengthen the staffs of highway and traffic engineers

—establish a vehicle inspection program as soon as the other elements of a balanced program had been developed

—insure that the state department of education—and colleges that train teachers—improve the safety education program

—see that the organization and personnel of all agencies responsible for traffic safety are adequate to the task

—determine what further contributions the state can make to promote research on the causes and prevention of highway accidents.

THE RESULTS

And the results? Well, I think that an examination of them would be instructive to a gentleman who talked with us the other day. The gentleman represented, shall I say, the man in the street. He came into the office to fix some telephones. He had a little time on his hands while waiting for the janitor, so we asked him if he would like something to read. Specifically, we offered him something on taxes, explaining that we had much literature on this subject, and it might interest him since his bill would be paid out of taxes. That reminded him of something.

"Just what," he asked, "does this organization do?"

"We try," I replied, "to help make government better."

"Well, our man in the street commented, "you don't seem to be having much success."

We in government don't resent that sort of thing. We expect it. People are always hard on government—partly, I'm sure, because it belongs to them, partly because they all pay for it, and partly because they depend on it for so many things. But I don't think our man in the street gave a completely balanced verdict. I'm sure that if he weighed what has happened as a result of the Governors' Conference lead for highway safety he would think better of government.

Here are a few facts:

By the middle of 1957—with a number of legislatures still to report—the Highway Safety committee was able to report to the Governors' Conference that 15 states had increased the size of their highway patrols, one had established a program to permit automatic increases in its patrol to keep pace with rising vehicle registrations, another had adopted a requirement that all highway patrolmen and licensing examiners take intensive college-level driver education courses.

NEW LICENSING LAWS

Among numerous other acts affecting enforcement, six legislatures had enacted or revised laws on chemical tests for intoxication. Several states had authorized use of radar and admission of radar evidence in court, and a number had increased their penalties for serious traffic offenses, especially drunken driving. Use of uniform traffic tickets and uniform accident report forms likewise increased.

In the area of licensing, two states had passed the country's first law providing for provisional licensing. One had adopted legislation requiring re-examination of all drivers every four years. Several had tightened their provisions on licenses for teen-agers and had adopted stronger license examining procedures. At least one state was added to the list with point systems for license suspension or revocation. Meantime, other states were making more use of license suspension. Connected with certain of the license systems, driver improvement programs were being started or expanded.

Speed also came into attention, and in several states absolute, fixed speed limits replaced "reasonable and proper" limits.

Driver education advanced markedly. Half a dozen states launched new state-sponsored training programs for high school students and four others improved or extended programs already in effect.

There was significant advance involving many states in adoption of features of the Uniform Vehicle Code, and more states were exchanging reports of accidents and violations.

Rising attention was directed to the traffic courts, and one state abolished the fee system for the justice of the peace courts and provided for salaries instead.

Probably as important for permanent results as anything else, numerous states strengthened their administrative machinery for highway safety. For example, at least five set up coordinating committes of officials to provide overall direction for traffic safety. One initiated a department of public safety, another a public safety division in the highway department, and two more established independent motor vehicle departments. Several states reorganized or reactivated citizen support organizations.

Meantime, legislative councils or special legislative committees in various states began assigned studies of such factors as periodic examination of drivers, vehicle inspections, justice of the peace systems, causes of accidents, and motor vehicle administration. Support was increased for safety research programs at certain of the state universities, and one state established a driver research testing center to study causes and frequency of accidents among various categories of drivers.

Therefore, the record shows that government is having some success on this nationwide problem of traffic safety.

But the job is never ending. The Governors' Conference knows that. At its 1957 annual meeting, at Williamsburg, Va., in June, it commended the Highway Safety committee highly, hailed the forward strides that had resulted in legislation, administration and enforcement, and then declared, "*there still is a most* urgent need to reduce the carnage on streets and highways which, unless checked, will claim half a million lives during the next decade."

The conference accordingly continued the committee on highway safety, and added the request that with its other work it "seek to develop recommendations for legislation requiring safety design features to be incorporated as standard equipment on all new automobiles."

THE CONTINUING TASK

There will be more contributions, and important ones, from the Governors' Conference and from its committee under Governor Ribicoff. There will be continued administrative action, stemming from the governors' offices and the state executives working under them, to tighten enforcement, improve driver education, strengthen licensing and attend to other key aspects.

As a result of the legislative interest engendered in 1957, and the legislative studies now under way, there will be more constructive legislation, next year and thereafter. Through the efforts of leaders of the judiciary, the bar, the governors and the legislatures, we are going to make progress in the traffic courts.

One reason for my confidence is the new climate of opinion about traffic safety that is now apparent. The National Safety Council *has contributed greatly to it* year after year. The Governors' Conference has contributed a great deal to it. The movement has spread rapidly at the community level, among officials and among citizen leaders.

One of the evidences of this new climate is a new direction of thought within the automobile industry itself, as indicated by its recent announcement that henceforth horsepower, speed and racing performance will not be emphasized in their advertising. This is an aspect on which governors had expressed much concern. The announcement of the manufacturers is important in itself. It is perhaps more important as a symbol of what's going on in public opinion.

For the fact is that, given leadership—which it has now received—the public wants and will support the measures that are required for traffic safety. But the leadership must not lag. It must continue in government, at every level, and it must continue outside government. I am confident that we will have it from the governors and state government.

REPORT OF THE TRAFFIC AND TRANSPORTATION CONFERENCE

by T. N. BOATE

manager, Accident Prevention Dept., Association of Casualty & Surety cos., New York city

The lifeblood of an association is membership participation in its activities.

During the past two years as chairman of the traffic and transportation conference, I have observed in detail the workings of this national association dedicated to traffic and transportation safety. If there is a weakness in the operation of this conference, it is the failure of members to participate in the formulation of policy and in guiding the traffic and transportation department in its program of traffic accident prevention.

Some progress toward stimulating active participation on the part of conference members was accomplished during the past two years by the organization of an executive committee, which met four times each year. The executive committee has made some notable contributions.

But despite this improvement, the significant aspect of the conference is still the noticeable apathy on the part of its members. We of the executive committee receive no comments or complaints about our activity or lack of activity. We receive no constructive criticism and virtually no recommendations on how the traffic accident problem should be attacked by the National Safety Council.

Needless to say, no organization—and this particularly applies to one that is trying to cope with a problem as vast and complex as highway traffic safety—can function at its peak level under these conditions.

This is by no means a criticism of the staff of the traffic and transportation department. I am fully convinced that the traffic accident prevention work of the National Safety Council is growing stronger day by day. However, we owe it to the Council management to participate actively in its affairs and strengthen, wherever possible, its continuous attack on the traffic accident problem. Unless we do, the full force of the national traffic safety effort cannot be brought to bear with maximum effectiveness on the problem.

CONFERENCE ACTIVITIES

Now I would like briefly to review some of the more important program activities and planning of the Conference that originated within the executive committee during the past two years:

Plans have been made and arrangements are underway for the distribution of a "Back the Attack" leaflet on pedestrian safety by state government in connection with the issuance of the 1959 automobile license plates.

With a view toward broadening the scope of the Council, brochures entitled "A Time for Decision," were written and a special committee has been created to study the services of national traffic safety organizations.

The National Committee on Uniform Traffic Laws and Ordinances has been requested to amend the Uniform Vehicle Code to include the "implied consent" feature recommended by our committee on Tests for Intoxication.

The executive committee members and staff are working constantly with the President's Committee for Traffic Safety in planning and organizing the 1957 officials' conference and the 1958 regional citizens' conferences.

Work is continuing on the development of an enforcement manual, the speed committee report, the accident records manual, and the revision of summary forms and tally sheets.

The 1957 Directory of National Traffic Safety Organizations with full-time field staffs has been completed and distributed.

A great step forward was recently taken when the "Public Safety" magazine and "Operation Safety" were combined to form the new periodical, "Traffic Safety." This new monthly publication, offering a more focalized area of coverage and a new design and format, has been well received throughout the country.

After considerable deliberation, the executive committee recently recommended that the scope of activities of the Traffic and Transportation Conference be confined to *street and highway traffic and transportation* and that hereafter the Conference be identified as the Highway Traffic and Transportation Conference. This, of course, requires Conference action and subsequent approval of the Council Board of Directors, with appropriate assignment of rail, air and water transportation to other Council components.

A new organization chart of the Traffic and Transportation Conference was developed with a view toward streamlining its operation, in the event the proposal—that the work of the Conference be confined to highway traffic safety—is approved.

The organization and administration of the "Back the Attack" program has occupied much of the Committee's attention during the past two years. "Back the Attack," representing a new approach to traffic safety by the Council, has amply proven itself as the first effective year-round national emphasis program.

The executive committee has urged that more releases be prepared by the Council for press, radio and television on the causes of accidents and what is being done to prevent

accidents . . . and that information on causes be reported in greater detail. It is the unanimous belief of the committee that a constant flow of news from the National Safety Council on these subjects will increase the influence of the Council with the public and produce definitely beneficial results.

Under the heading of Controversial Subjects, the executive committee reached agreement on the much discussed subject of hot rod clubs and drag strip races, thus enabling the Council to adopt a forthright policy in opposition to such activity.

During the past two years a number of workshops have been held which proved very effective. Two workshops were held in 1956—one devoted to a discussion of special emphasis traffic safety programs, and the other laying the foundation for our "Back the Attack" program. Two workshops also have been held in 1957—one to discuss ways to implement the highway safety recommendations of the 1956 Governors' Conference and the other to discuss the services and needs of national traffic safety agencies.

Looking back over these past two years, I think we can conclude that the executive committee has performed a valuable and needed service to the Traffic and Transportation Conference, and its members are to be commended for a good job well done.

To terminate my tenure as Chairman of the Traffic and Transportation Conference, I would like to leave a few thoughts with you. Some of them may sound familiar but they are worthy of your repeated consideration.

Today in the traffic safety field we face a grave and serious problem, the proportions of which we know will grow with the passing of time.

The situation on our streets and highways —present and future—must be brought under control.

TRAFFIC IS GOV'T JOB

Primarily, this is a job for government because in a situation where the health and welfare of the entire population of a country are placed in jeopardy, it becomes incumbent upon government to cope with the situation. I mean, of course, state and city government.

Unless firm action is taken soon by local government, one more function of the states will pass to the national level.

After 33 years of experience in the field of highway traffic safety, I sometimes think that it is already too late to salvage state and local government from the morass of our highway traffic accident mess.

The techniques of traffic accident prevention have long since been developed. These have been cut to fit the pattern of each state, and of communities of varying size, and of our rural highways. There only remains implementation.

Herein lies the role of the National Safety Council and all business, industry and civic groups—and leaders concerned with the problem.

We must provide inspiration, encouragement and professional assistance to responsible officials of state and city government to help them do the job.

We must provide the motivating force in organizing the public to back all necessary traffic safety measures.

Education is a fine thing but after 25 years of trying, we still do not have a sustained public education program on highway safety, and moreover, we have little more than scratched the surface of high school-youth driver training. We now know there is by no means enough potential strength in educational methods to stem the onrushing tide of ever-increasing accidents, deaths, injuries and loss of economic wealth.

We must take our cue from air, rail and water transportation where, regardless of the elements or varying peaks of traffic, we do not experience the catastrophic results constantly being realized on our streets and highways. The reason is that in these forms of transportation, we live by rules.

In highway transportation, there must be at long last effective rules, and these rules must be obeyed. There is no other road to successful traffic accident prevention. This implies a militant public determined, in spite of all obstacles both real and false, to adopt adequate laws on a uniform basis and see to it that they are enforced.

Are we of the National Safety Council capable of the kind and quality of leadership necessary to lead our nation out of this serious predicament? Is state and city government equal to the task that lies ahead?

One thing is certain. The day of decision lies just ahead.

A PRACTICAL APPROACH TO POLICE TRAINING

by ERVIN H. WARREN

director, Illinois Police Training Institute, University of Illinois, Champaign, Ill.

We can profit by repeating the importance of proper training of our officers to keep abreast of ever changing conditions facing us and to keep the proper goals ever before us. What goals are our proper goals today?—improving our service to our people by adequate pre-service training and regular in-service instruction, using more uniform curricula and finally the goal of professional recognition.

Years ago F.B.I. Director Hoover said, "Police work by untrained men is as obsolete as the practice of medicine by sorcery." As time passes, trying to take care of our growing responsibilities in the law enforcement field without comprehensive training schools is more and more obsolete. Sometimes we like to refer to the "horse and buggy days" form of justice in our lower courts when our own operations are just as antiquated.

Thousands of men are wearing the badge today who literally stepped into their jobs without any preparation at all. We find in our work officers all the way from the illiterate to the genius. Yes, we can still find bums cloaked in the uniform that should be looked upon with a feeling of respect, trust and security. If you want to read a real disturbing account on this, get a copy of Albert Deutsch's book "The Trouble With Cops."

POLICE ADMIT IT

You might question some of the reports of the writer, but study them more closely and you will find that he received his information from the best authorities, the cops themselves. And Deutsch's last sentence I repeat to you now: "Well what are you going to do about it?" Do you know any police training program that did not have a practical approach?

I do not, and I am willing to rely upon the ability of any persons in police service who are sincerely attempting to set up courses of training for their departments, or for others, to use a realistic or practical approach to this task.

As long as we continue to study and to seek out the weakness in our various operations that can be corrected only by raising the competence of our forces through training, we should be credited as using only the practical approach. Are we satisfied with our own sporadic efforts to improve police status by training programs where courses are attended by only our own personnel?

Expansion of training programs is our responsibility. We must do more missionary work and enlist administrative and supervisory personnel in those areas where training is unknown. Today we are following the same unsound and unwise course taken by the manager of a baseball team who attempts to raise the team's batting average by concentrating on improving the hitting of only his top sluggers.

TEAMWORK ON FORCES

Teamwork is needed in police work too—and we might find some top-notch hitters in some small town police department or among the deputies of some County Sheriff. We can get the results we want by setting up courses where law enforcement officers at all levels of government may attend and learn their work the easiest and the cheapest way of all—from experience of others. The same pitfalls await the unqualified rookie today that baffled and embarrassed the untrained officer a generation ago.

Let me quote some lines which list some of the subject matter for police schools:

Education of a Modern Police Officer—1957

"I believe that I can best bring this matter to your attention by just looking, first of all, at the things a policeman needs to know: the history of policing, the organization of our national, state, county, and city governments, stressing especially jurisdiction of each, the organization of the particular police department into which they are going, the work of the several divisions and bureaus, the rules, regulations, reports and what-not that they have to know there, the duties of a policeman on beat or patrol, the handling of traffic, crowds, fires, riots, strikes; the different ways of protecting property, the methods of protecting life; courtesies due from the police.

"Then they have to learn a lot of law, the law governing arrests and the law governing

evidence. A whole string of legal definitions must be mastered, larceny, burglary, robbery, blackmail, homicide, a whole chapter on misdemeanors, and another whole chapter on city ordinances. He must know also about the procedure of the courts; about the use of search warrants, summonses, statements and confessions, dying declarations; extradition; the law governing assemblages and free speech; additions; political gatherings; gambling; peddlers; drug addicts; auto thefts; treason; kidnaping; forgery; dwelling house, boarding house and hotel regulations; restaurant regulations; sanitary laws; arson; perjury; slot machines and lotteries; and bogus tickets.

"After the above few simple things, the various processes of crime detection, what is done by specialists through the use of fingerprints, bullet markings, footprints, pictures in the rogues' gallery, lie detectors, truth serums, chemical work, stains, odors, handwriting and forgery detection by microscope; and thorough knowledge of different kinds of wood. Parts of jiu-jitsu, or boxing, of wrestling, of the Texas Ranger's method of disarming, of the London police system, should be mastered by all policemen, a system of exercise and of correct habits of posture, so that he may keep fit for hard service at all times.

"He must learn some of the military formations, the handling of automobiles, the radio, first aid, life-saving, local information about institutions. He must learn to write reports, and to draw reliable maps and diagrams. And I still have not covered the field. There is the question of crime prevention. That is getting to be a large field, and in the future ought to be perhaps the largest field of police operation. I cannot go into details. That is what a policeman needs, and a policeman needs every bit of it and more."

I'm sure that all of us would buy this sort of thinking. Probably the only changes we would suggest would be the addition of several more specific traning needs. A close scrutiny of the Uniform Crime Reports of the F.B.I. or a careful study of our annual statistics on traffic accidents can result in but one obvious conclusion—namely that we are slated for busy days ahead because we have permitted our work to get out of hand—our controls need revamping.

Everywhere we hear laymen, on the street, in the coffee stops, and on the job discussing our traffic conditions, and the most of them are talking either about accidents, arrest tickets or delays on traveling our crowded streets or highways. Truly we have become not only a nation on wheels but also a nation of traffic experts. Do you recall some 20 years ago when, in most instances, only the police in our large cities were being forced by a conscientious study of their duties and by public opinion to work out an improved traffic control program?

Today police chiefs everywhere are conscious of their responsibilities in traffic supervision and except in rare cases are looking for help in today's most aggravating dilemma. These rare cases, either because of lack of interest or know-how are still retarding progress in effective traffic supervision. We still hear the time-worn alibis that "the police can't do everything," "we don't have enough men," we are too busy handling crowds and directing traffic to do anything else.

You are all familiar with the Annual Inventory Program, yet how many times when the presentation of the analysis is underway do you find the proper officials there? This highly constructive program can be effective only when the proper authorities show an active and a wholesome interest in the reports. Too often we find persons with authority to carry out the recommendations in the analysis, absent with some subordinate substituting for him.

This reminds me of many cases where an officer has been sent to a special training course on traffic and after his return to duty he resumes his former patrol of the municipal parking lots. Or where an F.B.I. National Academy graduate qualified as a fingerprint expert finds himself back with his buddy in the prowl car on the late shift. A practical approach to police training must be training for a purpose and not merely the rewarding of some members of the department for some fine bits of police work.

SKILL IN ALL RANKS

To build and maintain a high degree of efficiency in traffic supervision is to develop the skill, the intelligence and the sound judgment of every police officer in the department. This can be accomplished by a proper balance between pre-service and refresher courses. Recently I spent a few hours in a department headquarters and was shown an impressive records and planning section.

A short time after I left the offices I was talking with one of the officers in a patrol car and mentioned what I had seen in headquarters in the form of spot maps, charts and files. He informed me that it was used mostly to show the public that the department was "on the ball." Now here perhaps was an officer who was disgruntled because

of his assignment or his progress toward the next rank, but I strongly suspect that he seldom heard an explanation by his superior officer of the manpower distribution.

One question Gordon Shehee asked me 15 years ago when I was being interviewed for the long course of the Traffic Institute at Northwestern was, "Have you ever heard the expression 'selective enforcement'?" My answer was "no," and I still receive the same sort of reply when I put that question to officers all over our state. No successful campaign can ever be conducted unless the officers know why. No man can succeed at anything unless he believes in the work he is doing.

MUST KNOW REASONS

Any officer of the law should be convinced that his present tour of duty places him where he can do the most good and he should not only be fully informed of the reasons for his assignment but capably trained in the tasks he is to perform. If it were your responsibility to choose the type of training course most needed by your department, which would it be? If yours is an average situation you doubtless realize that the great weakness in police operations today is at the management and supervisory levels.

Effective policing today calls for command personnel who not only know how to handle basic police duties but more important how to handle police men. If you tried to outline the various qualifications for, and the duties of, for example a police sergeant, you would agree that it wasn't an easy job.

Now I wonder if we picked at random a dozen sergeants just how many of these commanding officers would measure up to accepted standards as befits that rank. Only a few, and we find this same unhealthy condition in all ranks in many policing agencies. These and many other observations after much study have caused me to place schools for command and supervisory personnel at the top of the list.

The commanding officer who can direct, supervise, evaluate, and improve those men assigned to him is a department's greatest asset. For various reasons there have been many projects carried out by police in an all out effort to reduce traffic accidents either in a given area or over a set period of time, or both. If we are to believe the recorded accounts of such experiments then we must agree that the results were convincingly gratifying and successful.

A closer look at these accounts often written up in magazines shows that seldom was any strange or novel plan for accident reduction instituted. It's usually the same technique that has worked time and again—selective enforcement.

The broad plans in our efforts to provide a practical approach to police training and traffic supervision and control are: first, higher standards and requirements in the selection of personnel for the police job; second, a program for advancement in rank based upon merit, performance and ability; third, training courses for all personnel of all law enforcement groups with responsibility in traffic regulation.

Only these three basic steps, but we still have a rocky roadway to travel before policemen everywhere can have equal opportunities to prove their worth. It is our responsibility—and our privilege—to extend our assistance and to enlist those who cannot or will not help themselves. It is also our privilege to serve this nation by dedicating ourselves to help provide our people with the best police service possible.

A great early American, William Penn, said, "as governments are made and moved by men, so by men they are ruined." "Therefore governments depend upon men rather than men upon government."▲

RURAL ENFORCEMENT PROBLEMS AS THEY RELATE TO SPEED

by FRED J. BLY

assistant commissioner, Calif. Highway Patrol, Sacramento, Calif.

Before proceeding, it would appear appropriate to review national figures indicating the magnitude of the traffic problem.

In 1956 there were 77 million licensed drivers operating 64,500,000 registered vehicles. During the year they consumed close to 48 billion gallons of gasoline, amassing untold miles of travel. These vehicle movements resulted in 40,000 traffic deaths and 1,400,000 injuries, of which an estimated 120,000 resulted in permanent impairments. The total estimated cost of traffic accidents in 1956 was 5 billion dollars, including $1,800,000,000 property damage and $3,200,000,000 in wage loss, medical expense and insurance overhead.

Where does speed fit into this immense and costly problem? Of the 40,000 traffic deaths, 30,400, or more than 75 per cent, occurred in rural areas. Of these rural traffic deaths 43 per cent were non-collision, such as ran off curve, ran off the straight road or overturned on the roadway. In 81.3 per cent of the non-collision rural fatal accidents the car ran off the roadway.

While fatal accidents rose 20 per cent during the period 1946 to 1956, deaths from non-collision traffic accidents increased 65 per cent. These figures show the clear and prominent presence of speed too fast for conditions and speed in excess of posted limits.

AVERAGE SPEED

An October 1956 survey, conducted by the California Division of Highways, revealed an increase in the average speed of all vehicles of 4.3 miles per hour when compared to a similar survey made in 1951. A comparison of critical speeds (speeds at or below which 85 per cent of the traffic is moving) reflected an increase of 5.2 mph.

On six rural freeways in California the average speeds of 1955 and 1956 model passenger cars were compared to similar speeds of 1954 and older model cars. The survey showed that 22.7 per cent of the 1955 and 1956 models were traveling 70 mph as compared to 12.3 per cent of the older models. Similar differences were reported at the various speeds above 70 mph.

These surveys, together with the already reported increases in single vehicle fatal accidents of the "ran off roadway" type, confirm many law enforcement administrators' apprehensions regarding increased horsepower in automobiles.

HIGH HORSEPOWER

During recent years there has been a continued advancement in the advertised horsepower of automobiles; with predominant competitive publicity directed to that item ahead of many other fine engineering changes.

When properly employed, increased horsepower *can* be a safety factor; however, the increasing emphasis placed on higher horsepower is a concern to enforcement officials. In the *mind of most motorists*, power and speed are synonymous. There seems to be some psychological quirk in the makeup of man that requires him to test and re-test the maximum power output of the mechanical machine he controls.

On June 6, 1957, the board of directors of the Automobile Manufacturer's Association unanimously recommended to the member companies that they take no part in automobile racing or other competitive events involving tests of speed and that they refrain from suggesting speed in passenger car advertising and publicity. This is indeed a very gratifying step; however, it *will require acceptance and implementation* to be effective.

Indications are that the new 1958 models will have increased horsepower and several makes will offer fuel injection. Item 5 of the resolution recommends that passenger car manufacturers:

"Not advertise or publicize actual or comparative capabilities of passenger cars for speed, or specific engine size, torque, horsepower or ability to accelerate or perform in any context that suggests speed."

In that regard it was interesting to note in a full page ad in the September 3 issue of a California newspaper the following: "The Edsel is powered by the newest V-8 engines in the world—The Edsel 400 and the Edsel 475. Specifications: 400 and 475 *foot-pounds of torque; 303 and 345 horsepower*; 361 and 410 cubic inches of displacement; 10.5 to 1 compression ratio. You have never handled this kind of power before."

We are today building straight, level highways which make speeds of 100 mph a blatant possibility. Many drivers, unable to handle vehicles at such speeds, seem unable to turn their backs to the challenge.

In considering the human equation the slightest deviation from ideal driving conditions can spell disaster when the vehicle is traveling at high speed.

I recently had the opportunity to peruse a "Mileage and Expense Record" distributed to patrons of the Conoco Oil company. At the bottom of the printed form they had listed the general highway speed limit requirements of the 48 states. Among them were 14 different regulatory speed listings ranging from 40 mph to "reasonable and proper" and "reasonable and prudent."

DEFINITIONS HAZY

This did not consider for a moment the multitude of special requirements each state has. What is "reasonable and prudent" or "reasonable and proper"? Most here have read several court cases dealing with this definition. In the main the courts have held that "reasonable and prudent" is that action which a reasonable man would have taken under a like set of circumstances. Webster defines *reasonable* as rational or not beyond the bounds of reason.

The word *proper* has many meanings. The one most applicable is "befitting one's nature, qualities—right, fit." *Prudent* means capable of directing or conducting one's self wisely and judiciously. This, then is the maze provided the motorist and the officer as a guide to driver behavior and enforcement action. It is no wonder the nation's drivers are confused and irritated when arrested for violating statutes so difficult to interpret.

The present controversy over which type of speed limit is the better appears to have been engendered by popular misconception as to the intent and meaning of prima facie type laws. This misconception is not limited to the average motorist. Members of law enforcement, the judiciary and attorneys must also be included.

REFUTABLE IN COURT

The adjective "prima facie" means "adequate to establish facts or raise a presumption of facts." This fact or presumption of fact as it pertains to the prima facie type speed law is refutable in court if a defendant establishes by competent evidence that the speed charged did not constitute a violation of the basic speed law. The prima facie type law does not afford to the enforcement officer the prerogative of the judiciary in determining a competency of evidence.

The obligation of law enforcement is the same under a prima facie type law or a fixed limit type law. The difference between these laws is the latitude permitted in the court in the interpretation of the evidence presented. The misconceptions previously referred to have resulted in the application of unreasonable tolerances. Confusion to the motorist and general disregard to speed signing and zoning are weaknesses inherent to any prima facie type law.

A fixed limit speed law would appear to overcome the major problems of a prima facie type limit. Tolerance is required in speed determination as in many other facets of law enforcement. This required tolerance, however, is for the sole purpose of *overcoming human and mechanical error and not* to provide for individual enforcement policy by the officer in the field.

SPEED CONTROLS

The principal requirements of a properly functioning speed control program are:

1. *Intelligent* and proper *zoning*.
2. Adequate signing.
3. Vigorous enforcement (with tolerances as described herein).
4. Public understanding of law.
5. Public support of enforcement.

The above requirements are amenable only *to a fixed limit type speed law. A fixed* limit type law does not obviate the need

for a basic speed law. The proper application of a basic speed law is obtained when adverse conditions require the reduction of the speed limit, not when optimum conditions permit the raising of a speed law.

Recognizing the great need for a review of the speed problems, the National Committee on Uniform Traffic Laws and Ordinances in early 1954 appointed a new subcommittee on speed regulation. The function of the committee was to review the provisions relating to speed found in Sections 56 to 62 of Act V of the Uniform Vehicle Code and to recommend to the National Committee changes or additions. The first meeting of the new subcommittee was called for March 30, 1954.

Following considerable work by the subcommittee and the entire National Committee on Uniform Traffic Laws and Ordinances, Section 11-801 of the Uniform Code was amended to provide a maximum fixed speed limit of 60 mph in rural locations during the daytime and 55 mph during the nighttime. The Department of California Highway Patrol feels that the five mile differential is impractical and creates an enforcement problem for the administrator.

In consideration of the elements contained in Section 11-802 of the Uniform Code, a maximum speed limit of 65 mph appears reasonable. This recommendation is supported, at least in California, by a statewide speed survey, conducted on state highways during October 1956. The survey showed that passenger cars averaged 59.8 mph on rural freeways as compared to an average speed of 55.6 mph for all locations. Comparable critical speeds were 67.1 mph and 64.9 mph, respectively.

The need for the individual states collectively to adopt uniform, reasonable, intelligent, enforceable speed laws has never been more apparent.

For the first time, the National government recognized the gravity of the traffic conditions by incorporating into the new Federal Aid Highway Legislation, provisions for the study of traffic safety needs. Items to be considered are:

1. Need for federal assistance in the enforcement of safety and speed requirements.
2. The advisability of uniform state and local highway safety and speed laws.
3. Possible means of promoting safety in the manufacture of vehicles.
4. Educational programs to promote highway safety.
5. Design and physical characteristics of highways.

Study findings will be reported to Congress in 1958.

As recent as the August 26, 1957, issue of *Newsweek*, the following was noted in "The Periscope" column:

"Senate Office Building—Sen. Albert Gore and his Public Works subcommittee are considering a federally fixed speed limit (no figure set yet) on the interstate highway system, and perhaps even federal police to patrol it."

NO SAFETY PRIDE

The reduction of traffic hazards through traffic engineering and development of adequate roads and streets is essential to any sound traffic control program. The importance of engineering and education should not be minimized; however, experience indicates that few people take pride in being safe.

Industrial safety programs have shown that safety discipline is essential. Improved highways and expanded education have not erased the common errors of driving that have always persisted in traffic accidents. On the highways the most immediate remedy remains in adequate traffic law enforcement.

Traffic law enforcement is a deadly serious business and not a sports contest between the officer and the motorist played by a set of illogical and prejudicial rules. The duty of the traffic law enforcement administrator is to utilize weapons available to him.

Traffic officers, probably more than all others in the economic structure, are in a more vulnerable position to suffer the condemnation of the public in a mere discharge of a duty. The more effectively this duty is discharged the greater the opportunities for emotional conflict.

Significant in this respect is the observation that traffic violations are common to all classes and levels of society. No striking evidence has been found to indicate any particular section of society is more ready than any other to accept traffic law enforcement for its true worth and purpose.

INVENTORY—A TOOL FOR IMPROVING TRAFFIC PROGRAMS

by CAPT. E. L. BUTLER

Traffic Bureau, Dept. of Police, Denver, Colo.

The City of Denver has participated in the Annual Inventory for Traffic Safety Activities since its inception and generally the recommendations of the inventory have been sound and have assisted the city in putting into effect a strong traffic safety program.

Preparing the questionnaires for the inventory takes considerable time and effort. The compilation of the statistics, examples, exhibits and the effort expended in getting other official agencies to complete their sections, is by no means a small task. However, I know of no other facet which allows a comparison of traffic safety activities, with other cities in like population groups, other than the Annual Inventory.

The various sections of the Inventory include:

1. Death and injury record
2. Accident records
3. Police traffic supervision
4. Traffic engineering
5. Traffic safety education
6. Traffic courts
7. Public education
8. Organized public support

These sections afford the opportunity of factual comparison with cities of like size. The recommendations in these sections can secure a better understanding of the objectivity of each city's program and can be a tool to acquaint our city legislators and public support groups with specific problems.

The title of my subject—Inventory—A Tool for Improving Traffic Programs is, of course, very broad. Through the use of the inventory information, our traffic programs can be bettered so that we may make better use of our accident records in formulating and administering a sound enforcement, engineering, and educational program to better our overall standing in the traffic field.

The Inventory furnishes us with a yardstick to measure our overall operation against the same performance data presented by other cities in our classification groups. We obtain a comparative look at personnel assignment, an evaluation of training methods and number of trained personnel assigned to like activities, and a comparative analysis of administration policies and operative procedures utilized by other departments.

A complete look at the accident investigation operation can determine whether quality investigation and reporting is being accomplished, how well investigating officers are evaluating evidence and placing of correct charges, and how well enforcement activities are matching the accident picture on a selective basis.

By a check of the court's section you can determine and get a second check on the thoroughness and completeness of investigative procedures and the ability of the officers to match their evidence to correct charges through the court's conviction and dismissal record. We can also judge the adequacies and inadequacies of our court procedure and are given information to guide us in correcting any difficiencies that might exist.

In the field of school traffic safety education, an evaluation of the activities of your own program carried on at home can be had, as well as a comparison of your program with schools all over the country. Valuable information is available on this comparison basis to assist you in gaining ground in this field for public support of enlarged programs, in the traffic field, in the schools of your city and mine.

COMPARE SIGNS, SIGNALS

The Inventory, gives you a comparative look at the safety environments of school properties as related to cross walks, school stop signs, signal lights, crossing guards, safety patrols and parking restrictions. It also opens for serious discussion items such as driver education and behind the wheel

training, as well as safety media for the elementary grades.

It has been said many, many times that engineering and enforcement are important tools in the control of a traffic problem; being in the enforcement field myself, I concur. However, I am sure that everyone has experienced difficulty in some phase of enforcement because the driving public has not been properly informed on our need for this type enforcement.

Through study of the Inventory section relating to public education and safety organization, we can determine factually how well our news media is giving this important message to the population of our community and how well our safety organization understands our problem and can disseminate the needs to the right channels.

We have a factual tabulation of the number of column inches in our newspapers; the number of spot announcements and other stories on radio and television; but unfortunately, we do not always know the quality and receivability of the stories; in other words, how do they fit our own local picture. The evaluation of the Safety Organization Section aids in the answers on values.

PUBLIC SERVICE MATERIAL

The news media, throughout the United States, have been most generous with their "public service time," but this "time" is limited and the competition is extremely keen. All worthwhile health and welfare organizations are aware of this fact and consequently many have secured competent talent for the preparation and presentation of their messages. It, therefore, behooves us to take a good look at our safety organizations and a better look at the material they present to our news media so that each is sure that the material has news worthiness and presents a true picture.

Any police department, with the proper use of records, if the records are good, can determine the quality and quantity of their activities; but only through the Annual Inventory can we compare our activities to other departments of like size and determine how effective our program might be.

I feel that the value of the Inventory lies in the systematic evaluation and comparison of like activities it affords. As you know, each section analyzed by experts in each field and the refinements made in the Inventory the past few years lend added weight to its importance.

The Annual Inventory of Traffic Safety Activities is a tool, and a good one. However, the extent of its value is measured by the intelligent application of the information.

INVENTORY TOO COMPLEX?

Although the Inventory is a tool of great usefulness, its complexity and area of coverage is fast making it a contest in figures. The police departments overburden statisticians and analysts try to get answers to many superfluous questions, which might mean something to the person asking them, but which have a very small value to the Inventory Representative.

To get a complete overall picture, you must have a report from all interested organizations; but who are we to demand that public or parochial school officials institute into their curricula driver training and safety training courses which pose a financial problem? Why should a police department be graded down in effectiveness of a program for things over which it has no control?

We in the enforcement field are very much in sympathy with this kind of reporting and Inventory; and feel that we again will begin to move back to a good, sound evaluation of the traffic programs of all cities and regain the complete value of the Inventory, rather than having a misleading contest in figures.

Yes, the Inventory is a "tool," and a good one, if kept sharp and in useable condition. ▲

URBAN ENFORCEMENT PROBLEMS AS THEY ARE RELATED TO SPEED VIOLATIONS AND THEIR APPREHENSION

by CAPT. GEORGE WARNER
Police Dept., Lansing, Mich.

The carnage of collision has not been reduced over the past years and the police generally can blame themselves by their lack of positive police action. 40,000 killed —1,400,000 injuries—five billion dollars in costs from traffic accidents last year. Law enforcement does more to keep motorists out of trouble than any other single factor. Let's have more of it.

I think there are two areas to explore when trying to attack the problem of speed law enforcement in cities.

1. Is speed law enforcement needed?
2. How can we get it?

The answer to the first question—is speed law enforcement necessary—can be answered "yes" by all communities and all police agencies. Is speed a factor in causing collisions? If it is, then speed law enforcement is needed.

Last year 38 per cent of all fatal accidents were caused by speed law violations. If the fatal accidents caused by speed had been prevented, the loss of life would have been reduced to 24,800 persons, or to a figure corresponding to 1928. Who must assume the responsibility for speed control? We are the only arm of the government that can control the movement of vehicles and beyond that it is our sworn responsibility to protect life and property.

SPEED LAWS ESSENTIAL

Information as to the causative factors of speed in accidents at your area level is needed and necessary before any program of speed law enforcement should be instituted. It may vary from 20 per cent to 50 per cent in different locations. To do a good job we must know what is needed before we start. In accident prevention work the question of causative factors must be known.

In our community we know that between 45 per cent and 50 per cent of all our collisions each year are caused by speed violations. This tells us that in accident prevention activities in Lansing speed law enforcement must receive number one priority.

What the causative factor of speed is in your overall accident problem should be determined by accident studies and summaries. Is speed law enforcement necessary in your accident prevention efforts? Where, when and how much is needed can be arrived at in no other way.

The answer to the second question—how to get speed law enforcement to match the causative factor of speed in accidents—is the only problem left to solve. However, it is the most perplexing and difficult of all traffic law enforcement problems.

PROBLEM MOUNTS

The problem of traffic management and control in its broad aspects has become more complex and acute each year. In the past 10 years the problem has doubled and redoubled. It continues to get progressively worse each year. Registration continues to increase about 10 per cent each succeeding year.

Few, if any, police departments have been able to keep up with the job. A few do not realize there is a job to be done. What can we as police do in the face of this dilemma?

We are never going to get the man power we need until we do the best job possible with what we have. We, collectively, must go to work.

Before any enforcement is applied (if you have not been doing your best) or the quantity increased, the public must be informed as to your plans and the reasons for the action. An informed public can be most helpful in any police function. Especially is this true in matters of traffic law enforcement. We, as police, forget at times to keep the public abreast of the problems and why we, as its police agency, are involved

in some of our activities. It has the right to know and our work is made easier by its knowledge of our functions.

Public information should be fed to the citizens regularly and in some communities the police do a good job. I believe a better job can be done by a local safety council or similar organization. A membership of interested, safety-conscious citizens in such an organization can be far more effective in conditioning the public to accept and demand traffic law enforcement by the police agency. The local safety council supports the official agencies charged with the responsibility of doing the job. Matters of policy must rest with the official agency and the local safety organization must not attempt to dictate it.

MUST INFORM PUBLIC

This local safety council can keep the public informed as to the public problems and can do a good job of selling the police department when they are doing a good job, which does not look too good when done by members of the police department.

If the community is properly conditioned, the citizens will accept and demand an enforcement action by their police agency. The police agency must do a good job. The biggest problem in traffic law enforcement is the activation of all the available police personnel in your community.

This activation of the police and the desire to do a good job in accident prevention must, of course, stem from the administration head and permeate down through the ranks to the men in the field. The men must know that it is an expected police function. The very nature, the lack of glamour in this police activity, makes it a tough administrative job.

POLICE OFTEN RESPONSIBLE

However, if the executive officer recognizes that the principal function of a police agency is to protect life and property, if he is informed of the problems, and shown that accidents are taking a toll far greater than any other reasonable police responsibility, he can be impressed and become enthusiastic.

The police themselves are in many cases totally responsible for the success or failure of the vital police function. All too often the department-head is insecure and feels that this added police action without public clamor will hasten his demise. This may be true in some locations. It would seem to me that if it were true the job would not be attractive nor could a chief hope to remain if he did anything. An honest, sincere police action is generally accepted and approved by the public if they are kept informed.

It is true that all strata of society are and must be treated by the police for these accidental violations of the law. If an impartial position is taken by the police, little danger of reprisal can be anticipated. What the public believes is important in a good accident prevention program.

A high contact rate by individual officers with motorists is necessary. Many contacts may be for verbal warnings but the passing motorists who witness the contact readily believe an arrest is being made. The good of traffic law enforcement is in its deterrent effects and not on the fines collected.

In Lansing, as a matter of policy, we encourage and investigate all citizen's complaints as to speeding violations. A cycle is immediately dispatched to the location complained of and the complainant at least sees the police respond. This takes little time and it helps to instill in the mind of our citizens that their police are interested and on the job.

CONTINUAL ENFORCEMENT

Police administrators should not sit back and be pushed into this business of traffic law enforcement. In our hands are the tools to reduce this carnage of collisions. Constant enforcement pressure is necessary to assure continued public acceptance of such a program. We have found that short drives on specific violations are not acceptable by the community, nor do they reduce the accident problem. Constant day-by-day traffic law enforcement by all uniformed police officers can, and will, reduce accidents and the public will approve.

Engineering and education are both effective in accident prevention, but both or either will fail without the assured knowledge by the public of police enforcement action. Enforcement does more to keep the average citizen out of trouble with his car than any other single thing. Let's have more of it by enthused police officers.

In no other facet of police activity can we accomplish so much in the protection of life and property by following these ideas:

1. Find out what per cent of your total enforcement efforts must be aimed at speed law violations.
2. Keep the public informed as to your efforts for their personal good (not police, but a safety organization).
3. Encourage citizens to report violations—respond. Have high contact rate with motorists.
4. Don't wait to be pushed into this vital police business. Discard the thinking that police operate on a complaint basis. This is not modern enough to meet modern problems.
5. In training schools and at roll call keep men on job every day.
6. Traffic law enforcement does more to keep the average citizen out of trouble with his car than any other single thing. So—Let's go to work as police officers.

ARE SCIENTIFIC DEVICES IMPROVING TRAFFIC ENFORCEMENT?

by ANTHONY L. SCHMEIG
chief of police, Highland Park, Ill.

In January 1956, the Saturday Evening Post published an article describing the first attempted use of mechanically controlled "speed checks" in this country in 1903. This article relates how police were having troubles with speeders on a road leading from the Bronx into Westchester County, New York. These speeders were driving so fast they eluded the bicycle police officers. The Police Commissioner set up three dummy tree trunks along the road, with a policeman with a stop watch in each of these hollow trees, which were equipped with telephones.

As a speeder passed the first station, the policeman phoned the time to the officer in the second tree, who set his stop watch accordingly and computed the speed as the driver passed his station. If it was above the limit, he phoned the officer in the third tree who lowered a pole across the road, stopping the driver. This was certainly more reliable than estimates of speeds as formerly made but was open to the objection that it was hearsay evidence.

In our small community we used a new Radar Speed Timing Device on our main arterial. With no wires, no hoses across the road, just by looking at a small black box, we gauged accurately the speed of each car as it went by. Those violating the speed limit were stopped by an officer a quarter of a mile down the highway, who was advised of the violation by radio. An interim of 54 years, but what a vast improvement had taken place.

MODERN MIRACLES

The relating of the various scientific devices in common use in our modern day law enforcement sounds like the science fiction writings of yesterday, Jules Verne's fanciful dream of life on a submarine, which is a reality today and Buck Rogers' space ventures which will be a reality tomorrow.

Such developments as the radio, which the ancients would have classed as miracles, have become a part of our everyday life. And the law has slowly but surely utilized these modern inventions and scientific devices in the detection, pursuit and conviction of criminals. Our Crime Laboratories today are a collection of marvelous scientific "know-how and skill."

Such things as color moving pictures, faithfully recording every detail of a scene of an accident or a crime; ballistics tests, by which the identity of a firearm from which a fatal bullet was fired can be determined beyond question; the wonders of

modern photography, taking photographs in the dark with infrared film by cameras tripped by the force of sound or air waves —all part of our life today.

And there are more: the amazing advances in the field of chemistry even to the point of determining the amount of alcohol in a person's blood; the principles of physics applied to skid marks left on the highways to determine the speed of an automobile; the polygraph which combines the use of psychology and physiology to detect deception and television with which we can sit in one room and watch the every move of our subject several miles away or a program half way across the country.

All one has to do today to get an idea about the scientific devices available (at a price) to Police today is read our magazines —they are full of graphic advertising depicting the multitude of gadgets and devices guaranteed to make our job easier and our street safer. The well trained, experienced investigating officer of today can tell quite accurately what happened in an automobile accident just by studying the physical evidence found at the scene of the crash.

SCIENCE AIDS INVESTIGATIONS

Students of the science of momentum and force can tell by studying photographs of damaged cars, how the damage was done, how the cars came together, whether both cars were in motion at the time of the collision and the approximate speed of each. Even our courts are beginning to take judicial notice of the stopping distances and to accept the average reaction time as three quarters of a second. Science has demonstrated the truth of these principles to a point where reasonable doubt no longer exists.

In June 1956, an article was published in the FBI Bulletin wherein Colonel Sanders of the Nebraska State Safety Patrol describes the use of the airplane in traffic control. Airplanes are being used by many state organizations to spot traffic congestions, and conduct air patrols. Colonel Sanders tells how the airplanes clock speeders from the air, communicate the information to nearby patrol cars who close in and make the arrest.

This is a far cry from the days I can remember chasing a speeding automobile at 90-95 mph for 18 miles on a motorcycle before it finally became involved in a traffic congestion and had to stop, so I could catch him. It took two hours for my knees to stop shaking. Today, we use three way radios, airplanes, electronic speed timing devices to accomplish many more times the amount of work as we did in the "old" days with less risk to the officer and less argument from the violator and greater acceptance from our courts.

DRUNKEN DRIVER TESTS

The problem of the "Drunken Driver" has received much attention from those trying to solve the problem of automobile accidents. Many devices have been invented for testing degrees of intoxication. In fact, so much attention has been given to this one type of driver, that there is an impression that this is a major accident cause. The problem of proof of intoxication has intrigued the various law enforcement agencies, often times to the exclusion of other important and even more prolific accident causes.

I can remember our early Alcoholic Influence tests which are familiar to all of us—picking up coins from the floor or the "accidental" dropping of the drivers license to see if the suspect could pick it up without falling on his face; walking a straight line; from an arm outstretched position to touch the nose with the index fingers while the eyes are closed; judging his impaired ability from the sound of his slurred speech or the blood shot eyes and/or the order of his breath.

While these same symptoms are still observed and related, they are now supported by the accurate evidence of a chemical testing device which chemically measures the percentage of alcohol in our suspect's blood and prevents the police officer from falling into a trap of testifying to symptoms that may be caused by some 70 or more pathological conditions which are in no way linked with alcohol.

The use of chemical tests of body fluids began in Sweden in 1914 and these Scandinavian countries are well in advance both in the exploration and experimentation in this field and in the enforcement aided by chemical testing.

Our courts and laws have progressed relative to these improvements. Today 28 states have laws providing for the admission in evidence of the results of chemical tests with presumptions as to their effect. These tests are also a protection for the sick who though they have all the symptoms of the drunk are in dire need of urgent medical attention.

In another field, our electrical accounting and tabulating machines have done wonders in the rapid, accurate assembling of information providing the supervisor as well as the traffic officer with that much needed information to tell them what is happening, where, when and why.

These machines are also a great boon in speeding up the compilation and dissemination of drivers license and motor vehicle registration information to the men in the field who rely on this intelligence to guide them in their daily operations. With the quantity of material to be processed, to do it even mechanically as we had to 15 years ago, would be a physical impossibility.

The police officer himself has no idea how far advanced he is today in his general knowledge increased through the simplification of learning through movies, television, training aides and working models.

MAN IS IMPORTANT

With greater emphasis being placed on training every day and more and more departments both large and small, realizing and accepting the fact that without training we will get nowhere, both the caliber and type of police officer is improving rapidly. And of course, the man himself—the police officer—is the crux of the entire situation. Regardless of the miraculous nature of scientific devices invented, they are no better than the men who use them.

High on a bluff overlooking Omaha Beach, in Normandy France, there is a graveyard which is the final resting place of some 10,000 of our American soldiers who fell during the first agonizing hours of the invasion of France during World War II.

Prior to the actual landing of the troops, all of the latest weapons of war in our planes and ships, unleashed an unmerciful bombardment of the coastal barricades, pounding this beach area for some 90 minutes. Yet the loss of life of our foot soldier storming these beaches afterwards was staggering.

With the development of each new military weapon, one hears how this new scientific discovery will eliminate the foot soldier. Yet, in Korea, just five short years ago, it was the foot soldier who marched up and down the continent back and forth across the Yalu river and it was the foot soldier who held the 38th parallel. I believe that our wars will always be settled in the final phases by the foot soldier—the man behind the gun—the man in the field.

NEED BETTER TRAINED MEN

And so it is in traffic law enforcement. In spite of all our scientific devices to improve our operation, to simplify and make our job more accurate, the success or failure will always lie with the man using these devices. The speed clock or radar unit used as a "speed trap" by unethical "Cops" preying in a defenseless public, is certainly no step forward.

The chemical testing device used by an unscrupulous or untrained person who twists the operation to answer his purpose does nothing to aid the cause of pushing forward the police profession. We must make sure that we have the right kind of a man in this profession—a man properly motivated, trained and dedicated before we can achieve the heights of professionalism which we are all striving to win.

Scientific devices will and are helping us to reach this goal and no one will question the statement that today, traffic law enforcement is greatly improved because of these scientific devices. But, as the scientist provides us with more and better equipment, we must provide better trained and highly motivated men to use it.

PROMOTING PUBLIC RELATIONS OF TRAFFIC COURTS

(Panel Discussion)

THE GFWC TRAFFIC COURT PROGRAM

by MRS. B. V. TODD

safety chairman, General Federation of Women's Clubs, Lake Arthur, La.

The General Federation of Women's Clubs was honored last year when the American Bar Assn., acting through its special committee on Traffic Courts Program and the Junior Bar Conference, asked our cooperation in its program to improve conditions in the traffic courts. As club leaders we are ready to recognize, study and try to cope with the everchanging situations that face our families and homes, our communities and country, and of course the world.

As the national chairman of the safety division, I was particularly pleased to pledge our organization's cooperation, for by your action, you have proved that your association recognizes the contribution that women can make—and are making—in traffic safety. Certainly, the more women become aware of the appaling conditions existing in many courtrooms today, the sooner corrective steps will be taken.

I shall discuss the role of federated clubwomen in the traffic court program as a preliminary foundation to the subject of improving the Judge's public relations. However, I believe background information of our Federation's program will be of interest.

The General Federation of Women's Clubs is the world's largest international organization of women with more than 11 million members—5¼ million American women are members in 15,600 clubs.

FEDERATION'S EFFORTS

Since 1938, the General Federation has given far more than just lip service to the crusade for traffic safety. Annually, seminars and leadership institutes for state leaders are conducted. Information regarding accident statistics and problems facing leaders in this field are discussed. Guides, leadership programs, workbooks, and promotional materials are developed, printed and distributed to the thousands of federated clubs.

Close contact is maintained with state safety chairmen through monthly newsletters and releases and our national monthly publication *The Clubwoman*. We have a state safety chairman in each state, in addition to the regional, district and club safety chairmen.

Our program of action is handed down from the national level. Definitely that is the reason we have been successful in our national campaigns for public welfare programs.

In order that our efforts may be channelled in the proper direction—that is, where they will be most effective—prior to embarking on a particular project, surveys are made to determine the need. The proposed project is discussed with representatives of leading national safety organizations.

PROMOTING TRAFFIC COURT

For instance, our program "Better Traffic Courts, Key to Safety" was not undertaken simply because we, and the American Bar Association felt it an area needing attention. Conferences and meetings were held with representatives of the Automotive Safety Foundation, the Northwestern University Traffic Institute, representatives of the Bar, and others. When the need was confirmed, we accepted the challenge presented to us by the American Bar Association.

Our purpose in the program—our objective—is to help build an understanding and appreciation of the role of the traffic court as a necessary prelude to court modernization. The heart of the project is a large scale effort to get citizens to visit their court as a *visitor* rather than a *violator*, to see how it works and how it measures up to the nationally recommended standards for court operation.

We believe this project will have important and far reaching consequences. We know that with it any judge can improve his public relations. All he has to do is to cooperate.

The women's clubs of the General Federation have long experience in rallying community support. They organize effective action at the local, state and national levels.

Since the General Federation announced its participation in the nation-wide crusade to improve conditions in America's traffic courts, representatives of various organizations have asked: "What's wrong with America's traffic courts?"—"Why is the Federation promoting traffic courts?" and "How do you expect to further this project?"

MORE TRAFFIC—MORE ACCIDENTS

First, let me state that I am not only a federated clubwoman, but also a wife, mother and grandmother. All of us know and realize what the passage of the Federal Aid Highways Act means—more and more highways being built across our nation—yes, more and more automobiles being manufactured. It has been predicted that by 1966, less than nine years away, there will be more than 90 million drivers traveling over our highways.

Need I tell you, what it will mean—more accidents, more traffic violators, and more cases brought before our courts. Unfortunately, many of these violators will be members of my own sex—my daughter or granddaughter. I believe I speak, not only for myself, but also express the honest opinion of every woman when I say "I want my daughter—my granddaughter—my son, and my grandson—to come away from the courtroom with greater respect for law and the enforcement officials.

I want the courtroom and the judges to be such that I need never be concerned about the people with whom she will come in contact. Certainly, when judges are allowed by the public, to call traffic violators before them, in groups of 10 and 15—ask if they are guilty—NOT as individuals, but as a group—and dismiss the violations with five dollar fines, we cannot expect our children—or our children's children, to have respect for law and order.

We cannot expect them to be considerate of others when the courts undermine respect for law and hamper efficient and impartial enforcement. Here is an excellent opportunity for judges to improve their public relations.

Today, the majority of Americans come in contact with the administration of justice in the traffic court. So it is important that these courts be well-administered, honest and dignified. Experience in the traffic court can make or break the individual citizen's respect for the laws that govern his conduct behind the wheel and his conduct toward his fellow men. A well-administered court should serve as a preventive of traffic accidents. The driver who leaves the court with respect is less likely to take chances with the law and become a chronic violator or an accident repeater.

The General Federation of Women's Clubs believes that traffic court improvement has the double-barrelled goal of preventing traffic accidents, and increasing good citizenship by building respect for the basic institutions of the community, the state and the nation. Now, "How do we propose to go about bringing needed changes in the courts?"

First, a special period—May 13 through June 7, was set aside as National Kick-Off Week for the Traffic Court Program. During that period clubwomen in many local areas attended sessions of the court. Working with the American Bar Assn., they talked with the judges. Using the check-list prepared by the American Bar Assn., Special Committee on Traffic Courts, the clubwomen judged the courts, its personnel and procedure.

As observers in the courts, the women gained knowledge pertinent to court practices and procedures. They determined objectively if:

—the traffic Court was dignified
—cases were handled with dispatch
—the Judge was impartial
—penalties were consistent
—records were kept of violations and the disposition of the cases
—ticket fixing prevailed.

WHAT WOMEN LEARNED

Here are some of the results from this visitation to the courts, and what the women actually found out:

First, they learned the things you—the lawyers and judges—say and do in your courts.

Second, they learned that generally speaking, the public does not hold proper respect for the traffic court. Why????

Third, they learned that in some communities, judges granted special favors and that the court failed to meet their responsibilities, and that penalties were not consistent.

Fourth, they learned that in many cases, enforcement of the law was for revenue rather than safety.

Fifth, in many instances, judges dispensed their cases hurriedly in order to get on to a more interesting one.

Sixth, the women found out that many offenders were assessed fines and placed in jails and nothing was ever done or said to help the attitude of the accused.

Seventh, they learned many people were not represented by counsel.

I need not tell you why the courts in many instances fail to meet their responsibilities. Nor am I here to criticize what has been done. However, I do feel that by the Bar and General Federation, working together to build a healthy understanding for good courts, we will have them. You, through public relations, must assist in building this phase.

The police and the traffic court make up the enforcement machinery of the traffic program in any state or community. The court occupies a key position. It can make or break any community program of law enforcement and the judge holds this power in his hands. The judge is, and will be, only as good as you and I want him to be.

HELP PUBLIC RELATIONS

Public support is a necessity if a traffic court judge is to achieve his proper objectives. If he is doing a good, conscientious job, he deserves that support. He deserves to have a decent courtroom, in proper surroundings, for it is the "people's court" where most Americans get their impressions of American justice. You must romance our nation's women through better traffic court performance. Sell yourself. Help us sell traffic court justice.

SMALL TOWN TRAFFIC COURTS

by MRS. O. G. RUSHING

safety chairman, National Home Demonstration Council, Shawnee, Okla.

Promoting the traffic court in small towns and improving public relations could be instrumental in raising the standards of traffic courts in our smaller communities.

Those who administer traffic court justice in these small communities have an almost overwhelming problem. They need help in finding working solutions. They need informed citizens who can give intelligent assistance in gaining support to carry out recommendations that come from such meetings as these.

They need people in their own home towns who understand their problems and how they are attempting to solve these problems. They do not lack critics but there is a short supply of those willing to help interpret new concepts of traffic law enforcement when the local judge tries to change the system.

Coming from a state of predominately rural population, I am interested in small town courts. This interest is not confined to my home state for as national chairman of safety for the National Home Demonstration Council, I represent a group of five million women who disseminate safety information to a vast nationwide audience. We are always looking for new findings and original thinking on our common problems.

CRITICIZE RURAL COURTS

All of our traffic courts have been more or less under fire but the heaviest blasts have been aimed at the rural courts. Here I use the official disignation of rural as referring to towns under 2,500.

Most traffic courts in these small towns are conducted by the Police Magistrates and Justices of the Peace—some good, some even excellent. Others are not so good and some tend to blacken the reputation of all such courts. Most institutions seem likely to be judged by their failures rather than by their successes and virtues, and courts are no exception to this human tendency.

A highway patrolman of a western state tells of escorting a motorist whom he had arrested for speeding to the home of a nearby magistrate late one night. He aroused "His Honor" who "held court" sleepily through a barely opened door. "That's ten dollars," he said when told of the charge, and pushed the door just far enough to thrust his grasping hand through.

The "victim" paid without a chance to say anything at all. The "magistrate" took the money, closed the door, leaving the two men standing on the porch, dazed and disgusted. As they walked back to the road the motorist asked the officer, "Is that justice in your state?"

The officer, recently graduated from a police training school which stresses that educating the offender is more important than fining him, offered no defense. "I never would have taken you there if I'd known that such shabby practices are still tolerated," he said.

This is not presented as typical but as a horrible example of how one "court" can damage the reputation of all. Motorists who feel persecuted never seem to suffer from being tongue-tied and they air their grievances far and wide and often!

POLICE PROBLEMS SAME

Perhaps we should clarify our terms. Some towns have their own police magistrates while in others the local justice of the peace serves in the same capacity. The problems of the two—whatever their titles—are substantially the same. They are elected or appointed in each township or village and are usually untrained in law enforcement. They handle such small volume that court facilities are frequently of the makeshift variety.

But the basic philosophy of modern traffic court administration should be the same whether the presiding officer is called a justice of the peace, a police magistrate, or a municipal judge. Jurisdiction and titles vary but the principles undergirding good traffic courts are the same in villages as in the larger cities.

We who are closer to the rural problem must regretfully reflect that most of the progress toward improvement in traffic courts has been made in the cities, not because their people are more honest and sincere but simply because their larger volume has demanded improved techniques. Then too, their volume has justified specialization.

The judge who handles the traffic court has to learn the newer approaches to the problems that confront him every morning when he enters his crowded courtroom. He must follow decent consistent policies or his community would demand his replacement, while the rural magistrate deals largely with persons he will never see again. He does not have to face his "public" every morning as the city judge does.

RURAL ACCIDENTS WORSE

While the number of accidents is greater in the cities, many of these are fender-benders or minor collisions while the rural accident is likely to be more serious due to higher speeds on highways. Accident facts, 1957 edition, cites traffic deaths in urban areas at 9,600 while the rural deaths in the same period were more than three times higher 30,400.

These disquieting figures make us realize that the rural highways, country roads and farm-to-market roads need good policing, good law enforcement backed by honest, fair and consistent courts, and, conducted according to modern standards developed by the American Bar Assn. In many states, particularly those which have adopted the uniform vehicle code, the arresting officer is required to take the violator with his citation "to the nearest or most accessible magistrate."

In most cases this means to nearby justice of the peace, or perhaps a police magistrate in a neighboring village. Unlike city courts, which hear cases at stated hours, these rural justices operate around the clock and hold court at some astonishing places. Stores, filling stations, garden patches, barns, living rooms and even cars have been the scene of many court decisions.

A South Carolina highway patrolman told me of hailing arrested violators before barefoot "magistrates" who leave their work in the corn field to hold court in the fence corner! This "housing" problem has faced rural courts since Henry Ford made us nomads on wheels wandering about the country.

One of our biggest challenges is how to improve the quality of justice at this level. How can we persuade these men to realize the need for improving their public relations in traffic safety courts. They have a responsibility in gaining respect for the American system of law and order.

They must realize that many people have their only court experience at the traffic court level and they judge the whole American judicial branch of government by what they see there. Their future respect or disrespect for law enforcement may rest upon what some J. P. or police magistrate does. Does he realize this? Here is where they must learn to practice public relations.

MUST IMPROVE SELVES

Are magistrates and justices willing to seek help? Judges of city courts, Keenly aware of their inadequacies in handling the staggering loads, often feel compelled to seek help. Many are willing to attend traffic court conferences such as those conducted jointly by the American Bar Assn. and Northwestern University Traffic Institute. Sometimes the judges are backed by their local communities in the form of financial aid in attending these training sessions.

I cannot think of a better way to spend money. Most rural magistrates do not have such financial aid nor do they have an incentive supplied by the community and coordinated enforcement agencies. The local magistrate or justice is on his own, without benefit of expense account, and meeting expenses from his own pocket may deter him from seeking further training even though he may realize his need for it. This I think would be a place where local civic groups—Kiwanis, Lions, Elks, etc. could help. They must be stimulated by your public relations approach.

CITIZENS SHARE BLAME

It would be unfair to load the blame entirely upon these men when we, the public, are reluctant to share the expense. But are we to blame when no one tells of the need? City courts pay their judges salaries fixed by the legislature or city governing body, and they are not dependent upon fees for their pay. Most justices of the peace get their only compensation in the form of fees which they impose in cases of conviction. Many of these men are but part-time public servants who combine this sideline with some other employment or private business.

Now let me be entirely fair about this. There are many conscientious rural judges who do recognize their local responsibilities and seek to uphold the American promise of "justice for all." Let us give full credit to those who fight daily for better standards and training and to those who every day, every night, in every state pass even-handed judgement in traffic cases throughout rural America.

Not many states require these men (and there are some women) to have legal training. Few of them handle enough cases to justify without adequate study the expense of setting up respectable court-rooms. Cases are hauled into poor court rooms: some are heard between the cracker barrel and stove in the crossroad store. Many of these magistrates do not even have access to a copy of the statutes, and some of them consult the arresting officer in the presence of the defendant about the proper disposition of the case. With such informality scanty (if any) records are kept by some of them.

LAW IMPRESSIONS FROM COURTS

Other speakers stress encouraging voluntary compliance with traffic regulations by setting up adequate deterents. This is the aim and purpose of the traffic law enforcement program to which you and I are dedicated. In this coordinated effort the court occupies the key position realizing that the defendant's experience in court climaxes his experience with the law enforcement program.

What he observes, hears and feels forms his impression of law in action. If the impression is good then the chances are he will respect the integrity of the court. Our hope in this whole effort is gaining his confidence in the good purpose of the police and the judge.

If he believes their aim is to protect him, to teach him better rules of the road, he will not leave the courtroom feeling resentful even though he has been fined. Some of these have later become the strongest backers of the educational approach to safer driving. To do this use your public relations.

Since the basic function of every well conducted traffic court should be to educate better and more responsible drivers we may well ask ourselves if this function is served when he leaves the courtroom feeling that he was the victim of an unfair arrest and trial and that the fine was unjustified.

My purpose is not to cast blame on the untrained men and the unequipped courts. We are groping for means of helping magistrates to a better understanding of their role in this national campaign to save lives and to strengthen respect for their own positions.

Those conducting traffic court conferences point to an encouraging indication. They report that an increasing number of justices, magistrates, mayors and county judges are attending these meetings. But those seeking even this brief training are still too few. Therefore, means must be found to reach more who need it. Some of them have been asking if trained sessions, especially tailored to their needs, could be provided so that they can learn approved procedures suitable for their courts.

The traffic court conferences have brought vast improvement over the past two decades, but at most they are only for five days' duration and many of them meet for but one or two days. Effective as they have been it is obvious that no legal education can be compressed into so short a time. The rural magistrates need a realistic approach to their own set of problems which differ from those of city policemen and judges.

FINANCE COURT IMPROVEMENT

In considering the part of our subject which deals with how improved public relations could help raise the standards of traffic courts in smaller communities may I suggest some measures that might be considered. First, we and the judges can undertake the job of getting the ideas across to the residents of our communities and to convince the taxpayers that it would be money well spent to provide training.

At public expense rural judges could be offered a short course in the fundamentals of judicial administration and at least the basic principles of law. These people are expected to administer the law, and many of them have no acquaintance with it. They need to understand what is expected of them.

Second, we could work to abolish the fee system: third, we can urge the use of a uniform, nonfixable traffic ticket. Fourth, we can advocate the establishment of county courts of record. The same automobile that makes these courts so necessary now also make it unnecessary to have so many justices so close to hand. People can drive a few miles to one central county court that is properly staffed, and equipped. The number of justices was determined back in the days of the horse and buggy or even walking to see the magistrate.

A few states have already replaced some local courts by courts of a wider jurisdiction. Fifth, we can try to persuade the judge to explain his rights to each defendent as he comes before him. He should also explain the reason for the fine, being sure that the person fined understands why he pays. The judge should establish consistent policies and practice strict impartiality toward all who come before him.

Sixth, we can help by supporting those who are doing a good job. It has been said that some of our best traffic judges are to be found in rural areas (may their tribe increase)! But many still need help and encouragement and training. These we can sponsor.

However, the long-time solution lies in changing the court system at this level. Some states have already made a beginning by putting at least some of their magistrates on a straight salary (Indiana, Arizona, California) and requiring some legal training. In one state (New Jersey) such courts have been made a part of the overall judicial system under the direct supervision of the chief justice of the state's Supreme Court.

These welcome symptoms of progress represent only a slight beginning. But the movement is gaining and we can help accelerate it. In most states the justices and magistrates are constitutional officers and cannot be eliminated except by constitutional amendments. Those of you who have worked for judicial reform through your state legislatures know that it is a long, slow process.

JUDICIAL CHANGE SLOW

One reason that change in this area comes so slowly is that many consider the justice courts, "the poor man's court," dispensing justice after working hours, within walking distance of home, etc. Often, too, the rural people cherish the tradition of the "friendly" squire in their midst giving homely advice along with legal services.

Perhaps we can urge our home communities to accept some readjustments in our legal and judicial system. But we must face the fact that change is always resisted and we may have to accept some temporary compromises. Many rural courts can be improved even within the present limitations. They must be improved. We must see that never again can a leading women's magazine publish an article entitled, "Traffic Courts: Blot on American Justice." (McCalls, June 1956)

JOB OF EVERYONE

We must all undertake the job of public relations in teaching the philosophy of traffic courts that has been evolving and growing, a philosophy based on the idea that improving drivers' attitudes is more important than punishing them. We can offer the judge our help in understanding his problems and his needs, and communicating his hopes for his court to his constituents.

We can applaud his efforts in the right direction. We can all back the judges who are trying to feel their way forward. Perhaps they would take the next step if they knew the public would accept it. If you and I work and we all work to improve our traffic courts we will speed the day when no police officer or patrolman will have to apologize to anyone for taking him before a justice or magistrate.

Let us work toward the time when every motorist who appears in any court with a citation will leave with a clearer insight into the overall program for safe driving, this we must do! But you, too, must explain, and help us to understand what needs improving.

Practice good public relations, teach us your problems by using public relation techniques to help all of us get better traffic courts.▲

REMARKS OF MRS. AGNES D. BEATON

director, women's div., Automotive Safety Foundation, Washington, D. C.

I certainly need not dwell upon the importance of good traffic courts to safe highway travel. We know that without good courts, enforcement and indeed respect for laws generally can be materially weakened. Conversely, good courts strengthen our entire traffic safety effort.

I will direct my remarks particularly to the public relations aspects of a traffic court program—the job of building public understanding and support and how women can help.

When I use the term public relations, I have in mind something other than mere publicity or what we usually think of as the work of press agents. Public relations for the traffic court begins with the court itself. There is nothing that communications, civic organizations, or anyone else can do to "sell" a court, unless the court itself is operated on a sound basis. Public relations is in no sense a magic art. It can't make something out of nothing.

To use a simple parallel: we all agree that it's a waste of time, effort and money to try to build public acceptance for something that is inferior. Take a product, for example. By a high-powered promotional campaign we might be able to sell a homemaker a new brand of soap, for instance. But as soon as the customer had sampled the product, used it and found that it was inferior, that it failed to measure up to claims, there would be no more sales, no matter how artful the hucksters.

CAN'T SELL INFERIOR GOODS

The same thing applies in the case of institutions. If we want to build good will, understanding and support for a traffic court, we first have to make sure that we have a quality product to offer. Otherwise we're wasting our time.

Because I have been privileged to work with a number of our major national women's organizations on this matter of traffic courts, I would like to approach the subject with particular emphasis on the role of women's clubs.

Suppose that a women's club, through its safety committee or its public affairs committee, wants to be helpful in support of the traffic court. How does the club begin?

The first step is fact-finding. Careful thought and study should precede any other action. The members should first understand what they have at present in their traffic court operation. Before seeking to bring about what they think of as "reform," they should determine that there is something which really needs changing. It is not safe to assume that any change necessarily would be a change for the better.

It may well be that the court is a good one but needs understanding friends to help promote its objectives. If it is not good, what needs correcting? Perhaps the judge is doing the best job that he can under limitations which are beyond his own control. Is the judge simply imposing fines, when he thinks the offender should be jailed, because his authority is limited?

Maybe the judge is fighting a lone battle to have such a statute or city ordinance changed. He may recognize the inadequacy of his penalties but be powerless to change them without help from the community at large.

Is the judge's case load so heavy that he lacks adequate time to develop a more constructive court program? Does he have a dignified court room? Is he interested in seeing that the violators who come before him become better drivers in the future? Does the court have facilities for showing safety films to assist with driver improvement? At the opposite pole, does the judge say, as some do, "I'm running a court, not a school. I've no time for these new fangled notions that traffic courts should be educational institutions."

PUBLIC'S ATTITUDE

What about the attitudes of local citizens? Do the people in the town favor a cafeteria court instead of something better? Do they want moving violation cases to be tried in court? Or do they favor a system which permits a forfeit of collateral even for serious moving violations?

On the other hand, does the public regard its traffic court as an important source of revenue? Does it force the judge to run a fining mill? Is the court willing to have juvenile sessions aimed at correction more than at punishment? Or does the public look on this as coddling the offender? These and many similar questions should be investigated and answered before any other action is taken.

After looking over the court situation and deciding where they can help, where do the clubwomen turn next? Are they competent to judge how much reorganization, or what kind, is needed? They are not lawyers. So perhaps one wise step would be to talk to some of the lawyers who practice in traffic court and get the benefit of their thinking. Surely, these members of the bar are in a position to determine whether the fault lies in the limitations of the system or the indifference of the judge.

Members of the bar will be in a position to know whether the judge is compelled to operate his court under rules set up by unrealistic state law, city charter or ordinances.

If an inflexible city ordinance is the obstacle in the path of modernization, perhaps the place to start working for a change is with the city council. On the other hand, if the court operates under the provisions of state law, then the approach may have to be with the state legislature.

ENLIST GOVERNING BODIES

Understandably, if a club is dealing with a city ordinance, the job is likely to be easier than if the state legislature is involved. Local governing bodies are usually more approachable by community groups and more aware of and responsive to local needs. City councils are accustomed to hearing the petitions of local people.

One way to approach the problem is to have members of the club talk with the strongest member of the council—report to him what they have found and discuss with him the various remedies that may be possible. If he is responsive, offer him help in enlisting the support of other organizations and townspeople generally for whatever action needs to be taken. If he is not persuaded, approach other members of the council.

When the fault lies, not in the legal organization, but in the attitude of the judge, then an entirely different method of procedure is called for. Assume that the judge has been on the bench for years, is set in his ways, is unreceptive to new and better ways of court administration. What can a women's club do in a situation like that?

MEET WITH JUDGES

One approach is to have several members of the club, selected for their tact and good judgment as well as their knowledge of the court situation, meet with the judge and talk things over. Even jurists, who had previously resisted change most stubbornly, were won over when they became convinced that through traffic court improvement they could do the community a real service and at the same time do credit to themselves as men of insight. In their desire to have their services to the community recognized and appreciated, most judges are just as human as any of the rest of us.

But let's assume that the judge refuses to move out of his established rut—what then? If he is an elected official, the sponsors of court reform might well begin looking around for a strong candidate to oppose him in the next election. The need for court modernization should be made a prominent issue of the campaign.

If the judge is appointed rather than elected, the club should meet with the appointing officer—the mayor, the governor or whosoever it might be.

Let me emphasize that the replacement of an incumbent judge by a better qualified individual can best be accomplished if the ordinary considerations of partisan politics are left aside—if the campaign is conducted in terms of principles rather than personalities. The real issue of community well being and traffic safety must always be kept in the forefront.

QUOTES JUSTICE VANDERBILT

The late Justice Vanderbilt, who was one of the pioneers in the traffic court modernization movement, once said: "Laws and courts have never been changed by judges or lawyers, but by the overwhelming demands of laymen."

Justice Vanderbilt advised: "If you really believe in law, if you really believe in respect for law as a necessary foundation of good government and of safe living, if you believe those things, you will start with your traffic court and you will change it, you will modernize it, you will simplify it, you will make it effective. And how will you do it? Not by asking the chief justice to do it, not by asking the governor to do it, not by asking the legislature to do it. You will do it by organizing laymen—the influential laymen in all walks of life—to do the job. The forces of inertia, the forces of conservatism are all stacked against us, and we have to appeal, and we should in every state for the aid of competent laymen and laywomen."

The task that is outlined in the paragraph I have just quoted is anything but an easy one. It can't be accomplished by a single organization, working alone. But everything has to have a beginning, and a single organization can provide the initial impetus that will rally others. In this light it seems appropriate to mention the work that one of our major national women's organizations now is carrying forward.

WOMEN HITTING COURTS

The General Federation of Women's Clubs, representing more than 1,500 clubs, now is carrying on a nation-wide traffic court improvement program. It has extended citizen support and sponsored community action toward improving traffic courts in many areas.

Federation members have enlisted other civic-minded groups of women, sometimes cooperating through local safety councils. In other instances they have taken the project to the Interclub Council in their community and made it a united effort of many women's organizations.

The General Federation has stressed that better traffic courts are the key to safety and has urged citizens to go to their courts as visitors and not as violators.

This program was initiated by the American Bar Assn.'s Traffic Court Program with special cooperation from the Federation. It is an invitation to citizens to view the administration of justice in the traffic courts of their home state and home community. The judge may speak briefly to these visitors, explaining what he is attempting to accomplish, and answering such questions as may be asked.

Citizens who go to court as visitors are given a check list of recommended standards of court administration. Thus they are able to evaluate what they have seen at first hand, and form some judgment as to how well their local court stacks up.

At the same time, this program gives the judge both the incentive and the opportunity for a critical self-appraisal of his own institution and its operations.

Many judges might be glad to reorganize their outmoded courts if they had some assurance that the public would accept and support some of the changes that might be required—and some of these might be fairly drastic changes. It is certainly understandable that no judge would want to cut himself off from community favor by running too far ahead of public opinion.

So it is readily apparent that through its current program, the Federation is helping to build a climate favorable for modernization of an increasing number of traffic courts. It is a program that holds great promise for the future and that may bear fruit for years to come.

It is a perfectly human trait to become impatient when something we are seeking is slow of realization. But I think that it is important to recognize—and I think that most clubwomen do realize—that it is futile to try and force something before the citizens of the community have been adequately informed both as to the need and the desirability of what is being sought. I think that we women recognize the need for patience, for hard work and for perseverance if we hope to bring about traffic court improvement or any other major advance in the realm of traffic safety.

In whatever community you may live, whatever your local traffic safety program may be, may I urge all of you, if you haven't already done so, to enlist the support of your various women's organizations. I can assure you that they will rise to the challenge and you will find them valuable allies in any program that will make your community a better one for its citizens.▲

REMARKS OF MRS. JOHN E. KRUEGER

Wisconsin Governor's Traffic Commission, Madison, Wis.

I shall discuss driver improvement schools as an effective public relations and safety promotion instrument of our traffic courts. Before commenting on Wisconsin's experience in this field, permit me to quote briefly from three notable sources . . .

First, a statement by J. Stannard Baker, director of research, Northwestern University Traffic Institute, from the book, *Judge and Prosecutor in Traffic Court:*

> "Traffic Schools conducted in cooperation with the courts are an aid to driver improvement.
>
> "They have not been fully developed and we are therefore not getting as much as we can out of them. Unfortunately, too many of these schools are viewed by the court and citizens who are sent to them, not as training, but as punishment.
>
> "Going to school for punishment is bad education."

Next, a statement by George Warren in his book, *Traffic Courts*, published under auspices of the National Conference of Judicial Councils. Says Warren:

> "The success of a violators' school depends on the manner in which it is operated, the enforcement of sentences to it, and the manner in which it is used by the court.
>
> "Experience has shown that well designed 'courses' are not only effective educationally, but are interesting to those in attendance and leave an imprint that is carried away."

TYPES OF VIOLATORS

Warren says that the general types of offenders for whom the school is most effective are:

> Violators who lack mechanical driving skill.
>
> Those who are ignorant of important traffic regulations.
>
> Drivers who show an inability to meet traffic situations.
>
> Offenders holding erroneous attitudes toward safety and who appear to be amenable to educative methods.
>
> Violators on whom a fine would be an undue hardship, or whose fine would be paid by another, or whose family

would suffer as a consequence, and who —at the same time—need a human appreciation of the traffic problem.

Violators to whom a fine means little

Warren concludes that the school is basically "an appeal to reason and conscience that will be accepted appreciatively on the part of those who are traffic offenders through either ignorance or thoughtlessness."

Now let me refer briefly to the National Safety Council's *Public Safety Memo No. 89*, which is a 21-page report on driver improvement schools. The Council emphasizes in this memo that driver improvement schools "are designed to instruct and educate and are not intended to be used as punishment."

The prime objective must be to prevent accidents. This is done by instilling proper attitudes in the violator or the volunteer who attends the driver improvement school; and by improving his knowledge of traffic laws and safe practices, his driving techniques, and his appreciation of many other factors involved in safe conduct at the wheel.

The results of a well-planned, effectively-administered driver improvement school are: an increased number of well-behaved motorists, a good working relationship between the court and other agencies in accident prevention, and excellent public relations for the court.

Before this type of school is undertaken, there are a number of steps that must be taken:

1. There must be a good instructor. He must be completely "sold" on the importance of his job. He must be well-informed on traffic matters. He must be enthusiastic. He must cause the students to feel they have been enrolled for the purpose of self-improvement, not punishment.

2. The school should not be called a violators' school. Students should include both those persons referred by the judge and additional citizens who voluntarily attend because of their desire to improve themselves in their role as motor vehicle operators.

3 The time and meeting place should be appropriate and convenient. Scheduling can be set up on advice of a school administrator. The place should be in a centralized location, with an educational atmosphere, parking space, and facilities for outdoor demonstrations.

4 Secure adequate financing. A definite budget should be set up. The instructor should be compensated for his services, and materials may have to be purchased. The expenses might be shared by the police department and the educational institution. Safety councils and insurance groups might provide some assistance, particularly in donating equipment.

5. Arrange for proper equipment and supplies. For illustrative and testing purposes, a school may use motion pictures, film strips, picture slides, magnetic boards, photos, spot maps, blackboards, posters and psycho-physical testing equipment—secured on loan without fee from various sources. Demonstrations can be effective —especially those which show how radar is used, how chemical tests determine degree of intoxication, and how many feet are needed for bringing an automobile to a stop from a set speed. Of course, the school also has need for booklets and pamphlets, attendance records, paper and pencils for note-taking, and some sort of certificate giving recognition for successful completion of the course.

ATTENDANCE CONDITIONS

Normally, a traffic court judge refers a violator to a driver improvement school under one of the following conditions:

—Suspend the fine or jail sentence on condition that the violator satisfactorily completes the school.

—Suspend the driver's license until the school course is completed.

—Attend school with no suspension or other conditions.

—Or—continue case with proposal that it be dismissed as soon as the violator successfully completes the school course.

The course outline should be flexible enough to permit use of occasional guest instructors, but fundamentally—the course should cover an orientation period, a presentation of the national and local traffic problem, causes of accidents, laws and ordinances, the purpose of enforcement, the role of traffic engineering, public education and cooperation, driver attitudes, and a question-answer period.

Now—permit me to describe briefly what is being done in Wisconsin. Under state law, a trial court judge may require a convicted motorist to attend a traffic safety school. The law specifies that the course of instruction must be approved by the Commissioner of the Motor Vehicle Department.

In Wisconsin, we have schools for driver improvement in Appleton, Beloit, Manitowoc, Sheboygan, Stevens Point, Superior, West Allis, and Milwaukee County. The Milwaukee County Safety School is for juvenile traffic violators only, but plans are being laid to enroll adults as well. In the spring of 1954, when the Milwaukee County Safety School was started, *The Milwaukee Journal* Radio Station—WTMJ—put a series of six weekly sessions on the air, which is a splendid example of public service by a broadcasting station.

BELOIT SAFETY SCHOOL

In Beloit, Municipal Judge Arthur Luebke reports an average attendance of 22 persons in the safety school held at the Vocational School. Five weekly sessions comprise the course, with each session lasting two hours. A small fee is charged for attendance. The fee of $2 is paid at the court.

The average age of the Beloit student is 20. The instructor, Noah Shaw, says, "My students come to me with a chip on their shoulders. They have a feeling that the other guy — not themselves — should have been arrested. At the first session of the class, I just ask them if they have any questions. The questions reflect the resentment that they have with being arrested and sentenced to my class. Pretty soon, the whole class is talking; everybody is itchy to get in his opinion. And they start educating themselves."

When Shaw was interviewed recently by John Newhouse, a staff reporter for *The Wisconsin State Journal* (Madison), Shaw said, "Generally someone gripes about truck drivers, cabbies, and the old ladies who drive too slow. When they get off base, I ask them what their insurance rating is. It seems to slow them down."

Shaw has a good way of turning the tables on any student who sleeps or pretends to sleep as a protest at being in school. He says, "I point a finger at the person and wait until he wakes up. Then I tell the class about the man who slept through one of my classes and the next night went out and slept in his car, while driving. He was killed. A lot of people knew him. It makes a pretty effective example."

Shaw also tells of a boy who habitually drove around with three older boys. He was in the Beloit Safety School the night that the news came through that his three friends had been killed in a head-on collision. That boy would have been with his friends had it not been for a session of the Safety School that night.

Judge Luebke reports that less than one per cent of the people taking the Beloit Safety course are brought before his court a second time. At Manitowoc, Judge Harold Mueller says less than five per cent of that city's Safety School students come into court a second time for violation of traffic laws in Manitowoc County.

I have spoken to Wisconsin's Motor Vehicle Commissioner, Melvin Larson, about the value of driver improvement schools. Commissioner Larson told me, "It is my hope that many more traffic judges will soon endorse a school of this type in their communities. I feel strongly that in many cases, paying the penalty of a fine does little to make the defendant a better driver."

Commissioner Larson's concern over the need for additional driver improvement schools in Wisconsin is heartening to me as a citizen, because this motor vehicle administrator heads a department which includes the State Patrol, the Driver License Examiner force, the registration and licensing of motor vehicles and operators, and the public information and safety promotion activities in the field of traffic accident prevention in Wisconsin.

The safety division of our Motor Vehicle department has just published a booklet called, *Trial by Accident*. This pictorial publication was especially designed for judges to present to traffic violators. It was distributed to every judge in Wisconsin, with the promise that driver improvement schools may have as many copies as needed

—plus any other assistance that the Safety Division can provide.

Let me read from this letter issued by our Governor, Vernon W. Thomson, dated September 25, 1957, and addressed to traffic court judges, chiefs of police, and directors of vocational education:

Gentlemen:

It is generally recognized that public education is as important as traffic law enforcement in any realistic approach to the traffic death problem. For this reason, I am writing to you, as responsible authorities in the communities of Wisconsin, to urge your serious consideration of a program of public education through Traffic Court Violators' Schools.

The purpose of these schools is not punitive in nature. Emphasis is placed upon the re-education and re-training of drivers who have been brought to court because of traffic law violations.

Naturally, not all traffic law violations are deliberate. Many drivers fall into dangerous and illegal driving habits without realizing it. However, fatal traffic accidents caused by careless violations are no less tragic than those caused by deliberate recklessness. These schools serve a constructive purpose in "refreshing" the drivers' awareness of their personal responsibilities on the highway and of the need for careful driving habits at all times.

Several Wisconsin courts are now requiring certain violators who come before them to attend special traffic court schools conducted in cooperation with local vocational schools. One of these courts reports that less than one per cent of the students attending its school have ever been arrested again for a traffic violation.

Recognizing the value of such schools, the recent legislature adopted changes in the law to authorize them and make them more acceptable to everyone concerned.

Since the ultimate purpose of our traffic laws is the prevention of accidents which may result in injury or death, such schools can and do serve as constructive a purpose in the promotion of safer driving as the collection of fines in arbitrary punishment.

May I personally urge you, if you have not already done so, to consider seriously the establishment of such a school in your jurisdiction. The Safety Division of the State Motor Vehicle Department will cooperate wholeheartedly in supplying information concerning successful schools in Manitowoc, Beloit, and Sheboygan, and will advise you as to how an approved school may be established in your community.

I am confident you will agree that in view of our responsibility to the public, the growing traffic accident problem makes it necessary to use every possible means to eliminate the causes of senseless and tragic highway deaths.

With kind regards,

Sincerely,

VERNON W. THOMSON
Governor

ARE DRIVERS FAILING OUR NATIONAL SAFETY MOVEMENT?

by ARTHUR S. JOHNSON

vice president and manager, Engineering Dept., American Mutual Liability Insurance co., Boston

Unfortunately, the answer to this vital question is both yes and no. From a standpoint of statistical analysis, remarkable improvement in accident control has been effected through better law enforcement, better highway engineering, better automobiles and better drivers.

In 1941 the number of persons killed in highway accidents per one hundred million miles driven was 12.1. In 1956 the figure was 6.4. If there had been no improvement in accidents and controls, if the 12.1 death rate had held true in 1956, more than 76,000 people would have been killed on the highways. On this basis the National safety movement has been successful.

But, the fact still remains that the National death toll from highway accidents is holding at the 40,000 level, the injury rate at close to one and a half million and the number of accidents per year in the vicinity of ten million. On this basis our National safety movement is falling short of success.

CAUSES OF ACCIDENTS

In tackling the problem of how to stop these 40,000 deaths a year and cut down on the appalling number of accidents occurring, our National safety movement must find positive answers to two very basic questions—first, what is it that drivers are doing that causes the accidents and second, why do drivers continue to do these accident-making feats? Actions describe the first question; motivation, the second.

Much has been done in investigating and statistically analyzing what any given driver has done that led to his highway accident. In its statistical report for the year of 1956 the National Safety Council estimates that in every 100 fatal accidents 64 per cent of the drivers violated a safety regulation. From the standpoint of all accidents, six out of 10 drivers committed some violation.

Here are the reasons stated—excessive speed, failure to yield the right of way and failure to keep to the right of the center line and under influence of alcohol. In a special study of Christmas holiday accidents the Council reported that 55 per cent were due entirely or in part to alcohol; over Labor Day the comparable figure was 48 per cent.

To get a clearer picture of the behavior of drivers, the Institute for Safer Living of the American Mutual Liability Insurance company conducted an extensive survey which included the drivers of *both* sexes, all ages, and in all sections of the country. It was evident from the answers that a vast majority of American drivers look upon highway regulations casually. Many look upon them with disdain.

In answer to the first question which asks, "Can you honestly say that, when you are behind the wheel, you never violate a highway rule or safe driving practice?" Nine out of 10 drivers admitted that they broke rules of safe driving. For example, 50 out of every 100 drivers decide for themselves what their speed limit shall be, regardless of the posted limit. Of the 50 drivers who take matters into their own hands, 10 exceed the speed limit occasionally, 30 exceed it as a practice and the remaining 10 drive under it.

EXCEEDED SPEED LAW

In a special investigation of violators made by Massachusetts state police, out of 212 drivers stopped, 160 were exceeding the speed laws. One-half of these had received *previous warnings for speed violation* and 91 per cent admitted that they deliberately exceeded the speed limit.

How do drivers behave in regard to passing on curves? Only 60 out of 100 said they never passed under any conditions —40 out of 100 said that if traffic were light, they would and did pass on curves. Just about the same relationship held true in regard to attitude about passing on hills—

60 per cent always stayed in line, 40 per cent would pass if conditions seem right.

How does the average driver behave in regard to "stop street" intersections? Seventy out of 100 drivers stated they always came to a complete stop, but 30 per cent said no—they only "slowed down enough to make sure that cross traffic was not coming."

On the question of drinking, respondents were asked, "How many drinks do you estimate you can take before your driving skill and judgment are affected?" Only seven out of 100 drivers said they never drink if they are going to drive; 32 out of 100 felt they could handle one drink; another 27 believed they could have two drinks; 18 saw no problem in driving after three drinks; and 13 felt that four drinks were safe enough and three could take more.

POLICE TOO EASY

The investigation took a look at driver attitudes toward highway law enforcement. This is what it showed—75 per cent of the drivers felt that not only were there not enough highway police, but that they were too easy on violators. As for attitude toward courts, 88 drivers out of 100 felt that the courts were too easy on violators.

The final question in this investigation had to do with attitude toward professional driver training—43 per cent believed that it is essential for all drivers, 48 per cent necessary only for some, and a scattered few feel that driver training is not needed at all, is a racket, a waste of time and money, or can be done better by parents or friends.

On this subject of driver training, important information was revealed by the State Police investigation of the 160 speed violation cases, which indicates a "good idea but I don't need it" attitude. Only 13 per cent of all these erring drivers had had driver training; 80 per cent had received their driving instruction from a friend, a member of the family and the remainder were self-taught.

There is much evidence here and, in all other available statistics, to indicate a regular, continuing violating of highway regulations and safe driving practices. It is most interesting to consider why this is so. Alfred L. Moseley, consulting psychologist, for the Institute for Safer Living, who has been conducting parallel research on the subject with drivers already involved in serious accidents and with police who handled them, attributed this widespread attitude to three factors:

1. Widespread unconcern about being "pinched" on the highway.

2. A lack of fear of being in an accident.

3. A conviction that being required to drive safely or obey the law is an infringement on their personal rights.

These conclusions are not superficial thinking or academic theorizing, but rather are based on roadside interviews with drivers involved in fatal accidents. Such would come closer to representing the truth than if it were secured after "advice and counsel."

As background for the attitude of no fear of the law, Moseley concluded that it exists because drivers find it relatively easy to get a violation fixed, or because they know that the local police and courts tolerate reasonable excesses, or because they have attained either a social or a job status in life which makes them feel they are bigger than the law, or they deliberately take a calculated risk of being caught.

BIGGER THAN LAW?

On the attitude of having no fear of being in an accident, Moseley found much evidence that drivers, unless they had previously been involved, could not visualize the possibility "that I could have an accident" or its impact on them and others. He found that drivers who were stopped for a violation had no notion that their actions were unsafe.

A certain percentage of the drivers included in Moseley's investigation made it quite clear that they resented being told by sign, by control light, by police, how they should drive their automobiles.

It may be that the big job to be done in understanding the causes of accidents lies in the psychological and psychiatric fields. Surely these three conclusions seem quite common sense.

Equally important in finding out why drivers do the things they do to create accident situations is to find out effective answers of control. While driving behavior has not been explored psychologically, and needs a great deal to be done, it is sufficiently clear to indicate some measures that can be taken along with improvement in older safe driving controls.

I do not believe that the answer lies solely in more enforcement. Safe driving is essentially a right behavior that lies between free uncontrolled exercise of one's rights and obedience to exact law. Since no one can possibly do as he pleases on the highway, there is little free choice beyond where to go, when, and in what vehicle. How one behaves getting there has to be very much controlled.

DRUNKS OFF ROADS!

Where statutes apply, such as all are familiar with or must be in the motor vehicle law and traffic ordinances, enforcement must be made sure. This may be unlikely so long as people seek privilege. I will not crusade this point, except to say that serious accidents will not be stopped until drunken driving is stopped.

The most of the answer lies in everlastingly hammering through educational processes the rightness of safe driving practice and that safety lies in obedience to safe driving practice.

It is not funny to pass a red light, on a hill, or fail to bring one's car under control at an intersection. Neither should these regulations be difficult to accept as self-imposed control.

In considering the vast strides forward of the past few years in highway engineering and building, and in automobile engineering and manufacturing, we may well ask, "What is wrong with our National highway safety movement?" The answer appears to be: "Nothing that cannot be fixed by the drivers themselves."

HUMAN BEHAVIOR AND ITS RELATION TO TRAFFIC ACCIDENTS

by EARL D. HEATH PH.D.

assistant professor of education, div. of general education, Center for Safety Education, New York University, New York city

There is considerable evidence to indicate that the primary cause of the majority of traffic accidents lies neither in the vehicle as such, nor in the condition of the roadway, but rather in that combination of personal factors which make up the driver. Accordingly, in recent years the human factor has been a major consideration in vehicle and roadway design as well as in the establishment of licensing and employment standards and in the establishment of training and retraining programs.

During the past few years there have appeared two exceptionally significant and complementary contributions to the field of safety which have pointed up the emphasis in this direction. One of these is the compendium of research entitled: *The Human Element in Industrial Accident Prevention* prepared by the staff of the Center for Safety Education at New York University; the other, *Human Variables in Motor Vehicle Accidents* prepared by the staff of the Harvard School of Public Health.

These two publications did much to focus attention on what had been done, the limitations of findings reported, and what remained to be done in the area of human behavior and its relationship to accident causation. They acquainted many with the results of hundreds of man years of research. Further, they point the way to the numerous relatively untouched areas which individuals or groups may desire to explore.

RESEARCH CONCLUSIONS

Representative of the findings reported are: 1) that the more reliable studies are consistent in their inability to find significant relationships between psychophysical functions, as currently measured, and traffic accident and violation involvement; 2)

that the search for explanations of driving performance is being channeled more toward psychological and sociological lines and away from those of a psychophysical nature; 3) that much more knowledge is needed about the effects of drugs on driving performance; 4) that knowledge of recommend ' driving practices is no guarantee of their faithful observance; 5) that the development of driving skills above a certain minimum represents an investment of time and effort which possibly could better be spent in developing attitudinal and other factors; and 6) that the bases upon which drivers are now labeled as either "good" or "poor" may well be open to question.

When it is remembered that most traffic accidents are the result of a combination of variable factors most of which are not readily identifiable, the varied approach to the problem which is in evidence today becomes quite understandable. It is difficult to find an area of interest in which traffic safety is not a topic of discussion, if not an object of activity. Over the past several years we have seen a steady increase in the number of groups, professional and nonprofessional, which have directed efforts toward this problem. The intensity of this activity, likewise, is increasing.

What are some of the newer developments in the search for more information on the driver and what are some of the techniques being used in the application of reliable research findings? While numerous individuals and groups are undertaking such investigations and applications, I shall confine my remarks to the work of the Center for Safety Education, work which is being guided by Dr. Leon Brody, Director of Research at the Center.

PERCEPTUAL ABILITIES

One of the projects now underway has to do with the development of perceptual abilities . . . teaching drivers how and what to see rather than indiscriminate seeing . . . developing in the individual the ability to interpret the driving scene for what it is and to select his driving actions accordingly. Among the methods by which this problem is being approached is the medium of film slides.

Color slides of driving situations representative of those encountered by the motorist in his everyday activities are made, then analyzed, and potential hazards identified. As the slides are presented to the subject, he is taught to interpret the driving scenes depicted and to indicate the necessary adjustments a driver would make in such a situation.

Attitude Assessment and Improvement

The search still is underway for improved ways of identifying, assessing, and improving attitudes which are believed to have special application to driving situations. A staff research currently underway and which is expected to last for three years is exploring this area. Unfortunately it is not possible to report procedural details or results at this time. It is the hope of the Center staff that the approach being used, which is novel, will also be fruitful.

A new approach to the problem of teaching for attitude improvement has been reported by Arthur Mahony. Formerly of the Bureau of Traffic Safety of the State of New Jersey, Dr. Mahony used the neurological approach in analyzing driver performance and in suggesting methods for the modification of attitudes. A guidebook containing suggested methods for applying the findings of this study is being prepared and should prove of considerable interest to those responsible for the education of driver personnel.

Licensing Standards for Commercial Driving School Instructors

To give some idea as to the breadth of the attack on traffic accidents through efforts directed toward the driver, I would like to mention a new evaluation technique developed by the Center staff at the request of one of the states for use in screening applicants for licenses as commercial driving school instructors.

A three-phase examination, which supplements the conventional requirements, consists of: a) a test of the applicant's driving ability, b) his ability to instruct others, and c) his ability to evaluate the driving performance of subjects so instructed. Such a requirement in the licensing of instructors is believed to be a much needed addition to the knowledge tests of driving practices and of the state motor vehicle code, physical qualifications and the search of the applicant's driving history.

Seeking to improve teaching techniques by applying research findings, the Center has been experimenting with the possibility of attacking traffic accidents through the medium of group discussion-decision. Decision-making has been defined by French and Willerman as being primarily a process of setting goals for the future behavior of the group members, rather than a problem-solving discussion concerning means.

GROUP DISCUSSION—DECISION

It is believed that this approach may prove of considerable value in tackling problems which heretofore have seemed rather inaccessible and for which conventional teaching methods seemingly were not the answer. The use of an educational method such as this in the effort to reduce traffic accident offenses is based upon an assumption that there are personal attributes which can be conditioned so as not to result in accidents.

Still another study being conducted by the Center is concerned with the performance of license applicants on the road phase of the examination procedure. In addition to this, the Center is providing consultative services in the design, operation and evaluation of traffic court schools and traffic accident prevention clinics.

Work also is underway on a publication which will popularize the findings of the Symposium on the "Medical Aspects of Motor Vehicle Accident Prevention" held at the New York University-Bellevue Medical Center in the spring of 1956. The Center for Safety Education is cooperating with the American Medical Association in the development of this brochure which will be made available to physicians throughout the country.

During the past year, these theses on the doctoral level, which dealt with the driver, were completed. One of these, entitled "Teaching for Attitudes Conducive to Safe Driving," is the study mentioned earlier which was conducted by Arthur L. Mahony, in which the neurological approach was used.

My own study, entitled "The Relationships Between Driving Records, Selected Personality Characteristics and Biographical Data of Traffic Offenders and Non-Offenders," gave indication of the impulsive and the highly sociable nature of the traffic offender, as well as the value of biographical data in identifying offender populations. The complete studies are available on microfilm or they may be obtained from New York University on an inter-library loan basis.

GRADUATE CONTRIBUTIONS

Several other researches are underway. These are being conducted individually by graduate students and each ranges from one to two or more years in duration. Among areas being investigated are many of those problems suggested in the research reported in the two summaries of the literature mentioned earlier.

I know that I haven't fully answered the question: "What's New in Traffic Safety Research" from the standpoint of the human element. The professional journals contain an increased number of reports of investigations underway, and we at the Center share in the hope that these studies will contribute to the solution of the traffic problem.

We are pleased to learn of the extent of developments at the Highway Traffic Safety Center at Michigan State University and the increased activity by other institutions and agencies, for it is through such efforts that many of the problems of human behavior and its relationship to traffic offenses will be reduced in complexity, if not solved.

AUTOMOBILE CRASH SAFETY RESEARCH

by EDWARD R. DYE

head, safety design research dept., Cornell Aeronautical Laboratory, Inc., Buffalo, N. Y.

One of the basic principles of protecting a passenger during the automobile crash period is to keep him from becoming a free missile. As a free body, he could injure himself by striking some object within the car or he could be thrown out where he would have twice the chance of being injured.

Last year I prepared a report on "The Development of the Automobile Safety Belt." The seat belt, we all agree, is just a preliminary but effective step in packaging the passenger. It has its advantages such as ease of installation and it can be installed in any car. But, we must admit it will never be used by 100 per cent of those who ride in automobiles.

We know many will not take the trouble to put on a seat belt. Others believe that death and injury statistics are something that is computed around the other fellow. They are not interested in this safety business at all. Therefore, the best crash safety improvements (as measured by total number of death and injuries reduced) will be those which are installed in the car ready to serve when the crash does occur.

Ideally, these devices should require no attention at all from the passenger (he gets his protection whether he wants it or not). Doorlocks, padded instrument panels and padded windshield headers are in this category. None of them, in my estimation, are nearly as effective as a good seat belt, but they have the real advantage in that they are there.

UNGUIDED MISSILE

To find how best to protect the lazy or careless passenger who won't wear a seat belt, engineering information must be obtained upon which to base the design. First, we have to consider such a passenger as a free body or "unguided missile" during the crash period. To get engineering design data on where and how much protection should be provided, we had to make a time-motion study of the passenger's action. The time-motion studies were made using anthropometric dummies inside an automobile snubbed to a regulated crash stop.

We made a short movie of crash snubbing tests on the Liberty Mutual Insurance Company sponsored project. Through frame by frame studies of the high speed movies, we were able to determine probable hit points, flight path, velocity of striking, attitude of body at instant of impact and the angle of the impact surface with the flight path.

Flight path data was useful in determining the possibility of hitting an area. From the velocity of impact, the total energy of the human could be determined. From the attitude of the body at instant of impact and the angle of the impact surface with the direction of motion of the head, the energy of the blow could be determined.

By allowing a dummy to fall free against an impact surface set at various angles with his attitude duplicating those picked from the movies, we were able to obtain the influences of body attitude and impact surface on the magnitude of the head blow.

CUT CAR HAZARDS

A study of such information suggested several things which could be done to reduce the hazards inside the car.

1. Control the attitude—keep away from the swan dive.
2. Shape the inside surface to make all blows glancing blows (small angle of 0).
3. Pad surfaces having high impact level.

One slide of plotted data showed the probable head travel and magnitude of head blow for a given crash condition. The angle of impact surface and attitude of the body have both been taken into consideration in the computations. It clearly shows the high danger zones where the greatest amount of padding protection is needed and where objects of high injury potential should not be placed.

From some 27 different projects such as these, bearing on the protection of the human against impact blows, considerable detailed basic engineering information has been obtained. The projects cover research on padding materials, development of instrument panels, safety door locks, shock absorbing steering wheels, windshield distortions, kinematic performance of the human body, injury potential of various items found inside the automobile, protecting the human head from impact blows and seat belts.

Last year the Liberty Mutual Insurance company, sponsors of our crash safety research work, and Cornell Aeronautical Laboratory, Inc. deliberated on the best manner to present this bulk of information so that it could be easily understood and used as soon as possible. It was decided to build a safety show car as an instrument of education.

SAFETY CAR

With the exception of having no radiator ornament, headlight shades, bumper guards or extended door handles, the exterior of the car is much like that of an ordinary sedan. It has a complete wrap around bumper system designed to encourage deflection blows, and the front and rear bumpers have some energy absorbing characteristics to take away initial shock.

The interior of the car is quite different. The bucket seats are located to give the best possible arrangement for the six passengers,—first as individuals and then as a composite group. The driver, the one who has the greatest exposure to an accident, has been located in the center of the machine. Two front seat riders are placed slightly to the rear and slightly lower than the driver to avoid visual and physical interference.

All front seat riders have pull-down panels which serve the same purpose as the automobile seat belt. By design, the windshield and instrument panel have been moved out of contact range. The two rear seats are located inside the wheel wells to give the passengers additional structural protection and are staggered between the front seats. The rear seat riders have the safety advantage of retractable seat belts and full head movement clearance space. A rearward facing seat for a child is located behind the driver.

One of the obvious changes is that the steering wheel and post have been replaced with a handle operated full hydraulic steering system. Another change is the folding type door which furnishes full opening and, when closed, bolts securely in place.

All in all, the interior of this human package has been cleaned up of injury producing items and possible head impact surfaces have been eliminated or padded to reduce their injury potential. The body of the car has been made structurally strong against roll-over collapse with the addition of two roll-over bars.

Several plans have been made to show this car so that our findings will be available to you. We hope that this dissemination of information will encourage others to think and act along crash safety design lines. If this has the effect of bringing your additional thinking into the problem to improve upon our initial meager findings, it will have served its purpose.

RESEARCH IN VISION AND TRAFFIC SAFETY

by DR. WENDELL E. BRYAN

chairman, Motorists' Vision and Highway Safety Committee, American Optometric Association, Denver, Colo.

This is an age of miracles. The miracle of the automobile makes us think in terms of power steering, power brakes, shatterproof glass, puncture-proof tires. Yet perhaps the most miraculous thing as we speed along the highways is that we still use the same visual processes as in the days of the covered wagon!

The Motorists' Vision and Highway Safety committee of the American Optom-

etric Association has been doing research to relate visual problems to traffic safety for 25 years. Early research was simple and limited. Our traffic problems were also relatively simple in comparison with today's problems of the highway.

The findings emphasize that vision is a key factor in managing a car. To drive properly one must see properly. Ninty per cent of our reactions when driving are based on what we see.

The National Home Demonstration Council, in cooperation with the Woman's Auxiliary to the American Optometric Association, has conducted a pilot survey on visual abilities of drivers. In this survey 3,000 persons in 22 states were screened.

Most states consider 20/40 vision adequate at the present time. Using this lenient figure as the minimum standard for testing, one out of every five, or 21.5 per cent, still failed the test for distance visual acuity.

20/20 NOT PERFECT VISION

Contrary to what people think, 20/20 vision does not mean perfect vision. We cannot stress this point enough. 20/20 vision is only one step of a dozen or more visual functions and performances. Many of these are tested in the present study. For depth perception testing we used the Howard-Dolman Peg Test on the Porto-Clinic instrument with a give and take of three inches in lining up the pegs. Twenty-two and one-third per cent failed this test.

Lateral phorias showed a failure of 16.9 per cent; vertical phorias showed a failure of 13 per cent. Simultaneous vision tests were also given to determine if the person was seeing with two eyes all the time or whether he would alternately suppress one eye or shut vision when fatigued. Fourteen per cent failed this test. Color tests given were failed by seven per cent.

In the peripheral vision test we considered a minimum of 140 total degrees or 70 degrees to the temple side of each eye. This was an easy test, considering that average side vision is 90 to 95 degrees out of each eye, a total of about 190 degrees. Yet using a minimum of only 140 degrees, 10 per cent of the people still failed.

In tests for glare resistance recovery, five per cent failed. Another 5.4 per cent failed tests for suppressions of one eye or the other. Tests for reaction time were taken on the Porto-Clinic and 51 hundreths of a second was considered normal. Thirty-two per cent of those screened on the Porto-Clinic failed this reaction test. This is a remarkably huge percentage, considering that the test is explained to the individual and he is prepared for what is coming.

A record was kept of all accidents the tested persons had had. These did not include scraping a fender or minor accidents —only those which were recorded. Twenty-two and four-tenths per cent of the persons tested had reported accidents. Of those a great number explained, "I didn't see the car," "I didn't see the child," or "I didn't see the stoplight."

Most officers and judges believe these statements are only excuses. However, many persons actually did not see in time to avoid the accident. There may be other factors involved. We know that visual alertness is related to mental alertness. Therefore, every time we make persons more visually alert, we are also improving mental alertness.

Let us next consider the implications of speed with regard to vision. Our research shows that as speed increases, the angle of driver vision decreases. This is known as the narrowing angle of driver vision. To illustrate, at 30 mph the driver can see his surroundings with far greater accuracy than at increasing speeds.

GREATER SPEED—LESS VISION

We cannot convince people to drive at 20 mph. Speed is here to stay. Consequently, we must teach people how to see properly at higher speeds. Research shows that at 60 mph, while looking straight ahead, the driver can actually see little on either side of the road.

Therefore, we must train ourselves and others how to make the most of vision. One publication on visual training recommends that we "get the big picture." This means that the driver should view the car ahead just as a tiny part of the roadway scene. He should view all objects for a block ahead in town and half a mile ahead in the country. But he should never watch anything in sharp detail. The sharp central vision should never stay fixed on one object.

By moving the eyes up and down, side to side, and by glancing at the ground near every object, split-second timing judgment may be made. This "foresight" not only aids mental alertness but gives one wider angles of driver vision. These rules of safety apply to the housewife going to the corner grocery and to the salesman who drives along the highway.

Thus far we have not mentioned the person with inadequate visual acuity. How complicated the seeing task on the highway is if vision is below normal or below Snellen 20/20 rating. If a person with 20/20 vision comes to a crossroad sign bearing names of towns and villages, how many do you think he can read at 60 mph? He will be doing remarkably well if he can decipher just the top one, since most signs are printed in five-inch letters.

In reading this sign with 20/20 vision at 40 mph, he could see about 280 feet. His stopping distance is approximately 143 feet on dry concrete. This driver is probably safe. But all drivers do not have 20/20 vision. Since most states consider 20/40 vision adequate, let us use this figure. This driver with 20/40 vision can read 113 feet before he reaches the sign. We have just seen that 143 feet are required to stop under the best road conditions. Even the 20/40 standard, then, is not stringent enough to allow adequate stopping time.

Let's go one step further. We know there are drivers on our highways with 20/50 vision. The person with 20/50 vision needs 90 feet before he can see what is on the sign. The implications are obvious. This driver is a potential murderer on our highways.

VISION CAN BE CORRECTED

Fortunately, this serious problem of visual acuity may be remedied. Most vision can be brought to normal or near normal by modern visual science. In a recent clinical study, Dr. Henry Hofstetter of the Indiana University Division of Optometry showed that 90 per cent of the population can have 20/20 vision by wearing proper prescription.

We do not wish to take the license away from any driver because of inadequate vision. One important result of vision testing and vision care is to make drivers more conscious of their visual capacities. We should warn people who do not have adequate vision, adequate depth perception, adequate side vision, or adequate reaction time so they can compensate with proper prescription and education. The driver who knows he lacks adequate depth perception can compensate by being especially cautious in situations where good distance judgment is needed. He can look to the side more frequently if he knows that he does not have good peripheral vision. If glare bothers him, he may reduce speed and/or his amount of night driving.

We are not the only ones bothered by accident rates. The public is tired of homicide on the highway. A recent Gallup poll reveals that 80 per cent of those questioned favored stricter licensing examinations on vision, general health, and driving ability.

The screening of vision is one of the few things that we can measure in determining an individual's ability to drive an automobile. Therefore, we should do the best job possible in screening that vision. We can also help see that these laws requiring a uniform type of vision screening are brought to our state legislatures and passed.

NEED SUPPORT OF VISION LAWS

There will be those who will haggle over who shall receive an unrestricted license, thus making it difficult for any action to be taken. We believe in taking small steps before large ones. In other words, we wish to secure public support for the minimum of 20/40 vision rather than have the legislatures oppose a requirement of 20/20 and leave us with no uniform rulings. In our heart we believe persons should have 20/20 vision to drive safely, but a nation-wide minimum of 20/40 is the necessary first step.

The best way to assure at least minimum acuity requirement might be to require a certificate of visual ability. This certificate would be made out by the vision specialist prior to the issuance or renewal of a driver's license. This method of certification must be the outcome of a long-range program. But, we cannot start too early in our crusade for more adequate driver vision. Many patrol chiefs and chiefs of police feel that certification is the answer.

Also, many legislators feel this is the answer since it is so expensive for the state to educate driving examiners and conduct

vision screening examinations. Some day we may be required to have a certificate of physical ability and a certificate of visual ability before we are issued a driver's license. Until that time, however, we must continue with programs to screen the individual driver and make sure he has adequate vision to safely operate a motor vehicle. Remember that visual alertness corresponds to mental alertness and that alertness saves lives.

Individuals, communities and organizations seeking an action program on traffic safety may direct their activities toward these driving goals:

1. Periodic re-examination of the vision of all drivers. Millions of drivers have had their licenses repeatedly renewed since the days when no eye tests were required for licensing; more millions who had an original test have never been tested again.

2. Thorough vision examination for accident repeaters.

3. More extensive use of licensed vision specialists as consultants to licensing examiners, traffic courts and other government agencies dealing with highway safety.

4. Adoption of minimum standards for the tests relating directly to vision problems of driving, such as, glare, vision in dim light, visual acuity, peripheral vision, color vision, diplopia, distance judgment, fixation changes and tachistoscopic vision.

5. Dissemination of more information on the fact that drivers lack necessary visual skills without knowing it; and that almost all shortcomings can be corrected with proper vision care.

Voluntary screening, voluntary correction and voluntary caution can bring immediate results.

ROAD DESIGN AND ITS RELATION TO TRAFFIC ACCIDENTS

by CHARLES W. PRISK

director, Highway Safety Study, U. S. Dept. of Commerce, Bureau of Public Roads, Washington, D. C.

The assignment I have in this discussion of what's new in safety research suggests that a review of the proved benefits of certain street and highway design practices would be in order. All of you are acquainted either professionally, or at least as a driver and pedestrian, with the features that distinguish modern highway design. I shall not confine myself to a safety résumé of the latest refinements in highway design. I am convinced that highway improvements of themselves can be powerful weapons in the fight against traffic accidents.

Therefore, I shall suggest a few ways in which the design of still safer highways may be achieved, and show how fresh ideas can modify some of our past and present impressions concerning the responsibility of the highway as an accident-producer. In short, I shall attempt to justify highway design improvement in a general sense as a step toward accident prevention.

The engineer usually works with concrete facts and figures. This preoccupation with measurable quantities undoubtedly accounts for some of the engineer's difficulty in highway safety. The total dimensions of the traffic accident problem are measured by more than one unit. Deaths and dollars are two measurements we use.

How do you logically add units of grief-stricken tragedy to the dollar units we attach to property damage, insurance, medical expenses and the like? It isn't readily done, and I would say that the failure to have a good understandable yardstick for the total distress that arises from traffic accidents has retarded the improvement of highway design from the safety standpoint.

Initially the highway designer gave almost complete attention to structural requirements. Then, gradually the demands of traffic service began to make themselves felt. Traffic services, measured in such terms as travel habits, volume, speed, and traffic capacity, now have a major impact on highway design. And as better knowledge of the needs of the man-machine-roadway relationship becomes available, safety seems sure to get greater consideration than ever before in future highway designs.

The growing emphasis on inherently safe highways was given strong impetus by passage of the historic 1956 Federal-Aid Highway Act. We can say strong impetus for several reasons. First, and without any material change in the Federal-State highway partnership that has been successful for more than 40 years, a substantial increase in federal funds was authorized—more, in fact, in the first four years than in the preceding 40 years.

The enlarged highway building program, now well under way, will continue the regular primary, secondary and urban federal-aid work at an accelerated pace. In addition, the program will be highlighted by construction of the 41,000-mile interstate system. Safer design, tailored to the needs of traffic on this new mileage, will be a continuing asset to our increasingly mobile civilization. It has been estimated that completion of the interstate system alone will bring about a saving of at least 3,500 lives annually.

HIGHWAY SAFETY STUDY

In providing for the massive program of highway construction, Congress also took specific recognition of the traffic accident threat as a factor in the nation's welfare. Section 117 of the 1956 Federal-Aid Highway Act calls for a broad investigation and study of highway safety. The Bureau of Public Roads now has this Highway Safety Study well started.

The important objective, briefly stated, is to determine what federal action can be taken to improve highway safety. Its scope extends through all branches of the traffic safety field, involving many disciplines in addition to highway and traffic engineering. The fact that Congress has authorized this comprehensive study is unmistakable evidence of concern on a national scale for the future of highway safety.

Questions bearing on traffic safety research are involved, of course, as well as the critical issue of whether the federal government should now take up new responsibilities in highway safety, and if so, what, where, and how. Similarly, there is the question of possible need for federal legislation of a regulatory nature. In working toward these ends, we believe that research has unique value in the design of accident prevention strategy and we are giving it chief emphasis in our study program.

RESEARCH FOR SAFE HIGHWAYS

Occasionally you find those who think you can buy research much as other services are purchased. Engineering can be bought, but the enlightenment that research brings is not always as easily acquired. Dr. Hafstad, General Motors' research head, recently defined research as "—the effort of the mind to comprehend relationships which no one has previously known." Adequate financing is essential to progress in safety research, but we must remember that special human capabilities, qualifications, and interests are at the real core of any research accomplishment.

The Bureau of Public Roads has been conducting fundamental researches in vehicle performance and driver behavior for the past 20 years. In most of these studies, we have enjoyed the cooperation and collaboration of state highway departments, Highway Research Board committees, city traffic engineers, universities, or other research personnel. The results have been of vast importance, first to the understanding of highway design, and subsequently to its improvement.

For example, the width of a traffic lane was standardized at a minimum of 12 feet when the findings showed that on nine, ten, and 11 foot lanes drivers of vehicles moving in opposite directions veered toward the edge of pavement as they met. This was especially true when commercial vehicles were involved.

The few drivers that did not veer away from the center of the roadway had an abnormally small lateral clearance between the side of their vehicle and the vehicle moving in the opposite direction.

This knowledge had direct application to design. At the same time it represents a safety development, since by increasing the lateral distance between meeting vehicles the possibility of head-on sideswipes or collisions is reduced, and by avoiding the veering action toward the edge of pavement, the chances of running off the roadway are also lessened.

OTHER SAFETY PROBLEMS

In the studies of passing practices, speeds, headways, lateral positions of vehicles on bridges, opposite piers and abutments, in tunnels and under many varying conditions of traffic, other principles of operation applicable to design have also been developed. Actually, the detailed studies of traffic behavior are observations of the potential accident situation before it happens. As such, they contribute in many ways to safer road design.

During the last two years, new traffic study equipment has been designed and built at the Bureau especially for research on expressway traffic operation. This latest equipment automatically records on a tape suitable for use with electronic computers the speed, lateral position, and time of passage to the nearest thousandth of an hour of each vehicle moving by the study site. By simple operation of a manual key, the equipment operator can classify vehicles according to type, car occupancy, sex of driver, state of registration, or any other obvious characteristic for which data are required.

With such information, the potential hazard of many roadway design and operating practices can be examined on a scientific basis without waiting for a statistically adequate sample of accidents to accumulate. The highways being built today incorporate many design refinements that were originally conceived as a result of these studies of operating experience.

BENEFITS OF ACCESS CONTROL

One aspect of modern highway design, which is perhaps the outstanding feature of the interstate system now under construction is that of access control. By this term, we mean the limitation or denial of the rights of owners or occupants of abutting property to have direct access to the highway. With the cooperation of more than half the state highway departments, the Bureau of Public Roads has explored the safety benefits of this design refinement.

In most cases, comparative data were obtained for pairs of routes serving the same general area, one a highway with full or partial control of access, and one without control—in other words, a conventional route.

We find that highways with full control of access, usually referred to as freeways, are roughly two and one-half times safer in terms of accidents, injuries, and fatalities than the usual major highway with roadside driveways, commercial establishments, intersections at grade, undivided roadways, and other built-in hazards.

The safety advantage of the freeway is outstanding in the prevention of rural traffic deaths. Contrasted with the nationwide rural highway rate of 8.7 deaths per 100 million vehicle-miles of travel, the average rate for rural freeways included in the Bureau survey is only 3.4.

This 3.4 is a pretty important figure for at least two reasons. First, it's only 39 per cent of last year's countrywide rural rate. And did you ever think how far a 100 million miles is? The Russian "Sputnik" circling the globe every 96 minutes at the fantastic speed of 18,000 mph will have to stay up there close to eight months and make almost 4,000 trips around the world to accumulate 100 million miles.

This vast amount of travel is producing about three deaths per 100 million vehicle-miles of travel on our modern rural freeways, perhaps not a record to gloat over, but one of no little consequence as compared with the much more serious situation on highways of obsolete design.

The other reason that makes the low rate on rural freeways worth mentioning is the fact that three-fourths of all our deaths in traffic occur outside of urban areas. As far as accidents and injuries are concerned, the freeway rates are better too, but its greatest margin over conventional routes is in urban and suburban areas. Since these areas, rather than the rural highway, are the scene of most of our accidents, freeway design is proving to have a double-barreled advantage.

Safety research has documented the merits of many other features of modern highway design. Halfway design measures are not satisfactory. The payoff in safety comes only when the design is uniformly adequate throughout. Special attention is being given these days to median design and width. Recent studies have indicated that there is no real substitute for width, and accidents involving the median appear to decrease rapidly with increased width up to about 40 feet, after which the improvements are smaller.

Wide medians also protect motorists at least partially from the discomfort and hazard of headlight glare. At the roadside as well as in the median, it is desirable that motorists have some reasonable recovery area within which they may regain control of their car in the event they run off or are forced off the roadway. Eventually this may involve more deliberate provision of suitably sloped and graded "landing areas," as at the bottom of roadway embankments, for example.

NEED SERVICE STATIONS

Only limited study has been devoted to the critical problem of servicing the motorist and his vehicle on controlled access highways. The indications are, however, that the average motorist wants and needs to have gasoline and related services, food, and lodging conveniently at hand even though he may not use all these facilities during any given trip.

For example, a composite compilation for more than 500 miles of eastern toll roads showed that about one-fourth of the gasoline consumed on these toll roads was actually purchased at the toll road service stations. Disabled vehicles and sleepy drivers may seem harmless but the record shows they loom large among the accident producers.

On the New Jersey Turnpike where an excellent safety record has been achieved, these two factors—disabled vehicles and sleepy drivers—appear to have been involved in nearly one-third of the fatalities that occurred during the past few years. Road design and control to relieve the frequency of these and the serious chain-reaction expressway accidents are today's big challenges.

Much other research is needed to provide the driver with improved information on the roadway and traffic conditions for his safety, comfort and convenience. The magic of electronics is likely to have a part in the solution. Recent tests in Nebraska, where a "Merging Traffic" sign is automatically illuminated as two vehicles approach on a near-collision course, one on the entering ramp and one on the expressway, are only a start on what may be accomplished in this general field of improved communication from driver to driver and from roadway to driver.

HUMAN FACTORS

We have often heard it said that most traffic accidents can be attributed to human failure. I am not so sure but that we might say all. However, in most accidents, the circumstances are not as straight-forward and simple as many think. Take the case, for instance, of a driver in a vehicle with poor brakes who has a right-angle collision with a careless driver at an intersection where the corner sight distance was limited. Where is the fault? Would it be the faulty vehicle brakes, the careless driver of the other vehicle, or the highway sight distance restriction?

It is likely that one or the other of the drivers would be charged with a violation, and it would end up in the records as another human failure. Now, let's look at that accident again. The circumstances described suggest that if the brakes of the first vehicle had been in proper working order, or if the careless driver in the second vehicle had exercised caution, or if the corner sight distance restriction had not been present, the accident could have been avoided.

If these are all factors, and the removal of any one would have prevented the accident, then they are all equally to blame. In that case, one-third of the responsibility should be assigned to each element, the brakes of the first vehicle, the driver of the second vehicle, and the sight obstruction at the intersection.

This crude example illustrates two observations: first, that more meaningful research into all the factors involved in traffic accidents is long overdue, and that only by this process can we aim our accident prevention efforts at the real targets. The second observation is that there are almost as many specialized areas of knowledge legiti-

mately bearing on traffic safety as there are specialists. Road design is an important one but it is only one.

We will do ourselves, and the vital cause for which we work, a high service by creating more opportunities for interdisciplinary discussion and evaluation of the many approaches we follow in the hope of greater highway safety. The unity of all our knowledge is little enough to throw against the grim statistics that are the Nation's highway accident problem.▲

THIS QUESTION OF SPEED

by LINDA SHULER
Linda Shuler Productions, Dallas, Texas

We shall consider the public in general and the feminine half in particular in regard to this matter of traffic safety, especially speed. Why do we speed? What can be done about it? And how can we get it done?

There are a number of reasons why we speed, but it all boils down to attitude and ignorance. We speed because we think it's all right to speed, so long as we don't get caught. There is no social stigma against it. In fact, it's considered a bit dashing. Both men and women are ignorant of the tremendous risk involved. They do not understand the chances they are taking.

Not enough is being done to *explain* to the public exactly *why* speeding is dangerous. You assume any person who knows enough to read or who can understand a picture should have sense enough to know speed is dangerous.

So it isn't a matter of intelligence. It's a matter of convincing *information*. Until a person knows exactly why it is dangerous and understands the laws of physics involved, you aren't reaching him.

EXPERIENCE SHOULDN'T TEACH

Of course there is always a stupid minority who can be persuaded only by force, or who can learn only by tragic experience. But people *can* be convinced by public education and propaganda that speed *is* dangerous for *them*. However, the recognition for the necessity of such education must come first.

A person knows fire is hot because he can feel its heat before getting burned. But he can't know the danger of speed by experience unless something happens that illustrates it—and that's what we are trying to avoid. We must substitute convincing information for experience. And such information is not forthcoming in degree and quantity to do the job.

I feel propaganda and information is most important because that happens to be my field. Others believe law enforcement is most important, and still others feel engineering is most important.

However, no field stands alone; each is dependent on the other for good results.

What can all these various fields do in regard to reduction of speeding? And the big question, how may these proposals be carried out?

Regardless of what the proposals may be, regardless of their value or necessity, their ultimate success rests with the public. The public must understand and cooperate; the public must authorize by vote; the public must pay with taxes. And half of this public is women.

For years you've heard that we do not use women as we should in the traffic safety field. There are women directors of women's activities, and the work they and their organizations do is necessary and valuable. But it's just a drop in the bucket to what is needed.

What we need is *active*, enthusiastic, intelligent support from the women. But that cannot be obtained unless men wish it to be so. For we are not deceived—this is still a man's world. Women like to be advised by a man, like a man to help them accomplish an objective or solve a problem. Many women prefer to be led and guided by a man.

These women will work hard for men if men do two things—sell them on the necessity and importance of their job and help them do it, with plenty of encouragement and a little recognition when deserved.

In considering the problem of traffic safety and speed, how can women help you? They have the time, the cars, the influence and the natural inclination for humanitarian projects. They have a husband and children whom they look for every day to come home safely. Get a woman stirred up about something endangering her children and you have fury. The subject of traffic safety and speed especially in areas with children, is a natural for appealing to women.

There are many good men in the traffic safety field. Intelligent, dedicated, patient—wonderful to work with. And what are they doing? Working with men, of course. Women must follow along as best they can, or be ignored altogether. A woman wants male leadership, but she also needs male recognition.

For example, in the Dallas Citizen's Traffic Commission no woman may serve on the executive committee or be chairman of any committee, no matter how well qualified.

The women resent this. As a result, the women of Dallas are not doing as much as they could for traffic safety. Perhaps the traffic commission feels it is struggling along quite well without them, since the commission is accomplishing some fine things. But no matter what they want, they can get it better and faster if the women of the city want it too.▲

THE ENGINEER'S VIEWPOINT

by DONALD S. BERRY
professor of civil engineering, Technological Institute, Northwestern University, Evanston, Ill.

Before discussing why people drive fast, we first must agree on what we mean by "fast." If "fast" is defined as speeds of 70 mph. or more on open rural highways, then I offer the following possible reasons:

- In my opinion, most people who drive on rural highways are driving with the primary purpose in mind of getting to their destination and getting there without wasting time. Drivers are in a hurry. With increasing traffic they lose time and few like being delayed. They are willing to pay to drive on roads where they can save time—an example is the success of the toll road.
- Highways are better. With the expanded construction program, we are getting longer sections of highways designed for 70 mph. It's now almost possible to go from Chicago to New York with no stop for traffic signals. There are also fewer roadside obstructions to let driver know how fast he is driving; fewer poles alongside the edge of the pavement.
- Vehicles are quieter and more powerful —Twenty years ago, our speed was generally limited in part by vehicle vibration and noise—shimmying at 60—vibration at 65. Not so now—we can drive 80 without any telltale vibrations from modern cars.
- With better cars and better roads, there is more and more of a tendency to forget about speed. On a turnpike, for example, a driver will plan to drive at 65 mph. In time, his speed may creep up to 75 or 85 mph. without his realizing it. The monotony of some of our new roads may be a hazard.

What can we do about this problem? From the standpoint of engineering, we can do several things:

1. Design highways with no unexpected hazards, and at the same time, avoid monotony. This may mean for expressways, the use of designs which vary the width of the median, and which avoid long, monotonous, straight sections.

2. Provide realistic zoned speed limits, adequately marked, for existing highways.
3. Encourage use of devices in automobiles which will give drivers indications of their travel speed. Some models now have as optional equipment, lights or buzzers which operate when a pre-set speed is exceeded. In 1958, some models will have devices which can vary the spring tension under the accelerator pedal.

If the device is set for 65 mph., the driver can travel faster than the set speed, but the extra pressure is tiring on foot muscles to keep the car at a speed above the pre-set value.

Such a device would be helpful in my own case. My wife is normally a careful driver, and usually drives at speeds slower than the average on most streets and highways. On long-distance trips on toll roads, however, she sometimes is astounded when I tell her she is going 80 mph. A spring tension device would be ideal as a reminder—not only for her, but for me also.▲

IOWA DRIVER IMPROVEMENT SCHOOLS COURSE OF STUDY

by BERT L. WOODCOCK

director, Safety Education, Iowa State Teachers College, Cedar Falls, Iowa

SCHOOLS IN OPERATION IN IOWA SINCE JULY 15th 1956: Waterloo, Mason City, Dubuque, Marshalltown, Sioux City, Des Moines, Ottumwa, Council Bluffs and Davenport.

SCHOOLS TO BE DEVELOPED: Fort Dodge, Creston, Cedar Rapids or Iowa City, Decorah, Spencer, Carroll or Denison and Burlington.

PURPOSE OF SCHOOL

Approximately 43,000 drivers licenses are reviewed in Iowa each year. This search of the records discovers hundreds of drivers with bad records of accidents and/or convictions of traffic law violations.

In many cases, however, no single accident or violation may have been of a nature to cause a court to recommend that the state safety department suspend the driver's license.

The accumulation of a lengthy record of accidents and/or violations indicates, however, that the driver may be accident prone or an accident or violation repeater. The present traffic death and accident record makes it imperative that an attempt be made to help this driver and to protect other drivers with whom he may come in contact. This is the purpose of the Iowa Driver Improvement Schools.

Selection is the work of the Iowa Department of Public Safety through its divisions of driver licensing, highway patrol and safety education.

The driver whose license carries numerous accidents and/or violations is asked to appear before a representative of the highway patrol for a hearing. In some cases, this action may be enough to cause the driver to change his pattern of driving. In other cases, more work is necessary.

Each driver who appears for a hearing is given a voluntary choice: he may have his license suspended or he may attend a driver improvement school and be placed under license probation for one year.

Those who chose to attend a school are notified to appear at a certain time and place. Those who do not agree are placed on 30 days suspension. Those who agree to attend school but who fail to appear or to complete the course also are immediately suspended.

It is the intention of the department to place these drivers in a situation that, as nearly as possible, resembles a school situation. It is understood that the drivers who are mentally deranged, criminally inclined, or physically handicapped will not attend. The schools will consist of drivers who, through misjudgment or misdirection, have either been involved in accidents or who have been convicted of traffic law violations. The recommended size of classes is 20 to 30 students.

The school consists of three sessions, each at least two and one half hours in length and all held within a period of one week. The sessions should be divided so that the lecture, film and testing on the psycho-physical equipment be divided properly. Monday, Wednesday and Friday nights are suggested; however, there is nothing wrong with three nights in a row. The following course of study will clearly indicate the time equal for all parts of the school program.

PLAN OF THE SCHOOLS

It is intended that all schools will be approximately the same throughout the state, a set pattern for the course of study and time element seem very important. However, it is presumed that certain instructors may deviate from the lectures as necessary, and will be duty bound to insert some of their original thinking into the lectures.

Basically the lecture should be approximately one and one half hours in duration, with a 10 minute break. The film should run about 30 minutes, and the rest of the time should be devoted to testing on the Psycho-Physical testing equipment.

Films: "DAY IN COURT" is recommended for the first session. "LOOK WHO'S DRIVING" should be shown at the second meeting, and "INCREDIBLE JOURNEY" should be shown at the last meeting of the class. ("INCREDIBLE JOURNEY," $75.00, Wilding Picture Productions, Chicago, Ill.; "LOOK WHO'S DRIVING," $50.00, Public Education Dept., Aetna Casualty & Surety co., Hartford, Conn.; "DAY IN COURT" $65.00 Black & White, $210.00 Color, Consumer's Relations, International Harvester company, Chicago, Ill.

Keystone tele-binocular (with test cards) —$278.+

Psycho-Physical Testing Device: distance judgment, reaction time, peripheral vision, and general vision testing equipment should be used. The Porto-Clinic, or the AAA testing equipment will fulfill the requirement. The results of the use of this equipment may at some future time reveal many deviations from the norm, thus care should be taken in administering the tests.

Detonator (If Available)

CLASS CARDS

The instructor is requested to make notations on the student's card that will reveal his measurements. The attitude marking is purely subjective, but the Psycho-Physical marking will be an actual grade of the subject.

Attendance may also be kept on the subject's card.

The course of instruction should be carefully laid out by the local instructor. Included in this manual will be outlines of three lectures that seem to fit the program best. The instructor in charge of the program should make all necessary arrangements and double check them before each session to insure interesting and informative periods. The object and intent of the school should be explained at the start of each course, and restated at the beginning of each session. The fact that the school is not intended as any form of punishment must be impressed upon all or their attitudes toward traffic laws or toward enforcement agencies will not change.

COURSE OF INSTRUCTION

It is necessary that men trained not only in teaching but in the driver education area do the instructing. This we feel is most important as many questions arise that cannot be answered by the average lay teacher. The instructor should plan the sessions to include as much student participation in the course as possible. It must be remembered that students learn in various ways, so different methods of learning should be provided. These include learning through listening, seeing, reading; testing and participation.

At the beginning of the first session some time must be taken, perhaps 20 minutes, to acquaint the violators as to the purpose of the school, its history, and the general procedure that will be followed. At this time it is well to inform them that they are expected to attend all three sessions and that

if they do not their names will of necessity be sent to the Department of Public Safety.

The students should be informed that the instructor is a driver education teacher, has no connection with the law as an enforcement individual, and that the conduct of the class will be such that at any time if anyone has a question concerning any phase of the school or the lectures, they may feel free to raise the question. It's important they know that the instructor will of necessity have to control the discussion for the greatest benefit of the entire group.

LECTURES

Following are rather complete outlines of the lectures. It is not supposed that these outlines will take the place of the actual lectures, but serve as a guide, and also as a means of keeping all schools uniform as to subject matter. All instructors are to be sent to Iowa State Teachers College before the start of the schools, where they will hear each lecture just as it is recommended that they be given. If rather copious notes are taken and the outline followed, the driver education teacher should be well prepared to meet his classes.

FIRST SESSION

Orientation: This normally will take about 20 minutes.

On form "A" have each student place the required information. (This is an indication to the student that you haven't all the records, which is good psychology. Also, there may be some changes from the original—such as change in occupation, education, etc. This is an excellent way to check the role and each one is always sure to get a slip and fill it out because they desire credit for their attendance.

Lecture: Psychology of Safe Driving.

I. Careful analysis of driving characteristics, accidents and human qualities leads us inescapably to the conclusion that the bulk of the psychological problem lies in the emotional and broader personality side of the individual. Unfortunately this is the most difficult of all to investigate and understand.
   A. Wrapped up here are all the personal motives, the individual conflicts, frustrations, reactions, wishes and desires. When considered in the light of the constant change the human being is undergoing we see why it is difficult to predict driving performance.
      1. What reaction does the teenager have after his girl "throws him over" and he drives away in a torment?
      2. How about the reactions of the youth being inducted, with the many fears, feelings of hopelessness, etc.?
      3. How about the impatient, the careless, the thoughtless?
      4. Why does the personality change so greatly when some individuals get behind the wheel?
   B. Driving is a special form of behavior and carries with it a tremendous egotistic weight. Apparently some of the self-satisfactions are as follows:
      1. Mastery over inanimate objects (using the automobile as an extension of oneself).
      2. Mastery over other people (making pedestrians and other motorists conform to one's wishes).
      3. Imitation (identification) response; copied from parents, or other admired persons.
      4. Thrill responses (using autos for roller-coaster type of thrills).

II. Other aspects of driving include: illusions, drugs and fatigue and boredom.

III. The driver's "sensory" and muscle response features.
   A. Vision, the most important single physical factor including: acuity, distance judgment, color perception, dominance, glare resistance, field of vision and moving eye has blind spots.
   B. Reaction time—simple, complex, anticipation and interpretation, methods of measurement.
   C. Hearing.
   D. Steadiness and extreme nervousness.
   E. It would be so easy if the answer to highway safety or even the major portion of the answer was found here. We could test and eliminate and permit only those physically fit to drive, to be licensed.
      1. Actually many of these defects can be compensated for quite adequately. Outside mirrors for hard of hearing individuals and one eyed persons; turning the head to compensate for narrow peripheral vision; placement of lights on traffic heads for those who have color deficiency.
      2. Reaction time may be dangerous if it is either too slow or too fast. The knowledge of the result of either is the important thing.

IV. Film showing "A DAY IN COURT."
   A. *Film is approximately 30 minutes in length.*
   B. Film points out many types of attitudes among drivers and leaves the audience with mixed emotions.

V. Use of testing devices.
   A. Every student should be tested on the reaction timer, the peripheral devices, the distance judgment device, and have their vision checked on the tele-binocular.
   B. This may take two nights since it takes about 15 minutes for each student.
   C. A careful analysis of each one's record is most important.

SECOND SESSION

Use an attendance form for each one to fill out just his name and date.

Lecture: Man Made Laws and Nature's Laws.

I. Discussion on how violations contribute to automobile accidents.
   A. 94 per cent of all fatal accidents show a violation of a traffic law by someone.
   B. Relation of improper speed to accidents.
      1. Excessive speed.
      2. Speed in excess of weather and road conditions.
      3. Car under control.
         a. What it actually means.
         b. When is a car out of control?

II. Failure to yield right of way—at stop signs, traffic lights, crossroads and uncontrolled intersections.

III. Passing on hills and curves.
   A. Dangers of so doing.
   B. Distance one must be in his own lane before meeting another vehicle.
   C. Discourtesy of straddling lanes.
   D. Not passing at all places where the law indicates there shall be no passing.

IV. Driving while intoxicated.
   A. Amount of alcohol that affects one's sensory controls.
   B. Effects of alcohol on the driver.
   C. Effects of drugs and other stimulants as well as alcohol.
   D. Potentials of driving while intoxicated.

V. Courtesy, co-operation, consideration for the other driver.

VI. Obedience to laws for the sake of the law's true meaning.
   A. Definite physical reasons for obeying all laws.
      1. The reasons for obeying some of the man made laws may be just as important as those reasons for obeying nature's laws.
   B. Why drivers violate traffic laws.
      1. Egotistical behavior.
      2. Laws are made for everyone else.
      3. Superior attitude of some drivers.
      4. Honest lack of knowledge on the part of some.
      5. Habit formation—definite contributor to accidents.
         a. Learning to drive from dad or other relatives who have always violated the traffic laws.

VII. Nature's Laws.
   A. Centrifugal force.
      1. Skidding accidents.
      2. How to prevent skidding accidents.
   B. Force of gravity and momentum going down hill.
      1. Law requires driver to slow as he goes over a hill and always on a down grade.
   C. Force of impact.
      1. Tendancy of all loose objects in the car to continue when car stops suddenly.
      2. Force of impact varies as the ratio of the square of speed increases.
      3. Kinetic energy (stored up energy in motion).
   D. Ability of brakes to stop a vehicle.
      1. Difference at high speeds.

2. Fading of brakes.
3. Varying quality of braking on different types of road surfaces.

E. Friction and (coefficient of friction).
F. Reasons for many skidding accidents other than centrifugal force.
G. Methods of compensating for problems that seem to be unavoidable.
H. Self-enforcement of rules of the road.
J. Review the Psycho-physical lecture enough to compare the logic of speed control and braking etc., to Nature and Man Made Laws.

VIII. Film showing "LOOK WHO'S DRIVING."
A. Film is approximately 13 and one half minutes long.
B. Film points out the falacy of allowing one's childish impulses to get away from him. Also in the end the failure to stop results in an accident, and ties in with the topic of the lecture.

IX. Use of testing devices.
A. Test the remainder of the students or at least as many as can be taken care of. Care should be taken that each person knows exactly what he has been tested for, and the results. Warnings should be given if the person's score is not above the danger point.

THIRD SESSION

Lecture: Defensive Driving.

I. The part each driver must play while behind the wheel of his vehicle.
A. Definition of defensive driving. (thinking and planning ahead).
1. Drive on the theory that all drivers are careless.
2. Realizing that as a driver you actually are driving six vehicles—your own, the one behind, the one in front, one from the right, one from the left, and the one you don't or can't see.

II. Most important factors of defensive driving are attitudes and control.
A. Control (what is it—what it means to safe driving).
1. Driver.
2. Car.
3. Traffic conditions.
4. Weather condition.
5. Surface and width of roads.
6. Reasonable speeds.
7. Ability to stop within the assured distance ahead.

III. Actions that cause most traffic accidents and deaths.
A. Excessive speeds.
1. Above legal speed limits.
2. Too fast for conditions.
3. Too fast for the driver.
B. Failure to yield.
1. High percentage of stop sign violations, most of which occur in area nearest home.
2. Yielding to trains.
C. Pedestrian violations.

IV. Last clear chance to avoid an accident. (define)
A. Pulling away from the curb.
B. Intersections (guarded and unguarded)
C. Respect for signals, flashing and actuated.
D. Slowing at all intersections.
E. Turning at intersections.
F. Meaning of shape of signs.

V. Some symbols of safety.
A. The three E's of safety.
1. Education.
2. Engineering.
3. Enforcement.
B. The three C's of safety.
1. Concentration.
2. Courtesy.
3. Control.
C. Anticipation — Perception — Interpretation—Manipulation.
D. Drive for the other driver.
E. Good Driving (IS) DEFENSIVE DRIVING.

VI. The "mental" side of driving.
A. Does it take brains to drive?
1. To some degree, yes. The I.Q. factor is quite argumentative.
2. Driver should have sufficient intelligence to:
a. Look ahead and anticipate consequences of his actions.
b. Profit from past experiences.
c. Retain knowledge of the road.
d. Have mental ability to apply the rules of the road.
e. Have sufficient earning power to maintain vehicle in safe condition.

VII. It must be remembered that ultimately the degree to which our highways are safe or hazardous depends upon drivers at the wheels of their vehicles.
A. Roads alone cannot cause accidents.
1. Wide roads in themselves are no safer than narrow roads.
2. Value of divided highways.
B. High Powered Vehicles.
1. Safety features of an automobile.
2. The proper use of the horse power.
3. The fallacy that safety features can keep you out of accidents must be dispelled.
4. No vehicle is safe because it has has seat belts, dashes and other paddings.
5. A vehicle is only as safe as the driver.

VIII. Film showing "INCREDIBLE JOURNEY."
A. Film is approximately 30 minutes long.
B. Film points out how a driver may be very careful and drive as nearly perfect as he knows how, but if he doesn't allow for the other fellow's mistakes he will still become involved in an accident that may cost lives. An excellent film to end the sessions on.

IX. Testing Devices.

If there are any more, this would be the last time, of course, that they could be tested. Be sure and test everyone.▲

PROMOTIONAL IDEA EXCHANGE

(Panel Discussion)

RICHARD O. BENNETT—PANEL CHAIRMAN

director, automotive div., accident & fire prevention dept., National Assn. of Automobile Mutual Insurance Cos., Chicago

Panel: Dorothy E. Wills, Better Traffic Committee, Pittsburgh, Pa.; Mrs. Robert (Linda) Shuler, Linda Shuler Productions, Dallas, Tex.; Jerry Marx, Oklahoma Dept. of Public Safety, Oklahoma City, Okla.; Dan Hollingsworth, Oklahoma City Safety Council, Oklahoma City, Okla.; Ty Cobb, Dept. of Public Safety, Oklahoma City, Okla.

Dorothy Wills discussed the Annual Mayor's Highway Conference in Pittsburgh. This has been a continuing project since 1946. The one-day conference has become a springboard for most traffic safety activities in Pittsburgh.

Various agencies, public support groups, business firms and media are given specific jobs throughout the year. They report back to the next year's conference and are given another specific assignment.

From the conference have come a weekly audience-participation radio show, a puppet show for children, and a number of other continuing traffic safety programs.

R. B. King, safety officer, Virginia State Police, described a television program in which a hospital emergency room was set up as a background while a state trooper spoke to the audience. He also told about a sticker for bathroom mirrors which was distributed to hotels, motels, restaurants and private homes throughout the state. The sticker reads "Are You Looking at Virginia's Next Traffic Victim?"

THE BELL'S TOLL

An arrangement was also made with a Richmond (Va.) radio station to sound a bell tone for every traffic victim during the past 24 hour period on a morning news broadcast. This idea was picked up by many radio stations in the state.

Jerry Marx told about a Chaplain's Corps established by the Oklahoma Highway Pa-

trol. Once a year on the last Sunday before July 4, a "Safety Sunday" is held in the state. In cooperation with the Oklahoma City Ministerial Alliance, the Highway Patrol prepares a kit of sermons, talks, messages and other material which is distributed to clergymen and others who take part in "Safety Sunday." This effort is non-secretarian and highway patrol officers give sermons on traffic safety on this day.

Clayton Hess of the California Highway Patrol described the California program to combat drinking and driving. A special program each December is aimed at curbing the dangers resulting from Christmas office parties. A variety of material is prepared including posters, leaflets, and special attention-getters such as a reaction timer.

Warren Taylor, health and safety dept. manager for the U. S. Junior Chamber of Commerce, discussed a project conducted by a Jaycee chapter in which a newspaper offered a prize to any driver who could stop his car within 50 feet traveling at 35 m.p.h. The challenge was printed in the paper under a picture of burned tire marks on a pavement. Taylor reported that no one claimed the prize.

Thomas C. Hempfield of the Mansfield (Ohio) Police Department described a police-sponsored, city-financed "Safety Town" for pre-school children. Children are taught traffic safety both in classrooms and in a miniature "town" with streets, sidewalks, traffic signals and markings.

P. W. Graves, safety inspector for Continental Motors Corp., Muskegon, Mich., described his company's traffic safety program which includes bulletin board cards, carton cards, outdoor posters for parking lots, place mats in the company restaurant and full-page ads in the local newspapers.

Dan Hollingsworth, director of the Oklahoma City Safety Council, told of the publishing and distributing of a traffic code manual in Oklahoma City.

Linda Shuler described a television program called "Aftermath" which has aroused a great deal of interest in Dallas. The program takes an actual traffic case and dramatizes it using real people, real judges and police, rather than actors.

W. J. Sturm of Hardware Mutuals in Stevens Point, Wis., described a traffic safety project held in Stevens Point with the cooperation of the local taxi cab company. The cabs carry white flags with the Green Cross for Safety. If an accident occurs anywhere in the city, all the cabs carry a red flag for 48 hours. If a fatal accident occurs, the cabs fly a black flag for one week as a constant reminder to the community.

Mark Markson, Minnesota Highway Dept., told of a summer camp maintained by the American Legion for the training of school patrol guards. Both boys and girls can attend a one week course at the camp which is fully equipped with camping facilities.

OFFICERS OF THE

TRAFFIC SECTION

NATIONAL SAFETY COUNCIL 1957-58

General Chairman—MATTHEW C. SIELSKI, director, safety and traffic engineering dept., Chicago Motor Club, Chicago, Ill.

First Vice Chairman—BERNARD R. CALDWELL, commissioner, California Highway Patrol, Sacramento, Calif.

Second Vice Chairman—JOHN MURTAGH, chief justice, Magistrates Court, New York, N. Y.

Third Vice Chairman—JAMES M. SLAVIN, chief of police, Kalamazoo, Mich.

Annual Congress Program Committee Chairman—EDWARD R. KLAMM, manager, accident prevention dept., Allstate Insurance co., Skokie, Ill.

Membership Committee Chairman—DAVID M. BALDWIN, executive secretary, Institute of Traffic Engineers, Washington, D. C.

Members at Large: RAY ASHWORTH, director, Northwestern University Traffic Institute, Evanston, Ill.; RICHARD O. BENNETT, automotive division, Accident & Fire Prevention dept., National Association of Automotive Mutual Insurance companies, Chicago, Ill.; T. N. BOATE, manager, accident prevention dept., Association of Casualty & Surety companies, New York, N. Y.; PAUL E. BURKE, executive director, Maryland Traffic Safety Commission, Baltimore, Md.; HENRY W. CLEMENT, magistrate, Municipal Court, Plainfield, N. J.; NORMAN DAMON, vice president, Automotive Safety Foundation, Washington, D. C.; M. R. DARLINGTON, JR., managing director, Inter-Industry Highway Safety Committee, Washington, D. C.; RUVIAN D. HENDRICK, judge, City Court, Shreveport, La.; E. H. HOLMES, deputy commissioner, U. S. Bureau of Public Roads, Washington, D. C.; JOSEPH M. KAPLAN, secretary-manager, Greater Los Angeles chapter, National Safety Council, Los Angeles, Calif.; MASON LADD, dean, College of Law, State University of Iowa, Iowa City, Iowa; BURTON W. MARSH, director, traffic engineering and safety department, American Automobile Association, Washington, D. C.; RALPH A. MOYER, research professor, Institute of Transportation and Traffic Engineering, University of California, Berkeley, Calif.; HALLIE L. MYERS, executive director, Indiana Traffic Safety Foundation, Indianapolis, Ind.; TIMOTHY J. O'CONNER, Commissioner of Police, Chicago, Ill.; M. W. PLETCHER, Traffic Safety Association of Detroit, Detroit, Mich.; R. C. SALISBURY, director, safety division, Motor Vehicle Department, Madison, Wis.; EDWARD SCHEIDT, commissioner, Department of Motor Vehicles, Raleigh, N. C.; GORDON SHEEHE, director, Highway Traffic Safety Center, Michigan State University, East Lansing, Mich.; JOHN D. WATTS, Judge of Recorders Court, Detroit, Mich.

Police Division Representatives: BERNARD L. GARMIRE, chief, Police Department, Tucson, Ariz.; HAROLD W. SULLIVAN, deputy chief, Police Department, Los Angeles, Calif.

Traffic Court Representatives: J. J. QUILLIN, judge, Municipal Court, Portland, Ore.; MORRIS ROSENTHAL, judge, Municipal Court, St. Louis, Mo.

Past General Chairmen: J. E. P. DARRELL, director, Traffic and Planning, Minnesota Highway Department, St. Paul, Minn.; ROBERT E. RALEIGH, Citizens Traffic Safety Board of Metropolitan Chicago, Chicago, Ill.

Secretary—DANIEL G. REYNOLDS, director, Traffic Operations division, Traffic and Transportation department, National Safety Council, Chicago, Ill.

Other Volumes in this Series

Users of this volume will find much value in its companion volumes. Here is the list:

LEARNING TO LIVE . . .

Learning to live—safely—was the drawing card which brought more than 13,000 men and women from the United States and 27 other countries to Chicago for the 45th National Safety Congress. These people gathered to exchange the latest ideas in safe attitudes, safe methods and safe equipment. Through speeches, panel discussions and symposiums, they acquired new ideas for helping others—and themselves—to live, work, and play safely.

This was the reason the National Safety Council was organized less than half a century ago, a time when man's thoughts barely kept pace with the industrial revolution. Since then, man has introduced an atomic age which is bringing the continents closer and has made the earth a smaller world. And now man anticipates inter-space travel!

Through science and technology, man is progressing to increasing speeds in travel and production, and increasing dangers—new dangers never before encountered. These, in addition to the everyday hazards of life, occupied the thoughts of the safety people at the Congress.

To encourage more widespread knowledge of the various fields of safety, the National Safety Council publishes the Current Safety Topics—30 volumes of condensations of Congress speeches and exchanges of ideas. Each volume is a handy reference to different phases of accident prevention. The complete set of volumes are listed on the back page of each volume.

Since the proceedings have been edited and condensed for reference purposes, the complete original manuscripts with any charts or illustrations used, are available in the National Safety Council files. Views expressed at the Congress or in any volume of Current Safety Topics are those of the Congress participants, and not necessarily those of the National Safety Council.

THE TRANSIT SECTION

This volume is a record of the sessions held at the 1958 National Safety Congress by the Transit Section. The conduct of these Congress sessions each year is only one of the many cooperative activities which the Transit Section carries on in behalf of its members, and for the benefit of accident prevention work in the transit industry generally. The section gives guidance in the preparation of a great variety of technical and educational material useful in the day-to-day safety programs of transit companies.

The activities of the section are under the direction if its executive committee, the members of which are listed at the close of this volume.

IT ISN'T THE COACH, IT'S THE TEAM

by PAUL O. DITTMAR
president, South Suburban Safeway Lines, Inc., Harvey, Ill.

To tell safety-directors that they don't count for much, that it's the team that counts and not the coach, would make me unpopular, and they wouldn't believe it.

To say, it isn't the coach, it's the team, is to say it's not Casey Stengel, it's the Yankees; and no one can say that and be believed. And one couldn't be right and say, it wasn't Toscanini, it was the orchestra. Neither could you turn those statements around and say: it isn't the Yankees, it's Casey Stengel; or say, it wasn't the orchestra, it was Toscanini. To be right you have to say: it's Stengel *and* the team; or, it was Toscanini *and* the orchestra.

It's a very rare manager or coach that can produce a winner without a good team; and it's a very rare team that is a good team that hasn't a good manager. My point is, both must be good, or neither will be good.

So, I should change this title to read *It's the Coach and the Team.*

THE MEANING OF SAFETY

Safety means many things to different people. To a child, it means a lighted room. To some motorists, it means straddling the line between two lanes, or taking both halves in the middle, in order to have plenty of room on each side of the car. To other motorists it means driving at 15 mph on a 50 mph highway.

To a western cowboy it means a brace of six-shooters. To a woman safety might mean putting her head under the covers, getting under the bed, or locking all the doors of her car. To many people there is safety in numbers.

Exactly what should the word "safety" mean to us? In its application to us and our industry, it should mean eliminating hazards and avoiding danger.

Would your safety-coach and his team approve of the action of a city council in a certain city that was proud of its citizens, its prosperity, and its record of accomplishment for the good of all?

In this otherwise excellent city, accidents were happening frequently on a certain corner. After each accident an investigation was called for and action demanded. The actions had been the installation of traffic signals, painting and repainting traffic control lines, the erection of traffic signs and special illuminated warning signs. But, on a certain night, the family of a very prominent citizen was killed.

This time, the newspapers said action must be prompt and effective. Days went by. The newspapers increased their pressure on the mayor and the council, but no action came. Finally, in desperation, the mayor announced the council would meet in continuous session until it could come up with recommendations to make that dangerous corner safe.

After three days a decision was reached. The headlines read, "City Council Orders New Ambulance!"

To that city council, saving lives with an ambulance was more important than eliminating the hazard and avoiding the danger. However, it is certainly more effective to eliminate the hazard, beforehand, than it is to save the life, afterward.

The purpose of a safety team and its coach is definitely to save limb and life by the elimination of hazard and the avoidance of danger. And, since safety is everybody's business, it's *your* business no matter what your job and title may be.

SAFETY IS MANAGEMENT'S RESPONSIBILITY

What is your title? Is it president, or general manager? If so, you should be interested in safety. It should be a big and important part of your job, one of your top responsibilities!

A transit company with a poor *safety* record has a poor manager, executive vice president, or president, and, most likely, it operates with the profuse use of red ink!

You can't separate management effectiveness into good and bad. If the top man is good at marketing bonds, and loses money through a poor accident record, he is still a

poor manager. A good manager is good all the way around, including safety as one of his top responsibilities.

Any good manager will demonstrate by his personal actions that he is 100 per cent behind safety as a continuous, never ending program. His interest must be deep and real. He must demonstrate his genuine interest by his actions, his personal appearances, his knowledge of safety and accidents, and by expecting and demanding good accident prevention action on the part of all his management and administrative personnel.

The most honorable purpose in life is devoting one's self to saving people to live, move and enjoy life. If you are dedicated to this purpose you eliminate the doctor and the undertaker!

The doctor who saves a life is acclaimed, and he may rightfully be proud. The hero who saves a life is rewarded with a Carnegie Medal, and he may rightfully be proud. But you, you may save a dozen or a hundred lives—no one will ever know how many—but you will not be acclaimed or receive a Carnegie Medal.

COUNTING THE COST

There is much controversy in our industry over how much accidents cost. There is unanimous agreement they cost too much! The controversy is whether or not all the indirect charges are included in any set of figures. You want to see the picture of the company as a whole with the basic factors of costs of personnel, goods and services purchased, depreciation, accidents, and taxes.

I advocate knowing what departments and factors cost. Therefore, for companies large enough to departmentalize, they should know the dollar costs of accidents and claims, including both direct and indirect costs. This would be nothing more than letting the managers and coaches know the score!

The operations manager, the safety director, and the claims manager, along with the top brass, should each receive copies of a statement of costs of accidents, to show the dollar costs of all the relevant accident and claim factors, as follows:

Cost of Accidents—direct payments
Cost of Personnel
Cost of Goods and Services Purchased
Cost of Depreciation
Cost of Government
Total Cost of Accidents and Claims

Transit Pars is nothing more than a comparison of the actual operating score with the predetermined perfect operating score, or par. Ross Young said in his book, *Personnel Manual for Executives*, "It is well known that measurement of any activity improves that activity, particularly if there is a connection in people's mind between that measurement and actual or implied consequences. . . . The knowledge that production is measured improves production, and the knowledge that quality is measured improves quality."

MORE ON ACCIDENT COSTS

You must have figures to know the score or to measure your safety program's progress or regress.

After you get the costs of your department added to a total, you'll have to deduct about 50 per cent from the total because the costs of your department act as a credit to reduce the company's income tax. Can a credit be called a cost? A private enterprise company that is earning profits reduces its costs of accidents by about 50 per cent, but a company losing money or a municipally owned operation can't do it.

The development of costs should be according to the viewpoint and purpose. No *one* column of figures can serve all purposes or satisfy differing viewpoints.

Certainly, accidents cost money—and much more than you think! But why think of their cost in the terms of money? No person, really injured, is ever made whole by the payment of money; and the dead person is beyond all possibility of recompense! Think of your job as one to promote safety rather than one to reduce costs. You'll do the latter if you do the former!

THE REAL COSTS OF ACCIDENTS

You can't measure the total cost of accidents with numbers following a dollar sign. The first and most important cost of accidents must be in terms of life and limb, pain and suffering, scars and disfigurement, cripples and corpses! In those terms you have the real costs of accidents—the most important costs—the costs that should be *first* in the minds of all people dealing with the elimination of hazards and the avoidance of danger.

The safety-director-coach whose first thought is for the pain, suffering and sorrow caused by accidents is doing the best possible job in keeping dollar costs down. He will have a team that is eliminating hazards and avoiding dangers.

For the accident you do *not* have, there is *no* accident cost. In other words, "without the seed, you won't have the weed." The worst "weeds" in our transit industry grow from accident "seeds" in the "soil" of hazard and danger!

ACCIDENTS IN THE TRANSIT INDUSTRY

In the transit industry, the chief concern regarding accidents is with those involving vehicles and the public. Those are most important because they represent the most accident troubles.

Our safety team is comprised mostly of vehicle operators. With these people our safety-director-coach can accomplish most in the prevention of accidents and the reduction of their dreadful costs.

A number of people working together as a team are working cooperatively in an effective manner, to accomplish their objective. If their objective is to prevent accidents, we can call it a safety team.

To develop vehicle operators into an effective safety team, we must use good management methods. Management is the development of people, and the art of getting things done through people. If our objective is the prevention of accidents, we can accomplish that objective only through people cooperating.

GOOD TEAM—GOOD MANAGER

A good safety team will have a good manager—and to be good, he must use the true and tried, good management methods.

Call the man anything you like, but if he gets things done through people, he is a manager.

You may not be another Stengel, Rockne, or Toscanini, but you can save more lives, and save more people from injury than they did! You can become a good safety-manager, if you will use good management methods to develop a good safety team.

Gimmicks and gadgets are useful to attract attention and create interest—advertising methods—but they are not necessarily good management methods. Certainly, they do not represent the whole of good management methods.

Isn't it about time we put some down-to-earth, fundamental, basic thinking into this matter of safety, this serious business of saving limb and life?

Safety *is* a serious business—the *most* serious business? And we don't dignify it as a *serious* business with gimmicks and gadgets.

If safety is your job, make it your job. Think of it as the most important job in the world—it is! And, it's the most difficult job in the world just because it is the most important: A little error can cause such a dreadful and terrible result; and the correction of a little error can save bodies from being mangled, twisted, deformed, and from becoming corpses!

Think of your job as an educational one—to teach your team the methods of safety, how to recognize and eliminate hazards and how to recognize and avoid danger when it arises.

Your job is not to instill a picnic, party, or carnival spirit in your people. I doubt that balloons, beer, gimmicks or gadgets ever instilled safety in the mind of people or promoted safety in general.

BE A GOOD SAFETY-DIRECTOR

Remember, your job is a serious one, and you should be serious about it. Your job is to reduce the need for hospitals, and to postpone the work of undertakers!

Learn to be a good manager and you'll be a good safety-director. You could read Drucker's *The Practice of Management* to learn what constitutes good management, and what are good management methods.

But if you want to be a good safety-director, a good manager of any kind, you'll find out for yourself. If you don't, you'll never be a good safety-director. If you're *not* a *good* safety-director, there will be more cripples and younger corpses—and, maybe, another bankrupt transit company!

Do you want a good safety-team? Then, be a good safety-director!

It is the coach *and* the team! They both must be good to win; and *you* are the only one who can make *both* of them *good!*

CAN SAFETY BE NEWS?

by BRUCE B. HOWAT
editor, Mass Transportation Magazine, Wheaton, Ill.

My obvious answer to the question, "Can Safety Be News?" is, yes, safety can be news—and the best part of it is that safety is good news.

Our world is full of bad news. And our news media feed on it. Crime and crises, rape and racketeering, misery and murder—all fill up our front pages and claim the lead on newscasts. Accidents, of course, make news—usually front page. But that, too, is bad news. But safety is good news—and you can plan safety activities which are both effective and newsworthy.

My purpose in this paper is to show how publicizing your safety work can pay off and to suggest some safety activities which can be made newsworthy. Is publicizing your safety activities worth the time and effort you put into it? Yes indeed—in many ways.

For far too many years too many people in industry in general and in the transit industry especially have paid too little attention to public relations. They either did not care what the public thought about their business, or did not feel that public opinion mattered, or were simply too lazy to put forth the effort necessary to help the public form good opinions about their business.

SAFETY—GOOD P. R. WORK

That, basically, is the aim of all public relations work—publicity included— helping the public to form good opinions about your company. Where else can public opinion be better formed than through safety? There are two areas in which you can publicize your safety activities—and the payoff is different in each. From what I have seen no transit company is doing half of what it should in either field.

You should first of all, publicize your safety activities locally—among all channels of communication—newspapers, both daily and weekly; radio stations; TV stations; local company house organs (including your own—if you have one—and you should!) and bulletin boards; school and college publications; and chamber of commerce and service club publications.

You should have a list of every communication channel in your community and keep a record of safety stories you send to them. You should know the different types of material each wants—and tailor your stories to their specific needs.

How long has it been, for example, since you have visited each high school newspaper editor and helped him (or her) plan a feature story with pictures of students on "How to Ride the Bus" stressing safety practices, courtesy and so on?

PUBLICIZE SAFETY LOCALLY

Here are some of the things you can accomplish with local publicity:

- It will help you sell bus rides—by convincing people in your community that they are safe on one of your buses—safer than they are when walking or riding in their own automobiles. Good publicity can build your reputation for safety. And a reputation for safe operation will become increasingly important in the years immediately ahead of us.

  The two fastest growing age brackets in our rapidly expanding population are in the "can't-drive-own-automobile" categories of "children under 15" and "oldsters over 65." There are millions of potential transit customers in both of these categories—and if Mr. and Mrs. Public are thoroughly sold on the safety of your vehicles, they will encourage their "Johnnys" and "grandmas" to ride the bus downtown.
- It will win friends for your company. Safety news is good news—and everyone who reads or hears of your safety activities gets a good impression of your company. Continued good publicity of safety achievements and safety work convinces reporters and editors that your company is interested in safety and does have a good record.

  If an accident does occur, they tend to be more fair in treatment of it. Good safety publicity helps put your company in a favorable light before your community. People who may someday be on a jury deciding one of your accident cases will be more favorable to your company if they have read from time to time of your safety efforts.
- It will nurture the morale and self-esteem of all of your employees—especially your drivers. And in so doing this good safety publicity is likely to lead to even better safety records. By creating a reputation for safe operation you give each driver a high standard to live up to.

TRY NATIONAL RELEASES

You should, second, publicize your more outstanding safety activities nationally—both by attempting to get stories on AP, UP, or INS wires and by sending stories to national magazines and to your trade press. The pay off from national publicity comes to you in three ways:

(1) It will win prestige for your company—and this prestige can usually be "merchandized" locally—among your own employees and, often, in your local news media.

(2) It will help others in the industry. Our industry is unique—the companies within it are not competitive—and thus you can help the other fellow without in any way hurting yourself.

(3) By supporting your trade press, you keep it alive to help you—not only in safety work but in all phases of transit operation.

"ZERO" SIGNALS SAFETY

For example, look at what my good friends "Happy" Hall and Randy Tucker did down at Nashville. Back in 1948 "Happy" started what has turned out to be a truly fabulous "zero" campaign. Zero may mean nothing to most people, but to folks in Nashville it is the magic word for safety. Down there the word "zero" simply means "no accidents today"—and the right hand raised in a zero salute made by thumb and forefinger is a pledge to work for a "zero" day.

The sound basis for Nashville's safety campaign was, of course, careful selection, good training and a lot of personal attention for each operator. But the real rallying point for the entire safety program was the "zero" theme. Interoffice phones were answered with "zero" instead of "Hello."

Employees greeted each other with "zero" instead of "Hi." A large "zero" flag was suspended from a staff in front of the main office—and lowered to half mast when an accident marred a zero day. The zero theme was seen everywhere—on placards, on old tires, on company calendars and business cards, on utility poles along new routes—everywhere!

Locally, Hall's "zero" campaign was extremely successful. Accident rates dropped year after year. Before the campaign started Nashville buses were travelling only 10,000 miles per accident. After a few years of zeroes, NTC buses were covering 22,000 miles per accident. Newspaper coverage was excellent and the zero symbol so caught the public fancy that traffic policeman and even citizens were saluting NTC bus drivers with the zero symbol.

ZERO CAMPAIGN SCORED

Happy and Randy could have let the thing ride—on its local success. But they didn't. They invited me to come down to visit them, made local "hay" out of the visit with a "safety luncheon," and gave me the material for a darn good story for Mass Transportation.

What did this story do for Nashville Transit? Well, they bought 50 or 100 extra copies of the issue in which it appeared—circulating them among civic leaders, pasting tearsheets on employee bulletin boards and getting local newspapers to write stories headlined: "National Magazine Praises Nashville Transit Safety Record." What did it do for Mass Transportation? It gave me a good feature story—of great interest to our readers.

What did it do for the industry? St. Louis Public Service Company and other companies read about it and launched similar campaigns of their own. As is the case in most phases of our life, when you help others you just can't help but you help yourself.

It might be helpful to prepare some sort of chart to keep track of your safety publicity efforts. You could list each media, possibly indicate types of material each is

interested in and then indicate stories sent to each.

Some such record will immediately flag for your attention any media who haven't had a story sent to them for a long time, prevent embarassing repeats and give you a visible record of your safety publicity accomplishments.

There is a pay-off for good safety publicity. How do you get it? First, of course, if you have a public relations man, you should work closely with him. Because safety work is so loaded with public relations possibilities, the safety director and public relations man should be as close as ham and eggs (and you know which one is the ham!). But whether you work with your PR man or go it alone, the mechanics of getting good safety publicity are the same.

There are many types of safety activities which can be publicized to advantage. Here is a brief check list of some of the things you can be (and I hope "are") doing to publicize your company's desire for safety:

- Your "routine" work can be news:
  - —Driver selection and hiring—rates a short news release, stressing the "high standards" you set.
  - —Driver training is good for an occasional feature article. And, incidentally—and trite but true, every safe driver you have is a public relations man for your company.
  - —New safety devices used in training or placed on vehicles should always have a release written about them. When new buses are added to your fleet, a story should go out telling about all of the new safety devices on them.
- Routine "announcements" of safety activities are news:
  - —When any driver, division or the company as a whole achieves any kind of a safety record, send out a news release. You may have to develop some new statistics or "create" the record but some time spent going over operation division records or the personnel files can prove valuable.
  - —When any individual employee, division or the company receives a safety award, send out a news release. Such releases can be made more newsworthy by having some big name entertainer, athlete or celebrity make the award—such as Dallas Transit has done with its "BUSTER" awards which have been made by Jane Russell, Danny Kaye and a host of other stars.
- Life-saving actions by your drivers are news. If one of your drivers pulls a motorist from a burning car, rescues some children in a flash flood or performs some other heroic act in the line of duty, that's news—and it's your job to ferret out those stories and get them to the news media.
- Special safety activities offer you your greatest opportunity—and call for the greatest imagination on your part. Here, for example, are a few special activities various transit companies have used to promote transit safety—all of which lend themselves to publicity:
  - —A bus drivers' "roadeo"—such as has been successfully staged by British Columbia Electric Railway Company in Vancouver, Indianapolis Transit and others. Indianapolis, for example, coupled their "Driverama" with an open house—and not only drew a good crowd but also got lots of valuable newspaper, radio and TV publicity. Bus drivers competed over three courses— a 200 inch straight line with four inches on each side and reverse; a simulated mid-block stop in a 75 foot loading zone with parked vehicles at each end; and a tricky serpentine. Each finalist received a cash award—up to $100 for the winner. An annual "bus drivers roadeo" could be not only a fine training gimmick but also a wonderful safety publicity hook for you.
  - —A bus "float" to appear in any and all parades—Memorial Day, Fourth of July, Christmas or what have you —with a special paint job to sell transit as the safest form of city travel.
  - —A Saf-T-Coach such as Transit Casualty has developed. Many transit companies have achieved wonderful public relations results with such a coach. Al Moore's Topeka Transportation Company, for example, recently put a specially painted "Safety Bus" at a downtown curb for 10 days. Thousands of Topekans went thorough the bus, 1,500 taking the reaction test and 500 sitting down before Keystone eye test machine.
  - —Booklets on safe driving (showing stopping distances, proper signals, facts on tire care and so on) or booklets on "How to Ride a Bus" (possibly using cartoons to show careless habits that lead to on-board, boarding and alighting accidents) can be distributed as a public service thru "take-one" racks and other means.
  - —A downtown department store window display of safety devices used on your equipment, safety posters and other attractive, interesting material.
  - —Shop tours, participation in B-I-E days and "open house" programs which induce the public to visit your shops and see for themselves the good maintenance and driver training which makes your buses safe.
  - —Bus company awards or citations to safe drivers in the community—based on reports turned in by bus drivers.

These news-making safety events all started as an idea in some safety director's noggin. Similar ideas can—and should—be hatching in yours! A couple of weeks ago Dr. Herb True of Notre Dame came out to Wheaton to talk to our sales force and editorial staff on "Creativity." Being creative—and that includes developing new ways to publicize your safety activities—does not depend, according to Dr. True, on your heredity, your I.Q., your health, your education or your years of "experience."

CREATE SAFETY NEWS

Your creativity depends on what True labels "tremendous trifles"—your personal commitment to your job, your open-mindedness to new ideas and your experimental nature. The real key to making safety news lies within you—and depends on your ability to see news in the routine things you are doing and to create newsworthy things.

In addition to newsworthy transit safety activities which you might plan, here are some "non transit" safety activities in which a transit company can be of real service and reap deserved public relations rewards:

- —Using car cards and bumper stickers to back local safety campaigns.
- —Conducting community driver testing.
- —Lending equipment and personnel to high schools for driver training.
- —Sponsoring school safety patrols.
- —Giving free "Scotchlite" to all bicyclists.
- —Donating special school zone "stop" and "slow" signs.
- —Promoting Red Cross and other community safety efforts.
- —Maintaining safe driving billboards throughout your city.
- —Furnishing safety posters to schools and industrial plants.

BEING A NEWSMAN

Finding or developing newsworthy safety activities is the first step in "making safety news." The second step is getting the story to news media in such form as to assure its getting into print or on the air. Newspapers (and other news media), contrary to what you might think, actually welcome a story showing the ability and skill of your drivers. I have never known an editor who was not hungry for material for his next edition. It is, therefore, the easiest thing in the world to get a newsworthy item into your newspaper.

Actually, today's editors are more interested in business news than ever before. A study by George Gallup, based on interviews with 7,000 readers, will be published this fall—"the most comprehensive study ever undertaken of the American press." Pollster Gallup has already indicated that the study shows that news of business not only deserves more space and prominence than it gets in most dailies, but has a far bigger potential audience than most papers have been exploiting.

The twin keys are ***newsworthiness*** and ***proper presentation.*** The first thing an editor wants to know is where the story is coming from—so tell him. Up in the right hand corner of the page single-spaced, put your name, title, company address and telephone number—so that he can check facts or ask for additional information if he wants to. Then skip a line or two and give the date.

Then drop down four or five lines and start your story—leaving at least an inch and a half margin at the left and an ample margin at the right. Editors use this space to designate type sizes and to make changes. The story itself should be double spaced.

Your editor wants his stories short and factual. Pack your five W's (who, what, when, where and why—or how) into the first paragraph. Put additional facts in succeeding paragraphs. Omit the superlatives, flowers and excessive use of your company name. Just tell your story—in a short, interesting and factual way.

Your editor likes pictures — dramatic, eight inch by 10 inch glossies. In fact, a good picture or set of pictures is your best guarantee of getting a story published. If possible, try to get a celebrity into your pictures—a movie star, a visiting dignitary, a famous athlete or some local big-wig. Children, too, are sure fire subjects in pictures. It helps, too, to get to know the reporters, editors and broadcasters in your town. But, really, this is the least of your worries. A good, well-written story sells itself.

If you have a public relations or publicity department, you'll undoubtedly want to channel your releases through them. If not, you may be sending them direct to newspapers, broadcasters and magazines. In either case you, as safety men, should master these fundamentals of journalism—the who-what-when-where-why lead; the short, factual story; and the dramatic, interesting picture.

SELLING SAFETY TO THE PASSENGER

by JOHN A. BAKER

director, Training & Accident Prevention, Chicago Transit Authority, Chicago

It's time we recognize that if we want to make a substantial reduction in passenger accidents, we must sell safety to the passenger.

Training our drivers to recognize potentially dangerous situations and to apply defensive driving principles has contributed greatly toward a substantial reduction in traffic accidents over the past several years.

A substantial reduction in passenger accidents can be effected if we follow the same logical approach with our passengers. We must get them to recognize that they have some responsibility for their own safety. We must make them aware of potentially dangerous situations. We must help them learn to apply defensive riding principles.

In developing these remarks on selling safety to the passenger, I have relied heavily upon information and materials from several sources. This does not mean that the opinions or the ideas put forth are necessarily endorsed by those of you who contributed materials.

We will discuss these three:

1. Surveying the transit industry
2. The need for passenger safety education
3. Carrying out effective passenger safety education

Because the purpose of my presentation is to relate what CTA and other transit properties are doing to sell safety to the passenger, a brief questionnaire was developed and sent to several transit properties. This questionnaire was designed to be answered quickly and the questions were phrased in the hope that we could add together the experience of several properties to form some general statements about the subject. These were the questions asked:

1. Does your management feel it is a good policy to conduct passenger safety activity for passengers themselves?
2. What has your property done to educate your passengers on how to ride a transit vehicle safely?
3. How have you evaluated the results of your efforts to sell safety to the passengers?

In addition to these questions, properties were requested to send samples of materials used in passenger safety activities.

The questionnaire was sent to the members of the executive committee of this Transit Section of the National Safety Council. These persons provided a good, though small, sample because they represented properties of all sizes, they represented several geographical regions, and they quite obviously had a great interest in the subject of passenger safety.

SHOWED INTEREST

The fact that 25 of the 30 companies surveyed replied and a good portion of them sent materials is proof of their interest in this subject of passenger safety. Those of you who were not included in the survey are urged to contribute your ideas and describe your property's activities in this area during the discussion immediately following these remarks.

Here are the general responses to these three questions:

In response to Question I, "Does your management feel it is a good policy to conduct passenger safety activity for passengers themselves?", 20 of the 25 properties replying answered "Yes," three properties answered "No," and two properties had divided opinion or questionable answers.

The response to Question II, "What has your property done to educate your passengers on how to ride a transit vehicle safely?", was even more one-sided. Of the 25 companies replying, 23 are carrying on some kind of passenger safety activity. The type of activity varies widely, but by far the most popular types of activity are car cards, "take ones," driver cautioning, and other on-vehicle techniques.

The response to Question III, "How have you evaluated the results of your efforts to sell safety to the passenger?" indicates that none of the 25 companies has been able to measure the effects of passenger safety activity in specific terms. However, several persons commented enthusiastically about the benefits of passenger safety education in general terms.

Responses to the questionnaire indicate that transit properties recognize the importance of educating the passenger and are carrying on some form of passenger safety education as a necessary means of reducing passenger accidents and claims. In fact, there seems to be a feeling that we are doing too little to sell safety to the passenger. Such comments as "We are not doing enough in this area," and "We hope to increase our efforts to educate passengers" indicate this disturbed feeling about passenger safety education.

So an apparent dilemma exists. We feel we must educate the passenger to ride safely; yet, something seems to be preventing us from doing a more effective job. Several problems are brought out as reasons why we haven't done more to sell safety to our passengers. Let's look briefly at some of these problems that are connected with passenger safety education.

First, we recognize the difficulty of selling safety to the passenger and feel unsure that we can do an adequate job in this area. It is extremely difficult to write a message to our customers that is direct and yet will not be taken as a criticism of them. We all tend to do things we are familiar with and things we feel we can do well, rather than attempt to do the things we are unsure of even if they are things that need to be done.

SUGGEST FALSE CLAIMS

Another problem brought up frequently is the feeling that stressing hazards might tip off unscrupulous passengers as to where and how they might claim injury. This feeling may or may not be justified. Has anyone proved that talking to passengers about their safety results in more claims? It seems logical that unscrupulous passengers will attempt to frame false claims regardless of our attempts to warn our passengers of hazards that do exist.

A third problem brought out by the questionnaire is our inability to measure the effects of passenger safety education in concrete terms. We are unable to hold many changing factors constant while we measure the results of our passenger safety activity. This same problem exists in other necessary fields of endeavor.

Safety training of our operators and installation of safety devices in our equipment are examples of activities whose worth we cannot measure in exact dollars and cents. But we have learned that it is terribly expensive not to carry on such activities, so

we carry them on, even though we cannot determine their exact worth.

Not the least of the problems is the feeling that it is inconsistent to talk about our good safety record and then stress the hazards of transit travel. This is not a problem unique to us as bus operators. The air lines have faced a similar problem and have done an effective job of resolving this "inconsistency."

WRONG TO STRESS HAZARDS?

Each air line passenger is required to fasten his seat belt when taking off or landing, and this requirement has not caused a loss of confidence in the safety of air travel. Quite the contrary, this firm policy gives us assurance that hazards are recognized and our safety is put first—sometimes even ahead of our convenience.

I am not trying to ridicule or to minimize any of these problems. They are real and the solutions to them are not obvious. What I am saying is that they should not be used as excuses for failing to attempt to sell safety to our passengers.

The real issue is: Is it necessary to inform our passengers about the hazards connected with transit travel? Must we persuade passengers to take necessary precautions for their own safety? This issue must be resolved in terms of the consequences of selling, or not selling, safety to our passengers. Only after we resolve this issue should we consider these problems connected with passenger safety activity.

The consequences of not informing the passenger are great. Today, the public demands fast transit travel. Traffic conditions require fast starts, stops, and swerves. Passengers must recognize these inevitable hazards of transit travel and develop good riding habits.

PASSENGER CONTROLS SAFETY

In many instances, the passenger has more control over his safety than we do. How many passenger accidents did you have last year that were due wholly to the actions of your bus operator? Or, put it another way, how many of your passenger accidents could have been prevented by the passenger? How many could have been prevented only by the passenger?

We must sell safety to the passenger. If we don't, we miss our best means of reducing passenger accidents, and we lose some of our investment in driver training and good equipment design because our passengers will not take full advantage of the safety helps we provide.

We are responsible for the safety of our passenger—and we are fully aware of the responsibility. But this does not mean we cannot ask our passenger to help us keep him safe. It is as much his objective to ride safely as it is ours to provide a safe ride for him. We cannot fully accomplish this joint objective without his help. We must sell safety to the passenger.

Once we have recognized the necessity of *selling safety to the passenger, we must* turn our attention to developing and carrying out activities that will accomplish our goal. There are certain principles we must keep in mind if we are to develop activities that will be successful.

PASSENGER SAFETY EDUCATION

First, our program must be audience oriented. Who are we trying to sell? What do we know about our passengers? What characteristics do they have? What *interests*? We must tailor our activities to the interests and desires of our passengers. We can give special attention to certain types of passengers who have demonstrated they are in need of safety education.

Women passengers, elderly passengers, handicapped persons, and children, for example, can be singled out for special attention in our program. We should also attempt to involve our passengers in our passenger safety educational activity. When people participate in a program, they accept the contents more *readily and remember* the facts longer than when they are completely passive and have no part in the program.

You are probably familiar with this claims questionnaire used by Transit Casualty company. Through this questionnaire, Transit Casualty is attempting to find out more about causes, contributing factors, and the characteristics of the people who are involved in accidents. With this type of information, activity can be designed and slanted towards those passengers who need the help most.

The Sunday riding pass from Cincinnati Street Railway company shows how we can utilize a medium that takes notice of a special part of our audience. In Cincinnati, Sunday passes are used a great deal by elderly persons. Elderly people have more than their share of passenger accidents. Therefore, the Sunday pass was selected as a good medium for this type of passenger safety message.

The next two examples show a means of getting passengers involved in passenger safety activity. One from Capitol Transit in Washington, D. C., shows a "take one" with a safety slogan blank. Passengers are encouraged to send in safety slogans and are awarded cash for slogans that are accepted. Twin Cities Rapid Transit in Minneapolis has a similar program using a "take one" to invite passengers to send in safety suggestions.

These examples show that activity can be tailored to the audience we are trying to reach. In addition to tailoring our materials to our audience, perhaps we could tailor our method of approach by working with groups that represent riders who require special attention.

We might effectively reach our women riders through women's groups; our handicapped riders through organizations that train and help them; children through schools. Before choosing techniques and developing activities, we should stop to remember whom we are trying to sell. Our program should be audience oriented.

NEED CONTINUOUS EFFORT

Another principle to keep in mind is that our program must be a continuous effort. It isn't reasonable to expect a one-shot approach to accomplish our objective. Reducing passenger accidents is a long-range problem. We must recognize that hazards will not be eliminated by this activity and that we must combat these ever-existent hazards with continuous passenger safety education. Perhaps it's more realistic to think of passenger safety education as waging a continuous delaying action rather than expect such activity to solve the problem.

Our program should be teamed-up with accepted plans, activities, campaigns, and organizations. Transit companies are not fighting the battle of reducing passenger accidents all by themselves. Many organizations are effectively working on passenger safety as well as other areas of public safety.

More effective results for our programs can be obtained if we will coordinate our efforts with the civic and citizens groups. People will accept criticism and suggestions much more readily from "accepted" agencies such as the National Safety Council, churches, schools, or citizens' safety groups than they will from a transit company.

Here are some examples of activities being carried out by various transit properties in conjunction with accepted organizations and campaigns.

This first example is a decal CTA has installed in our buses in cooperation with the Citizens' Traffic Safety Board of Chicago.

These next two examples are a series of posters designed by CTA and displayed in Chicago public and parochial schools.

Milwaukee Transit sent in two car cards and a booklet for school children on "How to Ride a Bus." Here again, one of the posters is sponsored by an accepted safety commission, and the booklet is distributed through the school system.

S-D DAY CAMPAIGN

Here's a campaign that should be familiar to all of you: the S-D Day campaign. Car cards and backs of transfers are used by CTA as part of our public safety activity. We coordinated our program with this nationally-observed Safe Driving Day Program.

When we design passenger safety activity, we should stop to ask ourselves, "Are we trying to go it alone, or are we taking full advantages of relationships with accepted groups?" Close working relationships with safety and civic organizations can extend and increase the effectiveness of our efforts to sell safety to our passengers.

Whenever possible, our programs should be integrated with related company activities that are wholly or in part designed to accomplish the same results. Passenger safety education is not a substitute for driver training or good equipment design. Actually, passenger safety education is a necessary supplement to these activities.

Unless passengers are informed, they do not take full advantage of good equipment design. As Mel Bullock's study points out, many of the claimants interviewed admitted stanchions were available, and their use

would have prevented passenger accidents, but for some reason they did not see fit to take advantage of the safety devices provided.

CTA has a specially designed training bus to take the passenger safety program to bus drivers. At the same time, we used several on-vehicle techniques such as car cards, "take ones," and backs of transfers to appeal to our passengers. We integrated our driver training and passenger safety activities into one program.

Indianapolis included a Driverama with an open house to demonstrate the skill of their bus drivers to the public.

USE HOUSE ORGANS

"Transit News," CTA's house organ, is put out monthly by the Public Information department. An employee publication, which usually has a wide circulation outside the company as well as to families of employees, provides an excellent medium for continuously emphasizing passenger safety.

Our Public Information department uses a character known as "Bill Saver" in much of our literature to the public, so we "latched on" to Bill Saver to talk about safety in this one.

Existing company activities provide many opportunities to sell safety to the passenger, and often effective results can be obtained through combinations like those we have just seen.

In presenting information to our passengers, we should concentrate on specific subjects whenever possible. Our message should be easy to understand. If the message is too long, too general, or too hard to understand, we will not get our point across. So let's figure out what we want to say and punch it across in an interesting, brief, easy-to-understand manner.

Most of you are probably familiar with the National Safety Council's Data Sheet No. 13. This is a good source of specific information on how passengers should ride transit vehicles.

There are several good techniques available that can be used right on the vehicle so that the message goes to the right people, our passengers, at the time they are exposed to the hazards.

Several properties sent in samples of "take ones," car cards, and other on-vehicle techniques that illustrate how they are getting a brief, specific, understandable message across—right on the vehicle.

Another technique that many of us use is a permanent safety message in the form of a decal which can be effective because it can be used to point out a specific hazard in the place and at the time when the hazard exists for the passenger.

"Gus, the Bus" is an Atlanta Transit System's personalized safety coach. These buses are used in regular service and contain a recorded safety message mounted near the center exit door. Atlanta has developed an intensive passenger safety program around this personalized bus.

The final principle to remember in selling safety to the passenger is never miss the chance to sell the present safety of our transit ride. This may seem quite obvious, and yet, I wonder how often we remember to stress our safe ride. Stressing present safety and asking for the passenger's help to keep him safe are not at all contradictory. Here are some of the ways that properties have included emphasis on present safety in their message to the passenger.

In Atlanta Transit System's "Gus, the Bus" program, the safeness of the transit ride and the automobile ride are compared.

Miami Transit stresses the same comparison in a "take one."

A CTA car card telling passengers that their driver has been trained in passenger protection is another way to stress the safety of their bus ride.

Toronto Transit, TTC points out that their men are winners of the ATA Safety Award. They are stressing the safe driving ability of their drivers in still another way.

ALWAYS SELL SAFETY

If we can gain our passengers' confidence, if we can make them feel that their safety is put first, they will be more receptive when we ask them to help us keep them safe. So we must never miss a chance to sell the present safety of our transit ride.

We must decide to sell safety to the passenger because passengers have more control over their safety than any other factor. Unless they recognize the hazards and apply defensive riding habits, we cannot fully accomplish our goal of cutting passenger accidents to the minimum.

Our passenger safety education program must be built around sound principles. We must: 1. remember the audience, 2. make our program a continuous effort, 3. team up with accepted organizations, 4. integrate our passenger safety activity with related company activities, 5. emphasize specific subjects to our passengers, and 6. never miss a chance to sell the present safety of our transit ride.

Recognizing the need for effective passenger safety education and developing a sound passenger safety program will accomplish our objective if we put these principles into action:

A—Audience oriented
C—Continuous effort
T—Teamed up with accepted organizations
I—Integrated with related company activities
O—On specific subjects
N—Never miss a chance to sell the present safety of our transit ride.

To make the principles easier to remember, we have figuratively put these principles for effective passenger safety education into *action*. I hope this will remind us that we must literally put these same principles into *action* if we are to accomplish our objective—the fewest possible passenger accidents.▲

SELLING PASSENGER SAFETY TO THE OPERATOR

by THOMAS L. WARD

supervisor of training, Milwaukee & Suburban Transport Corp., Milwaukee

"How can we reduce passenger accidents, particularly the on-board accident," appears to be the $64,000 question in accident prevention in our business. Our claim department cost figures show that more money is being spent to settle on-board accidents than our collision cases.

Until a few years ago, our safety concern was the rise in traffic accidents as the number of motor vehicles on the streets increased. Now the traffic accident rate for our company has been reduced more than 55 per cent from 15.37 accidents per 100,000 miles in 1951 to 6.40 traffic accidents per 100,000 miles in 1956.

It is true that many passenger accidents are minor, but many result in serious injuries and are costly to the company. Currently settlements for passenger accidents on our property total about 50 per cent of claims cost.

Most chargeable traffic accidents can be attributed to operator-failure. Our success in reducing traffic accidents is from working with the faults and attitudes of the individual operators.

A large majority of the passenger accidents are from man-failure, and we feel the answer is proper training and retraining of operators and encouraging them to follow the best operating procedures.

Over the years, the company has provided aids for the passenger to board, walk through the vehicle, support himself when standing and in alighting, such as grab handles, stanchions and grab rails.

SELLING PASSENGER SAFETY

This is currently being done at every opportunity, such as:

1. During the orientation and training of beginners.
2. During periodic regular follow-up of all operators.
3. During the refresher training for 90 day men.
4. During remedial training of accident repeaters.
5. At all contacts of transportation department supervisory personnel with operators.

In the orientation talk, we prepare the trainee's mind for the training course and the job.

Besides stressing the importance of driving as an occupation, we instill in him the desire to do the job safely and efficiently.

We point out that the good driver, besides knowing the written rules of the road also knows and follows the unwritten laws, such as:

—When behind the wheel, he must be attentive at all times;

—He must be alert for the unexpected;

—Through repetition of correct driving patterns, he established good driving habits which become a permanent part of his driving.

Skill in connection with driving is more than just the manipulation of the controls. We develop skill through well guided practice. Using proper methods of instruction and a competent instructor is the first step in teaching good driving habits.

True skill is the result of repeated practice. The good driver is one who practices correct driving procedures until they become a habit.

TRAINED IN TRAFFFIC

After the trainee learns the mechanical operation of the bus, masters the basic maneuvers and is thoroughly familiar with traffic rules and regulations, the next step is driving in traffic.

Before and during these road exercises, the trainee is indoctrinated with the principles of defensive driving.

One leading cause of accidents (passenger or traffic) is the driver's failure to cope with the unusual traffic situations. We train the new driver so that when he encounters these unusual traffic situations, he will react to avoid an accident.

The important factor to combat these situations successfully is to anticipate the occurrence of an unusual traffic situation. Trainees are taught to "think ahead" to anticipate the unexpected. If prepared for the unusual—they will have no unusual.

Of equal importance in avoiding accidents when the unusual situation develops is knowing the correct mechanical action and then performing it properly.

A driver is taught and practices the correct responses to unusual situations. Frequently when the unusual situation develops, the driver does not have time to analyze the situation. He must depend on prior training for the correct response.

We use various visual aids and distribute N.S.C. pamphlets:

1. Defensive driving.
2. How to be a smooth operator.
3. Passenger safety.

We teach that "courtesy and safety" go together. Emphasis is placed on the need to be alert for crippled people, old people, children, bus stop hazards. The operator is instructed to assist the blind, the aged, the crippled and the overloaded passengers and others who have difficulty boarding, standing on board or alighting from the bus. A word of caution "watch your step" may save an accident. Operators are taught to practice courtesy continually. The courteous driver is also a careful driver.

Selling by Follow-up Instructors

When the trainee has demonstrated a satisfactory degree of driving skill, he is assigned to a bus and a run. His training does not end at this point however. A follow-up instructor rides with the new driver during the first few days and periodically thereafter to observe driving habits and reinforce the initial training. Habits relating to passenger safety are watched and emphasized on all of these contacts. If bad habits are developing, the follow-up instructor retrains as necessary.

REFRESHER TRAINING FOR 90-DAY MEN

The purpose of this one day refresher course is to review the operators' original training and instructions after they have had experience on the job. The program is a six-hour conference session with subjects reviewed by slide illustrations of typical traffic and passenger situations.

Since passenger safety is a great concern, the conference reviews the original instructions on how to avoid situations that may require emergency brakes and the possibility of throwing passengers. The settlement costs of on-board accidents and typical cases of preventable accident situations are discussed.

Selling During Training for Repeaters

We have a good record on each operator's performance on the job, and use it for close follow-up and early indication of increased frequency or the specific nature of accidents experienced by individual men.

For operators who are accident repeaters or observed in faulty driving practice, our first problem is to discover the driving faults and then look for the reason for faulty driving. If it is primarily bad habits, additional training to instill good habits and proper attitude toward the job may be all that is necessary.

However, careful examination of the driver's accident record and attitudes on and off the job and during a personal consultation may reveal family trouble or mental instability as the root cause. Sympathetic treatment can relieve the operators of on-the-job tensions. We may be able to solve his basic problem, because often the driver does not recognize his difficulty.

If counseling and retraining fail to improve the employee's accident record, he is reassigned to non-driving duties or released.

SELLING SAFETY AT ALL LEVELS

Flyers, posters, bulletins, and honor rolls, have been tried to sell safety and keep accident prevention and defensive driving uppermost in a driver's mind.

Operators are frequently contacted by division superintendents, follow-up instructors, route supervisors and other management representatives. Some months ago we inaugurated the practice that each contact . . . discussing a complaint, miss, accident, or merely chatting . . . should conclude with a brief safety discussion and the need for continuous defensive driving. The objective was to keep the story and importance of proper driving behavior foremost. Short five-minute reconsideration on being alert and using good judgment to avoid accident situations will serve as an effective reminder and supplement other efforts to make our operators real defensive drivers.

We intend to contact every man on the system through this particular means. These short talks are well received by operators and are a satisfactory means of keeping men aware of accident problems.

Quarterbacking the safety program is the committee on personnel and accident prevention. Committee members are the operating vice president, who serves as chairman, the superintendent of transportation, the two assistant superintendents of transportation, the training supervisor, the personnel director, the claim agent, the engineer of way and structures, and the superintendent of equipment. This committee meets monthly to initiate plans for further improvement of safety. Goals are set. Facts relating to past accidents are reviewed. Where corrective steps are possible, orders are issued and action started. Safety is the first order of business at all departmental staff and supervisory meetings.

We continue practices which in the past have been effective accident prevention and keep a watchful eye on operating procedures. We correct and reinstruct as necessary and are continually searching for new ideas to improve our safety performance. We must do an increasingly effective job of instilling proper skills and attitudes in those behind the steering wheel—emphasizing the positive force of driver education and the deterrent influence of a soundly administered enforcement.

To beat a better record each year becomes increasingly more difficult. Our passenger accident rate in 1956 of 5.92 per 1,000,000 passengers was bettered by very few American cities. However, we do not rest on our laurels, but exert every effort to improve our operations and eliminate needless accidents.▲

A CLINICAL APPROACH TO RETRAINING

by CARL F. RAMSEY

chief station supervisor, Cleveland Transit System, Cleveland, Ohio

"Retraining" perhaps means different things to different people. But here "retraining" is any safety education or instruction given operators after their initial training period.

Although conditions may vary from property to property basically safety problems are the same. A clinical approach to retraining has five divisions:

Preparation of Supervisory Personnel

a. They should be specially selected.

b. They should be specially trained.

A definite relationship exists between supervision, operator's attitudes, and accident frequency. The supervisor is a key man in any safety program because his job deals with people. "The common denominator of all supervision is the direction of human actions." The transportation supervisor directs operators and it is his responsibility to motivate and teach them to operate safely. He must inspire them to cooperate, develop incentive and be interested in doing their best.

The transportation supervisor has a more difficult job of producing safe operation than the plant supervisor, because transit operators have physical supervision only brief periods of their work day.

This means the supervisor's instructions must extend beyond checking or correcting any deviation. Operators must be trained to make split-second decisions based on sufficient background training to insure a high degree of accuracy. Obviously, the key to a successful retraining program is the mental attitude the supervisor develops. This insures retention and recall of experiences to fit the problem at hand. For this the supervisor must have a high degree of leadership—the kind which inspires performing the job at peak level.

Supervisors selected to administer a retraining program should have the ability and desire to teach. They should know the principles of human relation problems, safe operating principles and practices, and all details of the retraining program. Safety should not compete with anything for their time, attention, and enthusiasm. The operators must feel that the supervisor wants to help them, is interested in their growth and improvement, and will be pleased by their success. The supervisor must recognize that our biggest problem is not "defective equipment"—is not "accident hazards"—is not "the other vehicles." Our biggest safety problem is people—our operators.

STANDARDS FOR OPERATORS

a. Determine average number of accidents per operator for the system.

b. Determine average number of accidents per operator for station or division.

c. Compare individual accident records against these averages.

A good safety record depends on the performance of operators. We must tell them what is expected of them as individuals. We can get safer operation by asking for it, by insisting on it, and by setting standards for it. Our operators are obligated to themselves to give their best. They should know how they are doing, and the standards by which they are judged. We should set individual goals—goals that are understandable and fair. In doing this we should appeal to operators' mind, not emotions, and bear in mind that while safe performance might be obtained by pressure tactics, it is much more desirable to secure willing, voluntary cooperation.

ESTABLISH PROCEDURE FOR RETRAINING

a. Establish pars for comparative purposes.

b. Separate individual records that vary from par.

c. Group individual records according to variance from par.

Retraining should not be a hit and miss basis. An orderly procedure (based on facts) should be set up to eliminate guess work. The operator's individual accident record is the key to this procedure.

First, an average par should be established for the station or the division. The number and the severity of the operator's accidents are considered. The individual can then be compared to the par established by fellow operators working under the same conditions, operating the same equipment, same lines and subjected to the same degree of accident exposure.

Once par is established, the next step is to separate the individual accident records that vary from par. They should be separated into groups according to their variance from par, such as:

1. No accidents—Commend
2. Above par—Encourage
3. At or near par—Accident clinic
4. Below par—High accident review
5. Unsatisfactory — Remedial training or suspension or discharge.

INITIATE RETRAINING ACTION

a. Prepare retraining programs for each group.

b. Administer program on an individual basis.

c. Start all programs with a personal interview.

Initiating the proper retraining action could very well determine the success or failure of the programs. Programs prepared in advance fit the needs of the five groups. The program is prepared for the entire group, but should be administered individually because retraining is not a group activity. Each operator must be handled on a personal basis as indicated by his record, length of service, past experience and personality.

Operators in Group 1 should be given a commendatory interview. The interview should be private befitting the achievements, because operators without accidents are prize possessions and should be considered as such.

Operators in Group 2 should be handled similarly. The commendatory interview should take approximately 15 minutes.

Skipping group 3, temporarily, group 4 are operators below the established par and should be given the high accident review course. This 8-hour course deals in detail with the six basic traffic hazards producing accidents and also gives techniques of professional defensive driving with demonstrations by the training instructor. It is suggested the operator be paid for this time.

Group 5 is operators with unsatisfactory accident records with whom more drastic action must be taken. They are given remedial training, a 3-day retraining course, and are not paid for the time. This course details safe operation with emphasis on defensive driving. In addition, everything bearing on the operator's accident record is explored, such as financial circumstances, or domestic difficulties which may lead to an interview with his family.

He may be given a complete physical examination, especially eye tests, and possibly psychological and psycho-physical tests. He then practices in actual operation the things he has been taught. If his actions indicate he can't do the job safely, he is discharged. If he can do the job, he is returned to service ON PROBATION.

Group 3 are operators whose accident records classify them as average. The objective is to move them into Group 1 or 2, but the approach must be carefully planned and executed. As long as an operator's accident record is average, he can't be told that it is bad. The very fact he is in Group 3 indicates he has the potential for Groups 1 or 2. These operators should be referred to the accident clinic review, a 2-hour course and they are paid for the time.

The accident clinic should prove to the operator that accidents can be avoided, instill in him the desire to avoid accidents and teach him defensive driving.

We prove that accidents can be avoided by showing and discussing the safety records of Groups 1 and 2. We point out that those operators drive the same equipment, over the same routes, carrying the same passengers. The operator's accident record is analyzed and he is shown his extended periods of time without an accident. We stress using defensive driving techniques all the time, so those accident-free periods will be extended and appear more frequently.

We tell the operator he has the potential for Group 1, and he is unjust to himself and the company if he fails to use this ability. A cost breakdown shows him the tremendous saving possible if he and others in Group 3 used their potential abilities. Slides are used to show the causative and preventive factors in the six basic traffic problems. Slides on passenger accidents are also used at this time.

The traffic magnetic board is next used to recreate accidents in which the operator was involved. The operator helps recreate his accidents on the traffic magnetic board and explains the defensive driving practices he will use to prevent those accidents in the future.

We are a sales business. We must sell our service to the public, and safety to our operators. Can safety be sold? Safety rules will not sell it, because rules do not control human behavior. Safety is an attitude and can only be sold through proper promotion and continuous, effective educational programs. It has been said that "safety is a problem of human behavior which requires education rather than legislation and crusade rather than tirade." If the operator is sold on the accident clinic program, and he will be receptive to the program, to safety education and instruction in the future. In addition, he will become a safety salesman among his fellow operators.

WAYS TO EVALUATE RESULTS

a. Follow up to see results of your action.
b. Keep an eye on attitudes, relationships and service to see if they have been affected.
   1. If record improves, call in for interview at six months intervals (commendatory).
   2. If no improvement, take further corrective action.

Once you invest time, money and effort retraining an operator, you can't afford to leave him to his own devices. You must protect that investment by periodical check-ups to see if the retraining is bringing the desired result or to take additional remedial measures as is indicated.

Safety educational programs for our operators cost money. There are those who feel they can't afford to combat accidents in this manner. However, the transit industry can not afford to spend approximately $60,000,000 annually for injuries and damages. Safety education is much less expensive and certainly a more worthwhile expenditure.

WE'RE KEEPING TOO MANY ACCIDENT RECORDS

by J. G. BUTLER
director, Personnel & Labor Relations, D. C. Transit System Inc., Washington, D. C.

The whole country has gone haywire over figures! We are nuts about statistics! We are slap-happy about records, surveys, polls, analyses, ratings and, in general, any kind of accumulated data!

Now, before I discuss the wanton waste involved in the superfluity of accident records most transit companies maintain, I want to make it clear that I recognize the stern necessity of compiling statistical information and informative records relating to accidents. However, if everyone would carefully and honestly examine every report form, summary sheet and analysis record used in safety, claim and personnel departments, we could dispense with 25 per cent to 75 per cent of the material. This pruning is practically guaranteed to improve safety programs.

Anyone concerned with safety work in the transit industry should insist on certain indispensable data to direct or execute the attack on accidents. Without keeping basic records you cannot know where your activities should be concentrated nor measure the results of your efforts.

It has been the universal practice to establish and maintain vast systems of record keeping, involving all activities of the various transportation departments. Also, a misunderstanding existed on the type of information necessary to prepare reports. A better understanding of laws and regulations governing our operation has afforded relief in that direction.

MUCH DUPLICATION OF RECORDS

Due to jealousy, distrust, and lack of proper communications between individuals and departments, record keeping was often established by more than one department within the same company. As an example we had established a record keeping system for individual operators in each operating division, the training division, the transportation personnel office, the transportation department office, the dispatcher's office and a general statistical record maintained by the claims department. In addition to this, each operating unit published reports. Daily, weekly, monthly and annual reports provided excellent dust-catchers, but seldom helped reduce accidents.

Even worse, the reasons why certain records were religiously maintained were forgotten. A large number of personnel were devoting so much time to gathering information, preparing reports, tabulations, analyses and filing that no time remained to present the material to the operating personnel, at least not effectively. As a result offices are actually overstaffed, and the safety supervisor, submerged in a sea of statistics, becomes prone to adopt negative attitudes, whereas positive thinking is needed.

Even when we provided a sufficient complement of personnel to present analyses of statistical information, orally or in graphs, charts or written reports, the operators soon became bored and immune to such dry media. One of the quickest ways to sabotage a safety program is to bombard employees with too many statistics and records.

The actual cost of record keeping was not established nor was the excess of personnel evaluated; consequently, an appraisal of the eventual savings is not available. This is because departmental reorganization was the paramount objective and persons displaced were reassigned to other duties in other departments. Also, a 52-day work stoppage in 1955 caused a substantial reduction in personnel in all departments of our company.

The work stoppage gave us another opportunity to determine what records were actually necessary. We reassigned work so that no person was specifically allocated the exclusive task of record keeping. It was distributed as a routine detail of a clerk's activities.

A change in personnel made it possible to re-evaluate our needs and to establish a centralized location to maintain the records of the individual operators. We eliminated record-keeping at our operating divisions and training division, thus relieving superintendents, supervisors, and clerks to perform a more desirable function.

The claims department still prepares the basic statistical information relative to number, date, location and classification of accidents under the system adopted by the American Transit Association. Each accident report shows the time, weather conditions, identification of operator and vehicle and, ultimately, the cost of settlement. From this reservoir of information, any form of analysis can be prepared.

The route and location analysis formerly prepared by the claims department was eliminated after a poll showed that the departments didn't use it. This not only released the person preparing it for other duties but eliminated files where useless material was accumulating. Any route or location accident information necessary can be secured from the reports maintained in our claim department or dispatcher's office.

RECORD NEEDS EVALUATED

A day by day comparison record is maintained of the number of current accidents with the number that occurred during the same period last year. This gives us a general view of our accident situation at any particular time. The time to analyze basic records to determine which lines, areas, types of vehicles, times of the day, individuals or groups of operators or kinds of accidents require special attention, is not daily, weekly, monthly or annually. Instinct or inspiration will not prompt you to select the particular problem in most need of corrective measures. On the other hand, an elaborate record system will not tell at a glance just where tomorrow's efforts should be aimed.

We can justify undue emphasis on records covering every detail of our accident picture

by saying it is impossible to determine what phase of the operations is costing claim dollars unless we have at our fingertips a day-by-day picture of each minute component of each accident. Cluttering up your files with non-essential accident records which require daily or weekly attention certainly is not going to reduce accidents.

Top management is not impressed by formidable reams of records. Don't wait for an order to reduce paper-work! Self-imposed restraint in documenting details will not only lighten the clerical, administrative and supervisory load of the safety department, leaving time and thought for action, but will also produce the results that management is entitled to and demands from the safety program.

HAVE ACTION—NOT RECORDS

There is a happy medium between processing too much accident information on the one hand, and not compiling or periodically analyzing basic records on the other hand. The safety man who thinks he can get along without records is a fool, but the safety man who overdoes the record-keeping will be so confused and have so little time for constructive work that he will actually find an ever-increasing number of accidents to add to his records.

To specify precisely what records are necessary is virtually impossible. The size of the operation, the effectiveness of the present safety program and other individual considerations all have a bearing on the answer. Two transit properties of identical size and operating characteristics may well require entirely different amounts of record-keeping to aid in their respective accident-prevention efforts.

A little study will reveal that we seldom refer to a great portion of our records. If we desire to use them, it would not be difficult to obtain special statistics promptly, provided we plan the basic record-keeping in such a manner that you won't need an electronic brain to produce the information.

The real secret to a successful, economical and effective accident record system lies in intelligent planning of the raw material. If you secure adequate primary information, it is easy to extract almost any specific data, including helpful comparisons, trends and examples. Just see to it that your thinking and planning and doing are not hampered by the vicious habit of piling up records that smother rather than serve a progressive program of safety promotion.▲

WE CAN DO MORE WITH ACCIDENT STATISTICS

by PATRICK S. SIROIS
safety director, Miami Transit Co., Miami, Fla.

As far back as 1945, M. A. Kraft, then director of personnel and accident prevention of the American Transit Association, said transit companies need a progressive program of accident analysis. To accomplish this, he stated, they must improve individual accident reporting by employees, expand present classifications of accidents into logical detailed groups, and establish a system of adequate files for quick, convenient, analysis of accidents along many different lines.

This need is as definite now as in 1945. Accident statistics are the compilation of fact and data of our fleets' accidents. We can do more with accident statistics, because they reveal answers to many of our problems. You can't lick a problem you don't know you have.

Suppose you were starting with a new company or with an old company which never had a safety program. How would you get started? You would find out what specific problems the fleet was having and then apply specific corrective measures at the specific problem. This would call for records, and if these were non-existent, incomplete, or difficult to evaluate, you'd do a lot of digging until you would come up with specific recommendations.

Many companies today don't keep records. Some keep many records, but don't use them.

TOO MANY OR TOO FEW?

Whether you are keeping too many accident records can be decided only after an analysis and evaluation of those records are made.

Adequate records must reveal unsafe acts, equipment, conditions, practices, or unsafe combinations of these factors. Unsafe acts can be controlled, unsafe equipment made safe, unsafe conditions improved and unsafe practices regulated by policy and supervision. But the control is not strict discipline. The control is driver education and driver improvement programs which bring about voluntary correction.

Adequate records must indicate trends to compare with other fleets in the area and the overall police experience in accidents. Most local law enforcement agencies keep detailed accident map studies and are glad to compare notes. Adequate records show the frequency and severity of the accidents, the most frequent type or classification of accidents and the cost of the accidents.

Effective records provide information for management. Management must see the need and necessity for specific problems you are attempting to solve and then will support and lead those programs.

Records also provide the safety man with information to see the problem of accident prevention. When he can see the problem, isolate it, and plan specific action, he is on his way toward reducing operating accidents.

Records educate the bus operators and passengers, to indicate areas of need. They also help persuade public officials to get bus loading zones, correct hazards unsafe for other drivers, establish adequate, safe routing, or rerouting. Again you have to show a need and a necessity based on records of your accident experience.

Records have legal value, and are strong deterents against fraudulent claims. Fair settlement depends on sound analysis of causes and circumstances.

Our records consist of operator's report of an accident, investigator or supervisor's report, and the claims file. If the operator's report is complete, we can do a good job with the other records. However, we usually don't rely completely on the operator's report, because some of us often require more detail from the investigator's or supervisor's report. If you have access to the entire claims file you should have an adequate source of information.

Most of the basic records in the safety department, consist of a daily log or accident register, a location file, a summary, and an operator's card or file, in addition to forms for either the ATA or National Safety Council.

The daily log or accident register is the first step in compiling information. We keep a more detailed log than the Accident Register prepared by NSC, covering number of passengers, passengers' or observer's names secured by the operator, the accident point rating for incentives and a brief description of the accident.

From this register, we have details such as, time of day, day of the week most accidents happen, and location of accidents. Also included are vehicle and operator most often involved, other person, vehicle or subject most often involved and the type of accident most often experienced. This breakdown provides the source for proper analysis.

The operator's individual card or record will reveal the number of accidents in a particular period of time, the type most often experienced, or pattern of accidents, and how the individual operator compares to the average of all operators.

Location files, vehicle and route information pinpoint areas to explore, analyze and correct.

Accident loss control must be the end result of sound accident prevention programs. Cost data will show which accidents are the most expensive and why.

A SAFETY MAN MUST BE CURIOUS

Besides interest and ability, the safety man's greatest assets are curiosity and imagination. Even after he has developed adequate source records, established basic records and made primary breakdowns—he still has not done all he can do with accident statistics. He knows he must analyze the information on when, where, what, who, why and how.

Asking questions reveals the primary causes of accidents. But you also have to see the underlying causes to see your problem completely, and these are multiple and complex.

The problem of accident prevention will be solved when we forget who was primarily at fault, uncover underlying causes and make these as obvious to drivers as the acts of following too closely, or failing to yield the right of way. To name a few, illness, inattention, emotional mal-adjustment, lack of adequate training, lack of supervision, or poor attitude, may be the underlying causes.

When the safety man sees primary underlying causes, he can take corrective action along productive, rather than general lines. The action he takes may be developing, improving or recommending the selection and training phases of the program. He may recommend proper maintenance of equipment, passenger education, hazard studies, bus stop surveys—programs aimed at more efficient supervision or driver retraining.

The safety man's records and analysis are to him what charts are to the navigator—they reveal the problem and steer him in the most beneficial direction.

WHAT CAN WE DO COLLECTIVELY?

We are not alone in this fight against loss due to accidents. Although we work as individuals, we have the National Safety Council's services. Not all of use are using these services. We haven't as yet started to compare on a uniform level, or relate information about our successful procedures. When we have a problem, we write another partner for a rundown of his experience. This takes time, and sometimes the person we write doesn't have the answer. We are missing a bet if we don't develop a single, convenient method of getting the information we need to do a better job.

Collectively, we can do more with accident statistics! We can agree on a uniform classification and analysis of accidents in the transit industry. We can report our experience periodically to a central agency for compilation and comparison with other companies. A better overall picture is shown with thousands of accidents and millions of operation miles than with local experience.

The objection is that our system is pretty good and serves our purpose. However, it isn't working half as well as it might if we still have problems to ask individuals. We have an excellent medium of exchange in "Transit Topics."

Since we all use something else, let's agree on something which will provide the answers. Let's use the ATA code and classification and Form Vehicle 20, Experience Analysis to poll and exchange data. A study of millions of operation miles and thousands of accidents should produce answers to many of the questions.

Our companies became members of National Safety Council for specific reasons—to get ideas, suggestions, help and knowledge which will effect accident loss control. Most managements have learned from hard, bitter, expensive, experience that general programs, will not produce the results desired in accident loss control.

Aside from reducing accidents in our fleets, safety men have further obligations to communities and fellow safety men. Accident prevention on the community level pays dividends in good public relations and greater safety in the community, which has a decided effect on accident experience. We owe each other the benefit of our experience and achievement.

I respectfully urge and recommend that we begin using the ATA code and classification and the Experience Analysis, Form Vehicle 20 and start sending periodic reports tot NSC. If you are satisfied with your present classification, fine, keep it. But in addition, take a few minutes each day to code and classify according to ATA. If your programs are secrets, omit the name of your company. With a good accident register, the ATA code and Experience Analysis, we may not have to keep too many records.

If we do this collectively, our experience can be summarized. We can determine a par or mean average, and measure ourselves either above or below standard. If below, we can direct our activities toward specifics. The best fleets can advise on solving a problem. They even may find that while their numerical experience is pretty good, some fleets with higher numerical scores have solved the problem of controlling cost. We can lose no more than a few minutes a day and have a great deal to gain.

The number of records you keep is your concern. I am not advocating that you scrap what works well for you. I am, however, advocating that you ask more questions of your records, dig deeply into underlying causes, and go after the problems through adequate records.

I recommend we start summarizing our experience in a uniform manner on the recommended ATA code and classification and Experience Analysis and that we do this on an industry-wide level. All of us will see new, unknown problems, how the experience changes from time to time, and how to solve the problems uncovered.

If we do these things, we will have done all we can with accident statistics and will reduce accidents making our transit industry the most attractive, efficient and the safest in the country.

THE MECHANICAL DEPARTMENT'S ROLE IN SAFETY

by HYMAN FELDMAN

director, surface maintenance dept., New York city Transit Authority, Brooklyn, N. Y.

A miracle occurred in New York! The Surface System of the New York City Transit Authority operates nearly 2,000 vehicles in all boroughs of the city of New York. This year 413 million passengers will be carried 76 million miles. Eleven garages and a base shop house, service, clean and maintain this fleet.

During the ten years prior to the fiscal year ended June 30th of this year, a total deficit of 77 million dollars accrued to the Surface operation. This continuing deficit reached a climactic point in fiscal 1953 when a deficit for that year alone reached a peak of 14.6 millions of dollars.

The Transit Authority, with consulting experts of the industry, researched the entire matter. The experts said fresh thinking, new experienced management officials and strong, dogmatic, skilled, experienced controls were required. Consequently they hired transit experts with known skills to devise and implement correctives.

The fiscal year ending June 30th this year saw this system in the BLACK. A miracle occurred in New York.

PROCEDURES NOT UNIFORM

What does all of this have to do with safety?—A good question. A first act in reorganization was examine the system, ascertain the problem and attempt to arrive at a solution. One basic problem became very clear—procedures were not standardized and practically everyone had his own way of doing a job. While the problem was simple, the solution was not.

In any case, since procedures required standardizing, numerous projects began to ascertain the best method for performing the work in standard operating procedures. After this "writing" phase came implementation. Obviously pitfalls arose and it was here the matter of safety was thought about.

Proper, economical and efficient maintenance is performed by using certain simple impediments. A man properly trained understood his work, and had adequate, proper tools and parts was required to accomplish the feat. The man was available, the procedures were established as mentioned before, and the simple term "safety" alone accomplished all the other requirements.

How could a man work efficiently and safely without adequate light? How could he work efficiently and safely without the proper tools and parts?

STUDIED SAFETY AND EFFICIENCY

Maintainers were seen with flashlights under their arms attempting to tune-up engines. Experts studied proper portable lighting and designed and manufactured a special fluorescent lamp. This lamp lights work and even permits a maintainer to stand in front of the light without casting a shadow and/or reducing the light intensity.

Furnishing proper tools and parts was simply handled by requiring the use of proper tools and severely disciplining those who did not use them.

While discipline may be necessary in both the safety and the maintenance fields, it alone will not breathe continuing safety practices or efficient maintenance. A safety consciousness must be present.

A special standard operating procedure was prepared, titled "Safety," which established safety committees of two hourly rated men and two annually rated men. Committee membership rotated so that each man would serve for one year with replacements each three months. One man was safety coordinator.

Once a month the safety committee at each location conducts a meeting on company time. Attending are committee members, the safety coordinator, the location chief, the division chief and the location's transportation department location chief attends.

The committee first inspects the area. Secondly, all employees are instructed to inform committee members of unsafe practices. At the meeting all items of safety —those noted on the formal inspection, those mentioned by employees and those mentioned by the transportation location chief,—are discussed. A report after each meeting makes it MANDATORY that action taken be noted as well as firm target dates for action. If these last two items are left off, the report is returned.

Also, at the safety committee meeting, every accident, notwithstanding seriousness, is reviewed by the committee and a recommendation is made.

An effort is made to enhance the importance of the committee members first, by posting their names on bulletin boards, secondly by each wearing a large attractive badge and thirdly, by giving them inspection freedom not permitted others of the same title.

In the base repair shop where there are more and more men, the same general committee set-up is established, except a representative is appointed from each activity. There is one man for floor work, body work, convertor work, unit rebuild and paint shop.

Although the committee members are from different activities in the shop, they are urged to criticize their associates' areas.

There is greater latitude in the base shop and consequently, friendly rivalries spring up between the various areas. Lots of joshing begins when results of safety matters are announced. This friendly rivalry is very helpful towards enhancing the safety record.

Four foot by eight foot signs were erected at all parts and tool room windows which read "SORRY—NO STOCK on Hands, Fingers, Toes and Legs." The shop maintenance forces consider these signs humorous and joke about them constantly, increasing safety awareness.

Moveable safety slogan rocks were installed in the shop, equipped with a different slogan. These are moved about every few days to keep them fresh at all times.

SIGNS, SLOGANS, CHARTS

Each area in the shop has a large sign which reads "Housekeeping" with a slot underneath for the words "good," "fair" or "poor." On Friday, the safety committee tours the shop and rates each area by marking the signs. This routine has generated tremendous interest as well as competitive spirit. It has been particularly good because hourly rated men act as judges.

This shop also has two charts listing the name of each section with a man-hour-exposure tabulation. Each week the number of exposure hours without a lost time accident is calculated and a red ribbon stretched to the cumulative total figure. This too generates competitive spirit and the workers become perturbed when someone harms their record. Through this, each group is aware of the American Transit award won for at least 250,000 exposure man-hours without an accident and informs them how near they are to the goal.

This year we began a competition among all locations and units in the shop. All location chiefs wrote a personal letter to their employees telling them of the importance of the contest. Large bar charts have been posted showing the positions of all entries. Each person in the winning group will receive a pin at a ceremony.

Our safety committees and supervision know that our practices are much more safe. But they are working even more diligently towards enhancing safety than they did previously.

EMPLOYEE SAFETY

by WILLIAM I. LITTLE
superintendent, Transportation division, New Orleans Public Service Inc.
New Orleans, La.

Every employer today gives much thought to his employees' safety. If this desire to make jobs safe was not brought about by man's desire to care for his fellowmen, it was encouraged by the National Safety Council and other organizations. If those two incentives were not enough, then employee compensation laws and the high cost of settling claims of employees injured have made it mandatory that we make our jobs as safe as possible.

After the industry and company take safety precautions by improving equipment and instructing the employees, the next move is to get the complete cooperation of all employees. They include top management, supervisors, foremen, clerks and the men on the job.

The New Orleans Public Service Inc. has a program to promote employee safety. This may not be the program you should use—yours may be far more effective. However, we believe the way to improve performance is to coordinate proven methods of other companies applicable to our needs with our own ideas.

At Nopsi, our safety training is broken into the following six steps.

1. The value we attach to employee and public safety is discussed with new employees.
2. Safety methods and practices are discussed and taught during an operator's training period.
3. Follow-up and close observation of an operator are made after he starts in regular service.
4. Personal safety and unsafe acts are discussed at refresher conferences. Safety training films and other visual aids and posters, are used.
5. Personal safety is stressed with public safety at safety celebrations.
6. Employee publications review good safety practices and noteworthy safety accomplishments.

The interviewer, who talks to an applicant before he is accepted by the department, discusses the importance of personal and public safety. He shows him the pride the company and employees take in safety records, and how these things are important in the way the public feels toward the company and from the humanitarian point of view.

NEW EMPLOYEES' ORIENTATION

This continues in orientation by the employment department after he is employed and before he is sent to the transportation division for his initial training. He sees an orientation film which emphasizes the company's efforts to make his job safe, and some awards received by the departments and divisions of the company. This lets him know he is a member of a team interested in his welfare, and stimulates his thinking of safety.

When new men report to the training school, their training in safety takes a more practical course. They see through motion pictures and slide films the safe way to do their job.

The types of personal injuries we experience are similar to those of other transit operators. Some of the more frequent types are:

1. Arm, hand or back injuries from handling the steering wheel.
2. Back and arm injuries in raising windows.
3. Hand, arm or back injuries from handling trolley retrievers.
4. Eye injuries in placing trolley poles on wires.
5. Falls.

On the practice track, they are shown the correct way to turn a steering wheel with the least amount of strain on their backs, shoulders and arms. They are told that one out of six personal injuries come from handling the steering wheel. We teach them to pull the steering wheel as if it were a rope. It surprises them to find how much easier it is to pull the wheel than to push it around. Strain and over-exertion, two other frequent classifications of personal injury, often come from improper handling of the steering wheel.

OBSTACLE COURSE TO DRIVE

Our practice track has a section of roadway with built-in ridges and depressions like rough street surfaces. They see here how the steering wheel can be jerked out of their hands, causing injury to themselves and possible injury to passengers if they lose control of the vehicle. With practice over these bumps, they learn to grip and control the wheel. We also set up large barrels, staggering them to force the operator to zigzag through them, and show him how to steer without straining and how to drive through tight spots safely.

The track has sample stops similar to those on our routes: a stop just after a right turn, one after a left turn, and one where you make a short turn to get up to the curb. If this lesson is learned well, the operator should perform his duties in a safe and efficient manner.

Raising and lowering windows are a frequent source of injury to operators and an inconvenience to passengers. The new operator sees it is easier to raise or lower windows before the bus leaves the garage. Without passengers, he can face the window and brace himself so the strain is on his legs rather than his back and shoulder muscles. Standing in the aisle making a quarter turn to raise a window is a good way to strain his back, especially if the window is stiff.

New operators are shown the proper method of resetting trolley coach retrievers to prevent hand, arm or back injuries when the trolley poles dewire. And they are shown where and how to stand to avoid eye injuries when placing the trolley poles back on the wires.

Many employee injuries result from falls. Getting on or off a vehicle, walking or running to the comfort station, walking or moving around the stations and bus lots. Injuries from falls are hard to control. No one wants to fall but anyone is prone to rush, which may cause him to slip. We emphasize "look where you are going" and "take your time," to minimize this type injury. Good housekeeping will help; oil slicks reported and taken care of, and objects picked up, especially from steps, reduce tripping hazards.

Close follow-up is made by instructors and supervisors after the new man begins. We stress to both new and experienced operators that safety measures are designed to help them and are essential to the welfare of the employee and his family. We sell him on the safe method being the best for him. We are not critical of an operator because he has to be shown how he is helped by safe practices.

Every year, our operators go to our training school class in groups of 30 for a one day's discussion. We discuss personal injuries of operators without giving names and ways these accidents could have been avoided. The men enter into these discussions, expressing their own views and are encouraged to make suggestions. When they can make suggestions, they are more likely to put them into practice.

FOLLOW-UP AND CLOSE OBSERVATIONS

Every year since 1948 we have had department get-togethers to celebrate winning various awards for safety achievements, both in public and employee safety. These awards have included the National Safety Council's "Award of Honor," the American Transit Association's Silver Plaque for Traffic and Passenger Safety, and a number of Bronze, Silver and Gold Awards from the American Transit Association for record man hours worked without a lost time accident.

These celebrations are attended by the employees and all the members of their families. We show them that their part in establishing records is sincerely appreciated by the company.

Officials from the president to the foremen express their appreciation. The main point we emphasize to employees and their families is that their good work is valuable to themselves and the company and that it is appreciated. A pat on the back does a lot of good and we all try to do a little better after that little pat on the back. In this way, we promote a desire in our operating people to do a safe job without making them feel they were brought there to be preached to.

"Transit Service," the monthly magazine of the transit department sent to all employees' homes discusses accident prevention work. The July 1957 issue featured the safety awards received in 1956, with the cover showing the eight awards received during the first six months. The feature article covers the awarding of the American Transit Association's Silver Plaque, and point out how the award was earned by the members of all divisions working together.

In other issues, operators' individual safety records are shown and the names of men receiving safety certificates are listed. Letters of commendation are published. Many point out how an operator handled his vehicle safely.

All these things help remind the operator he should be safe while at work and his safety record is appreciated by the company. But most of all, he and his family really benefit from his safe operation.

OFF-THE-JOB ACCIDENTS

Statistics are such boresome things
And figures rather dull.
It's hundreds, millions, billions, trillions,
Over which we mull.

But facts are facts where'er we go
Regardless of amounts,
So here's some facts on accidents,
And that's what really counts.

It isn't always big machines
With blades of sharpened steel
That rob a man of arm or leg
And make his senses reel.

Nor is it always "on the job"
Most accidents take place,
But just the opposite is true
And figures prove our case.

It's carelessness in little things
At home and on the street
Neglect in moving objects small
Away from running feet.

A makeshift ladder, sliding rugs,
Electric cords that spark
A disregard for cellar stairs
And stumbling in the dark.

Crossing where no crossings are
While looking at the sky,
Driving on a slippery road
With milestones whizzing by.

These are the things that take a toll
We all should frown upon
So watch for them when off the job,
As well as when you're on.

—Humble Pipe Line Company, Houston, Texas

DO WE DRIVE AS WE LIVE?

by DR. PRESTON BRADLEY
Pastor, The Peoples Church of Chicago, Chicago

When talking about safety you only have one theme and all you can possibly do is a variation upon that theme. The effectiveness of what you're saying will depend entirely upon your capacity to create the variation.

I'm chairman of the Library Commission of the City of Chicago and chairman of the Mayor's Commission on Human Relations and a member of the Illinois Prison Investigation Commission. I've given a great deal of my life to enterprises with a civic circumference. But, I get a little tired about the constant undignified references to Chicago. If they would only tell all the truth it wouldn't be so bad.

We are in an era where accidents, murders, immorality, corruption and sin are news. Goodness and truth and achievement are not yet news. They do not possess the dramatic quality of news and that happens in this matter called publicity. Let me tell you what I mean. I could lecture giving the best of my mind, the best of my thinking, the best of my energy.

I could project my ideas to the best of my limitations which are many and nobody would pay much attention. Every editor in the city of Chicago is my friend. But the probabilities are that no matter what I'd say while I have this opportunity, it won't make any headlines. Nobody will care much about it, nobody.

THIS MAKES NEWS

But, I can put my name in one inch letters on the front page before eight o'clock tonight of every newspaper published in the city of Chicago with no trouble at all. All I have to do is artfully get my fingers in your pocket and get your wallet and put it in mine and then go around and visit some more and get in and get another wallet and get four or five of your wallets and start out of here.

The house detective gets me going out the door on La Salle Street and says, "Doctor can you step into the office a minute." He finds your pocketbooks in my pocket. There isn't a newspaper in the city of Chicago that won't have a headline "Doctor Bradley Arrested As A Thief." That's news.

Until we can bring sufficient pressure on those who have the power of creating public opinion in your field and in mine and in every other area which affects the human personality this is going to be an uphill battle.

PUBLIC OPINION BRINGS ACTION

The greatest force and power in a democratic society are the newspaper, the lecturer, the educator, the person who has the responsibility of creating public opinion. For public opinion leads to action and action leads to destiny and destiny is where we are all involved.

You can have a technical appreciation and technological education of the whole problem of safety. You can exchange ideas at national Congresses; you can discuss the by paths; you can do all that. But you and I must find the way in which we can touch that intangible power in a democratic society in which every problem is involved in the creation of public opinion.

Just as the present cold war of the world —a war of missiles and satellites—is not a cold war in which the national boundary lines of unimportant nations are involved or little inarticulate people. It's not merely a cold war in which the representatives of the free world argue and meet and discuss in the United Nations. Fundamentally, it's deeper than that.

This cold war is a war for the human mind. When we come out into the area in which the most valuable thing in the world is involved—a human life—we've got to become more basic and more fundamental than I sometimes think we are. It isn't enough to have a technological understanding of the problem; it isn't enough to have a machine made with honesty and integrity in your control.

Have you ever thought that there never was a perfect machine yet that could not be destroyed and wrecked by an imperfect machinist?' The integrity of the machine

today is beyond question. Never were the manufacturers more honest; never was there less cheating in the actual product of transportation.

All of the great industrial equipment of the nation in the creation of the wheel, which is the symbol of the whole problem, were never more integrated with the basic honesty than they are today. I am familiar with a great many of them, a great many of the manufacturers, a great many of the techniques that are used. As an outsider who knows nothing about the technical aspect of safety I want to suggest to you something deeper; something more fundamental.

PURE ACCIDENTS DON'T OCCUR

I don't think that there has ever been a pure accident. I am not one of those who accept the philosophy of fatalism. I am not a fatalist in my theology and I am not a fatalist in my philosophy. And I have lived a long time in the heart of a population of three and a half to five million people and I'm face to face with this problem every day.

Perhaps I should tell you I never drove an automobile. I've been guilty of many things in my life but I've never been behind the wheel of an automobile. I've had an automobile every since there have been any and I have one today. But I have never driven an automobile in my life. Right now I imagine some of you are thinking, "What in thunder does he know about safety?"

Now don't be too sure. As one who doesn't drive, my opportunity to observe my chauffeur and the other fellows on the highway is pretty acute. Don't you discount the authority of that observation.

SAFETY DEPENDS ON PERSONALITY

I think that many times we've been a little wrong in our emphasis about some aspects of safety. When you resolved it all down to its final point it is a matter of personality. It's just as simple as that! It's a matter of personality! I submit this observation to your consideration for you are most deeply concerned.

Something happens to every man who gets behind the wheel of an automobile. Something happens to him, psychologically, and 99 per cent of the accidents both fatal and of *little* consequence can be traced to a personality defect, a fundamental personality defect.

I have written eight books, two of them on the human personality and I think in this field I speak with some element of authority. I'm dealing all the time with the human element—the element of personality. I have never yet seen a situation which could not be traced to some defect in the personality.

That means that over the long pull with the ever increasing opportunity of speed on the highways of America, and with the application of the scientific aspect of transportation which the experts are giving to us in the creation of the great freeways of the nation, we still have much work to do in the matter of driver's personality.

Last week I was speaking in Los Angeles and a friend of mine who was interested in this very subject took me out on the highways and freeways around Los Angeles. It was a never to be forgotten experience and in a matter of just two or three hours, I saw three tragic accidents in which the lives of eight people were involved.

. . . BECAUSE OF HUMAN FAILURE

When we followed through the investigations that came later, it was not alcohol or the like, it was human failure—lack appreciation of the rights of the other driver.

Obviously, no man should ever take the responsibility of all of his faculties. And, those faculties should not either be depressed or encouraged by an artificial condition. When a brain is befogged with alcohol, even a microscopic presence of alcohol that you could hardly detect on the breath, there is a psychological reaction in the person's will and judgment.

The idea that a person has to be so drunk that he staggers or that he weaves in traffic in order to come under the classification of intoxication is ridiculous. You can't take a spoon full of alcohol in a position of responsibility like that and not have a direct affect upon your will and your judgment. I think that there is an area of education is that field that sooner or later we've got to do something about. It isn't enough to treat it as objectively as it is being treated today.

If the job is really going to be done in the presence of the trend to create more power in an engine, *it will* take more regulation in the state legislatures and assemblies of our country. The paradoxical situation of most state legislatures talking about 65 daylight and 60 night time and putting increased limitations on speed and in the meantime the manufacturer providing more horsepower is creating serious situations.

I'm not so sure but what it's dangerous to put into the highway an instrument in the hands of a man who depends upon something called quick pick-up knowing that under him is 200 or 300 horsepower, that he can take a chance in any spot because he knows it's there.

I don't think we're beginning early enough to teach safety. This is a power age. Every kid is smitten by the power bug. I've got a nephew that's already talking about space flight. He explained to me the other day how to make a platform in the moon where they can land. He's got it all figured out.

Of course, I don't get as excited about those things as a lot of people. This little piece of tin running around the globe in an orbit doesn't bother me. I don't know why anybody bothers the poor old moon or Mars or any of the rest of it. I think we ought to be doing something about this earth first.

TRAIN PEOPLE EARLY

If we could have saved this money, half of the billions the taxpayers of America pay, to begin this problem of psychological training for the individual at the time we should be at it and not wait to do the job, we'd get the job done. We should be getting at this problem in the earliest grades of school.

We need to study the human personality; we need to develop the whole philosophy of one's reactions and reflexes and responses which are involved in any moment of emergency. What's the test of a man's character anyway? If we should have at this moment some great catastrophe; if there should be an explosion; if this roof would start falling in—we would all be experiencing some great emergency.

Let me see you in the first minute of that emergency and I'll read your character. Let some tragedy come into your life in the next 30 minutes. Let something happen and let me see how you handle that and I'll tell your character.

Most of us can be honest most of the time. Most of us can be true to one woman most of the time. Most of us can pay our debts most of the time. Most of us are pretty decent most of the time. Most of the time doesn't matter, it's what we are the rest of the time that matters, not most of the time.

EMERGENCIES REVEAL CHARACTER

A person is fundamentally what he does and how he responds and how he reacts in an emergency. If you can shape the human personality early enough to build a fortification for the emergencies of life you've done something to transform the whole area of our modern world.

This is a battle for personality and that's why I think that there are psychological tests that are now so definite in their character and so unimpeachable in their authenticity that I should think we would require a psychological analysis of each driver's personality.

There are people who have most of the major requirements but are so sufficiently defective in fundamental requirements that they go to pieces and you wonder why a sudden flare up in the highway happens, when sudden anger arises.

If my chauffeur who's been with me for many years ever told me I had the right of way, I'd fire him. There isn't any right of way, fundamentally. There is only a right way and yet there are those on these highways whose character becomes suddenly transformed and anger comes quickly. That's part of his personal character.

POWER AGE GROWING

It hasn't anything to do with his ability to drive or the principle of safety. It's a psychological factor in that person's life and I think we're wasting a whole lot of time and a great deal of our emphasis: first, by not beginning early enough. This is a power age and it's going to increase in power as the days go by; we haven't even started yet.

The automobile itself will undergo such a great transformance in the next 25 years that none of you would hardly recognize it today. Safety problems are going to increase not decrease. Let us, in the great area of *the mind and in the psychological*

aspect of it, recognize how important that phase is, too.

You let me see a person in traffic with responsibility and let me sit along side of him and analyze his reactions and I will grade that person's basic responsibility and understanding of safety to an uncanny degree of perfection. Let me see his reflexes and his responses and I will ascertain the quality of his understanding of safety. If pride and self-importance and right of way and all such factors are predominant, he's dangerous. And sooner or later he'll have trouble.

Of the awards that we have made in the city of Chicago for safety, and I've been making them to the Police Department and the Fire Department and to other institutions in our city, the recipients have been the most highly integrated characters in the departments.

A man for safety is an integrated personality. He's a man who is completely in control—first of his mind, next of his emotions, next of his body, so that he is in control of every given circumstance. That man knows and practices safety. Let us have more of those kind of men.

REPORT OF THE NATIONAL FLEET SAFETY CONTEST COMMITTEE

by E. G. COX

chief, Section of Safety, Bureau of Motor Carriers, Interstate Commerce Commission, Washington, D. C.

Each year we report the current National Fleet Safety Contest, bigger and better than the year before. To some, this might sound repetitious and uninteresting. We know, however, that the situation indicates progress both in volume of accident data and in the accident frequency rate of reporting fleets. The mileage of participating fleets increased 215 million miles in 1957 compared to the previous year, yet, accidents dropped 200. The result was a decrease in frequency rate of five per cent.

The average frequency rate of 1.51 accidents per 100,000 miles operated is the second lowest frequency rate in the history of the contest. It is only exceeded by the 1954-1955 contest rate of 1.44.

Records of winning fleets were verified by personal audit for the seventh year. The largest number of contestants were checked by audit than ever before. The 325 audits represent over 93 per cent completion despite the difficulty of obtaining representatives of the contest committee in each state, Canada and the Territorial Hawaii.

From the audit work sheets reviewed by members of the contest committee, it was found that 70 per cent of the contestants were certified exactly as they reported to the contest. Twenty-one per cent of the audits resulted in some change up or down in mileage or accidents and in nine per cent of the audits, the contestant dropped out of the running.

250 AWARDS PRESENTED

More than 250 awards are being presented to contestants in the 1956-57 National Fleet Safety contest.

These consist of first, second and third place awards, as well as perfect record certificates.

To each of the winners, we extend our heartiest congratulations and to the runners-up our hope for improvement during the coming year. To every contestant who participated in the contest, we offer our thanks.

Needless to say every contestant cannot be a winner. Yet, every fleet that improves its record in each succeeding year is a winner by virtue of savings to the company in dollars and lives.

OFFICERS OF THE

TRANSIT SECTION

NATIONAL SAFETY COUNCIL 1957-58

General Chairman—D. L. WILLIAMSON, supervisor of accident prevention, Cleveland Transit System, Cleveland, Ohio.

Vice Chairman—J. GODFREY BUTLER, director of personnel and labor relations, D. C. Transit System, Inc., Washington, D. C.

Immediate Past General Chairman—JAMES S. OSBORNE, president and general manager, Cincinnati, Newport & Covington Transportation Co., Newport, Ky.

Secretary—JOE V. GARVEY, general manager, Harrisburg Railways Co., Harrisburg, Pa.

Membership Chairman—J. M. BUSBY, JR., safety director, Memphis Street Railway Co., Memphis, Tenn.

Program Chairman—ELMER R. SCHUEMANN, superintendant of transportation and safety, United Motor Coach Co., Des Plaines, Ill.

Members at Large:—CARL J. ANDERSON, personnel director, Milwaukee and Suburban Transport Corporation, Milwaukee, Wis.; HOWARD M. BAKER, safety director, Montreal Transportation Commission, Montreal, Quebec, Canada; R. DEWEY CASSELL, general manager, Safety Motor Transit Co., Roanoke, Va.; TYRELL ESTEP, safety director, Indianapolis Transit System, Indianapolis, Ind.; PAUL J. FANNING, director, Bureau of Personnel and Safety, San Francisco Public Utilities Commission, San Francisco, Calif.; BERNARD C. HAMEL, supervisor of personnel, safety and welfare, Quebec-Autobus, Ltd., Quebec, P. Q., Canada; CHARLES E. KEISER, superintendent of transportation, Chicago Transit Authority, Chicago, Ill.; VAN COURT LUCAS, administrative assistant, American Transit Association, New York, N. Y.; LEE MILLS, director of safety, Cincinnati Transit Co., Cincinnati, Ohio; PAUL W. MOYER, general superintendent, Lehigh Valley Transit Co., Allentown, Pa.; J. W. PRUTSMAN, safety director, Los Angeles Transit Lines, Los Angeles, Calif.; MACHLIN E. STERNBURGH, director of safety, New York City Transit Authority, Brooklyn, N. Y.; PATRICK S. SIROIS, safety director, Miami Transit Co., Miami, Fla.; B. SUDDERTH, safety director, Dallas Transit Co., Dallas, Tex.; C. R. SYPHER, manager, Safety Engineering Department, Transit Casualty Co., St. Louis, Mo.; RALPH T. TALBOTT, safety supervisor, Phoenix Transit System, Phoenix Ariz.; ELLIOTT A. THIEL, director, Accident Prevention, Columbus Transit Co., Columbus, Ohio; J. L. WEEKS, general supervisor of safety, South Carolina Electric and Gas Co., Columbia, S. C.

Counselors:—M. C. BULLOCK, supervising engineer, Transit Casualty Co., St. Louis, Mo.; COLIN DOBELL, director, Transportation Safety & Training, B. C. Electric Co., Vancouver, B. C., Canada; ARTHUR J. NAQUIN, safety counselor, New Orleans Public Service, Inc., New Orleans, La.; H. W. WHITCOMB, superintendent accident prevention, Philadelphia Transportation Co., Philadelphia, Pa.

Staff Representative—CHRIS IMHOFF, Motor Transportation Division, National Safety Council, Chicago, Ill.

LEARNING TO LIVE . . .

Learning to live—safely—was the drawing card which brought more than 13,000 men and women from the United States and 27 other countries to Chicago for the 45th National Safety Congress. These people gathered to exchange the latest ideas in safe attitudes, safe methods and safe equipment. Through speeches, panel discussions and symposiums, they acquired new ideas for helping others—and themselves—to live, work, and play safely.

This was the reason the National Safety Council was organized less than half a century ago, a time when man's thoughts barely kept pace with the industrial revolution. Since then, man has introduced an atomic age which is bringing the continents closer and has made the earth a smaller world. And now man anticipates inter-space travel!

Through science and technology, man is progressing to increasing speeds in travel and production, and increasing dangers—new dangers never before encountered. These, in addition to the everyday hazards of life, occupied the thoughts of the safety people at the Congress.

To encourage more widespread knowledge of the various fields of safety, the National Safety Council publishes the Current Safety Topics—30 volumes of condensations of Congress speeches and exchanges of ideas. Each volume is a handy reference to different phases of accident prevention. The complete set of volumes are listed on the back page of each volume.

Since the proceedings have been edited and condensed for reference purposes, the complete original manuscripts with any charts or illustrations used, are available in the National Safety Council files. Views expressed at the Congress or in any volume of Current Safety Topics are those of the Congress participants, and not necessarily those of the National Safety Council.

THE WOOD PRODUCTS SECTION
TEXTILE SECTION

This volume is a record of the sessions held at the 1957 National Safety Congress by the Wood Products and Textile Sections. The conduct of these Congress sessions each year is only one of the many cooperative activities which these Sections carry on in behalf of their members, and for the benefit of accident prevention work in the wood products and textile industries generally. The Sections give guidance in the preparation of a great variety of *technical and educational material useful in the day-to-day safety programs of* wood products and woodworking plants, and textile plants.

The activities of the Sections are under the direction of their executive committees, the members of which are listed at the close of this volume.

THE WOOD PRODUCTS SECTION

SAFETY NEEDS COMMUNICATING, TOO

by HERBERT E. IHRIG
staff consultant, Florez, Inc., Detroit, Mich.

America has become the greatest technocracy in the history of mankind. Aside from our being second best in the business of creating man-made satellites, this great country of ours can probably build anything bigger, better, faster and cheaper than any other nation on the globe.

Essentially, we have been, and to a great extent still are, "things" minded. When it comes to the "human" side of the equation, we are still pretty much in swaddling clothes.

To see how "mechanically" minded we are, let's take the subject of automation. The average person will tell you that automation means building an automatic factory where you put the raw materials in one end of the machine, press a button and a packaged product comes out the other end. Peter Drucker, in his book "The Next Twenty Years" says, and I quote, "The automatic factory is the end-product rather than the beginning of automation.

Automation properly does not start with production at all, but with an analysis of the business and its re-design on automation principles. The form the automatic production takes in the plant is determined by that analysis and re-design; and mechanization, the replacement of human labor by machines, is a detail of automation and not always an essential one."

MECHANICAL COMMUNICATION

Take "communication" as another example. Realizing the need for improved communication, what have we done? Quite naturally, we have attempted to solve the problem of increasing human understanding through mechanical means.

Today, we not only have the printing press and the telegraph, but an intricate system of telephones. We can talk to our homes and offices from our cars. We have "ship-to-shore," whether the ship is in the air or on the water. Before long we'll be able to dial to any point of the world without the benefit of an intermediary operator.

We have radio and television, and the newspapers, magazines, pamphlets and books which are produced every 24 hours total up into an unbelievable amount of tonnage.

But have these mechanical means really helped us? Or wouldn't a true appraisal indicate that they have merely made it possible for all of us to misunderstand each other faster!

FASTER MISUNDERSTANDING

Now, let's relate the problem of communication as it evidences itself within the structure of our business organizations. Here again "mechanics" have led the way —perhaps backwards. For the past 25 years, they have attempted to improve understanding within business groups through the utilization of such mechanical devices as pamphlets, flannelboards—yes, even elaborate closed-circuit TV programs.

I do not mean to imply that the "gadgetry" and "gimmickry" of communication is not useful. It is indeed. However, due to our mechanistic, intellectual heredity, we are sometimes prone to think of these mechanical widgets and gadgets as substitutes, rather than as supplements to the creation of better understanding.

Tremendous strides have been made in the field of golf, for example. We have easier courses, better greens, greatly improved golf balls and superlative playing equipment, yet the number of good golfers has not increased perceptibly. There's no doubt about the fact that good equipment will make a good golfer a better golfer.

But the finest of equipment will never make a pro out of a dub. What the majority of we hackers need is to know how to swing a golf club correctly. Until we know how to do that, any investment in superior equipment can only help us produce marginal results.

LOST RIGHT ROAD

And so it is with communication. Not only have we naturally looked for mechanical means of solving the problem, but in so doing we have been guilty of taking our eye away from the right road.

The problem has probably never been better phrased than by W. H. White, Jr. of *Fortune* magazine, when he stated, "The greatest enemy of communication is the illusion that we are communicating." And he added—"and the chief reason for the preservation of this illusion is that we continue to place undue emphasis on the format instead of the context."

To put it more briefly in another way —in trying to find short cuts to our communication problems, we have developed an expensive and elaborate system of short circuits!

Allow me to indulge in a "corney" example of what I'm trying to get across. Take some kernels of one of the finest types of seed corn developed in our part of the country. It's called K-29 and it comes from Fremont, Ohio. I'm not a farmer, but I'm told that this type of seed corn will guarantee taller and stronger stalks, a highly desirable resistance to fungus, and will result in bigger and higher quality yields.

SEED REPRESENTS AN IDEA

So let's assume, for the moment ,that this seed represents an idea, any kind of idea, some idea that you want to put across. After all, an idea is nothing more or less than a mental seed. We know that the idea is good—just like this seed corn is good. Now, if I throw some of these kernels out into a meeting room, will they grow? Of course not.

Let's put ourselves, therefore, in the shoes of the farmer who wants to get a record-breaking harvest of corn. What does he do? Doesn't he take a look at the field in which he wants to plant? If he finds rocks, boulders, or stumps, doesn't he arrange to have them blasted and removed? Before going into that expense, wouldn't he send soil samples to determine whether the soil is worth planting, and what ingredients it might lack?

Assuming that the effort is worthwhile, doesn't he then plow and prepare the soil and then fertilize it as needed? Doesn't he also have to worry about the amount of moisture the soil will need—maybe irrigate, if necessary? And what about the temperature factors? Doesn't he have to plan keeping them in mind, too?

It is only until he has given plenty of thought to each and all of these many and important inter-related factors that he is ready to do the planting. He knows, of course, that the planting operation itself is probably the simplest one of them all.

ACCEPT FALSE BELIEFS

Most of us have been unthinkingly educated into accepting the false concept that it is possible to pound ideas into people's heads. In accordance with this concept, we have been trained as the shock troops of communication to increase our vocabulary, learn about semantics, study grammar and rhetoric, develop our powers of logic to become public speakers, even to become ham actors or participants in some type of a "communicational show."

The emphasis has been on improving our ability to tell other people our ideas better. Our school systems and our business systems in following this concept have done two things. They have provided us with different kinds of hammers and have taught us how to wield them more effectively. But a hammer is still a hammer, no matter what shape or size or weight. And no matter how skillfully used, an idea is still an idea—a bit of mental seed.

Probably the greatest lesson that my company learned in the past 25 years is that it is impossible to transplant an idea as such. All we can do is to stimulate the other person in such a manner as to induce him to recreate for himself a facsimile of the idea we are trying to get across.

MUST RE-EVALUATE

This, in essence, represents a complete reversal of method—a method which requires that we make a total re-evaluation of our individual concepts of communication.

Can the gimmicks of communication help us as we look upon this problem from an inside-out point of view? Certainly. But only when they are used in the right way and at the right time. These gimmicks can perhaps be compared to the mechanical corn planter—a useful bit of farm equipment indeed when used at the right time, in the

right way, with the proper seed, and given the proper soil conditions.

Since we of Florez Incorporated are primarily specializing in sales training, our greatest opportunity to experiment has been in relation to our efforts to help our clients develop greater efficiency of marketing manpower, to assist in the marketing personnel development function of marketing.

JOB DESCRIPTION

Like many other people, we have learned the hard way. For example, the simple truth that before you can train a man to do anything, you must have a pretty good idea of exactly what you want this man to do. Out of this kind of thinking comes what is commonly known as job description.

The next truth which is equally simple is that a cabbage cannot be trained to climb a trellis—even if it is made of solid gold. Similarly, we have to define generally the kind of man who can do what the job description calls for and then go out and get this kind of a man. Now, of course, I'm talking about man specifications and the elements of recruiting and selection.

There are some close similarities between my job in the field of sales training and the work of safety personnel. My job is to help develop more effective sales manpower and this really does not differ too much from the fundamental responsibility of developing safer employees.

I have just said that in applying these principles of communication to the job of developing more effective sales manpower, we learned that the beginning point was the job description, the establishment of man specifications, and the proper recruiting and selection procedures. Is this a starting point for you in developing safe employees?

PUT SAFETY IN DESCRIPTION

It is as important for safety to be written in as an integral part of the employee's job description as it is for salesmanship to be written in as an integral part of the salesman's job description? Can the man specifications for a given job be so drawn up that the safety factor is taken into consideration?

Do the selection and recruiting processes of your company tend to eliminate the unsafe employee in the same way that a good system for recruiting and selecting salesmen will tend to screen out those men who are not readily trainable, to recognize the cabbages that cannot be trained to climb the trellis?

This, you see, is some of the important soil analysis, cultivating, and conditioning which must happen before we plant the first seed. When it comes to actually planting the seed, once again it depends upon the conditions that exist. In actually training the new man, we use all three methods—on the job training, self-study, and various types of meetings.

Within each of these situations we employ the media which seems to fit best. When you go to plant the seeds that will help make the new employee a safe employee, do you have a variety of methods and media at your disposal? When the employee is new, you have your greatest opportunity to make your broadest, deepest impression and here the devices and gadgets of communication take their proper place.

MUST RE-CHECK ALWAYS

The only way to measure the effectiveness of your communication is the constant checking and re-checking of understanding. In the development of effective salesmen we feel that the close personal supervision and an organized system for performance evaluation is the only effective way to check understanding.

Does this apply in the field of safety?, Do you find the supervisor with his evaluation of an employee's performance to be a vital link in your chain of communications?

With this approach to the communications problem, I think perhaps we can see communications now not as an isolated program or campaign, but we see communications as a concept which applies beginning with the definition of the job to be done through recruiting and selection, training, supervision, and performance evaluation.

There is only one true measure of my effectiveness as a sales trainer and that is the performance of the salesmen I have trained. We also seem to agree that your effectiveness as safety directors could be measured by the safety performance record of your employees.

In other words, how good we are is measured by how well other people perform. A few years ago we worked on a safe-

driving program for the United States Army and one of the points we made in this program was that performance was a combination of skill plus attitude.

COMMUNICATIONS GROW ATTITUDES

I think it is apparent that the development of proper employee attitudes is contingent on a broad and mature understanding of the communications concept by management. If we can understand that no matter how wide the screen is, it is still impossible to transplant an idea as such.

Remember, the best farmer with know-how and the finest seed corn mechanical planter cannot make corn grow on the floor of a meeting room. Neither can all the mechanical and visual devices in the world do any appreciable good unless a company develops a concept that communication is a process of management which begins prior to the selection of an employee and carries on through the process of recruiting and selection into his everyday contacts with his supervisor.

It is this kind of effective communication that I would recommend to help you in your job of developing safe employees.

HOW TO TRAIN LOGGERS

by H. J. DEABAY
safety director, Woodlands dept., Great Northern Paper co., Ashland, Maine

"How to Train Loggers" covers a broad field and varies because of different hazards caused by terrain features, snow and ice and different sizes of timber being cut. However, training is basically the same whether you teach a man to fell a tree or operate a drill press.

My experience has been in the Northeast, so my remarks will be based on cutting and handling small trees as compared to the large Western timber. In the Northeast the one man chain-saw is used exclusively, as in the lake, southern states and Canada.

The frequency of the logging industry is twice or three times greater than it should be as is our severity. It is hard to believe some companies still do not have a formal safety program in their woods operations and that others charge the safety work to someone in personnel as a secondary duty. This is certainly not the way to reduce woods accidents.

There are several reasons why the logging industry is more hazardous than most industries.

1. Work in the bush is seasonal. The lumberjack has lost time during each year. Since most work is done on a piece work basis, the men work at excessive speeds earning as much as possible while the job lasts.

2. Every cutter works with very sharp tools, i.e., axe, chain-saw, cantdog, bark spud, and works with either a horse or tractor. The new direct drive chain-saw which turns fast, is used on snow and ice, in brush, steep terrain, all weather conditions, and by all types of workers regardless of their intelligence. There is no such thing as choosing the right man for the job during the cutting season.

EXISTING HAZARDS

3. All types of uneven terrain, rocks, roots, mud, snow and ice, and other hazards cannot be taken care of with "Non Skid Paint" or "Speedi-Dry Absorbent." These hazards exist, are exposed to all kinds of weather, and have to be accepted as part of the occupation.

4. In most of our Maine forests (and in sections of Canada) there are dead hardwood trees and stubs that are a menace overhead. Some are so rotten that the least jar will cause them to fall. Many are around yards where wood is piled and along twitch trails, but it would be costly to saw them all down and would also be dangerous.

5. Our large labor turnover is another factor that has an adverse effect on our frequency. There is much discussion on how it could be stabilized, since a lot could be

and should be done. However, it can never be as stable as our mills and factories where people live, own homes, and depend on the work in that town for a living. Several incentives would help stabilize our labor and also help us keep a better caliber of men:

1. Bonuses.
2. Contracts drawn up with employees guaranteeing them a certain number of months work during the year.
3. Sick benefits insurance and retirement benefits.

TRAINING PROCEDURES

Indoctrination is one of the most important steps of any training. A new employee is more receptive to instructions before going to work. All the instructions possible should be given at this time. A successful safety program is largely dependent on the attitude of management, supervisors and the worker, but it must start at the top. In an indoctrination program, we must tell new employees what is expected of them and what they can expect of us.

They should be briefed on the company rules and policies, who will help them with problems, where the first aid room is and to be sure and get treatment for minor injuries. Men should be told about the safety clothing and equipment available for their use and protection, and of their responsibility for the safety of their fellow employees as well as their own. Make them feel we are interested in their welfare and if time permits find out something of their past and their families.

This is not always possible in our woods camps where turnover is sometimes great, but we should do what is most important. The first impression a new employee gets of his boss and the camp he is to live in, plays an important part in how long he stays at that camp and how content he will be.

FORMAL TRAINING

Formal training is given by specially trained instructors or foremen. There are many stages of training: there may be men who know nothing about the work, others who have some experience, while some may be semi-skilled.

These men should be divided into three different groups so the ones with less experience would not hinder the progress of the others. However, until labor is stabilized, this type of training is not feasible. In addition, we may feel some men need training while in their own minds they are experts. If asked to attend a training session and be paid on an hourly basis they would be apt to pack up and go elsewhere.

Our company has tried twice to train some of our American youths. In May 1952, we went to all the high schools in the surrounding areas and talked to boys 18 years old. We explained our planned program telling them they would be paid on an hourly basis until they could produce enough to make more. We showed the earnings of skilled woodsmen and estimated their earnings in two months. We also advertised our program in the local paper. Few boys showed interest but some said they might try it. On the opening day we had one recruit from the southern part of the state.

Our second attempt was in 1955. This session began after our employment manager received letters from college boys who wanted to cut pulpwood during the summer to get in shape for the football season. Eleven boys showed up and the company started its program with a very capable instructor. They were healthy, rugged fellows with no experience and had to start out with the basic fundamentals of what tools were used and how to prepare and maintain them. They were enthusiastic and started out very well. With the exception of a minor scratch, none of the boys were injured during the summer. This was quite an accomplishment because after the first three weeks the boys were producing in crews of two or three and were on their own because the instructor was with one crew at a time.

ON THE JOB TRAINING

On-the-Job training is the type of training our company has concentrated on for the past six or seven years. Most of our employees come from Canada and are skilled to some degree. "On-the-Job Training" we make extensive use of visual aids. We show safety movies and slides which emphasize the proper and improper working habits. We also have camp meetings with the men to discuss work hazards during the current season, brief the men on our accident analysis and discuss means of eliminating reoccurrance by better working practices and techniques.

Our foremen see their men at least twice a week. Unsafe practices are corrected and any possible unsafe condition eliminated. Here are some of the common unsafe practices noted:

1. Bucking on cluttered yard (too many logs yarded in).
2. Bucking too close to pile.
3. Starting chain-saw from knee.
4. Failure to clear around tree to be felled.
5. Walking with chain-saw with motor running.
6. Men working too close together.
7. Occasionally a man is found not wearing his hard hat.

Common unsafe conditions are:

1. Working on yard with a dry stub or tree overhanging.
2. Poorly maintained tools.
3. Working on icy truck bodies.

These are only a few of the unsafe practices or conditions that may be noted. If an employee needs more attention than the foreman can give him, we could send him home because our Bood Quota calls for *SKILLED* woodsmen. However, this is a rare case. If the man was willing he could work at our experimental camp where the supervisory force has time to train him properly.

When making his rounds in the woods, the foreman talks with each crew three to five minutes about some of the hazards or an accident that happened at another camp. The safety supervisors visit the men in the woods and work with new foremen to assist and encourage them to speak to the men. One important, never ending task is keeping our employees safety conscious.

It is a foreman's obligation to inculcate a sense of individual responsibility in each employee, to himself and his fellow worker. To accomplish this, it must be made a daily task that is never completed. Should an accident occur, our foremen and clerks are trained in first aid to make a man as comfortable as possible until a doctor arrives or the injured is transported.

SUPERVISORY TRAINING

Supervisors are not necessarily all good instructors. Therefore if we expect them to do "On-the-Job" training, they should attend an instructor training course. Most insurance companies offer this service to their insured.

Good instruction is as important as good tools. A man should be told why he should do something, and should be shown in an easy manner, and observed while doing it. The supervisor should return frequently at first to make sure the job is done as he taught it.

An annual refresher training course is almost as important as the initial one. Some supervisors have done a better job of instructing after they had the course for the second or third time. There are steps and techniques that are a MUST for effective instruction. These may not be fully retained by the supervisors until they have taken the course for the second or third time.

SAFETY IN THE SMALL SAWMILL

by **FREDERICK B. MALCOLM**

technologist, Forest Products Laboratories, U. S. Department of Agriculture, Madison, Wis.

The numerous scientists on the staff of the Forest Products laboratory study every property of wood—how strong it is, how it can be made stronger—its chemical nature—what can be made with the chemicals derived from it—how it can be made more useful. In other words, these men are trying to make a better way of life through the use of wood. Why do I emphasize the small sawmill? A brief sketch of the character

of the industry will be helpful. In general, there are 50,000 sawmills that annually produce 36 billion board-feet of lumber products. One-half of this amount, or 18 billion board-feet, is produced by 2,000 large sawmills. The other 18 billion board-feet, are produced by about 48,000 small sawmills, each of which cuts less than 5,000,000 feet of lumber a year. It is this group of small sawmills with which I am primarily concerned.

They are operated by small businessmen—rugged individuals—and are located in the timbered areas or rural farm areas of every state. On the average, these operators employ no more than eight men, although a number employ as many as 30, depending upon the extent of their logging and remanufacturing activities. This is not a large labor force per sawmill, but collectively it is sizeable.

In many small communities these mills are an important industry, and most owners have a strong sense of responsibility for every employee. These small units are essential tools in the effective harvesting of our timber supply—one of our most important natural resources.

SMALL MILLS AID IN EMERGENCIES

About 75 per cent of our private commercial forest land is in the hands of four million farmers and other owners of small timber lands—in tracts of less than 5,000 acres. In many tracts the small sawmill is the most efficient method to harvest timber.

This is another reason why the small sawmills are a highly important part of the lumber industry and why it is important to keep them operating. In times of emergencies such as disastrous hurricanes that blow down huge areas of timber, these small units can quickly move in and harvest the timber before it spoils.

Few of these small mills operate anywhere near capacity. The large mill, on the other hand, is operated near capacity because the owner, with a large investment, cannot afford to do otherwise and increased production requires additional equipment and men.

Consequently, during World War II the small sawmill was an important source of increased production when lumber was critically needed. For the most part this was accomplished not by adding men or equipment but simply by increasing the operating efficiency of the mills and by operating more days of the year.

The unfortunate part of this whole picture is that small operators usually work so hard they seldom recognize that efficiency is the key to greater profits. Large mills readily recognize the need for efficiency and often hire special engineering firms to solve their problems. The small mill owners generally cannot afford such services.

Added to the small sawmill operator's difficulties is the fact he has the reputation of being a poor financial risk and of producing poorly manufactured lumber. But that picture is changing. Today a large number are efficient, produce accurately made lumber, and are quite successful financially.

These usually produce three to five million board-feet annually. Unfortunately, there are many small mills producing large volumes of lumber not nearly so efficient because they operate close to break-even cost margins. They are so absorbed in keeping out of financial difficulties they fail to see inefficient and unsafe practices which cost them money.

As a part of my work, I help small sawmill operators improve their practices. This responsibility is met through research on ways to improve small mill operations and by developing informational literature on improved practices. But one of the best mediums is to work directly with these people showing them their problems and how to overcome them.

PERSONAL CONTACT BEST

Because it is impractical to visit many mills individually, we work with state forestry agencies, forestry colleges and other organizations, conducting short courses or sawmill clinics. As many as 200 sawmill workers may attend, although small groups of 25 to 35 are best to work with. We cover most phases of small mill operations and their associated problems. But the successful meetings are those run for more than one day covering problems in more detail and giving individuals more time to "air" their problems.

Prominent among the subjects covered is production efficiency and its relation to reducing operating costs, and mill setup and alinement. Worker fatigue from unnecessary lifting and carrying contributes to production slowdown. Associated with this is that unsafe conditions and practices increase production costs. Workmen's compensation insurance is a direct cost that operators readily recognize. However, few small sawmill operators recognize that unsafe practices contribute to his cost of operation.

However, the small operator sincerely wants to practice safety but does not know how without interfering with normal production. In the past year I have been emphasizing safety as a factor in production costs, although I spend only about 15 to 30 minutes on safety as it applies to efficiency in sawmill operation.

My approach is to show them unsafe operating conditions that contribute to inefficiencies and higher production costs. I use pictures of actual conditions taken at various mills to point up my discussion.

SLANTED LOG DECK

One picture shows the log deck has considerable slant, and it is obvious the logs are heavy. They are restrained from rolling only by chuck blocks. The question here is, how can the logs be efficiently and safely brought to the carriage?

The workers must pull the blocks and run. A badly bent turn-down device is mute evidence of this. The sawmill carriage and track likewise had borne the brunt of pounding by similar logs. A slip, and a man can be badly injured or killed. The poor design of the mill deck slows production as well as being unsafe.

Another picture shows a worker dodging a log overhead. The crane operator was being crowded to unload logging trucks and was swinging the logs directly to the mill deck. The man in the center was supposed to be a spotter, but the crane man could not wait for him, hence the crew was not forewarned. It almost was an accident. The mill manager was with me at the time, and measures were taken to correct the situation. Nevertheless, these men were constantly conscious of looking for danger, and their actions—and consequently their production—were slowed.

One picture of a man chopping truck stakes shows a practice sometimes outlawed. Trucks must be equipped with safety trip stakes. However when wooden stakes are used, the truck driver chops the stakes nearly through. If he chops too deep, the entire load will come tumbling down on top of him or his helper.

Another hazard is caused when a sawyer reaches for chips alongside saw to remove chips that wedge against the saw. A slip, and the sawyer may lose an arm or his life. Another stunt sawyers sometimes pull is brushing the saw with their hand to find out if it is overheating.

In all such cases, the tax cost is only a minor consideration. The really severe cost is the loss of a key man, and possibly one's entire business, because of one careless act.

DANGEROUS KICKBACKS

The third area extremely dangerous is kickbacks due to jamming saws which are one of the main causes of accidents at the edger. The board through the edger is cut on the bias, because of poor mill layout. But equally as important was the dangerous working situation. Once an edgerman tried to slow down his end by holding it. One-half slammed back against the end of the mill just missing the sawyer. The mistake was in placing the edger too close to the headsaw. The edgerman did not have room enough to handle long boards. Not only was this a definite hazard, it greatly reduced mill production because the sawyer had to wait until the edgerman was out of the way.

A hazard that small sawmill operators do not recognize is failure to shield moving shafts, pulleys, and belts. The small mill is not the main offender, either, for many larger mills are equally at fault. Often the end of the saw mandrel and the driven pulley are practically "ready to reach out and grab" a loose piece of clothing. Even more hazardous are keys that stick out from pulleys attached to the ends of shafts.

AID MILL OWNERS

Until this past year practically no concentrated safety effort has been made to help small sawmills. They occasionally received safety literature, and a few operators posted it at their mills; but such cases were the exception rather than the rule. Nor does that material constitute a safety training program. Responsible for safety programs among these small operators is of course, the mill owner. But how can he start a

safety program when he does not know how to go about it? He needs help.

This past year I asked at each of the 30 sawmill clinics how many had had safety inspections from any organization or agency. In 26 clinics only scattered hands were raised; at a few, there was no show of hands at all. At the last clinic I attended, only 3 of 25 attending raised a hand—and that was in a state with one of the highest accident frequency rates.

If safety inspections at such mills are just casual visits, how can you expect them to have a safety training program?

Small operators may well ask whether, if they start a safety training program, they will get their insurance rates reduced. If not, they may not understand how they will benefit. Someone must show them, and there must be concrete evidence that their efforts are being appreciated.

Some effort was made this past year; nothing in the way of a broad safety program, but still a start in the right direction. The Northeastern Logging Congress, spearheaded by Fred Simmons, logging and sawmilling specialist of the Northeastern Forest Experiment Station of the U. S. Forest Service had a panel discussion on small sawmill safety as a part of its program this spring.

Kenneth Compton, professor of wood utilization at the State University of New York's College of Forestry, devoted a section of his small sawmill short course early this fall to sawmill safety. These are excellent starts, but unfortunately they are only "a drop in the bucket" compared to the need that exists.

SAFETY SAWMILL CLINICS

Not only that, but safety is not the primary work of either of these men. They are doing this because they recognize the tremendous need. However, there is a great, immediate need for safety men to spearhead some of this work. Possibly this should not be done strictly as safety training sessions but rather as overall sawmill clinics in which good safety practices are given the spotlight.

These small operators are not going to be converted overnight. One thing that must be avoided if possible is the mandatory attitude of "do it or we shut you down." Regulatory measures have been with them for years, and to clamp down suddenly or to initiate new measures would only hamstring the industry.

These operators work on a small profit margin, and if another burden were placed on them, one which they do not understand, many would shut down. These men need to be shown that good safety practices pay off, and helped to accomplish it.

DEVELOPING SAFE WORK METHODS

by **WILLIAM E. HUIE**
personnel & safety supervisor, Crossett Lumber co., div.
The Crossett co., Crossett, Ark.

Regardless of whether or not our plants undertake a methodical job-safety analysis in the near future, we will benefit from a description of something about the techniques and its purposes and how they are accomplished. Within relatively few years, accident prevention has progressed from a hit-or-miss proposition to a technique closely approaching the scientific method.

The humanitarian appeal to management and workers is not as great today as yesterday. Today, methods are employed which isolate and identify the causes of accidents and which permit direct and positive action to be taken to prevent their recurrence. Accident prevention must be based on facts which clearly identify the problem.

The techniques approaching the scientific method work nearly 100 per cent with the exception of lumber industry—I am talking about southern sawmilling. Due to the type of labor employed in our sawmills, it would pose a big problem to get away from the humanitarian appeal to these workers. Although we as supervisors understand the technical side of our problems, we *must*, appeal to the humanitarian side of our employees.

There are four steps in a "Job-cycle":

"JOB-STEPS"

A "job-cycle" is a unit of work, from the time it begins to the time it is completed. A foreman or supervisor must analyze an operation to some extent before he can come to any sound conclusions about safe work practices, guards, or protective equipment. In some jobs, such as inspections or assembly work, the basic work cycle may be completed in minutes. In others, such as certain milling machine operations, the cycle is quite complex, sometimes involving two or three days time.

However simple or complex the cycle, the objective is to list, in logical sequence, every step taken in completing the unit of work you have set out to analyze. Include every single element, every action, every inspection, every delay, everything that is involved in accomplishing the job purpose. The more complete the breakdown, the better the chance for improving the operation from the safety or health standpoint.

Once you have the whole pattern down on paper, double check it with the most experienced employee performing that particular job. By combining your knowledge and observation with his, you should be able to break the job down to its finest details.

The next move is to list after each step in the job cycle, every exposure to potential danger, every health hazard that is involved. Indicate the exact cause and its source. Keep looking, questioning, experimenting, imagining, analyzing, until you are positive that you have combed out every potential hazard for every step in the job cycle.

"ACCIDENTS CONTROL"

Looking over the entire job pattern, ask the following of every detail: Is it necessary? What is the purpose? Can it be eliminated through substitution or change? Can it be combined with other details to reduce exposure, cut down on handling, storage or transportation? Can any details be rearranged for smoother sequence, to make the job easier and simpler? Can any details be simplified to reduce or eliminate the danger?

Searching questions such as these are all important, because in this questioning process ideas for improvement are usually generated. The ideal action, of course, is to wipe out the exposure if at all possible: substituting a safe material or process for an unsafe one; replacing manual with automatic feed; changing the design or operation procedure to eliminate handling, and smooth out a dangerous kink or erase an unnecessary job step.

Sometimes the only answer will be to guard an exposure, fencing off a hot spot with a barrier guard, developing some adequate way of keeping the operator's hands away from danger. For unavoidable exposure, protective equipment is often the best control: goggles, face shields, safety shoes, ear protectors, aprons and gloves.

After you have exhausted all physical controls, there is still the possibility of special instruction, warning, and retraining as control devices. If the exposure cannot be eliminated or safely walled off, the employee must be taught the best possible method to avoid injury, and it will take persistent education and supervision to see that he uses this method.

"FOLLOW-THROUGH"

When the analysis brings about changes in equipment, arrangement, operating methods or work practices, you must thoroughly sell the employee on these revisions. It is important that he clearly understands the reasons for the change. Those employees who assisted in the analysis and the planning of controls will have a natural enthusiasm for seeing that the new method is constantly in effect. This is one of the valuable benefits of "job-safety-analysis" work.

Finally, remain alert to the necessity of keeping job safety breakdowns up to date. Changes in materials, processes, and equipment often create new exposures, and the necessity for new controls. There is a need for constant analysis in industrial supervision, for change and progress are the natural laws of our existence.

In accident prevention, and in the general business life, we never have the final answers to anything—there will always be a better way and a better result.

DOES SAFETY TRAINING PAY?

by A. R. MOBBS

manager industrial relations, Abitibi Power & Paper co., Ltd. Toronto, Canada

As the largest section of our operations is located in Ontario, I will concentrate my next few remarks on that province.

The Ontario Workmen's Compensation Board administers the Workmen's Compensation Act. The original Act came into force on January 1, 1915. An article entitled "The Workmen's Compensation Act, How It Works," published in *ABITIBI*, our employee magazine in April 1929, was written by Victor A. Sinclair, K. C., who was then chairman of the Ontario Compensation Board.

"The Act was passed in the year 1914 but came into force on the first of January 1915, and so accustomed have workmen become to the fact that the Act is in force and that they can rely on its provisions that practically all except the older workmen have forgotten the conditions which existed prior to the Act being brought into effect, when the workman in case of being disabled by accident in the course of his employment either had to depend on such voluntary contributions as were made by his employer to him or had to endeavour to procure damages by an action at law.

DIFFICULT VERDICTS

"If an action were brought, usually he might be delayed from six months to a year in getting his action tried and having any appeals which might be taken disposed of, accompanied by large legal costs, and in the end, if he were successful, so much would be taken up in costs that the actual amount received by the workman would be small, even in cases of serious injury.

"There was also the difficulty of recovering any verdict in such action because in the first place he had to establish that his employer had been guilty of some negligence, either in the plant itself or in the machinery used in it or in his method of carrying on the business, and that there was some carelessness on the employer's part which caused the accident.

"Also the employer had a number of defenses, such as contributory negligence, which would deprive the workman of his verdict if he had in any way contributed by his own carelessness to the accident, or if the accident had been caused by the negligence of a fellow-workman who was not in the position of superintendent or foreman he would not collect. So that the workman had little real compensation for injuries received in the course of his employment."

This was written 28 years ago.

The Workmen's Compensation Board endeavours to administer justice to the injured man, speedily and humanely, and it has three main motivations:

- The prevention of the accident in the first place.
- Failing this, the paying of maximum benefits at the least possible cost to the employers.
- The return of the injured workman to employment in the shortest possible time and with the minimal permanent disability. This of course requires first-class medical and hospital treatment.

Their schedule of benefits to the injured workman is not exceeded anywhere and the administration costs are low; on the average 92 cents of the employer's dollar is spent in one way or another on the injured workman. Maximum weekly compensation is $72.11.

The average rate charged in all industry, from mining and heavy logging to the needle trades, is approximately $1.19 per $100 of payroll. As the Act forbids litigation, there is no wastage on lawyers' fees.

PERMIT INDUSTRY SAFETY GROUPS

Another important feature of the Act is the provision to allow the Board to assist all Ontario industries in accident prevention by permitting companies in the same industry to form an association to promote and carry on the work of prevention of accidents. The Board may make financial grants to assist them.

The pulp and paper industry in Ontario has its own, the Ontario Pulp and Paper Makers' Safety Association, non-profit and without share capital. This Association is governed by a Board of Directors consisting of 20 top-ranking executives of member companies. Together these companies make up 96 per cent of the total payroll in the industry.

A new Board of Directors is elected each year at the annual meeting of members. The directors in turn choose the president and vice-president from their number. The only paid officer is the efficient secretary-engineer, D. B. Chant.

STEERS CLEAR OF AUTHORITY

This Association believes that accident control in industry is primarily a management function, inseparable from other duties and responsibilities of productive organization and leadership. The Association avoids any attempt to perform that function for its member companies and confines itself to activities designed to encourage, stimulate and assist them to do a good job of controlling work injuries in their operations in frequency, severity and cost. It employs no inspectors or field men and does not try to maintain a routine inspection service.

The Association believes that accident control is one of management's responsibilities and should be carried out with the same efficient attention to detail as is given to all other operating functions.

We in Abitibi have always been interested in accident prevention. In fact, in our mill labor agreements, one of the clauses reads: "The mutual interest of employer and employee is recognized by this agreement for the operation of the entire plant under methods which will promote to the fullest extent: safety to the employee, economy of operation, quality and quantity of output, cleanliness of plant and protection of property."

FIGHTING HAZARDS

In labor agreements with our woods workers we say: ". . . and to ensure to the utmost extent possible the safety and physical welfare of the employees, economy of operation, quality and quantity of output and protection of property."

In 1953 in most of our mills and woods operations we had safety first committees on which hourly workers and supervisors served with great interest, discovering unsafe conditions, pointing out dangerous practices, studying accident causes and devising ways to prevent them. We had machinery guarded and encouraged the use of goggles, respirators, masks, hard hats, safety shoes, buoyant vests and gloves. But in spite of everything, our lost-time accidents in 1953 in the mills were 191 and the woods 937.

Late in 1953, our president, D. W. Ambridge decided that he would concentrate his close attention on accident prevention and safety. Besides the human suffering and loss of earnings to the injured, he was sure that accidents were causing us increased production costs.

Authorities on the subject today estimate that the indirect cost of accidents are at least four times the known costs. Indirect cost items are: confusion and loss of production at the time of the accident, training new workers with loss of production and quality, possible equipment damage at time of accident or in training, cost of safety programs and other miscellaneous items.

We have a Quarter Century Club in our company with nearly 1,000 active members. On the occasion of their 1953 annual banquets in the company, Ambridge in his message to them, said: "The number one problem in our industry is safety and I can think of no better or more challenging one for your group to take on.

TARGET FOR THE YEAR

"Let this be your target for the coming year—to eliminate the needless human suffering caused by accidents. I would like each member of the Quarter Century Club to make a realistic effort to assist wherever and whenever he can in this most humane cause. You set the example for those who do not have your quarter century of experience.

"Take an active part on safety committees. Form a committee of your own and tell us what we need to do to make safety work. Consider yourselves 'commissioned' as of now to point out to individuals hazards and any unsafe act you see being committed. Make safety a religion and your efforts will have the blessing of all."

He also talked to Toronto office officials and to all mill and woods managers, stating that their responsibility for safety was as important as operations.

He also told presidents of the International Unions with whom we have labor agreements of our campaign. They replied in turn endorsing the work. Copies of their letters went to all the locals. Safety committees in the mills and woods were organized or improved. They included members of supervision and workmen.

For the first time, a safety committee was organized in our Toronto office to keep close tab on the mill and woods activities and to advise and act as a clearing house for all safety information between the mill and woods divisions of the company.

So, in 1954, Abitibi Safety Year was launched.

MEETING OF DIVISIONS

It is our custom each year to hold a labor-management meeting in Toronto to which we *invite* a delegate from each of our union locals and their international officers and company representatives from our divisions. At these meetings we have frankly discussed problems of interest to all of us. So in March, shortly after our campaign had started, we held the 1954 Conference.

The subjects were "Economics" and "Safety." The principal speaker on safety was Al E. Brown who at that time was vice-president and regional director of the International Brotherhood of Paper Makers, now the United Papermakers and Paperworkers, on the west coast. Brown told us of the good work being done by the industry on the Pacific coast, and following his address there was a challenging question and answer period.

As proceedings of our Conferences are printed and distributed to all employees, this conference also played its part in highlighting safety and accident prevention.

Also about that time, after a survey of film libraries, we found that there were not many safety films available in Canada dealing directly with mills and woods operations. So we *produced* two films—one, the use of hold cards on machinery when shut down for repairs or inspection, which we called "It's In The Cards" and the other, for the woods operations, portraying the use of safety equipment, shoes, hats, buoyant vests and gloves. It is called "Saga of Safety Sam." This film was produced in English and French.

The preparation of the scripts and shooting of these films all helped to highlight safety and they were well received by our employees. They are still in service—refreshing older employees' memories and instructing new employees. The film "*It's In* The Cards" was awarded top honors by the National Safety Council's National Committee on Films for Safety in the Occupational Field for Non-Theatrical Films on Safety Produced in 1954.

NEED POWER SAW FILM

Today, if we were making a similar woods film, we would have to include scenes showing the handling and maintenance of power saws. In our woods operating year 1953-54 when the films were being made, wood cut *by power saws was only 12 per cent* but last season it had increased to 82 per cent and I am sure that it will be higher again this season.

There is no doubt that the introduction of power saws to woods operations has created additional hazards and problems and we try to make sure that our employees recognize them. In fact, at one of our divisions, we have had experienced men go through the woods inspecting and examining power saws in the same manner as a highway traffic officer inspects automobiles for defective brakes. If the saw is in good order, it is so tagged. If not, and if adjustments cannot be made there and then, the man must return to the camp and get his saw fixed.

EFFORTS PROVE EFFECTIVE

Before 1954, we had trained many of our foremen in job safety. We again gave them and many members of ther crews J.S.T. Courses. We utilized every device we could find to keep safety continuously in front of our employees. We used our employee magazine, *ABITIBI;* held more St. John Ambulance First-Aid Courses and held contests in the mills and woods. In the woods we gave a turkey dinner each month for the camp with the best lost-time accident record in its division.

This combined effort by all of us from the president down, ended by reducing the number of lost-time accidents in the mills from 191 in 1953 to 98 in 1954, and in the woods *from 937 to 648 the same year.*

The 1954 results proved what sustained effort can do—and I mean sustained—because accident prevention must be everlasting and we in Abitibi are continuing on that basis. Since then we have continued our efforts to eliminate accidents. For instance, *last year some men attend a Lateiner method* of accident control course and they, in turn, have instructed all mill foremen.

Briefly, our record of lost time accidents to date has been:

	1953	1954	1955	1956	First half 1957
Mills	191	98	101	102	49
Woods	937	648	531	476	237

I have not confined myself entirely to training because we think that our other activities are equally important but we are convinced that the only effective way to approach accident prevention is from the top and all management, from the president down, must consider safety on the same basis as every other important business function.

Does safety training pay? We believe that it does and that a good accident experience reflects an efficient operation and both together add up to lower costs.

TRAINING FOR SAFETY ATTITUDES

by GLENN F. GRIFFIN

director, Industrial Training, National Safety Council, Chicago

Attitudes of people are undoubtedly the most important factor in the prevention of accidents. For this reason we should give *much serious thought and study to attitudes* to understand them and do something about them.

There is danger that the term "attitude" will fall into misuse, that it will come to cover many unexplained or difficult to explain kinds of conduct, something like the word careless which is so carelessly used.

For example, a man neglects to lock out an electric switch when he is working on a line. He knows he should lock the switch but he doesn't. So we say, it's his attitude. Another hurries too much to get a job done and *doesn't secure* a ladder and falls. He has been told. He knew better. Then why did he do it? Attitude.

The American Standard Code for Classifying injury causes lists the several improper attitudes thus:

—Willful disregard of instruction
—Violent temper
—Absent-mindedness
—Willful intent to injure
—Nervous, excitable, etc.
—Failure to understand instruction
—Improper attitudes not elsewhere *classified*

"Violent temper, absent-mindedness, nervous, excitable, etc."—they are not attitudes. *To call them attitudes, to think of them as* attitudes is harmful, because we tend to concentrate our efforts on these overt manifestations and miss entirely the real attitudes which underly them.

UNSAFE ATTITUDES

What is an attitude? Again, I am not searching for a dictionary definition, but for one that most of us accept and use in everyday conversation. *An attitude is* a belief, a way of thinking or feeling about things, a principle, a conviction, a usual way of reacting. Literally, an attitude is a position we take.

President Dearborn, a few years ago, drew up a list of unsafe attitudes which he called seven deadly beliefs.

1. I'll get it when my number comes up.
2. It can't happen to me.
3. It's the law of averages.
4. Danger is the price of progress.
5. An accident is an act of God.
6. *I'm tough, I don't bruise easily.*
7. Safety is sissy stuff.

And here are a few I have added:

1. Resentment of authority.
2. I don't like my boss.
3. They can't teach me anything about this job.
4. Practicing safety slows me up.
5. The other fellows will laugh at me.

6. It looks smart to take a chance.
7. Slogans and posters and contests and safety meetings are for kids.

A man who holds any or several of these attitudes is likely to disregard instructions, fail to learn safe practices or to follow them when he does learn them. He may lose his temper and blame bad luck or somebody else for his own mistakes. In short, he is likely to act unsafely and hurt himself and others.

SAFE ATTITUDES

This paper began by discussing attitudes for safety and now the subject is attitudes for accidents. Let's change that. Here is a list of attitudes for safety. If we expect other people to develop safe attitudes, indeed, if we want to develop them ourselves, we must know what the safe attitudes are.

—Accidents can be prevented.
—Preventing them is more important than blaming the people who cause them.
—The company I work for is sincerely trying to prevent accidents.
—The safety regulations are reasonable and important.
—The foreman is for safety.
—The fellows I work with will respect me for practicing safety.
—Safety is a mark of intelligence and skill.
—It's dumb to take chances.
—I have a responsibility to correct any hazard I see.

Because management attitudes are important too, here are three especially for management:

1. Safety is good business.
2. Safety promotes efficiency.
3. We can't afford to have accidents.

ACCEPTING THE PRINCIPLES

Simple, aren't they? If we could get these attitudes universally accepted, we might have the accident problem licked. How can we do it?

Can we give a course in attitudes? Can we tell people how they should feel about things and have it take? For supervisors, there are many good courses, but workers and supervisors, too, we need to think of training as something a good bit broader and deeper than the classroom. Training is forming or shaping, giving direction to, stimulating the growth of a person in the way we want him to go.

The first, and possibly the most important influence in training is the environment. New attitudes develop in an environment favorable to them. Many things make up the environment: physical surroundings, the boss and the other employees.

By physical surroundings I don't mean new buildings and air conditioning. I do mean that the work area should be clean and orderly. The comfort and safety of the employees should be considered. Unnecessary noise, smells and extremes of temperature must be eliminated. Good attitudes can develop in a place like that. They don't stand much chance in the other kind of work place.

EMPLOYEES' BEHAVIOR ESSENTIAL

The boss is part of the environment. And fellow employees are an important part of the environment. Their influence is probably greater than that of the boss, company management or the safety engineer. Think how much time employees spend together, compared to the amount of time the foreman or any management person spends with them.

Tell a new man the importance of some safe practice, wearing safety glasses for example. He agrees and looks around to see what the other fellows are doing. If they are not wearing glasses, you know what happens. But if they are wearing glasses, the new man will go along.

If you want to build favorable attitudes don't overlook the crew and their influence on one another. Get them into the act. If you have a gang with pretty nice attitudes, treasure that possession, cultivate it, and don't let any person or any incident spoil it.

Attitudes are influenced strongly by two kinds of examples. First is the boss who practices what he preaches, who, if he says you should wear safety shoes or a hard hat wears them himself. The second kind of example is that set by the management, the foreman and the safety engineer, who think safety is important. If a safety suggestion is made it gets prompt attention. They are willing to spend money for safeguards or safety activities. Never forget that a guard does more than keep hands out of danger. It shows everybody that the boss thinks keeping hands out of danger is important. And that goes a long way toward building good safety attitudes.

INSTRUCTION REAPS RESULTS

Given a favorable environment, and a good example, the next thing that influences attitudes is instruction. Instruction starts with the first introduction when a man comes to work. He needs to be told what the company believes and practices about safety. You can't assume that he knows and you can't leave it up to a printed book or posters on the bulletin boards. You need to tell him, simply and earnestly, without a lot of phony preachments.

The old timers who weren't told this when they came to work, should be told also. Make a project of it. You'll be amazed at how much they will appreciate it and how many will tell you they never heard it before.

The next kind of instruction is, of course, job instruction on every job and repeated as often as necessary. This is not off the subject of attitudes. Knowledge and skill are one thing and good attitudes are another. But we can not have the attitudes without knowledge and skill.

If a man knows a job thoroughly, his attitude is likely to be good. Moreover, when a foreman gives good, careful job instruction he gives evidence that he thinks the man and the job are important. That's a strong support for a good attitude toward the job, the foreman, and safety.

SUPERVISION BENEFICIAL

Instruction leads to supervision. If every man has been carefully instructed about every job, the foreman needs to correct any worker who does the job unsafely or in a manner differently from what he was taught. And he needs to do it every time he observes it. Two great weaknesses of supervision are reluctance to correct people for wrong work methods and lack of skill in correcting them.

I know foremen who get scared or angry because they see things getting out of hand, but more often than not, these situations come from letting wrong work get by because the foreman doesn't want always to be griping about something.

Bad attitudes develop where supervision is lax and men are never quite sure how much they can get away with. Then, when laxness leads to a serious mistake or a bad accident, comes the big blow-off. Good attitudes develop in a department where supervision is firm and consistent and decent.

Finally, good attitudes about safety are formed by talk. I don't mean preaching. Irving Lee said that preaching is the great instrument for strengthening beliefs that people already hold, but for changing beliefs, preaching is such a direct assault on the personality that it arouses resistance.

LET'S NOT PREACH

No, I don't mean preaching, I mean lots of talk in small meetings and with individuals about accidents and safety. Supervisors should talk with workers in the same way we safety people talk among ourselves, the subject being, "How can we prevent these accidents, or this accident."

They should consider the whole problem, the unsafe condition, the unsafe act, the wrong method, and they should agree upon remedies and help to carry them out. When they do that, every worker tends to become a safety man. When their minds turn to the subject of how we together can prevent accidents, we will have achieved what we have hoped for in their acceptance of good safety attitudes.

SAFETY IS PROFITABLE

To build safety attitudes we need to know what the safety attitudes are. It is profitable to spend time discussing them with associates.

The first requisite for attitude building is a favorable environment. Management and supervisors must set an example of safe practice and an example that they think safety is important.

Instruction, the great cure-all for social problems is necessary to build attitudes; instruction in management safety policies, instruction in how to do every job.

Supervision follows instruction. Bad attitudes grow out of lax supervision. Good attitudes develop where supervision is firm and fair and consistent.

Finally, taking people into our confidence, talking out our mutual problems with them, giving them something to do for safety, getting them onto the team, is the ultimate goal. When we do that we quit worrying about attitudes for safety. The attitudes will be OK.

USING AMERICAN STANDARDS IN SAFETY TRAINING

by HENRY G. LAMB
safety engineer, American Standards Assn., New York city

Training can be simplified by the use of standards. Some people have defined a standard as a solution to a recurring problem. A standard solution available for instructors saves him the time and effort of finding a solution of his own, and helps him to get on with the job.

In any training program there must first be standard tools, standard processes or procedures for doing the job, and lastly standard procedures for training.

American Standards are just one of many working tools for the instructor. Like any other workman with any other tools, he should know their strengths and their weaknesses.

American Standards are agreements reached after discussions and consultations between the representatives of the various national organizations which have an interest in the problem. The best experts in an organization meet with the experts of other national organizations. When these representatives come to an agreement, it is approved as a standard. It, therefore, seems safe to say that an American Standard on any one subject probably represents the best group thinking of the best experts on that particular subject.

HOW STANDARD IS DETERMINED

One weak point of an American Standard is that too frequently a standard simply states a specification, but does not tell why this is required, or how the committee came to this conclusion.

There are many situations when the committee actually bases its final decision upon long and expensive research on the subject, but there are other times when the committee just has to use its best judgment in coming to a given figure or value.

Whenever a training instructor tells an employee what he should do, he should also explain why it is important for him to take that particular action.

To overcome this difficulty, several American Standards now include an appendix which provides a discussion of the standard, and sometimes includes why a certain value was selected. The latest development on this point is the newly approved American Standard Safety Code for the Use, Care and Protection of Abrasive Wheels, B7.1-1956. Here an entirely new format was used. The left-hand column printed in bold face type states the specific requirements of the standard. In the right-hand column on the same page, appendix and explanatory material in light face type tell why certain provisions were included or give helpful information on how to achieve the objective of the standard.

SAFE PRACTICES IN STANDARDS

Much of the American Safety Standards is devoted to specifications for machines and physical conditions. These may not be of too much help to the training program. Even from the very beginning, however, provision has been made to include safe practices in these American Standards. A safe practice included in the standard should be considered as important as physical requirements, and should be specifically stated to determine easily whether or not the safe practice is observed.

B7.1-1956 on Abrasive Wheels.

This standard includes special instructions on handling abrasive wheels. These are fragile and therefore, it is important not to drop them or give other sudden impact. This standard also provides for the inspection of wheels and instructions concerning their mounting on arbors. For instance, it is important to pick the right wheel for the right job.

Accidents have occurred when a slow speed wheel was accidentally mounted on a high speed shaft. Needless to say, the wheel exploded. There are also instructions concerning the flanges and the tightening of the mounting nuts. It is surprising how minor details, such as a sprung flange, can affect the safety of these abrasive wheels.

A14.1 and A14.2, Safety Codes for Ladders.

A14.1 concerns portable wood ladders, and A14.2 portable metal ladders. The bulk of these standards is devoted to specifications for the ladders themselves. These specifications are important to decide whether or not a particular ladder is safe, or may now be defective.

In addition, each of these standards includes a separate section on the use, care and storage of these ladders. They include suggestions on the proper angle for placing straight ladders. For instance, in the metal ladder standard one specific recommendation warns against using these ladders in locations where the ladder may possibly come in contact with electric wires.

Several American Standards contain provisions for minimum age of operators, to protect operators on hazardous machines, and protect other workmen when the actions of the operator might affect other employees, such as in the operation of cranes, derricks, hoists, elevators and industrial power trucks.

CODES FOR TRUCKS AND MACHINERY

B56.1-1955, American Standard Safety Code for Industrial Power Trucks.

In addition to the qualifications of operators just mentioned, this standard includes 35 specific safety rules for operators, and provides a firm foundation for any training program for industrial truck operators.

O1.1-1954, American Standard Safety Code for Woodworking Machinery.

This standard concerns specifications for guarding woodworking machinery, but Section 7 of this standard is devoted to operating rules. For instance, it is important to select a suitable tool or machine for the job. There are certain jobs which are far safer on a band saw than on a circular saw.

These operating rules also require the removal of cracked saws. This may not be as important a problem with small saws as it is in logging operations or other operations where some of the circular saws may be as much as five or six feet in diameter. When one saw costs a large sum of money, it is not practical to discard it as soon as one crack appears in a single gullet. Therefore, the standard recommends the correct procedure for repairing cracked saws, and it also discusses the causes of saw cracking and how to prevent these.

P1.1-1956, American Safety Standard for Pulp and Paper Mills.

This safety standard is one of the latest of interest to the wood products section. It includes safety requirements for piling pulp logs at the mill to prevent the pile from sliding and to provide the proper clearance for cranes, trains, and equipment so employees will not be caught between the equipment and log piles. This standard also includes four safety rules which could apply to many operations as well as paper mills:

1—Wearing safety shoes in handling logs or other heavy equipment;

2—Using cranes with booms near overhead electric wires;

3—Providing for life lines and the two-man rule where one employee has to enter a tank, a pit or some other space where it is difficult for the employee to climb out by himself;

4—Providing the lock-out practice for both electric motors and pipe lines where an employee has to crawl inside equipment to clean or repair it.

These are just examples of some of the safe practices contained in American Safety Standards which should be of real help to instructors in training employees.

REHABILITATION IN ONTARIO, CANADA

by DR. BRUCE H. YOUNG

superintendent, Hospital & Rehabilitation Center, Malton, Ont., Canada

The aim of our program of treating the injured workman is to prevent accidents and subsequent disability and loss of skill to industry. To accomplish this, the united effort of legislators, management, labor and medicine is required.

The immensity of the problem is seen in the statistics of Ontario, where more than 120,000 work accidents occurred resulting in more than 70,000 persons being off work for more than five days. The answer to this problem is sought through the combined effort of the legislators, management, labor and medicine, with legislation interpreted by the Workmen's Compensation Board, consisting of three members. It is within this framework that we can accomplish some success in rehabilitation.

I shall discuss our work in cases where an accident has occurred and injured the workman. Our program considers the injured person as its key.

AIM OF PROGRAM

A definition of rehabilitation is "the process of returning an injured workman to a normal and healthy position in his community." The basis of our process is rehabilitation, and to be successful it must be continuous from the first aid station to the return of the injured workman to suitable and gainful employment. In the majority of injuries the patient's own community is where this program should be carried out. Consequently, we strive to utilize the community's resources in medicine to their maximum.

There is a point in the injury when more than the supervision of a doctor, physical therapist or any other single person is necessary. There is also a point in the process of the patient's recovery when the patient's belief in himself begins to wane. To deal with this set of circumstances the Ontario Workmen's Compensation Board provides a Hospital and Rehabilitation Center.

At this Center are the various skills to accomplish our objective, and to superimpose leadership towards recovery for the man by a team. The needs of any given individual vary. Consequently the services offered by the various representatives of this team will vary, depending upon the individual patient requirements. Thus, we provide a program that may be fitted adequately and suitably to an individual's needs.

LADIES GUIDE MEN

We do no active surgical care at our Center. Ours is the care of the patient after the initial medical and surgical therapy. The members of our team are staff doctors, occupational therapists, physical therapists, remedial gymnasts, rehabilitation officers, psychologists, nurses, recreational officer, part time teacher and an administrative staff to see that the overall unit functions smoothly and without delay. In addition, we have the various elements of a maintenance staff, such as cleaners, kitchen and dietary personnel, making a total of 225.

Only male patients are treated at our Center. Therefore, we choose a good percentage of female therapists, since it is my firm belief that we are all notoriously lazy and selfish, and have a natural instinct to exhibit our talents in front of members of the opposite sex.

In this way we have an atmosphere which is void of any militant routine and one in which the necessary element of patient co-operation is stimulated. The young ladies on our staff are particularly skilled in the approach to our workmen, and in obtaining a maximum performance under a given set of conditions.

Our program is basically to gain the maximum physical performance which a man will do. Any program under any circumstances, is only an observation what a man will do, not what he can do, for none of us really know what we can do in terms of physical output, but we all are aware of what we will do. We will do best only what we want to do (the selfish side of our nature), and in our own time (the lazy side of our being).

Certainly the old adage that "you can lead a horse to water, but you can't make him drink" applies in our work. It must be remembered that the sum total of this program is the assessment of the individual from start to finish, and this assessment is only on the basis of what a man will do, not what he can do. In ascertaining the physical capacity of an individual, we must have the patient's full co-operation. This can only be achieved by gaining his confidence.

GAIN MEN'S CONFIDENCE

At the outset we attempt to gain the patient's confidence by a thorough discussion of his problems with a staff doctor. This discussion is then followed by a complete examination of the injured part. We must remember we are treating an individual, not merely an injured part.

Therefore, during this interview and examination we relate the man to his injury. Our patients frequently remark this is the first time they have had an opportunity to discuss their problems thoroughly with a doctor. This initial period also gives the doctor an opportunity to understand the patient's problem, and from this a program of active treatment, based on physical function, is assigned.

There is a saying at our Center that if the man remains with us for four days he will remain willingly until his treatment is completed, because he observes the staff's personal interest as well as his own opportunities for improvement. He also talks with fellow patients and they impart to him knowledge that we try to assist him in getting better.

PHYSICAL THERAPY

Just as it is essential to have the patient's co-operation, it is equally important for the patient to see the actual benefit from his treatment. Most of our patients feel the only form of treatment which benefits them is physical therapy. This is the application of heat to a given part to ease discomfort, the use of massage for relaxation and to ease discomfort, the applications of electrical therapy, or the use of the full length water bath for relaxation.

Any one or all of these methods are interpreted by the patient as being active and useful treatment. These various forms of therapy by easing discomfort, facilitate the next step of the rehabilitative treatment—functional treatment.

In this treatment various occupations offer the necessary use of muscle co-ordination to increase strength so the patient will gain confidence in his own ability and make progress. The use of these methods prepares the man for the work he has to do. I try to explain this to my staff by using the analogy of taking a quinine capsule. None of us would take a spoonful of quinine and drink it down with water, even though we knew the results would be beneficial, because of the extreme bitter taste of quinine.

However, in a capsule it is easy to take and we obtain the same beneficial results. So, with the passive forms of treatment, these act as a capsule around the next step —obtaining proper muscle action individually and in a group manner, thereby increasing strength, as well as re-establishing patterns of movement. It is in this particular field that our Center has made its unique contribution.

PATIENT SELECTS ACTIVITY

We use occupational therapy to develop and re-establish muscle patterns, adapting a craft or activity to a production function. In choosing an activity for the patient, we find if a patient chooses to make a product he or his wife or mother might be interested in, then we have the first evidence of good co-operation. We follow this, with direction by the occupational therapist, into that activity which will produce the most benefit for his injured part.

The activities which we use of a lighter nature are arts and crafts, of a moderate nature we use carpentry, handling projects made from wood, and in our heavy program we use gardening, or simulate or duplicate the man's activity. For example, if it were a hand case, we may want a fine movement such as a needle and thread activity.

However, we go over a list of projects with the patient to find out what he would like to make for himself, or others. His choice will be guided so that making the article will require proper functional use of his hand. It will have the interest necessary, because our patient is doing something he wishes to do, and he will also be exercising his hand properly, regaining its proper co-ordination with other parts of the body.

In this way we have rugged lumbermen, miners and construction workers accept light, unrelated activities with enthusiasm. Certainly a few patients are not interested in this project, so we must look further to find what will satisfy their desires and our requirements. It is necessary that the patient understand his activities.

CASE HISTORY

I like to mention the case of John, hospitalized at our Center after an amputation of his right arm above the elbow joint. On the first day of his hospitalization, he came to me in my office to say in a very belligerent manner, "I don't see any reason for staying here at all. That girl in green gave me, if you can imagine it, a ball to throw, and horseshoes to pitch with my left arm." He said, "I certainly see no reason why I should be required to do this, nor am I going to stay any longer to find out."

After discussing his problem for one hour, he was convinced that although we were going to fit him with a prosthesis and that the prosthesis would help him in holding and carrying activities, he would have to utilize his minor hand and arm to a greater degree than before. The principle behind having him throw a ball and play horseshoes was the first step in gaining co-ordination of this part into a new muscle pattern, and gradually finer skills could be introduced for this previously little used hand.

REMEDIAL GYMNASTS

This patient was the secretary of a local press plant union, and in a week he became one of our staunchest advocates. One's greatest support comes from the opposition who have been converted, because he has been converted by reason. By the same token, men with shoulder injuries work on looms, working at the level of the shoulder, which requires increasing range and muscle power to hold the arm in its new position, and all the time the arm is exercised in its proper manner.

In this stage, to gain muscle power we utilize resistance exercises through the guidance of male therapists. These therapists are called "remedial gymnasts." In this field we consider the male represents a better leader than the female. Under the remedial gymnasts we also have group exercise activities graded into classes. These classes are organized on an anatomical basis, for example, the back class, shoulder class, foot class, hip and knee class and special hand class. In these classes we have group morale development which stimulates the patient. Here the patient sees those about him who are much worse off physically. It is generally true that the more severely handicapped put forth a greater effort, and, in truth, shame those less severely handicapped into a greater degree of co-operation and performance. After a patient says he feels he can go back to work if so-and-so, who is much worse off than he, can perform the way he does. He sees no obvious reason why he should not be able to carry on at his former gainful occupation.

MEN, GARDEN, PAINT, PLASTER

In this group of classes we also have an obstacle course, which is a means of increasing physical exertion, as well as a lot of friendly competition among our more advanced patient groups. As the patient progresses with his program, we try to increase his activities so that he is putting forward an effort as near to the maximum as possible. To do this we utilize a variety of media.

We have 12 acres of grass to cut, and purposely do not have power motors. We have our patients with various types of injuries push the lawnmowers in groups, and thereby keep the lawns in shape. We have flower gardens prepared, planted and maintained by patients. We paint the insides of our buildings, not once, but many times by patients who are painters by trade, or require shoulder activity on their particular job. By graduating these activities the patient gains confidence in his ability to handle his own work.

WORK ON BOXCARS

We have the shortest railway in Canada, which is frequently raised and lowered by injured railway personnel. For the plasterer, we have an area of wall which is continually being plastered to test the man's skill in plastering; for the bricklayer we use the bricks of his trade and allow him to re-establish the fact that he can bend, if he is a back case, or lift and handle bricks, if he is an arm or shoulder case.

He may also carry the hod to gain confidence in ladder climbing. We also have provided a boxcar for those railway men who have to climb and walk, and otherwise handle a boxcar. All these activities are used on a graduated basis to regain the conditioning of the workman for his previous occupation.

If a medical or surgical consultant is required on case, we refer these men to specialists. In our particular area we utilize the staff of the University of Toronto to assist us in sorting out the difficult problems regarding treatment. One year ago we acquired the services of two highly skilled psychologists to evaluate a man's potential for work, to give aptitude tests to those who must change occupations, and assist us in counselling patients who are not responding to the program. We represent as large a psychological unit as there is in this type of work, because our program stimulates psychological health.

A question commonly asked us is, "Do you have out-patients at your Center?" The answer is, "We do not." We can better rehabilitate the patient if he remains for the entire treatment day. By doing this we can control his daily routine.

In addition, we provide him with recreational facilities during the off hours and evenings. A patient who takes our program is required to maintain a reasonable habit as far as work hours are concerned. He is up at 7:30 a.m. for breakfast at 8:00, and commences his daily six hour program by 8:30 p.m.

WALK 2-3 MILES DAILY

Every patient is required to walk a minimum of two to three miles a day. Actually most of our staff cover the same distance. This is true without any other treatment consideration—about five to 10 times the distance he would walk while at home. There are no places nearby to obtain food other than that provided at the Center.

Consequently, our patients are reasonably prompt at meal hours, and this keeps them in touch with the type of control most are accustomed to in industry. The program is on a timetable basis, which requires their attendance—and their attendance is checked. This, again, is supervision comparable to that in industry.

When the patient is sufficiently improved to return to employment, we arrange his discharge from the Center. Approximately 80 per cent of our patients return immediately on discharge. This is arranged through our industrial placement officers during the patient's stay at the Center. They contact the patient's employer and try to give him an idea when the man will be available for work. From the medical side, the original attending doctor is informed by a full medical report on his particular patient every two weeks.

No matter what type of program is set up, we cannot really duplicate all aspects of a man's occupation, and therefore, return to work represents the fourth stage in the man's recovery.

THE REAL TEST

The fourth stage means returning to old friends, to areas where his skill was used before, but where he tests his real ability in competition, and must not only co-operate, but co-operate and produce at the same time. This is an added factor which is most difficult to duplicate.

We, therefore, ask our employers to consider this fact, and many patients receive some form of work modification. The duration of the modification varies with the individual case.

The employers in our province assume a moral obligation in the vast majority of cases to take back their injured workmen. This is a purely moral obligation, because no employer is, by law, forced to accept a workman after injury. We feel that those who do not return to work represent the failure from the Center, even though they may have recovered sufficiently to become independent.

We like to feel that there is a place back in industry, since each of these men came from industry. We do not want to see a scrap pile of broken, unproductive bodies, which represents people whose whole aim in life has been shattered by an industrial accident. However, some end this way despite all our efforts.

The greatest contribution to lessening serious industrial disablement is preventing the accident which has caused the disablement. If it does occur, however, I have

described a program of activity led by a team of dedicated people, from the sweeper to the doctor, whose only interest is locating a solid road to recovery for the injured workman.

We do our utmost to abolish disability which can be abolished by treatment. But if this is impossible we then assist the patient in accepting his disability, and attempt to motivate him to come out with an accepted disability with which he will meet his future in the industrial world.

SAFETY TRAINING FOR FIRE PROTECTION FORESTERS

by JOHN F. SHANKLIN
staff assistant, U. S. Dept. of Interior, Washington, D. C.

An official report transmitted by the Bureau of Land Management to the Secretary said of the bad fire situation which existed in Alaska this past summer:

"As a result of a combination of factors, the Bureau of Land Management is experiencing a serious fire situation in Alaska. The driest year in the interior since 1906, coupled with the normal difficulties of vast areas, isolation and rough terrain has created a "bust" fire suppression condition. To combat this situation the Bureau has expended Emergency Fire Funds at a rate of 15 to 20 thousand dollars per day during the month of June. Such expenditures are continuing this current fiscal year and will probably continue through July unless normal rainfall occurs.

"Approximately 400 fire fighters have been mobilized and dispatched to going fires, 12 supervisory personnel were drawn from Area 1, Portland, for assistance in directing fire fighting during June, and 12 replacements have been obtained from Area 2 at Salt Lake and Area 3 at Denver for similar aid during July. Extra tools and equipment have been purchased through GSA at Seattle and flown to Fairbanks. In addition to the six BLM owned and operated aircraft, light planes and helicopters have been chartered from private sources. The military forces have provided excellent cooperation on an emergency basis by providing helicopters and manpower. In addition, the military has assisted the logistic situation by flying gasoline and other supplies into air strips being used as fire operations bases.

THREE FIRES DAILY

"An average of three or four new fires has been and is being reported daily. Most of the fires are lightning caused and appear to have started high on the ridges in spruce timber. During the initial period of the fire fighting season simultaneous lightning fires at great distances apart forced the Bureau immediately to commit its full fire fighting resources to its physical limit. Continued dry weather, increasing hours of daylight, and exhaustion of manpower soon created a lag in the number of fires reported and the number upon which initial action could be taken.

"To meet this continuing demand, the Area Fire Control Officer was forced to establish areas of priority within which initial action could be taken consistent with existing transportation and communication facilities. Manpower has not been the critical item. Once a fire crew was committed to action on any one fire, additional demand immediately developed for the air transportation of relief manpower, additional tools and supplies. The air transportation of these items thus became the limiting factor.

"Action on all new fires occurring outside of the limits of air service had to be postponed or ruled out. It is for this reason there has been an average of approximately 40 fires burning daily with about half of them being manned. Complete control action without rainfall on fires in excess of 40,000 acres appeared to be physically impossible. By July 1 an increasing smoke pall from the several large fires in excess of this acreage had made aerial reconnaissance and regular fire line service practically impossible in some areas."

During that period contact was lost with fire fighters for as long as three days at a time, due to the tremendous volume of smoke. Difficulty was experienced in dropping food supplies and additional fire fighting equipment. More than five million acres were burned over. The tremendous and hazardous operation to bring these fires under control has a direct relationship to the training in safety instituted by the Department of the Interior.

To understand the problems confronting the Department in its safety training program as related to the forest resources administered by the Department requires first, an understanding of our responsibilities.

EXTENT OF RESPONSIBILITY

The Department of the Interior has a total of approximately 57 million acres of forest and woodland in the continental United States. In Alaska it is responsible for some 125 million acres of forest and woodland, including 40 million acres covered by mature timber and 85 million acres of woodland most of which has been devastated by fire and in various stages of natural revegetation. There is an additional 225 million acres of range, marsh and timber requiring protection.

The annual utilization of timber from forests administered by the Department has been averaging approximately 1½ billion board feet in volume and with a value of nearly 25 million dollars. The average number of fires for the past 10 years has been slightly less than 2400 and our average fire loss for the past 10 years has been slightly more than one million acres.

Four Bureaus of this Department are concerned with land management and especially with forest administration; the Bureau of Land Management, the Bureau of Indian Affairs, the Bureau of Sport Fisheries and Wildlife and the National Park Service. Wide differences exist between these Bureaus as to their basic objectives.

The National Park Service administers approximately six million acres of forest lands in the States and approximately one-half million acres in the Territories of Alaska and Hawaii. The obectives of management are primarily to maintain the forests as nearly as possible in their natural undisturbed condition. These forests are cherished for their aesthetic and scientific values. Portions of them are heavily used for recreation.

CARES FOR WILD LIFE

The basic problem of management is to devise ways and means of handling the increased visitor load to the parks safely and at the same time conserve the forests in their natural state. A total of 55 million people visited our national parks and monuments in the calendar year 1956.

The Bureau of Sport Fisheries and Wildlife administers about ¾ million acres of forest lands of which ½ million acres are considered as commercial forests. The timber lands found on the national wildlife refuges are managed to demonstrate practical means of developing and maintaining optimum game populations, to produce removable surplus wildlife species for restoration projects undertaken by other Federal and state agencies, to determine the practicability of research findings in the management of forest habitat, to explore means of managing wildlife population, for removal of animal increment through regulated public hunting and, consistent with these objectives and in accordance with sound forest management practices, to obtain the maximum timber yield and return from the refuge forests.

OPERATED FOR INDIANS

The Indian forests, of which 6½ million acres are considered commercial, have the distinction of being managed under the first Federal legislation in the United States in which the practice of sustained yield management was definitely prescribed. The management of the Indian forests is directed towards the same objectives sought in the managament of a public forest. However, there are certain

fundamental difficulties which give rise to radically different management problems.

Indian lands are private property held in trust for the Indians by the United States. As such, the timber resources must be managed for the best benefit of the Indian owners. Moreover, by reason of the fact that the Indian forest property is so closely interrelated with the welfare of the Indians themselves, forest management plans must recognize the general Indian problem and be coordinated with the whole program of social and economic betterment for the Indians. This necessitates a far greater flexibility in long-term forest management plans than is ordinarily required or considered ideal from a purely technical viewpoint.

Generally speaking, the first objective of Indian forest land management is to obtain high level timber production. The second is to obtain for the Indian owners the highest possible income not only through the sale of stumpage but also through the direct employment of Indians.

The forest lands administered by the Bureau of Land Management fall into three major categories. The first, the revested Oregon and California railroad grant lands and reconveyed Coos Bay Wagon Road grant lands in western Oregon, commonly referred to as the O & C lands. Second, the public domain forest lands in the continental United States, and third, the public domain forest lands in the Territory of Alaska.

TOP AMERICAN FORESTS

Forestry on the O & C lands presents one of the most challenging problems in American timber management. On these lands are some of the finest stands of original timber left in this country. Their economic and social importance both locally and nationally places them in the front rank of American forests. In accordance with basic legislation, it is the policy of the Department to restrict cutting timber on these lands to their sustained-yield capabilities.

It is the policy of the Department to direct all timber cutting operations under approved rules of forest practice. Moreover, it is the policy of the Department that these rules of forest practice shall be established only after full consultation with a local advisory board consisting of citizens of the State of Oregon who represent the lumber industry, the forestry college, conservation associations, labor unions, grazing mining and agriculture.

The management objectives for the approximately three million acres of commercial public domain timber in the West are much the same as for the O & C lands. However, these plans are subject to the establishment of policy determinations as to whether the lands should be retained under the jurisdiction of the Federal Government or should be disposed of to public agencies, private citizens or corporations.

In addition to these commercial timber lands there are 25 million acres of woodlands on the public domain. These are found chiefly within the grazing districts and are of considerable importance locally as a source of fence posts and related material for use by the range industry. The management of these lands is definitely keyed to the objectives sought in the management of the range lands.

FIRE SAFETY MAJOR PROBLEM

In the Territory of Alaska a major problem confronts the Department in determining proper management for the tremendous extensive areas of forest and woodlands. To date the objective has been to provide something approaching adequacy of protection from fire. This has not been entirely achieved, as reference to my opening statement in this paper will show. But the future appears to be much brighter due to a better understanding by the citizens of Alaska of the need to exclude fire from the Territory.

To relate safety training for fire fighters to the fire situation referred to in the opening paragraphs of this paper, let us look at exactly how the Bureau of Land Management provides safety training.

The Bureau at the present time does not have either a safety manual or any specific safety instructions issued solely for training in safety with respect to forest management. General instructions pertaining to the entire work of the Bureau have been prepared by several of their field offices. All field areas use safety material issued by other agencies, Federal, state and private.

The Bureau does not have a safety committee functioning at its national level, but each of its major regional offices has a functioning committee. None of these regional, or area offices as they are termed by that Bureau, nor any of its state offices have made any special safety studies in the field of timber management, and no analyses have been made of accidents occurring in the timber management field alone.

TRAINING SESSIONS

However, each year training sessions are held for fire control and timber cruising. Such programs always include training in first aid and safety.

The Bureau has approximately 300 permanent foresters and 60 temporary foresters. It operated during the past year 18 fire training schools at which approximately 250 employees were present. It also operated five timber cruising schools at which approximately 100 employees were present. Furthermore, 24 Bureau employees attended some six training schools supervised by other agencies.

All employees are required to follow certain safety practices including those employees concerned with forest management. These safety practices include:

1. Equipping all of the Government vehicles with fire extinguishers and first aid kits.
2. All fire fighters are being equipped with hard hats as rapidly as sufficient funds are made available.
3. On all project fires a first aid station is manned by qualified first aid attendants.
4. All employees are encouraged to take the essential courses in first aid.
5. It is general practice not to permit single persons to work in an isolated area. Two or more are always assigned.
6. Radio communications are being installed as a safety measure in fire control.

As examples of the exact safety program, two states will be described quite comprehensively.

IDAHO SAFETY PROGRAM

The Bureau's program in Idaho is fairly well organized. It so happens that the Area Fire Control Officer is also the chairman of the safety committee. Accordingly, he also handles the safety programs at the fire training schools. All Bureau vehicles in this state are equipped with a safety packet which includes a first aid kit and instructions for first aid treatment together with the necessary forms required for accident reporting.

All grazing districts in this state are equipped with a very high frequency radio communications network. A base station is located at strategic high points to insure communications to mobile units operating in other parts of the state. From a safety viewpoint, radio communications are very necessary.

Second, the Territory of Alaska. In Alaska, as we have already indicated, special problems confront the Bureau in safety training. In Alaska, two foresters serve on the Territorial Safety committee. All permanent and temporary foresters and temporary fire guards are required to take first aid training. This training includes instructions on survival in the Arctic. To insure the safety of employees working on fires, cruising timber or on routine inspection, it is mandatory that the crews consist of two or more.

USE CHECK-OFF LIST

In order to insure the safety of all employees involved in air operations in connection with the fire control and timber sale programs of the Bureau, the Civil Aeronautics regulations are followed explicitly. This includes the use of a printed chek-off list before each takeoff.

The Bureau has developed picnic areas along the highways in Alaska especially at those points where the highways either cross streams or are close to lakes. This was done essentially as a fire hazard reduction measure. Campers, picnickers and travellers who stopped along the highways to cook a meal usually found heavy debris and deep organic material. To clear out a place for cooking or warming fire was quite discouraging. Many times fires were built on wet organic material that was in some cases mistaken for

mineral soil. Many fires have originated from such a situation. However, with the development of over 30 picnic areas by the Bureau, the incident of man-caused fires along the highways was measurably reduced.

Comparable training is given in the Bureau of Indian Affairs. However, there is a very interesting development in the field of fire safety training which involves the Indians under the administration of this Department. We have what is called the Red Hat Program in which several hundred Indians from the Southeastern states are annually trained. These Indians, it has been found, make the finest fire fighters of any personnel in the United States, and their services are utilized by all forest fire services both in this Department and in the Department of Agriculture as well as by state agencies.

LOW ACCIDENT RATE

This training program, initiated by the Bureau of Indian Affairs, includes training by the Forest Service and the National Park Service. The training afforded these Indians has certainly paid off well, not only in bringing fires under control but in taking care of themselves while on fire lines with the least possible record of accidents of any group of forest fire fighters commonly used in this program.

The isolated nature of the installations maintained by the Bureau of Indian Affairs on each large reservation presents serious problems in protection and safety training. Many of the reservation agencies are in close proximity to extensive areas of forested land.

The protection and training of thousands of Indian children who attend reservation schools in programs designed for their safety are of special concern.

Fire hazards are high because the agency buildings are generally old. Consequently the wiring and heating systems are often inadequate by present day standards. Occupational hazards are ever present in the numerous garages and other service shops where power tools are in use.

In recognition of its special problems the Bureau has a safety committee functioning at the national level. Similar committees function at the Area and Agency levels. In all, there are over 100 safety committees. A Safety Director has been appointed to head up the program. Two safety engineers were hired within the year to provide guidance and impetus to it.

NATIONAL SAFETY COMMITTEE

The enthusiasm created in all ranks of personnel by these developments in the safety field insures that this program will take its rightful place among all the others carried on by this Bureau. The safety training of fire control personnel should benefit under the skilled direction now available.

Finally, let us look at a problem in safety training which is allied with our management work. Recreation is considered one of the multiple uses within the over-all forest management programs of most land managing agencies. For example, more than 55 million visits were made to the national parks and monuments last year, and while these visitors are on Department lands every effort is made to insure that the visit includes a safe experience.

SAFETY FOR VISITORS

Here are some of the activities in health and accident prevention which are applied to visitor activities and also to employees in general by the National Park Service. In order to insure visitor health, many types of actions are required including:

a. Provision for potable water.
b. Provision for sanitary rest rooms.
c. Provision for adequate garbage disposal and camp ground cleanliness.
d. Provision for first aid facilities.
e. Provision for inspections of eating and lodging facilities in order to insure adequate sanitation.
f. Provision for hospitalization and medical care.
g. Periodic inspections of bathing and swimming facilities.
h. Elimination of noxious insects, plants and animals in public use areas.

Many things are done for the safety of vistors. Highway safety practices are included in the design, construction and maintenance of park roads. Hazardous trees such as leaning or dead trees are removed from the public use areas and road sides. Elevators, used principally in those parks with caves, are regularly inspected.

All structures within the National Park System are given regular periodic fire hazard inspections. Fire control facilities for all structures are available and building fire brigades trained in structural fire control. The Service maintains regulation and inspection of all mountain climbing activities. It maintains regulation and inspection of many water activities. It inspects ski lifts and tows and provides for safe practices for winter use activities. The Service trains and provides lifeguards, patrols and rescue teams.

It provides for safe walking surfaces, including hand rails and guard rails at hazardous points within the parks. It provides boardwalks in the thermal areas and enforces all visitor activities pertaining to enjoyment of bear and deer. The Service insists that safety features be followed in the designs of new public use structures. It also has regulations for the installation of automatic sprinklers in multiple story hotels.

EMPLOYEE PROCEDURES

As employee safety has a direct relation to visitor safety, the National Park Service has developed many specific general employee safety procedures. It has safety committees at all field and regional levels and follows the dictates of the Department requiring Government drivers' licenses.

It provides orientation training and on-the-job training for employees, including training in safe practices. All employees' quarters and working structures have regular periodic structural fire hazard inspections. First aid training is required of all protection personnel. It requires training of all personnel involved in structural fire control, water activity protection, and all mountain and winter sports personnel.

The Bureau of Sport Fisheries and Wildlife has an over-all safety program which applies to the management of its forest resources as well as all other activities. The program is based on the Bureau's safety policy which, in essence, states that safety is an integral part of every task. No job is so important or no service so urgent that sufficient time cannot be taken to perform them safely.

Each employee is directed to give safety the same serious thought and consideration that he gives other phases of his work. The rules for safe operation of motor vehicles and certain other equipment and tools as well as safety in construction work are set forth in a Safety Requirements Handbook and other instructions.

EQUIPMENT STANDARDS

The Branch of Engineering is responsible for the establishment of standards in respect to the acquisition, operation, maintenance and review of operating methods for all equipment from the standpoint of job adaptability and safety, industrial safety, fire prevention, public and employee safety and provides technical assistance to the regional safety committees in evaluating the causes of accidents and making recommendations for remedial actions.

Each Regional Office has a safety board and a fire board responsible to the Regional Director for program development, directed toward improving safety conditions and reducing fire losses. The fire board is specifically directed to assist the Regional Director in determining responsibilities, developing programs to prevent fire losses and in improving fire presuppression and suppression.

The National Wildlife Refuges and Fish Hatcheries hold monthly safety meetings and on-the-job training in their respective work activities, including timber management and fire suppression. Periodic fire inspections are made on all buildings and facilities. Over-all safety inspections are required of Regional Supervisors on each visit.

Public education and active participation in fire pre-suppression and suppression are sponsored in those areas of high

fire hazard and extensive public utilization. Radio communication facilities are used extensively in the National Wildlife Refuges to facilitate patrol and for directing fire fighting activities. Controlled burning is practiced as a means of wildlife management and to reduce fire hazards in certain areas. Slash disposal and other fire safety requirements are written into timber cropping contracts. Each National Wildlife Refuge and Fish Hatchery has a fire plan appropriate to its problems.

The Department provides for safe working conditions for employees and where functions are hazardous, provides the necessary training to alert employees how to handle themselves safely.▲

HOW TO SET UP AN INDUSTRY SAFETY TRAINING CONFERENCE

by W. C. CREEL
safety director, North Carolina Dept. of Labor, Raleigh, N. C.

Safety training is one of the greatest needs in accident prevention work. While this need is generally recognized, very little has been done on an industry basis to promote safety training. One idea used successfully by one section of the National Safety Council is to use the conference method to promote safety training.

The leaders of the fertilizer section of the National Safety Council promote safety training for the fertilizer industry. They believed that the need for safety training was so great that a special committee was set up to promote safety training.

The committee further felt the greatest need was on the supervisory level, and therefore, set up the Supervisory Training committee. This committee, with the full assistance of the entire fertilizer section has conducted two successful industry safety training conferences.

MUST TRAIN SUPERVISORS

The first objective in setting up an industry safety training conference, is to sell the industry on the idea. In the fertilizer section, the selling job started with the entire executive committee of the section. The proposals of the Supervisory Training committee were explained, and suggestions were received at a regular executive committee meeting. After complete plans were approved, the executive committee was asked to endorse the plans, and give full cooperation. Securing this cooperation was probably the most important step in assuring the success of the safety training conferences.

The great need for safety training in the fertilizer industry is on the supervisory level, as is true in the wood products section and the pulp and paper section. Once the level of the conference was established, emphasis was placed on making the conference as practicable as possible. With these ideas in mind, it was decided the conference should be in the form of a training course—more of a school than a social get-together.

The general idea for the meeting was to instruct fertilizer industry supervisors in the latest techniques of accident prevention and to train them in setting up their own plant safety programs. The importance of a supervisor in a plant safety program and the ways he could reach the worker was stressed throughout the program.

The topics on supervisory safety training included "Safety and the Foreman," "Know Your Accident Problem," "The Human Element," and "Safety Education and Training."

Besides the topic of supervisory training, basic subjects in a plant safety program were presented. These included "Safety Organization," "Materials Handling and Storage," and "Housekeeping."

A special session on "Practical Problems in Supervisory Safety Training" was held to allow all participants to take part in an open discussion.

The course was based on the needs of the industry and followed the suggestions in the National Safety Council's Supervisory Safety Training Manual. In fact, this was one of the two textbooks used for the course. The other was the Safety Subjects, revised 1956, U. S. Department of Labor.

The agenda for the meeting was planned so that a wide variety of methods of safety training could be used. The straight lecture was used only in combination with some other method.

DISCUSS MAJOR HAZARDS

A most important part of the two day program was a planned group discussion on major hazards in fertilizer plants.

Each student was asked to designate on a card the group discussion section he wished to attend. Assignments were made on the basis of these requests and each student attended one of the three group meetings where the leaders presented the problems and lead an open discussion. At the end of one hour the groups met together and a designated person reported for each of the groups.

The audience participation plan was used in the "The Accident Problem" presentation. Each student received a series of 12 questions to answer. At the end of the period the instructor gave the correct answers. The questions covered basic information on the accident problems in the fertilizer industry.

The audience participation method was also used in the presentation of the topic on "Plant Inspection." Each student was given a flow chart showing the steps in the operations of a dry mixing plant and asked to mention hazards with which they were familiar. The instructor then summarized likely hazards for the important fertilizer plant operations.

MOCK SAFETY MEETING

A mock safety meeting was used as one form of panel discussion. The instructors acting as members of a plant safety committee actually conducted a plant safety meeting. The instructor briefly gave the fundamental ideas of a safety committee before the mock demonstration, and summarized the safety committee's part in a plant safety program after the mock demonstration.

The instructors for the safety training course were selected to give variety to the sessions. A college professor presented the basic ideas of training, and an industrial safety engineer with teaching experience gave the basic ideas on accident prevention. Discussion leaders from the industry were selected to give prestige and guidance for the meeting. The idea of balance, as well as variety, was stressed throughout.

The accepted basic methods of presentation were used, including some from our visual aids. In every unit, one of the best received visual aids material was the new National Safety Council series of training films, "Safety and the Foreman." This series is recommended for any safety training course.

The committee went to great lengths to plan details for the meeting. Besides the usual name badges, banquet and local newspaper publicity, two or three different ideas were successfully used for instruction. At the mid-morning and mid-afternoon breaks, cokes were provided saving time and offering an opportunity for fellowship. In addition, all participants were given an opportunity to meet with one of the industrial leaders for an individual conference, on their specific problems.

The two conferences were attended by 94 people representing 56 plants. Each participant received the basic ideas of safety training and instructions and materials to set up a safety training program for their individual company or plant. Other regional conferences are being planned for the fertilizer committee. The executive committee of this section has completed a successful project and has done much on an industry wide basis for the cause of accident prevention.

I believe the following conclusions will be of interest and benefit to all engaged in industrial safety.

- There is a real need for supervisory safety training in the fertilizer industry as well as the wood products and pulp and paper industry.
- The industry recognizes the need for supervisory training and will send plant

representatives to a regional safety training conference.

- Full cooperation of the National Safety Council, state agencies, and safety leaders can be obtained for conducting supervisory safety programs.

The fertilizer section of the National Safety Council is comparatively new. The wood products section, and the pulp and paper section are not only much older, but are larger and more influential. It is a real challenge to you as individuals and representatives of your section to do something about the need for safety training in your industry. If you want to make a lasting contribution to the cause of accident prevention in your industry, urge the executive committee of your section to start immediate plans for safety training.

PROMOTING WOODS SAFETY

by J. KENNETH PEARCE

professor of Logging Engineering, College of Forestry, University of Washington, Seattle, Wash.

In considering what I, an amateur in safety, could say to you professional safety men who represent firms with excellent safety programs and award-winning safety records, my thoughts wandered back to my laboring days in the woods. Thirty-seven years ago I was hired as a third rigger on a Lidgerwood skidder out of Union Mills, Washington, now a ghost town. I had worked on ground lead and high-lead yarding crews but had no experience with skylines.

My first morning on the job the head rigger handed sledge hammers to me and another green young third rigger and told us to go knock the tail hold on the skyline loose. That was all the instruction we received. We proceeded to the back end where the one and one-half inch diameter wire rope skyline was wrapped around a stump and fastened with railroad spikes. One thousand feet of skyline was suspended 100 feet in the air between head, tree and tail tree shoes.

SAFETY ORIENTATION

The surplus length of the skyline lay stretched out on the ground to one side of the stump. We started knocking out spikes, and soon the skyline started to run. The wraps sizzled and smoked around the stump and the loose end flailed around like a snake. How we got out of there alive I don't know.

That incident typifies the "let him learn the hard way like I did" attitude toward the green hand coming into a logging camp in those days. No one told him how to do the job safely. Great progress has been made in woods safety since those days. In the operations today safety goes hand-in-hand with production and safety-minded foremen keep a watchful eye on the training of the green hand. But are you doing all that could be done to promote safety at the time the worker is most receptive, most eager to learn? This time is when a young man first comes to work in the woods, or in your operation.

Many of my senior logging engineering students have worked one or more summers in logging labor jobs. Some have worked for companies with outstanding safety records. When I asked the students what orientation or safety training they received, all replied that they started right to work with the whistle the morning they reported. Any orientation they received came from their immediate supervisor.

They felt it was just luck if they started under a helpful, safety-minded supervisor. (Of course it was good management, but they did not realize it at the time, and no one told them this was part of the safety program.) The concensus of the students said that the weakest part of the safety and labor-relations program of the employer was how they were handled when they first went to work in the woods.

Some executives in the Pacific Northwest logging industry have felt concern that young men from communities which traditionally furnished woods labor are going instead to aircraft and other industries. One deterrent to recruiting the active, intelligent young men is the accident record of the logging industry, well known in woods communities.

ACCIDENTS DISCOURAGE WORKERS

Not so well known is the fact that logging accident statistics show the highest accident frequency rate among the youngest age class and the group with the least number of months experience. Efforts are being made through Junior Logging Congresses, vocational talks to high schools, and industry films, to attract young men to the logging industry. A good safety record could be a potent recruiting aid.

The book "Safety Subjects" published by the Bureau of Labor Standards, U. S. Department of Labor, used as a textbook in my class "Safety Practices in Forest Industries," makes a distinction between safety education and safety training. Education is defined as broadening of knowledge and understanding; training as the development of skill in performance. Safety training is usually competently handled by the safety-minded supervisor. But what about the safety education, particularly of the new employee? Is this a weak link in the chain of woods safety promotion?

University authorities have found it worth while to take the first one, two or even three days at the start of the new academic year for the orientation of the freshman and other new students. If college students need orientation, is the man in the same age group entering industry any less in the need of orientation?

SAFETY EDUCATION PROGRAM

The following program of orientation, and initiation of safety education, is suggested for groups of new employees of large operations. It embodies suggestions from students as to what they would have liked to have had when they first started to work in the woods, as well as my own ideas, as an ex-logger, foreman and superintendent.

1. *Orientation Session.* The first morning they reported the new men would be brought together for an orientation session. The Logging Superintendent would tell them of management's interest in safety and other company policies. An organization chart of the operation and authority might be shown.

Opportunities for advancement in jobs with the development of skills and learning by experience would be explained. The timekeeper would explain pay periods and procedure, deductions and insurance plans. The forester or fire warden would emphasize the importance of fire prevention and the organization for fire-fighting, since every man in the woods is a potential fire-fighter.

2. *Safety Education Session.* Following the orientation session, the safety supervisor would take over, and tell them of the safety program, first aid facilities and the training program. Safety training films are available from the various Loggers Associations, the American Pulpwood Association, State Safety Departments and the National Safety Council.

REPETITION VALUABLE

Booklets or cards covering job safety instructions would be issued and discussed. The value of repetition cannot be over-emphasized. Even college students can learn only by the repetition of reading the textbook, taking notes on the lecture, and writing the examination.

Ample opportunity and encouragement to ask questions should be given. Time for private talks with the personnel man should be made available for men who have a question or problem they do not want to voice in the group sessions.

3. *Observation.* Opinion among my students was divided as to how the first afternoon should be spent. Some thought that a tour of the whole operation, and observation of the various operations, such as yarding and loading, felling and bucking, road construction, and the shop to give the whole picture, would be helpful. Others thought that the afternoon might be better spent by observing the particular activity or job in which they

are to work, in company with their foreman, who would point out the safe and efficient way to do the job.

The foregoing orientation and safety education program is obviously not suggested for boomers or drifters who will hit the road with their first paycheck. Rather it is intended for the "home guards" who can be expected to stay on the job long enough to justify the time and money expended on them. It would be followed up at intervals with evening safety education sessions, using audio-visual aids.

Since the average 20 to 24 minute film teaches more lessons than can be absorbed, combining the running and re-running of short sections of a training film with the discussion-conference technique, is advocated. As an example, the Rarig Motion Picture Company of Seattle reproduces the sound-color film "Hauling Logs" which they made for the British Columbia, Pacific Northwest and Redwood Loggers Associations, in six four-minute sections. They publish a film guide of questions and answers for each section and a "Conference Leaders' Manual" to accompany the films.

The small operation, or the one to which new men come singly, presents more of a problem. However the same objectives of orientation and safety education, accomplished by individual discussion, rather than group sessions, would improve labor relations and promote woods safety. This is only a preliminary to the most important on-the-job safety training under a safety-minded supervisor.

TEXTILE SECTION

TRIAL BY SURVIVAL

(A Skit)

WITNESS NO. 1

Q. Name?
A. Don Maynor.
Q. Do you work in Gullyjumper Mill?
A. No, I was fired.
Q. Why were you fired?
A. I had an accident.
Q. What was your job?
A. Baler in cloth room.
Q. When did the accident happen?
A. Last Wednesday.
Q. How did it happen?
A. Tells about falling in oil slick, etc.
Q. How long had it been there?
A. Ever since I started work.
Q. Why didn't you wipe it up?
A. Nobody ever told me to.
Q. Didn't your second hand ever tell you to clean up?
A. No, only to keep it off the cloth.
Q. Don't you know that good housekeeping is the first law of safety?
A. No.
Q. Weren't you instructed in safety when you came to work?
A. No. Nobody ever said anything to me.
Q. Wasn't your job explained?
A. Yes sir!
Q. Wasn't safety also explained?
A. No.
Q. Don't the inspection committee report things like oil on the floor?
A. We don't have any that I know of.
Q. Are you really hurt?
A. Yes sir, I knocked one of those little things, etc.
Q. Who saw you fall?
A. Nobody—I guess.
Q. Did you report it to your second hand?
A. No. The boys told me I'd get fired if I did.
Q. Did you see a doctor?
A. Yes sir.
Q. When?
A. That night. I got to hurting, etc.
Q. Does it still hurt?
A. Yes sir.
Q. Where?
A. Right here. I have to walk all bent over like this.

(JUDGE: "How did you walk before the accident?"

Defendant illustrates—cocky walk across stage and back.

JUDGE: "That will be all.")

Q. Who is your second hand?
A. Mr. Ed Dickert.
Q. Who was the doctor?
A. Dr. Cuttem.
Q. Show me again how you have to walk since you got hurt.

PROSECUTOR: "Your honor—I'd like to call Dr. Cuttem in order to determine if this man is really hurt. I think he is malingering."

WITNESS NO. 2

After being sworn in:

Q. Now, doctor, give the court your full name.
A. Gladly sir. Doctor I. Cuttem, M.D., Ph.D., BVD.
Q. Dr. Cuttem, what do those degrees mean and where did you get them?
A. Well, sir, the M.D. and Ph.D. I got from medical college and the BVD I got from Sears Roebuck.
Q. Doctor, are you what is commonly called a bone doctor?
A. Yes, you might say I am a bone doctor. In fact I worked my way through college with bones (pulls out some dice and rattles—try to work up a game).

(Prosecutor and Doctor get on knees—Judge breaks it up.)

Q. But, doctor, did you study about the human bones?

A. Oh yes, I know all about them things.

Q. Now will you tell the jury what you know of the injury of Don Maynor? He says you treated him after he got hurt down at the Gullyjumper Mill.

A. Yes, this young fellow came to my house and woke me up about 3 o'clock in the morning the other day and wanted me to treat him—said he got hurt. Well, after I had time to get a credit rating on him, got him to sign over his car to me, promised me his Christmas Savings at the Mill, just a precautionary measure or two, I decided to look at him—and BOY what a sight—what a wreck—this fellow must have been hit by a train!

Q. Doctor, can you tell us exactly what is wrong with him?

A. Oh sure, but I'll have to call in my partner for a demonstration, my silent partner. (Pull out skeleton.) (Go through a routine with Ralph holding skeleton for me—using terms—also using song, "Dry Bones"). Finally getting around to the back and bringing out that the injured has a dislocated intertube in his sacrocrackerjack.

Q. Doctor, is this serious?

A. Tell about one out of ten gets along fine and this fellow has a good chance since my last nine patients died.

Q. Doctor, after getting this man to give you all the security you mentioned and after the examination you made, do you think his present condition is a result of an accident on the job?

A. (Thinking out loud) I'll get more money from a compensation case. Yes, that's my opinion.

WITNESS NO. 3

Q. Name?

A. Ed Dickard. (Have a handful of papers.)

Q. What is your job?

A. Second hand—cloth room—Gullyjumper Mill.

Q. Do you know that man?

A. Yep—I know him.

Q. Where did you know him?

A. He worked as a baler in the cloth room.

Q. You mean he is not there now?

A. No. We had to let him go.

Q. Why?

A. He couln't run his job.

Q. Do you know why he can't run a job?

A. Yeah—he claims he got hurt.

Q. Did he get hurt on the job?

A. I dunno whether he did or not.

Q. You mean you don't care. Your attitude is not so good.

A. I can't be bothered about guys like that. All I ever hear is my overseer on my back about getting out the work. Quality and production and seconds is all I hear around here. What am I doing here anyhow? I was called off the job and was told to come down here with no explanation.

Q. You are here to determine if this man had an accident. Now, did he report his accident to you?

A. No.

Q. Did he go to the nurse?

A. We don't have a nurse.

Q. How do you give First Aid?

A. I just slap a little iodine on 'em.

Q. Do you have a department safety committee?

A. Heck no. We don't have time for that stuff.

Q. Doesn't your overseer make you keep a safe department?

A. Goodness no, All he cares about is production and baseball.

Q. You mean you don't have any kind of a safety program at Gullyjumper?

A. I guess that's right. If they've got one I never heard of it.

Q. Who is your overseer?

A. Mr. Owens, who is also manager of the Mudhens.

"Call Overseer"

WITNESS NO. 4

Q. What's your name?

A. Red Owens.

Q. Where do you work?

A. Gullyjumper Mill.

Q. What's your job at the mill?

A. Cloth room boss and manager of Mudhens ball team. What y'all want with me? I was called from the ballfield, etc.

Q. How many employees do you work?

A. 18 working and four ball players.

Q. What are your duties?

A. My biggest job is getting out production, etc., ball team.

Q. Do you know that man—there—who got hurt in your department?

A. I've seen him around.

Q. Do you have a report of his accident?

A. Nope. I didn't even know he got hurt till the super told me to come here. I need to get back to the ballfield.

Q. Do you agree with his statements?

A. Heck no. They are a pack of lies.

Q. Do you have any kind of a departmental safety program in your department?

A. No. We don't have time to take people off the job for that stuff, etc.

Q. Hasn't your superintendent told you to start some safety activities in your department? Hasn't he told you what to do?

A. He told me what to do all right—not to have any seconds. He says that safety stuff ain't worth a darn.

Q. Who is your superintendent?

A. Mr. Fred Thackston.

"Call Superintendent"

WITNESS NO. 5

Q. What's your name?

A. Fred Thackston.

Q. What's your job?

A. Superintendent.

Q. How long have you worked at Gullyjumper?

A. 25 years.

Q. How many employees do you work?

A. About 600.

Q. Do you have a personnel department?

A. No, it would cost too much money.

Q. Well, who hires your help?

A. Overseer.

Q. Does he explain any safety rules to the employee?

A. No, he doesn't have time.

Q. Do you have a cost department?

A. Yes, we have a cost department.

Q. Why do you have a cost department?

A. Because it is necessary to know what it costs to make a yard of cloth.

Q. Well, why don't you have a safety program?

A. We carry insurance to take care of our accidents. We can't see where it would save us any money.

Q. Do you know what your insurance costs you?

A. Yes, it costs about $15,000 per year.

Q. Has the insurance company ever sent their safety engineer around?

A. Yes, some little college engineer came around. He wanted to tell me how to run my plant; wanted me to spend $10,000 to change my elevators, cables, etc.; and they have been running for the last 20 years and no one has gotten killed yet. He wanted me to put a guard on every motor; even wanted me to change all the electrical outlets; said somebody could get electrocuted. So, I just told him to get his little handbag and go back where he came from. I didn't have time to fool with him.

Q. Whom do you take your orders from?

A. From Mr. Sawyer up in Massachusetts.

Q. Has he ever told you anything about having a safety program in this mill?

A. No, all he is interested in is how much money I make for him each year. He expects me to make him money and if I don't do it, he will get somebody that will.

Q. Who is in charge of safety?

A. Nobody.

Q. Who keeps records of accidents?

A. Don't keep any.

Q. What is your frequency?

A. I don't know what you are talking about.

Q. Do you have a nurse?

A. No.

Q. Do you have a physical exam when you hire new people?

A. No.

Q. Do you hold any safety meetings with your overseers?

A. No—only production meetings.

"Call Owner"

WITNESS NO. 6

Q. Could I have your name?

A. J. A. Sawyer.

Q. Are you the owner of the Gullyjumper Mill?

A. Yes, I own that mill.

Q. Would you tell us where you live?

A. I live on Beacon Hill in Boston, Mass.

Q. Now tell me, is it true that everything that is done or goes on in the Gullyjumper Mill is your personal responsibility—all decisions, all new machinery, all maintenance, etc?

A. In general that is true. I only get to the mill about five times a year but in general I do make all the major decisions.

Q. Now in this trial we have been trying to find out who was responsible for the accident to this poor claimant sitting here. All the other persons have told this court that they were following their orders and they all appear to be doing just as they have been told. Is that about right?

A. That may be true but I've never told them to get anyone hurt.

Q. You personally don't like to see anyone hurt, do you?

A. No, of course not!

Q. Do you at this time or have you ever taken any personal interest in the prevention of accidents at Gullyjumper Mill?

A. No, that's not part of my job or my responsibility. The people down there have got to look out for themselves. Our job is production—not worrying about who might get hurt.

Q. Do you know how much you are paying for W. C. insurance?

A. I don't know exactly—I do know it's too high.

Q. Have you ever discussed the cost of accidents or insurance costs with your superintendent?

A. No.

Q. Have you ever instructed the superintendent to install a safety program, or to make sure he runs a safe mill?

A. No.

Q. One last question, don't you agree that if you personally have never expressed any interest in the prevention of accidents, that the superintendent and all his overseers could easily have the same opinion?

A. I am afraid that I cannot go along with your reasoning. What I say or do has no connection with an accident that happens at Gullyjumper Mill. People have to look out for themselves. We can't waste our time worrying about a spot of oil on the floor.

Q. Do you believe in good working conditions for your employees?

A. Yes. We will do anything to get out production and improve our work.

Q. Do you ever discuss safety with superintendent?

A. No. His job is productioin.

Q. Do you ever mention costs of accidents to superintendent?

A. No. His job is production.

Q. All the testimony you have given shows that no program has been injected in Gullyjumper Mill for anything but production and costs. Nothing for the safety of your people, which means that you are overlooking the best possible way of reducing costs, reducing seconds and therapy increasing efficiency and production.

A. Now wait a minute. I don't see how all this is any business of yours. Dragging all these witnesses down here etc., etc.

Q. Your Honor, I rest my case, as I have proved without a doubt that all supervisory personnel are guilty of this man's accidental injury, and I demand a verdict of guilty and the supreme penalty of conviction. I would now like to put my case before the jury.

JUDGE: You may charge the jury.

Prosecutor to Jury
(Face Audience)

Ladies and Gentlemen of the Jury. You have heard the injured explain how he got hurt. He worked in a mill utterly devoid of feeling for the worker. He was driven to seeking medical attention on his own hook because the mill provides nothing in the way of a medical program. For his trouble he was fired for not being able to run his job.

You have heard the second hand explain that he had no time to operate a safe shift. He stated he was driven constantly for production and quality.

You have heard that ignorant overseer testify that his only interest was in the baseball team. He hardly knew his own employee. Production and baseball was all he cared about.

You have heard the superintendent testify that he took no active interest in the welfare of his employees and that he didn't have time for safety.

You finally heard the owner state that his only interest was in money and that he felt no obligation to provide even the rudiments of good working conditions for his employees.

Such a history of buck passing I have never seen. Not one of these men has proven himself fit to run a mill.

I ask you to return a verdict of *guilty* in the first degree. I ask this court to invoke the extreme penalty on all of these men. I demand that they make full restitution to this poor man and that they be required to operate in the future according to the strictest Safety Code.

I rest my case.

Judge charges the jury and finds that they are all guilty and sentences them to one full year of having a safety program in their respective plants. Then asks if they think each individual is guilty and brings them up before the bench to be tied by the bailiff and carried out to jail.▲

OFFICERS OF THE

GREEN CROSS FOR SAFETY®

HUMAN RELATIONS and MAN-MANAGEMENT

by Dr. J. L. Rosenstein

INTRODUCTION by R. L. FORNEY

secretary, National Safety Council, Chicago, Ill.

Welcome once again to the early morning sessions of the National Safety Congress. I am sure that a great many of you were here at these sessions last year, but I wonder how many of you were here in 1947, 10 years ago? Will you hold up your hands? How many of you were here in 1947? Well, a fairly large number at that.

Those of you who were here that year will recall, I am sure, that the speaker we had was a smashing success to us—a theatrical term. He was so good in fact we had to turn around and bring him right back the next year.

Now, although Dr. J. L. Rosenstein has not been back at these early morning sessions since 1948, he has certainly been a part of the American safety scene during all these years.

He has performed many services for the National Safety Council and has gone back and forth across this country and Canada, conducted training programs for community safety organizations, ASSE groups, industrial concerns and organizations of all kinds.

All during these years, we have had a good many letters from people saying that, "Isn't it about time to get Dr. Rosenstein back to the early morning sessions of the National Safety Congress?"

The thing sort of built up from year to year until we felt that it certainly was the right thing to do to bring this man back to this crowd and to these early morning sessions, and that is what we have done this year.

Now, as you know, these sessions will continue through tomorrow morning, Thursday morning and Friday morning at the same time. The general topic for the series is, "Human Relations and Man-Management."

I am happy to present to you Dr. J. L. Rosenstein, who is Assistant Director of the Management Center of Marquette University, and a nationally recognized training consultant.

I am sure we are all glad to have Dr. Rosenstein back.

THE ART OF MANAGING MEN

SESSION ONE

I HOPE that every one of us here likes to think in practical terms because this entire program is concerned with the practical problems of practical men.

Practical problems met with and dealt with by every supervisor eight hours a day on a realistic job, not in theory.

In many places, I am introduced as a psychologist, but my pride is not related to being a psychologist. Rather, it is related to being a teacher and as a teacher my job is not to tell you very much but to try to say something which will cause you to think. And if anything I say or do causes you to think, then I think it will have been an awfully good and a very successful program.

Today we are going to be concerned especially with the practical problems of specifications—leadership, discipline, and the needs of men, realistic, practical needs.

One of the aspects of being practical relates to the recognition that every business is different from every other business; and that every executive's job is different from every other executive's job; and that every supervisor's job is different and every foreman's job is different and everybody's job is different from every other man's job. Everybody deals with different economic and different policy problems. Everybody deals with different social, personal and personnel problems. Everybody deals with different equipment and has different mechanical and different production problems.

But, as true and corny as it seems to those of you who think of yourselves as being sophisticated, the most important thing I have ever learned in 55 years of living, is that with all the differences that exist from company to company and industry to industry and job to job, every one of us has one thing in common that we deal with, and that is people, and they are exactly the same everywhere, and not a thing ever happens anywhere, and that is the most important thing I have ever learned.

If I ever forget that for one moment I am being impractical.

I know there is antagonism between so-called objectively-described groups as management on the one hand, labor on the other, but I am too old to be scared by words.

Management, to me, is people; labor is people. They are men and women with hearts and souls; they are fathers and mothers and sisters and sons and brothers. I know that management is people. I know that labor is people. And I know that strikes happen under all kinds of conditions for all kinds of reasons in all kinds of industries. But it is always people who are antagonistic. It is always people who go out on strike. It is always people who have these man-made antagonisms, and it is always people who work out their man-made differences with man-made solutions.

I know that you all receive the publication from the National Safety Council called "Accident Facts," and I know that all those figures and all those statistics relate to accidents. But don't fool me and don't try to kid me. Every one of those statistics is a person, not a number. We are talking about people. After 20 years around the Safety Council and working and talking with safety men, I know that accidents happen in all kinds of industries for all kinds of reasons, under all kinds of conditions, but I have never yet seen an accident which was not made by a person. I did not say people have accidents. People have babies. They make accidents.

. . . CAN PREDICT ACCIDENTS

Being a practical person, I would not dare say to any of you, "What is an accident?" You might reply with the classic definition which makes me angry every time I hear it. It starts out like this, "an accident is an unexpected occurrence." But don't tell me that an accident is an unexpected occurrence." Maybe it happens when you don't want it or least expect it. But every one of us knows an accident is expected. Every one of us knows he can predict an accident. Any time you show me an unsafe condition or an unsafe act, I can guarantee there will be an accident. Maybe

it will not happen when you want it to happen or when you are ready for it, but there is going to be an accident.

So, let's be practical. Accidents are to be expected and they can be predicted, whenever an unsafe act is performed or an unsafe condition exists.

In these meetings we are concerned with the management of people. And these people are the same everywhere. They present the same kind of problems everywhere. They all have the same kinds of worries, the same hopes, the same fears, the same dreams, the same aspirations, the same grievances, and the very same human nature everywhere.

So, we are going to talk about the one thing which is universal in every business and industrial activity, people.

It seems to me that as practical people we ought to be concerned with what I consider to be a most important word in industry and business, and that is specifications. You and I know that everything we deal with and everything we are concerned with in our jobs, has its own specifications, which means it has its own peculiar attributes, its own peculiar qualities, its own peculiar limitations of performance.

We know that brass is different from wood and that gold is different from steel. We know that a lathe is different from a punch press and that an airplane which is a conveyance is different from an automobile which is also a conveyance. We know that a washing machine is different from a dryer and that a hand tool like a hammer is different from a hand tool like a chisel or a saw.

As practical men, we are never provoked if glass won't do what gold will do. We just do not expect it. We are not upset when wood won't do what steel will do. We don't expect it, and we are not disturbed if a garbage disposal will not type letters like a typewriter, which is also a machine. We don't expect it. We are never upset if a punch press says, "I'm not going to turn stock, I'm no lathe." It doesn't make any difference what the pressure on us may be. It makes no difference what we want or must have. We just do not expect and we know that we can not expect to get from things anything which is not in keeping with their own specifications. That is being practical. We work within the specifications. We do, if we have good sense. Even if we are not satisfied. Even if we are unhappy about what we are going to have to accept as a final product, we know we have to work within specifications.

Are you practical? How can you call yourself practical if for one moment of any eight-hour day on the job, you forget that people too, are phenomena of nature and that they too, have their specifications, their qualities, their attributes, their properties, their limitations? Human properties, human qualities, human attributes, human specifications, which are the same everywhere. There is a logic and a common sense in dealing with these human specifications too, whether you like it or not, whether it is difficult to believe and accept the first time you hear it.

HUMAN NATURE NEVER CHANGES

The first and most important of these human specifications, the one we must live with and work with even if we don't like it, is that human nature is immutable. It is unchangeable.

Our first principle in dealing with this human nature is to recognize and know that of all the things you can depend on in this ever-changing world, you can always depend on human nature. It is always the same. It has always been the same. You just can't change this human nature.

Of course we like to think of normal human nature as a changing or changeable thing. But then we are thinking about the way it expresses itself, not human nature itself. Many of us would like to change some of the ways which human nature uses to express itself and we try to do so, by teaching people, by making rules or laws. We think we make better people that way. But human nature itself cannot be changed. It may be understood, it may be guided, it may be directed, it may be led, it may be controlled, but it cannot be changed. It has never been changed. It has never been changed since the beginning of time.

Everything that we talk about concerning human nature today you can read about in the old Koran, in the Old Testament, in the New Testament and in the Chinese Literature of 7,000 or 8,000 or more years ago. It is exactly the same.

Well, if it cannot be changed, maybe as practical men and women we ought to stop

wasting our time trying to change it and begin spending our good energy, and good intelligence, trying to discover ways and means of controlling, guiding, leading, directing and managing it.

Teaching practice requires that we repeat ourselves from time to time. So, at this point, let me repeat.

Hasn't your experience taught you the logic that you must never expect anything out of a tool, out of a machine, out of anything you deal with, a pencil sharpener, a typewriter, a generator, a truck—you must not expect anything which is not in keeping with its specifications?

If we invent a tool or a machine, that tool or machine is planned and controlled from the idea stage to the paper stage, mock-up, trial, and production stage. Every single step of the way we put into it the specifications we want, exactly as we want them, *if possible*. Sometimes it is not possible. Sometimes, we have to compromise, which means we also have to compromise with what we are going to get out of it, and we don't like that and we are unhappy because we have to compromise. But, at least we try to recognize that it is the specifications which are important to the end result not the things that we want.

If we go out to buy a tool or a machine or anything at all, we think in terms of specifications.

When the personnel department starts testing and interviewing and goes through all its various steps, it is trying to discover specifications as it relates to people for a job. We talk about and are concerned with specifications because we know that if we don't know specifications or if we work outside of or demand things beyond specifications, something is sure to go wrong.

WORK IN SPECIFICATIONS

We have mistreated that device when we work outside of specifications. If we make demands of a machine, not in keeping with specifications, if we use it improperly and something does go wrong with it, we don't say the machine is vicious: We don't say the machine is anti-management. We don't say the machine is uncooperative. We don't say the machine is a Communist. We don't walk up to the machine with a wrench behind our back and say, "You're not giving me what I want. I will show you who is running this outfit." We don't hit the machine and say, "You have too many teeth in your gear wheels anyway! That will teach you."

We don't go up to the machine and say, "If you think you're going to waste my good time and the company's money you're crazy. You are not giving me what I want. So, no grease, no oil and no maintenance for you for the next 10 days and when you start hurting and squeaking and groaning and squawking, you'll know. You'll learn."

We don't walk up to the machine and say, "Hey, listen, you're either going to or not going to give me what I demand. You're not? OK. I'll pull the switch and shut you down. You're laid off for three days. No work. That will teach you."

We don't take this machine and throw it out the window or fire it. That would be silly, wouldn't it? Oh, are you really practical? Think about it a moment.

We do make demands of people, don't we? We make demands of ourselves too, without ever being concerned with the special specifications of ourselves and others. When people don't come up to our demands or don't give us what we have to have or what we need because we are under pressure to get it, we do have a lot of dirty names for them don't we? We use words like lazy, vicious, antagonistic, anti-management, insubordinate, uncooperative, disloyal, Communist. And we do discipline them, don't we? We punish them or fire them if we can. It is not as easy as it used to be to get rid of them. And if they are no good at all, we try to transfer them over on to somebody else. There must be a national manual of standard practice because it is that way clear across the country everywhere.

With people, we do not do what we know should be done, as practical, intelligent people, we don't stop the man just like the machine, do we? What do we do with the machine? For that machine, we set up a completely formal program of preventive and corrective maintenance. Prevention comes first. If something despite our preventive plans begin to go wrong, at the first sign of something wrong, we stop the machine, shut it down, take it apart as quickly

as possible, correct what is wrong, put it back on the job as quickly as possible and not in anger or hostility or with a sense of aggression.

What happens with people? We don't stop a man like we stop the machine. Take him off the job; find out what is keeping this good man from being the good man he could be and would like to be; correct what is wrong with him and put him back to work on the job as quickly as possible. You don't have to be a professional psychologist to be aware.

How do you know when to do this? The moment you say to yourself, "What's eating him?" or "Joe isn't himself today" or "Brother, he must have gotten out of the wrong side of the bed today," you have recognized that something is wrong with that man.

Would you let a machine with something wrong continue to work?

Why ignore the man?

We know that with ourselves, there are many days when we say, "Oh, brother, this is one of those days I should have stayed home." Things happen to people. We know that. But, are we practical when we forget to use what we know? What is the use of collecting all this know-how if we don't use it? We are impractical if we don't use it and we know there are things that happen to people over which they have no more control than a machine has over something that happens to it, which keeps it from functioning like it could and should and would.

CAN'T REASON ABOUT PEOPLE

Our own human nature seems to be especially peculiar in that we can reason rather reasonably about things, methods, materials or equipment, but not so reasonably about people. Primarily, this is because we have never been taught so consistently and insistently about people and their normal functioning as we have about things. So, when human nature is expressing itself normally, it seems to be vicious or radical and exasperating and distrubing and we want to slug it.

Are you practical? Stop a minute and think. When was the last time you said to yourself, "Am I perfect?"

When you reluctantly agree that nobody is perfect, including yourself, what does that imply? Well, you know that if you are not perfect, and none of us is perfect, that there are many hundreds and hundreds of so called imperfections.

You've always known that people just don't seem to look ahead. Neither do you too much.

People are impulsive and petty and they are sensitive and they like assurance. They are proud and their feelings are easily hurt and they lack initiative and resist change and don't have any real long-range goals in life.

People are not self-starters or self drivers. They want to be liked and babied, and want to be identified with good things and things they can be proud of.

They will deny making mistakes. They will pass the buck and try to pull fast ones on you.

They are always on the defensive, always looking for an angle, a curve or break.

They see good in the things they like and see things wrong in the things they don't like, and always have a good reason for doing the things they want to do, and a pretty good reason for not doing the things they don't feel like doing.

We are certainly most impractical if we ever forget for one moment that these and many hundreds of other every day performances are ordinary expressions and symptoms of a normal realistic human nature which just can't be changed no matter how we try.

Imperfect? Of course it is imperfect. Difficult to deal with? Why sure. If it weren't difficult to deal with we would not need any of those so-called leadership qualities in supervisors and all supervision problems would be simple ones. Anybody could handle them.

It is those hundreds or thousands of inadequacies and imperfections that create the need for man-managers and leaders.

What have you considered to be the mark of a real leader? What is your concept of a real leader? Well, you may be sure that all of us, loaded with these inadequacies, spend a major portion of all of our mental and physical and emotional energies trying to make it look as though we don't have any inadequacies, because none of us is proud of them. The good leader knows it. We are ashamed of our inadequacies, our imperfections. We don't want people to know what is wrong with us.

We say, "Sure, nobody is perfect," but we don't go around bragging about what is wrong with us and we spend a major portion of our mental, physical and emotional energies trying to make it look as though we don't have anything wrong with us.

We would rather have people see our good qualities. We have all been taught as though it were immoral and delinquent, not to be perfect or ever to do anything wrong or to make a mistake. So, we learn to deny and hide mistakes or error or doing wrong because from the time we were children we have been trained by a sock across the ear or across the rear that when we do something wrong, we are always going to be punished.

SELF-EVALUATION

We are not proud. Rather, we are ashamed of not measuring up to some standard, a standard established by society in the form of our parents or the school, or maybe the world all around us. But more important we are especially ashamed of not measuring up to some standard which we set for ourselves.

Just remember, that the true psychological measure of any man or woman is not what we actually are or what we might become or what people think of us. The true psychological measure of every single person is what he thinks of himself. The pictures which he has of himself—and every one of us has many idealized pictures of himself as a good man, as a good father, as a good husband, as a good workman, as a good citizen—these are the pictures he holds up as personal standards and these are the things he tries to be or aspire to; those are his standards of values.

All pictures which a man has of himself; what he thinks of himself provides the motive power, sets the standard and is the incentive for the way he thinks, the things he will do, the things he will be proud of or ashamed by.

We have known for years that the racketeer or the embezzler of widows and orphans, despised by decent men and women, can strut down the street in great pride, all wrapped up in his warped and twisted, self-esteem. This racketeer, this embezzler, has a picture of himself too. He sees himself as a big shot, and as long as he sees himself as a big shot, he does not care what you think of him. He will fight and kill if necessary if anything threatens his stature as a big shot or he thought it did, and his kind have killed in order to be and remain big shots.

At the other extreme are the things we accept casually. Parents sacrifice and give up necessities in life for themselves if necessary to take care of their children and give them a better break in life. When you talk to them, you find that it doesn't make any difference what the world thinks about the wisdom of their secrifices. It has nothing to do with reality; it has nothing to do with intelligence; it has nothing to do with the world and true life. They have a picture of themselves as parents and what parents ought to be like and they will live up to that picture if it kills them.

They couldn't live with themselves if they did not live up to their picture of what good parents ought to be like.

What about the workman on the job? What picture does he have of himself which causes him to be a co-operative, hard working, decent workman, anxious to do a good job? Golly, I don't know. But basically, he is a good man. He has a picture of himself as a good man and he wants to be known as a good man and he wants the world to know him as a good man.

MAN WORKS FOR MONEY

What motivates good men? Of course we work for money. Everybody who works has to work for money. That is the only reason we work. We would be silly if we didn't. But, a man may work grudgingly or he may work cheerfully. He may work indifferently as a machine or he may work with a purpose as a man. He may see his work as a means to attain all those things for his loved ones which provide comfort and security, or he may despise his work as a perpetual burden to be hated.

There is no workman so stolid, but that he tries to find a way not to be ashamed of his work. There is no man so ox-like, but that he tries to find meaning and soul in the things he has to do for a living. There is no workman so dull but that he looks for ways to enliven and find color in his work.

Yes, we applaud the actor and hockey player and the racer who knocks himself out for applause or the fighter who lets himself be punched silly so he can get a pat on the back from the audience, and if there is no audience, then the boys in the gym will say, "That guy is really a fighter's fighter, a man's man," and so on.

No genius ever drudged away long, lonely hours, hoping to produce a painting, a symphony or a great novel unless he believed or hoped throughout all his labors that one day his work would be acclaimed and he would get recognition and praise for it from the world at large.

Praise, applause, recognition are necessities whether the man is a clean-up man or a hod carrier or a window washer or genius.

At any level of performance, praise, recognition, expressed appreciation or, a word of thanks for good work done are the psychic shots in the arm, that provide continuing energy to keep on slugging. Recognition for having tried even if things don't come out right is the basic incentive. Praise and recognition make possible that the necessary work of drudgery be done and have even converted drudgery to a labor of love as you all know.

On the other hand, what is the worker's picture of himself, which leads to resistance, antagonism, destructive anger, rage, and aggression? Well, I don't know that either.

But, studies in psychology have taught us that destructive anger and rage in adults will result from restrictions and controls which are imposed by others. Controls are imposed on a man by others and so bind a man's mental or physical freedom that he will rebel and try to break out of these bonds, even if they are imposed for his own good.

That is why we do touch, when the sign says, "Don't touch." That is why we do balk at and break restrictive safety rules. That is why we still go out there when it says, "Stay out of street," or "Don't light a match," or "No smoking."

Did I say adults? I always love to brag and I have been bragging about my grandchildren all over the country. I used to brag about Holly. Well, she is seven now. Then, I began bragging about Cynthia. She is past four. Now, let me talk about Lisa. It is wonderful to see this thing going on from one child to another. Those of you who have young children or grandchildren know what I am talking about. And one thing, for a guy as old as I am it is bad to start out a day with an hour and a half of playing around with a couple of grandchildren. By the time I get ready to go to work I am no good for anything. As my wife says, "Grandchildren are wonderful for young people."

But, if you come in as we do, on a visit two or three times a year and there is our daughter and she has Lisa in her arms and I wiggle my fingers at her and I say, "Come to Poppy," and the baby makes a dive for me and my daughter says, "See, she recognizes you," you know that your granddaughter would go for anything that wiggles but with mine it is a sure sign of intelligence. She recognizes me.

You take this child and throw her around and laugh and sing and croon and hold her close to you, and she is happy too and she laughs and slobbers all over you. But soon her Mama says, "O.K. Poppy, let's go. Soup's on. Bring her in. I am going to feed her and put her to bed so I can relax too."

REBEL CONFINING BONDS

But you hate to give her up and just before you let her go, you want just one more cuddle, and you put your arms around her legs and around her body pinning her arms and you squeeze.

Then what happens to that sweet and happy child who was laughing and crooning with you and drooling all over you, having a wonderful time? Suddenly, she is converted from a sweet thing into a wild creature. Suddenly she cries out and begins to fight her way loose and breaks out in a loud scream. Your daughter says, "What did you do now? Did you hurt her or scare her?"—and you turn to her and say, "No—daughter. I didn't hurt her or frighten her.

You and I should get down on our knees and pray our thanks to God because this child was born normal with the built-in urge and drive to break out of bonds that are imposed on her by others. Thank God she is normal. She was born normal and will always rebel against and try to break out of confining bonds imposed on her, even if they are bonds of affection. She won't have to, as our men in industry think, get to be 23 years old and join a radical union to be antagonistic and try to break rules which are imposed on her by the bosses who call them policies or rules, regulations, even if they are good rules and wise policies.

Thank God she was born normal. If you are practical, you will never forget that.

Oh, we know too that people in pain will strike out and attack wildly. You have seen them haven't you? They are hurt in an accident. You rush to them, to try to help them. And they strike out and they say, "Get away from me!" People have been hurt in other ways. You have seen them, when they have been hurt inside—hurt terribly. You have seen them turn white. You have seen them withdraw. You have seen them tighten up and then you have seen them burst forth in a surge of anger and rage to attack you physically or verbally for having hurt them.

If you ever forget that even for one minute, of any eight-hour day on the job, you are being impractical. Because destructive anger and rage will always result from injuries to self-esteem, pride, self-respect.

Many men, treated unkindly by fate have nothing else left in the entire world but their own self-respect. They will fight to the death if necessary to protect [illegible] one little thing they have left—self respect.

Nobody likes to have his self-[illegible] lowered by anything or anybody, [illegible] by supervisors who demand things which he can't accomplish and which will surely result in a sense of shame and inadequacy or by supervisors who assign work to us we are ashamed to be seen doing, or the supervisor who repeatedly threatens and nags. You have heard them rave, "One of these days there are going to be some changes around here." So that, even if there is a union, a good, strong union, there is a sense of personal affront, a loss of personal self-respect and we are unhappy.

Maybe we don't pop off—because we need our jobs—but our unexpressed anger will express itself in some fashion against the supervisor who supervises so closely and keeps telling us how to do things so much of the time that we are publicly made to feel incompetent and so enraged that we feel like saying, "Why don't you do it yourself instead of trying to make a big shot out of yourself by making me look like a nitwit;"

or the supervisor who makes fun of us or makes wise cracks or is sarcastic especially when we dare not retaliate directly.

We all have a picture of ourselves which we like and we keep our mental fists ready to defend that picture from defacement, from anything or anyone. In the case of supervisors who do things which might lower our self-esteem, we do retaliate by striking back through lies, whispers, rumors, spoiling work, doing anything we can get away with which will make them look bad in return.

WE HIDE INADEQUACIES

When there is danger that the picture we have of ourselves and our self-respect might be defaced by the appearance of real, honest-to-goodness, genuine inadequacies and deficiencies, we try to hide these deficiencies and inadequacies from others because we don't want to be shamed in the eyes of others. But, because our own opinion of ourselves is more important than that of anybody else, we especially try to distract ourselves from our own inadequacies. And we try to cover up and hide our deficiencies from ourselves, and go through all kinds of defensive actions and develop all kinds of compensatory devices, including lying to ourselves as well as to others in order to make us seem the kind of person we like to think we are and which we can admire and not be ashamed of.

Because all of us are so loaded with inadequacies, (so many of them), we are constantly walking around with our fists up, trying to maintain our self-respect. We see this sort of thing in the six foot four, 250 pounder. He is easy-going, placid, soft-spoken. He has always had a problem since he has always been big. He was always twice as big as his friends, and even in being playful with a light punch, he knocked somebody down. These kids ran to Mama and yelled Mama, "He beat me." Now if he bumps into you accidentally—and you protest—"Where are you going, you big lug. Trying to kill somebody?" He doesn't take umbrage. He might say "I am terribly sorry. I hope I haven't hurt you."

His size has always been a problem with him—he is just a great big easy-going, human, St. Bernard.

On the other hand, you have the little human Pomeranian, haven't you, always

ready for a scrap. His size is a problem to him too.

Sure, we little fellows have to keep proving to other people as well as to ourselves, "I am a man." This great big man doesn't have to prove it, he knows it. And any one can see it by looking.

You see that same sort of thing in the homely girl, who uses too much makeup, bad taste in the way she dresses, or maybe she wears her skirts a little shorter than they should be or her sweaters a little tighter than they should be or maybe she wiggles her rear end a little more than is necessary for walking purposes. She wants to be whistled at too. Being ignored is the most horrible kind of experience for any girl. She wants attention just like the pretty girl, even if it is an undesirable kind of attention. The important thing is that she not be ignored. Being given a second look, being "whistleable" is vital to the psychic life of women and there is nothing wrong in that.

Every woman has a picture of herself, regardless of her beauty or lack of it. She knows she is just as fine and maybe a lot better person than her prettier friend who gets attention.

You see self-esteem and pride defended by the girl who says, "Yes, I could be popular, too, if I wanted to do the things she does when she goes out with the fellows." You have heard that sort of thing. She isn't talking about her girl friend. She is talking about herself and what she is hungering for.

You see it in the man who says, "The dirty rat's got it in for me. He never will give me a chance." Or, the man who says, "I could have gone up the line. I could have had some of those swell jobs if I had wanted to lick boots and polish apples. Now, here I am, but I don't want to be a stooge or yes-man for anybody."

You have heard it. You have seen it in the man who tries to hide a mistake from his boss, who says, "Why didn't you come to me and tell me?" If he had good sense, he would know why he had not come. You get it from the man who comes home and his wife looks at him and says, "John, what is wrong?"

"Oh, nothing."

"What do you mean, nothing? It is written all over you. Something has happened." Finally she corners him. He says, "Just as I was getting ready to go home the boss laid me out and he was going to town and it had nothing to do with me and he finally threatened me and my job. So I said, 'Look, I have got a wife and a couple of kids and I need this job, but I don't have to take this from you or anybody else. You know what you can do with your stinking job.'" Being understanding she might say, "There are some things you have to do for a job and some things a man can't take and remain a man. I'm sorry about the job—but a man has to live with himself too."

Of course, he doesn't tell her he was telling the boss this while he was waiting for the red light to change on his way home from work.

Oh, sure, as a supervisor you are busy. Maybe you don't feel you have the time to give people all the praise and build-up they need all the time. That a man is always after you for personal attention may irritate you. You may feel that you can't waste time looking for pretty pictures and overlooking inadequacies.

NEVER SUPERVISE PEOPLE

But, let me remind you that you never supervise people. You have always known that supervision is never of more than one person at a time. The practical fact remains that the picture which this one person has of himself is the major key to understanding that man and what motivates that man and what is an incentive to that man, and it is the only guide to successful man-management.

Just as their equipment needs continuous and corrective maintenance, so people need continuous man-maintenance. It is the oil in their psychic parts. That is what makes them run smoothly. And whether you like it or not, whether or not you think it is a lot of foolishness and a waste of time, you have got to give them the attention and the build-up, and the praise and the psychic oil and the psychic maintenance that real leaders of men always give their men.

One of the marks of a real leader of men is an emotional maturity. It is from the infant, from the child, that we expect, "I want what I want when I want it and I'm going to scream and yell and kick and I'm going to raise hell until I get it." That is what we get from the infant and we call it infantile behavior. Even when it comes from supervisors and managers and executives it is still infantile and immature.

What do you think of as the mark of the real leader of men if these inadequacies require leadership? Is it the capacity for driving things into people? Is it the capacity to force and coerce? Is it the capacity to demand?

Isn't it true that for you the mark of the real leader has always been seen in his special ability to bring out the best in men? The best in good men? The best in weak men? The best in men with whom others have failed? Not the capacity for driving things into them, but the capacity for bringing out the wonderful things which are already in them? Of course, for some men their best is a tiny little best. That is all they have got to give. For some it is a great big best. But for each man, this man who is considered a leader brings out that best of which each is capable in keeping with his own specifications.

If that is so, then we ought to begin as practical people to become less concerned with the negative leadership of being so concerned with human inadequacies, so that we see only what is wrong with people. We must not permit ourselves to be constantly distracted and blinded by the continuation of a seemingly endless run of deficiencies and ineptitudes and what almost seems like a vicious effort to try to do things wrong. True leadership is not so much concerned with the negative of prevention of inadequate performance as it is with the capacity to bring out that positive, that best which is already in them.

Let me assure you that there has never been and there never will be a born leader. Every man that you have ever talked to or will talk to, who is now at the upper echelons, will tell you he had to learn his the hard way. That means that you can learn it if you have any intelligence. Your major need is to develop that capacity to bring out that best in men, because every man knows just as you know, that inside him he has depths which have never been plumbed. As you well know, some of you who have been in service know, that men will fight and follow and even die for the men who can inspire them, motivate them and bring out in them their best.

We are hungry for men who will encourage us and make us more than just the *mediocre, everyday, run-of-the-mill selves* which we, left to ourselves, seem to deteriorate to.

Ask yourselves as practical people what it is that your major problem is. Isn't it true that we are impractical if we ever forget for a moment that loyalty to us and cooperation with us are reciprocal reactions which result from an unshakeable faith that loyalty and co-operation can be depended upon from us?

Isn't it true that we are impractical if we ever forget by our actions on the job to motivate men by giving them a feeling of being needed?

You have heard some so called supervisors, "Well, we got along all right for 27 years before you got here and we can still get along without you." What a way to motivate people to knock themselves out. Isn't it rather just the other way around? "I need you. I couldn't do my job without you." Isn't that the thing that motivates you —knowing you are needed?

But we are decidedly impractical if we ever permit the pressure of the moment to cause us to forget that sentiments and emotions are the most important motivators of us all.

We are impractical when we forget that all men, whether on a truck, in a store, office, or shop, all the men want from you, their bosses, is the same things that you want from your bosses, your superiors, your executives, your leaders. What is it that you want from your own superiors? What is it that you want which you don't always get?

Every one of us wants financial security. Sure, we want economic security, but beyond that economic security which we may already have, we want an emotional and psychic security. And our economic security comes from knowing that we have a job which is sure and steady and an income which can be depended upon from year to year. But, psychological security comes only when our leaders give us a sense of trust and a sense of self-reliance, a sense of initiative, a sense of equality as men, a sense of individuality, and personal dignity.

SUPERIORS MUST SUPERVISE

Is there one of us who does not want from his superiors a sense of trust which comes only when we know that our superiors never have abused their authority, never have taken advantage of us or pulled fast ones on us, or tried to steal credit or pass the buck on us for something that went wrong?

Is there one of us who doesn't want from his superiors a sense of self-reliance and self-confidence which come only from the knowledge that our superiors believe in us and in our ability to do our job well and stay away from us and let us do our job instead of bossing all the time and trying to tell us how to work?

Is there one of us who doesn't want from his bosses a sense of accomplishment which comes when they don't just merely accept good work but express appreciation for work well done? Is there one of us who doesn't want a sense of initiative which comes only with the assurance from our bosses that we won't be pushed around if we try something and it doesn't quite work out and if we experiment and it doesn't quite jel we won't be made to look like fools but that our mere effort to use ingenuity and intelligence will be appreciated and encouraged?

Is there one of us who doesn't want a sense of friendly equality as men? We don't want to socialize necessarily with the boss, but we want them to know and let us know, that we are equal as men. That comes only when our superiors exchange in a friendly and informal fashion hundreds of little bits of all kinds of information and comments and discussions about the Giants, about Eisenhower's health, about the Milwaukee Braves, about "Gee, they don't make a beer like they used to 30 years ago"—anything, hundreds of little inconsequential things that express a sense of equality as men. Little things which next door neighbors might comment on in passing.

Is there one of us here who doesn't want a sense of individuality which comes only when we feel that we are considered important as a person to our company with a personal dignity and a personal pride in our desire to earn our way in life honestly?

So it is, with all men and all women, in a realistic and practical fashion just as you need these things, every man needs from his boss, from you, this man-maintenance which comes only from a sense of trust, a sense of self-reliance, a sense of accomplishment, a sense of initiative, a sense of equality, a sense of individuality and personal dignity in order to be emotionally secure.

I know that every one of you has a full and busy schedule every single day, but if you don't take time to make time to give men these things, things which you need and which you have always known your men must need, then you are just too busy to be practical.

PSYCHOLOGICAL TOOLS FOR SUPERVISORS

SESSION TWO

I SUGGESTED earlier that it is my job to try to say something or do something which might cause you or stir you to think. Let's see what happens when practical men think about things that they always have known.

You know that nobody is perfect. You have always known that. Now, what does it mean when we stop to think about it? Where does our thinking lead us?

We say no one is perfect. That means every one of us is loaded with all sorts of inadequacies, all sorts of imperfections. Every one of us has things wrong with us, ineptitudes, ineffectualities.

If that is so, then it means that every one of us is a handicapped person, and every worker is a handicapped worker. Not just the man who has lost an arm or a leg or his sight. Not so obviously handicapped, but every one of us is certainly handicapped to the degree of our inadequacies or imperfections. Yet, every one of us knows no one is handicapped on a job if he is placed properly, let us say, on a job that does not require the use of a lost member or a weakened member.

We know that a man without legs can do just as good a job on a sitting operation as a man with legs; and a man with one arm can run an elevator as well as a man with two arms; and we know that a man with a bad back can do just as good a job as a man with a good back if he does not have to do heavy lifting.

We know there are many jobs being done well by so-called handicapped workers. We have at least one plant where blind people are doing final inspection of small parts—completely blind—not partial but with total loss of vision.

Some people are dangerous and accident-prone in jobs that require rhythmic coordination like on a printing press. Others are handicapped emotionally and do not have control over flare-ups or depression. Others are handicapped mentally. And all of these handicaps make people more liable to accidents and it also makes these people more liable to inadequate performance, and all kinds of emotional difficulties on certain kinds of work.

DISCIPLINE CAN'T CHANGE HANDICAPS

The fact is that people who are mentally, physically or emotionally incapable of keeping up with the job demands are unsafe and inadequate workers. There is not a single thing that you can do about it. No amount of punishment or what you call discipline is going to make the slightest difference in these handicaps. No amount of warning or no amount of instruction is going to change those physical or emotional or mental inadequacies.

Are you practical? We do need discipline, that is certain. But, we don't need the punishment which we substitute for discipline because we don't know what else to do.

Sure, we need discipline which will control people and their performances. But what is your experience with your kind of discipline? This so-called discipline which is really punishment?

What kind of punishment or discipline or warning or instruction will put a man's legs back where they belong so they are alive and active and function like normal legs after he has lost them?

What kind of punishment will put strength back into limbs which have become weakened through illness or disease?

You want men who are more stable and more dependable and more reliable and more co-operative. Has your experience taught you what kind of punishment will make them more stable and reliable? Do you know any disciplinary action which will give a man back his sight after he has lost it? Has your experience told you how much punishment and what kind of punishment will put a brain between a man's ears or give him foresight or insight?

Do you know from experience what kind of punishment, warning or instruction will

give a man good sense or good judgment? Has your experience taught you that any kind of punishment will do any of these things that you want?

We still call ourselves practical people and we still go ahead and dock them if we can, and lay them off if we can and we still fire them if we can, and we put little marks in ther personnel record and we demote them or transfer them all as disciplinary measures, and we still call ourselves practical men. That, despite the experience of 10,000 years of work history in which punishment has been used as a procedure which has never been effectual, and we still call ourselves practical people.

Sure, many of the inadequacies of people can be dealt with by education, training and placement. But, our major problem of managing men and their human nature on the job is related to the mental and emotional and physical inadequacies of people which just can't be changed, not by punishment, not by warning, not by instruction, not by anything. Yet our success as man-managers requires that we have a control, a discipline.

But, we can't watch people eight hours a day, 480 minutes out of every work day, so our discipline must be the kind that will work even if we are not there.

What controls you? Are you honest only because you are afraid of getting caught, or afraid of being punished, if you are not honest? That is ridiculous. You are honest primarily because you believe that is the right way to be. You believe that it is better to be honest than to pretend honesty. You believe it is wrong to do things dishonestly and unethically and immorally. That is what controls your behavior—that which you believe.

Instead of continuing to waste our time as men have for these thousands of years using punishment to control others, maybe if we are intelligent and practical supervisors and leaders of men, we will devise ways and assume the reponsibility for teaching them about our rules so that they say, "Hey, that is right. I believe that."

Once they have said that to themselves—"I believe that" "That is the right way"—you can go away and forget them because that discipline will be there. You have always known, as practical men, that the only real discipline is a self-imposed discipline, a control imposed on us by those things which we believe to be right. If we believe something to be right, we are going to knock ourselves out trying to do that which we believe is right.

Sure, this practical experience with human nature has taught us that we can't change it. This unchangeability makes difficult problems. But, our most difficult problems arise as the result of forgetting to use those things which we have always known.

A PRACTICAL MAN

You know what an impractial person is. A practical man is a man who has learned from 20, 30 years of experience what is right and what is wrong, what will work and what won't work. When a man doesn't use that experience and what his experience has taught him, he is impractical because he is surely going to do the wrong thing.

Therefore, supervisors are often impractical in dealing with people. It is a waste of time to look for whose fault it is, but let's put it this way, they have been trained improperly.

You have been taught haven't you, "Don't go off half-cocked when you are dealing with people?" "Be sure and get all the facts?" How silly can you get? Facts! Since when have the important problems of people been related to facts?

You know that in your life and in the life of every one of the people you have ever dealt with, that the important problems of people are emotional problems—problems which they make for themselves and for you as well, in trying to adjust to the conditions which come to them. They are emotional problems, not intellectual or factual problems. They make these problems themselves and for you in trying to save face and in trying to maintain their stature and that picture they have of themselves as a man or as a woman.

We all have just one fixed and limited amount of psychophysiological energy we can expend at any one time and when most of that energy is expended in trying to save face, trying to maintain a kind of emotional security, we don't have much left for anything else. That is why psychologists tell us that we rarely use more than 30 to 40 per cent of our potential. The rest of it is wasted trying to maintain our stature in our own eyes and in the eyes of others.

Normal people like you and I do it. We all do it. If you don't, you had better find yourself a good psychiatrist. There is something wrong with you. But we don't do it planfully, deliberately or consciously. We do it automatically and unconsciously. We do it by developing over a period of many years, a collection of habits, defensive, compensatory, and protective habits that function so automatically that people perform a great deal of the time as though they were automations.

Habits according to psychologists are our only perfect performances. Once a habit is established all it needs is a proper situation and it functions automatically. A habit is the most perfect and efficient of all mental, emotional and physical performances. The habit requires no mind, no consciousness, no awareness. It requires the least effort.

We can classify all these defenses and compensatory habits in a thousand different categories, if we want to, but it isn't necessary. I put them in four—cover-up, evasion, emotion and neglect. And they are not mutually exclusive. You can bet when a man is emoting he is covering up and evading, and when he is evading, he is covering up and emoting and so forth.

They are all artificial groupings and you can make up a thousand more categories. You have seen these performances, these cover-ups, and evasive performances. You have seen the man who uses one kind of defensive performance, the man who is always feeling bad—he is under the weather, there is always something wrong with him.

Sure, you know these people. You run into this man and all you say is a normal greeting—"Hi, Joe. How are you feeling?" —Instead of saying "Hi, OK" this fellow takes a long time telling you in great detail about what is wrong with him.

PEOPLE NEED ATTENTION

Our language tells us about how we think and how we express ourselves and what hungers there are and we are always hungry for things. When you say about someone, "Oh, he is such a kind person," are you talking about him or are you telling the world, "I don't meet very many kind people." "I don't get much kindness."

When you say, "Oh, he is so understanding." Are you talking about him or are you telling us about the things that you long for and don't get?

When people live their normal lives, they apparently don't get enough kindness and attention and consideration and gentleness and understanding. We are all hungry for it. But there comes a time when things are different. If I don't feel good and you are a friend of mine, you do have time for me. If I am sick, you take the time to find out whether you can do anything for me.

When people are tired you try to be helpful, don't you? When people have sorrows you try to be understanding and kind and concerned about them. When people are sick, you give them sympathy and attention. You try to make things easier for them. You do things for them. You take the load off. You say, "Don't worry about it, we'll handle it. We will take care of things for you." You give them lots of attention.

I don't know how intelligent you are. I don't know how old you were when you learned the value of sickness. I know my grandchildren learned awfully early.

I can remember way back, long before radio and long before television—it was swell. Today it is even better. Papa comes home every night from the mill. He is whipped. He has barely energy enough to eat and sit down and start reading the paper. And then he dozes off. He doesn't have time for us. Papa is tired. He works hard.

But, if he comes home and Mary or Johnnie is very sick, that is different. He is never too tired to go in there and see them. And the sicker a person is the more concerned he is. He even moves the television set into the bedroom and helps entertain, and you get ice cream. You don't hang asafetida bags on your necks any more. You get ice cream and fruit and funny books and Mama reads you a story. And everybody comes and they send you little gifts, and your friends remember you and so on.

How old or intelligent do you have to be to grasp the idea of relationship?" Sickness means attention. I am neglected and ignored —especially if I have five or six brothers and sisters." Oh, brother, what a wonderful career sickness can become!

If it weren't for that sort of thing psychologists would go out of business. Just what more respectable out is there than be-

ing sick? What more can you expect from a sick person than his best—which is less than normally demanded?

"Gee, this man is sick but he still came down to the office." You have heard them. "Boy, look at that, sick as a dog, but he still came down."

He never gets attention and is ignored all the time except when he is sick. His sickness even gets praise for him.

There are all sorts of variations on the same theme. You know the person who would rather be a failure because he knows that if he tries he might not make it. But he knows also if he doesn't try he can't fail and if he doesn't try and doesn't fail, he can always say, "I could have if I had wanted to. I could have been a writer. I could have been a musician if I had wanted to."

You have heard them. Even before you get started, they say, "It won't work. It's no good." They know it will fail even before you try it. Or, men who say, "How do you know it's going to work? I'm a married man, you know. I can't take a chance. I have responsibilities."

Imagine a man deteriorating to the extent of saying, "I am going to remain a failure because I have a wife and children. It is not my fault I am going to be down here and mediocre, but I can't try or take a chance. I've got responsibilities." A respectable out.

You have seen supervisors whose sense of unsureness is so great that even a good suggestion is unacceptable. If you could open them up and watch the wheels go round, you might hear something like this: "After all, a suggestion is an idea; an idea for correcting something wrong or improving something. Well, I am supposed to be on the ball and know what is going on and apparently this got by me and this guy saw something wrong that needed to be corrected and not only that, he has the answer. Furthermore he's going to put it on paper and send it upstairs. Like Hell!"

Then of course, you have other variations. You have the private office syndrome. I won't ask how many of you feel that you should have a private office. There is a good reason for having a private office. You may say, "I want an office because I earned it. I have been around here for 18 years and I want an office with my name in letters 18 inches high—gold letters. It is a sign of achievement. A general gets five stars. Some guys wear stripes. I want an office. I worked 18 years for it."

There is nothing wrong with that. Nothing wrong with a man saying, "I want a glass cage where I can lock myself in so people won't bother me." But when a man says, "I want an office because I want to sit down and think where the phones and the noise and all these things won't bother me."

Then you might say to him, "John, didn't you prove to the company you were an awfully good man *while out on the shop* floor with all that noise and stuff? Why do you really want an office? It occurs to me, John, that people who have good sense try to stay away from and evade getting involved in things which are competitively too much for them. A woman who is homely and has good sense stays out of beauty contests. A man who has a big pot-belly and is over 60 and has flat feet stays out of foot races, whether at church or company picnics. A person who knows he is not good in mathematics stays away from getting involved in complex mathematical computation work. That sounds like good sense.

Do you want a private office because you are unsure about your capacity and ability for dealing with your people? Is that what you want an office for? So you can shut yourself away from them? Is that it? Are you afraid if they get closer and closer to you they will discover some things you would rather not have known about you? Is that what you are afraid of? Is that what you want the private office for?"

Sure, you can say and honestly, "I want to be like those smart cookies with the crew cuts and the Phi Beta Kappa keys." They say, "We want a laboratory where we can do our experiments." Well, all I know is that if a guy's first experiment is no good he has to perform a second one. In other words, what he means by a laboratory is a place where he can make all his mistakes, then when he comes out in front of everybody, everything is wonderful. I want a place where I can make mistakes too, and nobody will find out about them until I am ready."

There is good sense in that. Why do you want a private office? Have you defended yourself by saying, "I don't want to shut myself away. After all, we have the open door policy here."

Then, someone says to the man, "Why don't you go in there?" And he says, "You just dare walk in through that open door and see what happens."

Why do you want a private office? Do you feel so inadequate at dealing with men that you want to isolate and insulate yourself against them?

WHY DO YOU CRITICIZE?

You know the man who is a constant critic. As a supervisor you are supposed to criticize, point out what is right and what is wrong and correct it and revise it. But there is the abuse of it, too.

If your criticism has for its purpose to teach a man, that before he gets into trouble, to come and see you so you can keep him out of it; if he gets into a jam, to come to you as a friend and let you keep him from getting into further trouble—if it has for its purpose to teach a man that he can learn to do a job and that you are there to help him, that is part of your job and that kind of criticism is good.

But, if it is for the purpose of putting a man in his place and letting him know who the boss is and who knows more around here, that is something else, isn't it?

Sure, there are ways of being superior. One of the ways of being superior is to look at a picture of yourself and to say, "I don't quite like what I look like. I remind me of you. I would like to look better. I am going to improve that picture of myself. I am going to try and work and grow and some day I am going to be superior to you."

Or he holds somebody else's picture up as a goal and says, "I would like to achieve to his stature and by study and hard work I am going to try to be better and superior."

There is nothing wrong with that kind of superiority. But, there is a much more common way. You don't have to grow. A man can stand still but the smaller he can make you, the more he can tear you down, the bigger he is by comparison with you. He can even deteriorate a little. But, as long as he makes you smaller and smaller, he is still superior to you. And that is a most popular way of being superior.

Are you perfect? You say, no. Well, why would you fight me if I said, "You know, John, you are not perfect."

You say, "Oh, I wouldn't fight with you. Nobody is perfect."

Now, let's see whether you would or not. Certainly, I hope that when you come home and your wife asks you, "How did you like Dr. Rosenstein's sessions?" you will honestly say, "They were terrific, wonderful."

I hope you say something like that. Or some time later, if she asks "What did you get out of those sessions?", you might show her the complete set of these lecture notes.

She might take those notes and flip through those pages and come to "No one is perfect" and she might say to you if she is a normal American housewife, "Well, Honey, you didn't have to go to those meetings. If you had stayed home and if you had listened to me all through the years—"

Later on, maybe you would be sitting over a cup of coffee she might say, "You know, Honey, it is a curious thing. Successful business men take the time to review performances and they bring in experts of all sorts to come into their business and tell them what is wrong with the way they operate and how to improve their operations. And this happens in big business, successful business, operated by highly intelligent people; they bring in the so-called experts as consultants to tell them how to improve; take a complete inventory of the way they perform and to analyze their various operations so they can do a better job."

"People don't seem to take that kind of inventory of themselves, the most important thing in the world to them."

TAKE SELF INVENTORY

She may say to you, "Honey, I hope you love me as much as you did when we first married and I know the longer we live together the more I love you. But, that is not because you are perfect but despite your imperfections. Now, there is only one way to improve. The intelligent way is to be like business men. The most important business we have is ourselves. We too should take inventory and do something about our inadequacies and ineptitudes. We can't ever be perfect but we can certainly strive for improvement."

She may continue, "There is no one in the world who is concerned with you and your well-being more than I—not even your parents. So, Honey, let me tell you what is wrong with you."

She may give you a long inventory of your inadequacies and when she is through, being the intelligent man you are, you may say, "Darling, thank you so much. Now that you have made me aware of all my failings, now that I know what is wrong with me and all my imperfections, now I can really go to work and do something about them."

Isn't it interesting? We are not perfect. We admit it, but we don't dare permit anyone, not even someone who truly loves us to point out a single imperfection about which we might do something intelligent.

Of course, we have others. One that I call the hardened arteries delusion. You never hear some young kid of 19, a fullback on the high school team or college team, walk around saying, "Oh, boy, I am just as good as I ever was." It is always some dilapidated old goat you have to carry in and out of the shop who keeps on announcing, "I am just as good as I ever was. They don't make men like they used to in my day. Men of integrity! If you think I am going to be dishonest in order to keep up with crooked competition you got me wrong."

There is a good reason why he isn't making the grade any more. But he can't say, "Look, competition isn't any tougher than it used to be. It is just that I can't keep up with it. I am getting older. My legs are giving out. I can't move as fast. My co-ordination is not as good—"

He can't say that. He has to defend himself by believing, as he thinks, "Why can't I keep up? Because people are not today like what they were. They are dishonest. They don't make men of integrity like they did in my day. I am a man of integrity. That is why I can't keep up."

Oh, what a wonderful way to defend the picture a man has of himself.

I have had people say to me, "Doc, I'll tell you we have got a terrific problem. How can we get the older men to teach some of the younger fellows? They just won't."

I say, they would be silly if they did. Any intelligent older man who looks around and can say, "You know, with consolidations and with mergers and all these changes going on, I am not too sure of my job any more. When they consolidate or merge or move a plar: from up in New England down to Florida—you know what they are doing. They look at me and say, 'He has only nine more years of service. Joe has 31 years more of service if he wants to be with us.' You know whom they are going to take. They are going to take Joe. But, the trouble is that Joe will have to spend 22 years learning what I know and if you think I am going to teach him all I know you are crazy."

Out go the tentacles in that octopus complex of apprehension and insecurity, to grab hold of and to hold on to everything that isn't nailed down, in order to be needed; in order to be less expendable. Does that sound like these variations of defensive behaviors?

Now, these things we have been talking about, they are in the realm of emotions, aren't they? They are emotional performances to protect and defend. And psychologists tell us that a true emotional state is truly a mentally blank state. It is a biological reaction.

EMOTING FOR PROTECTION

Psychologists and biologists will tell you that an emotion is a visceral thing. You may say, "I love you with all my heart." But if you were telling the whole truth, you would say, "I love you with all my heart, liver, kidneys"—and it may not be so romantic to say, 'I viscerate you,' instead of 'I love you' but it would be closer to the truth.

Love is blind, yes. It is deaf, dumb and blind. When we talk about the human animal, we come closest to animal in a state of emotion. An emotion is a purely biological performance. You have used the terms. You have used the language. You have talked about the man who was "frozen with fear," or the man who was "scared stiff." Have you ever said, "I don't know why I did it, my mind was a total blank." A little later you were all right. But at the moment—blank. You have driven down a wet highway or you have driven down a slick street and suddenly your rear wheels

begin to skid and you see somebody coming in your direction and you know he is going to hit you, and he misses you by the thickness of a layer of paint, and you turn to your passenger and say, "Oh brother, I saw him coming and knew he would hit us and if he had, he would have killed us both. But I wasn't the least bit scared. Funny thing, I knew what was going to happen and I was calm." Then you reach for a cigarette and your hand comes up shaking. Sure you were calm. You weren't even there. You were just a hunk of meat behind the wheel, and you began to get scared, when you came out of that state of blankness into your first state of awareness. That is when you began to get scared.

If you are normal, and I think you are, there are things that happen in a shop that can cause you to blow your top, and you get mad and do things and threaten to do some other things. You have had it happen, and if I were to come to you and say, "Hey, Bill, I could hear you two blocks away. Are you really going to do what you said?"

You might say, "Well, Doc, you just try and stop me." I'd say, "Not me. I am not going to try and stop you. I am an innocent bystander. I don't want to get hurt. I am going to stay away. But, are you really going to do it?"

"You just bet."

"Is it all right if I ask you a question?"

"Yes, but don't get involved."

"I won't. But do you remember our training program for supervisors?"

"Sure."

"Remember, about four weeks ago we got involved in a problem relating to emotions and everybody had to bring to class experiences of emotions when they went mentally blank?"

"Sure."

"Remember you had a couple of good situations in which you were emoting? You were scared to death, blank, you couldn't think, you didn't know what happened? You just sat like this?"

"Yes."

"Let me ask you something, Bill. It seems to me that what I just heard would prove that you were emoting pretty good. Are you going to force yourself to live with, abide by and carry out a decision which you made when you were mentally blank, mentally at your worst, mentally no better than an animal?"

He might say, "Doc, I knew darned well if I let you get started I would wind up being wrong. What do you expect me to do?"

"I don't know. Nobody knows all the answers. But, I know there have been times in your life when you have gone into your room, or gone somewhere by yourself, and prayed to God, 'if I could only have another chance,' and what you have meant is, 'if I had another chance, I would do it better.' You have here as part of your job, the right to give yourself a second chance. Maybe the thing to do is bop the guy as you plan. On the other hand, what you can do now that you have cooled off a little is think."

And as a result of your thinking, part of your thinking may ask, "what is it that I want to accomplish with this cookie which should be more than just slapping him down and watching him bounce?" You have the right to give yourself a second chance and no man ever lost stature who said, "I think that is a pretty good decision I made the first time, but if I went at it a second time, I think I could do it better, and the third time I could do it still better." And you have the authority to give yourself a second chance.

Only the man who knows that his first decisions are perfect, who can never improve—only that kind of stupidity causes loss of stature.

You can go to the man. You can say to him, "Joe, that was quite a thing you pulled this morning. There are some things that make me fighting mad and that is one of them. I want to see you in my office at two o'clock. You and I are going to have this out so it doesn't ever happen again, with you or anybody else. You can do that. You can give yourself that second chance.

What about your workman? If he is normal, things can get so wound up for him so that he too can blow up and tell you exactly what he thinks of you and the whole damned company, and normal people do that from time to time. He, too, is unhappy about his performance. But if you think for a moment he is going to come to y-u crawling on his knees for that job, you

don't have a right to your job as a supervisor of men.

He is a man, and even though he has a wife and kids and even though he needs the job, the first thing he is going to do is remain a man.

SUPERVISOR CAN GIVE SECOND CHANCE

If you are the true leader, it is your job again, to come to him and give him his second chance.

He can't say to you, "Hey, boss, that was quite a hassle we had this morning. I want to see you at my bench at two o'clock this afternoon. We are going to have it out so it doesn't happen again."

But you can and must say to him. "I want to see you in my office. We are going *to have this thing out.*" It *is your* job to go to him and say, "Jim, you know that was quite a blow off you had. Even the steward would back me up if I throw you out of the job. I want too see you in the office at two o'clock."

He may say, "We don't have anything to talk about. If you are going to fire me, fire me." And you can insist "If I want to fire you, I don't need your advice or permission. We are going to talk this out, find out what it is eating at your guts so much that you are willing to lose the job for it. It must be something awful."

You can give that man his second chance, and you must if you are really his supervisor. You have got to *make it easy for* him to clear the air and still remain a man.

Now, we come to this business of NEGLECT. I have asked this question from one end of the country to the other and I have had young men and old men and young women and older women who came up with the same answers.

I have said, "Look, we know you are concerned with your health. We know that you are concerned with all aspects of your health. But, suppose you had to make the tragic choice as a couple of parents did in Chicago a couple of weeks ago when they had to choose between permitting their child to be operated on or die, and their faith wouldn't permit the surgery. Their religion did not permit cutting of the human flesh. Can you imagine the tragedy of having to make that kind of a decision?

What happened of course, was the child was taken away from the parents, made a ward of the court, and the judge ordered the surgery. But, it still didn't please the parents. Suppose you had to make a tragic choice. Suppose you couldn't have a sound mind in a healthy body. Suppose you could only have a sound mind or a healthy body. Which would you choose?"

Invariably they answered, "I would rather have a sound mind. Sure, I would rather have a sound mind. A healthy mind."

Well, you watch your diet. If you have good sense you see a dentist a couple of times a year and if you have good sense you see a doctor at least once a year. And you take some kind of exercise, to keep yourself in shape, not to become a professional athlete. You do all sorts of things to stay physically well.

You learn and use the principles of physical hygiene in order to keep yourself in shape and healthy. You have a family physician whom you call up every once in a while and say, "Say what about this?"

Do you have a family psychiatrist or psychologist? Do you see one of them once a year, maybe, for preventive care? You don't wait until all your teeth are ready to fall out before you go to a dentist. You don't wait until you need major surgery before you see a doctor. Do you have to wait until you are ready for a straight jacket before you see a psychiatrist?

I am not exaggerating. Talk about neglect—12 per cent of the boys drafted for the Second World War were rejected because of emotional disturbances. They were emotionally unable to adjust. Of those boys admitted to all the services, army, navy, air corps and marines and so on, between 30 and 40 per cent of all those boys who were discharged for medical reasons were section eight boys. Psychos. Between 30 and 40 per cent of all the boys discharged for medical reasons were psychos.

I don't know what the figures are in your community, but we have heard for years and it is still true, whether it is 90, 80, 70, or 60 per cent, but your doctors say that more than 50 per cent of the people who go to doctors' offices complaining of physical aches and pains, don't have a thing wrong with them physically.

Where are these people? They are not in institutions. I will tell you where they are. They are in this room, in your offices, your shops, in your homes, in your church, in your club. They work with you and for you; they supervise you and they are your subordinates. That is where they are. They are trying under the stresses and strains of their lives to make adjustments to the best of their ability.

DEALING WITH MENTAL HEALTH

You may say, "Well, what do you expect me to do about it? I am no psychiatrist and I don't want to be a psychiatrist."

My answer is, "Mister, I don't care what you want. Whether you like it or not, you are dealing with the mental health problems and the maladjustment problems of your men and women who work for you and with you eight hours a day on the job. Whether you like it or whether you don't like it, you ought to find out something about it, instead of just kicking it around and ignoring it."

Don't tell me that you are not interested. These things are eating your heart out every day. You have seen the hot-shot. Don't tell me you don't know him. Conceited, care-free, over-confident, over-active, over-friendly, egotistical. He will tell you how to run the whole department. He takes chances just for the Hell of it. He knows all the answers. You know that fellow or girl.

You know the other extreme. Little boy blue. Life is real; life is sad and life is earnest for him. He is always unhappy. Things are always going to the dogs. Things are never going to work. Things are always going wrong for him. He has all kinds of problems and conflicts and his mind is not on his job but on his troubles and problems. You know Dangerous Dan the paranoid man who is always being pushed around, always getting the dirty end, the dirty deal, always being persecuted or taken advantage of by somebody. His mind isn't on his job either. He is always looking around to see where his supervisor is. If a couple of people are talking over there he knows they are whispering about him, and he is going to take care of them too, one of these days. And he is dangerous because he often attacks his imaginary persecutors.

You have a big mass of neurotics. Adult children, they have all kinds of problems; they need special consideration; and life is dull; and they feel sorry for themselves; and they pull hair and quarrel and they have family troubles and money troubles and marital troubles and they quit and then they beg to come back and they never learn their lesson and they quit again and come back and quit again. They have always got something going wrong. They are always complaining.

They come to you with their psychological cuts, bumps and scratches and want you to kiss them and make them well. You are the Papa for them. You have them.

Maybe you don't want to be a psychologist, but you are working with these problems eight hours a day and you are working with psychologically-induced sickness and illness and that is not such a rare thing either.

Permanent and temporary ill health is common and the physical manifestations of it are common. You have seen all the figures on the board. Talk about this business of a lump in the throat, pain in the back of the neck, ulcer-like pains and gall-bladder-like pains—50 to 80 per cent of those are not physical. Gas. Despite the laboratories who make the fizz stuff 90 per cent of gas pains are up in the head. Ninety per cent of it is emotional. Dizziness, 80 per cent. Headaches, 80 per cent. Constipation, well over 70 per cent. Tiredness, more than 90 per cent.

You are dealing with those problems every day. You have all sorts of people. You have the kind who balk against the restrictions; the kind who get into trouble when you put the pressure on them; you have the alcoholics and the gamblers and those who come in late and make up for it by leaving early; and those who get sick on Mondays and after holidays and at the opening of the hunting and fishing seasons. You have the men who make passes at women and the women who are unhappy because nobody is making passes at them. And you know women who spend much of their time in the rest room—

One of the big contributions I am going to make one day, after I do some research—some day I am going to find out what it

is that women do in the rest room two at a time, which men can do one at a time. Have you noticed that?

You can't change human nature, and you are not a professional psychologist, but you have got these problems with you every single day. If it is true and apparently it must be true, because the very same answer to the question comes from everywhere; "If we had to make a tragic choice between mental health and physical health, we would choose mental health."

If that is so, what are you doing about your own mental health? You don't expect to stay physically well by ignoring your physical self. Why do you think you are going to remain mentally well by ignoring your mental health? Most of your problems are in that area; most of your personal problems and most of your problems of man-management and supervision.

It would seem to be intelligent to learn the basic principles of mental hygiene and to use them. I recommend that you do so.

MENTAL HEALTH FOR SAFETY AND PRODUCTION

SESSION THREE

WE HAVE been talking about being practical. Aren't you bothered when things are going on all around you and you don't know what is going on? Don't you go around wondering or asking people, "Hey, what is cooking?" What is your trouble? Nothing.

You just want to know.

Do you forget that eight hours a day on the job your men want to know. They are anxious to know what is going on. They want to know about hundreds of seemingly insignificant things, which might or might not affect them. There are always things going on.

Somehow, people are not afraid of anything so much as not knowing what is going on. What is going to happen? They want to know how business is. They want to know whether they are doing a good job. I am sure that many men in these last three or four days were worried about what was going to happen because the stock market was going down and maybe there might be layoffs.

They want to know if there are going to be lay-offs. They don't want to be left hanging in the air. Even if it is bad news, they want definite answers to all sorts of questions that are bothering them. They need the assurance of definiteness. That is one reason rumors get started. Rumors are the answers to all the questions they have on their mind. They may be the wrong answers, but they are definite answers.

That is why it is necessary to let them in on changes that might be planned. That is why it is necessary to explain changes that are being made and what might be expected as a result.

Every one wants to be in the know. Everybody wants to know what's cooking and what's stirring. And you are never going to change it by saying, "It is none of their business. We are running this outfit," as I have heard people say, and maybe you have used that kind of language too.

As a matter of practical fact, if you don't tell them, there are others who know the needs of human nature as well as you know them, and don't forget them and who are therefore quite anxious to tell them, and will tell them, and because people are only capable of thinking with the information that is given to them and because some sources of information are anxious to provide only warped and twisted information, it is important that you let people know and keep them informed. If you forget that on the job, you are being impractical.

Do you like to be left out of things? Have you ever forgotten on the job that people are gregarious? It is only the screwball hermit who wants to live off by himself somewhere. People are hungry to belong to things, to be attached to things, to be identified with things that are important and worth while to them. They want to be part of something. That is why they will join clubs and join lodges, and that is why many of them join unions, even if they don't have to.

Few people are outstanding or have achieved the great things. Yet, they all want and need something to be part of, to brag about, to be identified with, so that they can say, "I, too, am one of this fine group."

Some of you wear spot pins in your lapel. Some of you have a chain with a key on it of some kind, and most of you probably have cards in your wallet indicating you are members of something. You don't wear the spot pin because you are ashamed of it. You want to be identified with it. When you walk down the street, you want people to look at it and recognize that not everybody can wear one of these. You can. You have achieved something. You are part of something worthwhile.

Nobody wears a pin that says, "I am a paid-up member of the Amalgamated Order of Thieves, Gunmen and Murderers. The pin you do wear represents things you are

proud of. People could just as well be proud of their jobs and their bosses and their departments and they would like to talk about them as well as they talk about "my lodge" or "my club" or, "my team" or, "my kids." And men have bragged about, "My boy is the greatest guy in the world" and "Boy, I sure do work for a swell outfit."

PRIDE IN ONE'S COMPANY

There is no reason why they can't be proud of their department and the fellows they work with as they are proud about their bowling crowd.

I think it is a worthy purpose to give men pride in their company and their jobs. If you are forgetting to make that an important part of your job, there is something wrong with the way you operate and you are being impractical, because nobody lives in a vacuum. Nobody in your department lives by himself. Everybody is part of a social group, a crew, gang, department, and everyone in your department is bound by a powerful workers' code of the proper ways to perform in order to be considered O.K., and in order to be accepted by his fellow workers.

Men don't want to be considered anti-social by their fellows, so they tend to be and do what is expected of them by that unwritten code which makes them part of and identifies them with the rest of the gang, with the rest of the men in the organization. And they want you to think well of them, too.

They would like to belong with you, too. But, they don't have the capacity by themselves to work their way out of the dilemma which you have permitted others to force on them. As a result of management neglect and other groups' very active proselyting they have been taught, haven't they, that if you are going to be a good labor man, you have got to be strong anti-management, and if you are going to be true to the company, that means you are going to be anti-labor.

They haven't been taught that labor and management are two facets of the same thing and that what hurts one will hurt the other. They haven't been taught that and if you neglect to teach them that, you are being impractical. Because, you are not facing the realistic facts of life on the job.

To me, that is a major managerial problem, and worthy of the attention of the best of brains in management, because it is an obvious fact of good human relations that if what you are after could be made part of their code—if being a top producer or safe workman or a co-operative workman were made a virtue among men, then men would try to live up to that picture they have of their good workman just as you try to live up to the picture you have of a good supervisor. And it should be you who should be providing the pictures for them to live up to.

"Going along with the boys" and "I'll stick with the rest of the gang," can be a most important asset, if the boys or gang are going in the directions set by you. They want to belong and if they can't belong with you, because you, like most brass are so tied up with important things that you ignore them, you are going to have trouble and you are impractical because there is no more important thing that you have around your shop than men. That is why on Sunday when you have all the same equipment and all the same machinery and the same buildings and the same rent and everything is exactly the same, you are not turning out a single thing. You are not making a nickel because nobody is around making money for you. If you ever forget that, you are being impractical.

PART OF THE GROUP

If they can't be attached to you because you are too busy with important things, they will find others, or rather, others will find them and attach themselves. You just bet. They can't float around in a human relations void or psychic limbo because human nature demands being attached to and being part of worthwhile things.

Do you know why you have your job? If you don't, you are impractical. Everybody ought to know why he is around, because nobody has much sense of security if he doesn't know whether he is needed or not. The only reason why you have—well, there are two reasons why you have your job. Certainly if we could get everything we need from our workmen without leaders and supervisors, we would not need you, would we? We could just ship the orders to workers through the vacuum tubes and they would get them and do the things necessary. But that is not how we operate because we need people with foresight and planfulness, and administrative ability and coordinating and integrating ability. We need people who can see ahead and organize and get others to cooperate. That is one reason why you will always be needed. That is one reason for your job security.

Supervisors are needed to make up for the difference between what we have got to have and what people can give us without you. You have got to make up for that difference. So, don't ever be unhappy because people are not giving you what is needed. No, your job is to add that little difference.

The other reason for supervisors is that most people don't have any particular goals in life which can be expressed dramatically. All we want to do is live and make a living. We want security, sure, but we don't want any bother, too much planning for it or striving for it and so on.

A lot of my friends are engineers and a lot of good engineers spend the major portion of their professional lives trying to discover ways and means to overcome inertia which is a natural property of all things in nature and that includes human nature.

Human nature, like all things in nature, is loaded with inertia and for that reason we may expect people to be basically drifters and just go along exerting as little effort as possible beyond that which is absolutely necessary to maintain themselves.

SUPERVISORS OFFER INITIATIVE

Don't criticize your people for lack of initiative or foresight. People don't have push. Your job is to give them a little push. You were chosen because you have that little initiative. People don't have initiative. Your job is to try to stir up a little.

They are not self-starters or self-drivers, and your job is to urge them a little bit, push them a little bit, provide the urge for them to go along by themselves for a while, while you are trying to devise new and different ways to motivate them again and again to try to provide a continuum of effort.

Don't let it irk you to have to fight constantly and push to fight the problem of human inertia. It is part of nature and if you don't like it, you are trying to buck nature. You are trying to resist the universe and what you should do is thank God for it, because if people weren't loaded with inertia, you wouldn't be needed, because they would have all the initiative needed without you. You have security because you are needed to make up for the difference between what normal people can give and what is needed. If you ever forget those things, you are impractical.

You know people who are always bucking you when you try to change things. We are afraid of new things. We are insecure with new things. We don't know if we can or how to handle them. Even if the old ways are uncomfortable ways, we have already adjusted to them and we are accustomed to them and we can go along with them. But, we are afraid of new things because we might make mistakes and might get into trouble. We might be criticized, maybe we won't do so well, and we try to avoid those kinds of situations.

We are afraid of new things and we resist new things. Many of us who had to quit school long before we wanted to, because we had to go to work and bring money into the household, seem to have an over-developed sense of sympathy for those who quit school.

However, most people stay in school only because the law forces them to stay in school. They quit learning long before they quit school. They hate school. They hate teachers. They hate learning. When you come along with something new and they are getting along comfortably and you insist they learn something new, they will hate you and buck you and fight you and resist you and if you ever forget that, you are being impractical.

You could provide similar examples of things which we have always known and forget to use them on the job, and therefore are impractical. Nobody is perfect. Everybody is a handicapped worker. Everybody needs praise and buildup and maintenance, psychic maintenance, and we all use habits of cover-up and evasion and emotion and neglect.

Everybody wants to know what is going on and everybody wants to belong to something, to be part of something they can be proud of and live up to. People just don't

look ahead. We are not self-starters or self-drivers, and we are all loaded with inertia and afraid of new things and change and we resist it.

Last but not least, just like you and just like me, normal people will remember small hurts for a *long*, long time. They will brood about them and enlarge upon them and permit them to fester and poison their souls.

PEOPLE FORGET FAVORS

Normal people will remember small hurts for a long, long time, and forget great big favors almost immediately. If you ever forget that, you are being impractical and don't belong in a job supervising men and women. They will remember small hurts for a long time and forget great big favors almost immediately.

Well, those are a few of the symptoms of normal human nature in action. Whether you like it or not, you can't change it. Where does that leave us? Does that mean that every one of us should quit our jobs and go back to college and get a Ph.D., in psychology in order to be a foreman?

You know that is silly. But, maybe we ought to again talk about being practical. If we were to remember all the psychology we already know and use it; if we were to realize what good practical psychologists we already are and use what we know on the job, maybe we would not have to worry about professional psychologists and psychiatrists and all these other things.

We don't expect you to be a psychiatrist any more than we expect the industrial nurse to be a doctor. But we expect the supervisor with intelligence to be able to recognize something when he looks around and says, "I wonder what the Hell is eating John today." When he thinks that, he has already said, there is something wrong with John, just as he might have said when he hears a squeal or knock in some machine, "This needs attention of some kind."

If he would use what he knows he would already say, "John is not himself, maybe I ought to do something about it." In the same way that the nurse recognizes those things that she can do and that at a certain point she ought to call for some better skilled professional help—the doctor—so, the supervisor can do some things about some things but should also be able to recognize the point beyond the simple counselling stage which needs highly skilled professional advice.

After all, psychology is a branch of study which is concerned with people. Psychology is concerned with what people do and how they do things. Some psychologists are concerned with interpreting why they do things, trying to discover ways of controlling, guiding and directing the performances of people, changing the expressions of this human nature, knowing we can't change human nature itself.

Certainly if you would get two well-trained psychologists and they were to sit on different sides of the room or in little cubicles separated from each other and they were to observe something going on and if they were well-trained, and you examined their notes afterwards, you would discover they were almost duplicates of each other. But, when it comes to interpretation, what this behavior means, if you get two psychologists together and they agree, I would like to examine them, because they need psychiatric care. There is something wrong.

In the same way that two good psychologists don't always agree, you and I might not. I might come into your department and say, "Vince, I have been studying this safety problem for 20 years now and it seems to me some of your guys should be wearing safety goggles."

You may say, "My boys ain't going to do it."

I might say, "What do you mean? I know the old gags about the rims get grimy and irritating and get *all fogged up and that* they cut out lateral vision. But that is silly. You have got to choose between goggles and losing a couple of eyes and the men will do it."

You may say, "No, they won't."

And I might say, "I am a psychologist. I spent 20 or 30 years of my life learning what I know about people and if handled properly they will."

You may say to me, "Well, Doc, with due regard to all your degrees, study and observation, I have been working with these boys 35 years, 12, 14 and 16 hours every day, and they ain't going to do it." You could be right, you know.

If your conclusion is based on and your interpretation of what might happen is based on observation and study of these people, your interpretation is as valid a psychological conclusion as anybody's, maybe better, because it is based on more and continuing observations.

Well, that is being a practical psychologist, being able to interpret what might be expected based on study, observation and experience.

When this young mother who has had maybe two years of high school, who has two or three kids, and is playing bridge with her girl friends and says, "Pardon me, girls, I am the dummy hand, I want to take a look out back. The kids have been too quiet for two long."

She is saying, "I am a practical psychologist without benefit of diploma or Phi Beta Kappa keys. When they are running around making a lot of noise, they are a nuisance, but when they are too quiet for too long, there ought to be some investigation." That is being a good, practical psychologist .

You just bet, Americans have their own psychology. Every people has its own social stereotypes and approaches to things. We are a nation of gripers. We feel we have a right to express our opinion about anything and we would like to see anybody stop us. We will gripe. So, along comes some smart cookie and says, "We don't want to have any more lost fingers or lost hands."

Some of you remember Art Secord. He tells a story about his father who had a shingle mill and the way he would hire men. He would have them hold up their hands and he would look at them and if you had all your fingers you were not even an apprentice. Because if you work around that industry, the longer the experience, the shorter the fingers, and an old timer—no hands.

So our employer says, "We don't want any more of that from now on. We have spent $38,000 and we have bought a bunch of wrist cuff pull-away guards. From now on, when this knife comes down or the rollers come around, *your fingers are not* going to be pinched or cut off. They are going to be pulled away." Sounds good doesn't it?

Do you know what is going to happen if you are working with a bunch of nice, clean-cut American boys. Somebody is going to say, "Wrist cuff pull away guards—hell—things aren't tough enough. Now the rats are going to shackle us to the damned machines."

Then, you put in a public address system, because now we don't build plants high, we build them horizontal. So we say, we are going to put in a public address system and somebody is sure to say, "Public address system! These white collar, yellow-bellies are afraid to face us. Now, they are going to give us orders by remote control."

You put in a music system and you know the old one. Somebody is sure to say, "Sure, those wise guys found out chickens lay more eggs or cows give more milk when they put a radio in the barn. You watch and see. They are going to start the music every morning real slow and then gradually as we go through the day faster and faster and faster."

You know, if you don't get that, there is something wrong. You know if you do any of these things and they are accepted quietly with a loud brooding silence of acceptance —that is where you have got trouble—not in the griping.

In Chicago near the Newberry Library, there is what we used to call Screwball Square. They let people pop off as they do in New York in Columbus Circle. They let them get rid of their hostility, get rid of their aggression, get rid of their griping. We give them a chance to do that because we know it is important for people to do so.

But not around a shop. If you hear a lot of gripes around you may feel it means there is somebody you have got to get rid of. If so you are trying to change human nature. You want to keep them all bottled up until the valve is not strong enough to hold it and it blows. That is not good sense. It is not good, practical common sense. That is not being a good psychologist.

SCIENTIFIC PSYCHOLOGY

Certainly, practical psychology is important but scientific psychology can help you too. It can describe *some things you should* expect as a normal or abnormal. It can give you guidance about how to deal with many of these things and how to prevent them. It can give you guideposts to the understanding of these people you deal with, by describing accurately many of their attributes and limitations.

It can describe to you where your demands are impractical and unrealistic because you don't expect enough or you are unrealistic because you expect too much.

But, psychology cannot give you a cut and dried list of human acts and controls which you can memorize and apply like a mechanic. There is no such thing. It can't give you the intelligence. It can't give you the insight. It can't give you the interest or the desire to do a better job than you have done before. It can't give you the clinical insight.

We are fortunate in that we have good medical schools no matter what part of the country we come from. Maybe you know a couple of young fellows who graduated just last June. They were the leaders of their class for several years. They were not just outstanding students. They were brilliant men and the school was proud of them and know that one day they would make their mark in the world.

Maybe a few months before graduation their deans or their counsellors called them and said, "Well, gentlemen we are sorry you are leaving. Your complete records show that you both came from the same little town and your folks were hard-working men, and they wanted you to have an education. We know you fought your way through grade school together and fought through high school. You fought for the same position on the basketball team and you scrapped with each other regularly. You quarrelled about the same girl, but you were always good friends, the best of friends. If one of you had a $40 jalopy you both had a jalopy and the major quarrel was who was going to drive it, not whose jalopy it was.

You went away from your mill town to college. You shared the same room and the same books. He who was up first was the best dressed and all that sort of thing. When you get out of medical school, you will have attended the same classes, have had the same instructors, the same labs, the same instruction, under exactly the same type and the very same kind of conditions.

"Tim, what do you plan for yourself? Where do you want to go? We look for great things from both of you fellows. We are proud of you and are concerned about your future. Tim might say, "Well, you know how fellows do around medical school. They all start out knowing they are going to save the world.

"Joe was going to be an obstetrician and I was going to be a pediatrician. He was going to bring them into the world and I was going to keep them here. Then he discovered that women seem to have their babies at four o'clock in the morning, especially when there is a big blizzard blowing and since he likes to sleep he was through with that. I decided once to be a skin man. Nobody ever gets cured from it; nobody ever dies from it and you can sleep as late as you want to and there is only one fatal skin disease.

"But, truly, I always dreamed I would love to be a surgeon. I would like to be the man with a scalpel in my hand. But only if I thought I had something more than the run of the mill medic to start with."

The professors may say, "That is a fortunate choice. We have always thought that surgery was the direction for you and had hoped you would go in that direction.

"Joe, what about you?"—and Joe might say, "Well, when my girl dumped me I thought I was going to be like Schweitzer, be a medical missionary, go off in the jungle. Then I met another beautiful little nurse and I think I am going to stay here, but, I am not like Tim. I don't care about this business of cut-and-dried stuff like the surgeons do. Once you have done that appendectomy they all look practically alike to me. I like mystery. I like to look at something that nobody knows what it is, can't figure it out. I like to try to solve that mystery. Tie things together into a syndrome and make a diagnosis. I would love to get into internal medicine and diagnosis.

"Yes, you both have made the most wonderful choices." These two young men might go away and 20 years from now you discover that one is a great surgeon. Among his fellow surgeons he is looked on as outstanding. And the other is looked on as an outstanding internist."

Did the medical school make one a surgeon? Did it make one the internist? Hardly. They got the same education at the very same time, under the same conditions, by the same men, in the same labs, same classrooms, from the same teachers. What happened?

The medical school apparently gave both of them exactly the same guideposts to the practice of medicine and then each had to take from himself, from his own temperament, his own personality, his own personal interests to guide and direct his energies and his knowledge.

Certainly we don't expect to make you a psychologist in one easy lesson, but it seems to me that we would be remiss if we did not try to give you some guideposts which you could throw away or do something with, think about, study and then from your own intelligence, your own temperament, your own personality, your own interests apply these things in your own way to your own practical problems.

GUIDEPOST NUMBER ONE

It is normal for normal men and women to be dissatisfied and discontented. Not unhappy. Just not satisfied and discontented.

The only reason why you or anybody else ever does anything is described in a basic law of biology to the effect that every living thing must adapt itself, must fit into and constantly adjust to the changing conditions which come to it, and solve the realistic problems of living which are forced on it or die.

That is the basic law of life. Every single thing a person does and every single thing a person thinks is based on his own personal effort of trying to better adjust to those conditions which come to him, over which he has no control. The basic reason why you do things as you do, why you think as you do, why you perform as you do, differently from all others, so that you are recognized as a distinct and different personality, is a simple one. The conditions and the problems of life which come to you are never the same as for anybody else. And so if you are normal, you should adjust in a different fashion.

All men have organic and physiological and economic and cultural and social and spiritual and psychological needs. But the conditions of living are never ideal and these human needs and human wants are never readily fulfilled. We all go through the process of trying to fulfill and satisfy these needs and these wants—and to try to make up for the difference between the needs and the degree to which they have been satisfied. It is that portion of the need which has been left unsatisfied which produces the dissatisfaction and discontent.

Oh, we can go into all sorts of examples, some of them profound. The most simple one is in the economic area.

If you need $300 a month that will barely satisfy your economic needs and you only earn $250, there is a difference of $50 between the degree to which that need has been satisfied and what is needed. You go through all kinds of behaviors trying to make up for the difference between the need and the degree to which it has been satisfied.

Maybe you ask for overtime. Maybe you try to get a job over weekends or on Saturday. Maybe you try to get another job at night. Maybe you try to reduce your budget so you can live within the $250. Maybe you go out and steal.

Whatever ou do, you go through all kinds of behavior to try to make up for that difference, and our lives seem to consist of trying to maintain a sort of unstable, unbalanced equilibrium between needs which are not completely satisfied and new needs which are constantly arising, trying to maintain equilibrium and stability in the face of unstable and uncontrollable needs.

So, no matter how complex, no matter how confusing, no matter how stupid or irrational the behavior of some people may seem, you may be sure it is based on their attempt to satisfy personal needs.

Often, you yourself have done something or said something and before you are barely started or before it is off your tongue you want to retract and say, "No, that is not what I mean. I wonder why I said that? You know I know better than that. Isn't that the craziest thing?"

Sure, a moment later, an hour later, or a year later you know better, but at the moment when the demand was on you to satisfy the needs of the moment that was the best you knew. A moment later you know better.

Now, since complete satisfaction requires no adjustment, and since adjustment is a basic law of life, and since the mere effort to adjust, which means change, indicates dissatisfaction, or the mere thought of change denotes dissatisfaction, it is normal

for normal men to be normally and continually in a state of dissatisfaction.

Men don't like to be bossed by men. Most men are honest men. Most workmen are honest workmen. When honest workmen take jobs, they expect to carry out all the demands of their job if they know what is to be expected of them and they will do so, if they agree to take their jobs with the full knowledge of what is to be expected of them.

GUIDEPOST NUMBER TWO

When a man says, "That ain't up to me," when a man says, "Hell, I don't have to do that for anybody" or "I don't have to take that from anybody," or when a man says, "Why don't he keep his nose out of it, that's not up to him?"—he is saying to you that he feels imposed on. That somebody is pushing him around. Somebody is getting into something that he considers is in his own province. He is telling you that *the basic guide for all supervisory practice*, is a complete and detailed job description which completely delineates job duties, responsibilities and authority. Without that job description, he feels like the man going to play poker with you while you have to change the rules of the game after you have looked at your hand for a minute.

"*I have got to do it because it is my job*," has a different connotation than, "I have got to do it because the boss says so."

Men are apprehensive of being taken advantage of. They will resent and fight against being pushed around. With the knowledge that what is demanded of them is truly part of the job, they will believe you are pushing your weight around and taking advantage of them and they will fight and buck you.

Human beings are still a phenomena of nature and will obey all the laws of nature, including the basic law that action is always equal to reaction and in the opposite direction. When men are pushed, you can be sure they are going to push back. No man ever bucks the demands of his job. Men will even brag about the dangers and discomfort in their jobs.

Talk to the men working out the long lines. All summer it is beautiful but with winter coming on, there will be rain, and sleet and snow and flood and all sorts of terrible working conditions.

But they don't squawk about the working conditions. They look around and say, "If you can't take this kind of thing stay away. This is a job for he-men." They brag about it. "It takes a man. If you can't take it down at the bottom of a mine, you don't belong there, that is all."

You know that resistance by men has nothing to do with the job at all because men do not buck the demands of a job, but they do buck the demands of men unless they know that these demands are demands of the job. Men don't want to be bossed by men, but they will be bossed by the demands of a job.

Most of us are not brilliant; most of us do not have the answers to everything, nor do we all have the ability to analyze and discover answers for ourselves. That is why we need someone whom we can trust to turn to and say, "What is the thing to do?"

GUIDEPOST NUMBER THREE

We need leadership. We need guidance. We need direction. We want to do the right thing, but are not always sure what the right thing is. We have a great need and a great hunger to have someone we trust to tell us what is the right thing, what to do and how to deal with the problems that are bothering us.

Once people have faith in a man, they will always follow him often to their own harm, because faith and trust are in the realm of emotions which blind people to the faults of those in whom they have confidence, and so they can be easily led or misled by them. Among the greatest human hungers, the one rarely satisfied is the need of people for something and someone to believe in, a faith.

They will turn to anything, they will follow anything, follow anyone, any scheme, any idea, any man who promises to alleviate their ills and correct their grievances; any man who claims to understand them and their problems, who by doing one simple thing, not by doing anything really constructive for them, but by merely taking the time to listen to them and encouraging them to talk, and merely giving them the opportunity to get it off their chests, (the psychological catharsis); by merely listening to them, he convinces them he is really deeply concerned with them and the things that are bothering them.

For the honest leader of great personal integrity, faith is a most wonderful tool, because when people have faith in a man, they will follow him, you can be sure. Their faith will make it instinctive, without ever having to think about it—"That my boss is the man to go along with"—because people always follow their faith.

GUIDEPOST NUMBER FOUR

This relates to bragging. I know a lot of people want to slap down a man who starts bragging and boasting. It can be annoying and he can become obnoxious. But what is a man doing when he is bragging to you? Isn't he telling you something? Isn't he describing something that he hungers for? Isn't he saying to you, "I don't know how I stack up in your eyes, but I want *to look pretty good*. I'll even lie like the dickens if necessary about my achievements so that you can think better of me." Isn't he trying to paint a picture for you, to see of him, which is a little better than the picture he thinks you see? Isn't he describing a dream to you of what he would like to be or like to be able to do?

Instead of slapping him down, why not encourage him to brag? You may say to me, "O.K., Doc, you straightened me out, so, I'll praise him. But what do I praise him for?"

Well, don't worry about it. Encourage him to brag and tell you exactly the things he would be proud to have you think of him or know about him. He is telling you what he would like to be like, by bragging. It would be a much more worth while and satisfying thing to try to help him be what he would like to be like. Encourage him to brag and listen to his bragging.

Bragging describes deep human needs.

GUIDEPOST NUMBER FIVE

People are not logical animals. People are psychological animals. People do not live up in here. (Pointing to head) Here is where they live. (Pointing to the heart) Here is where the most important things in your life happen. People don't react to conditions, people don't react to things. Good grief, we even pay to get involved in the most horrible conditions. A man will go out and spend several hundred dollars for a gun and several hundred dollars for equipment and go out and find some cold, miserable damp four o'clock morning and wait there shivering for some poor little, innocent duck to come flying across the sky. He says that is fun. It is not the condition which is terrible and unhealthy. It is the idea of the whole situation which this man has built up into a symbol of pleasure, sport, fun, something to be enjoyed.

People don't react to things. We wrap things up in emotions and feelings and they become symbols and these are the things we live for and die for. Special meanings are attached to things. The flag is just a hunk of cloth, but when the red and white and blue and the stars are arranged in a certain relationship with each other, it is no longer a piece of cloth. It stands for something we are willing to fight and die for.

Hours—you know people who put in 20 hours a day when necessary and then others put in two hours a day, and you can reduce hours like Reuther wants it, to four days a week, and reduce it to where a man needs only to turn over to answer the phone and I bet you still will have a gripe on your hands because he wasn't ready to answer it and you woke him out of a sound sleep or in the middle of a lovely dream.

Wages—you know as well as I know that wages are merely a symbol because intelligent labor leaders know that wages can't keep going up forever because there is an ultimate limit to what the consumer is willing to contribute to a company for its products.

Working conditions—we have talked about these. These are really symbols. The union is a symbol. The management is a symbol. The employer is a symbol. These are symbols. And we are willing to fight and die for or against these things, aren't we?

I can remember that some of the happiest years of my life were spent up at Loyola university in Chicago. Over the doorway of every one of my classrooms there was a symbol. It was black. I don't know if it was made of wood or clay, I have no idea. But, it had a different meaning for the boys and girls in my classes than it had for me

because I am a Jew. I am not a Christian I am not a Catholic.

A little piece of paper and people fight for it. Until I go like this (making a cross out of the paper) and say to you, "Do you think that people who fought for what this stands for, for a couple of thousand years—do you think they were crazy? Those men and women who fought and died for this?

You say to me that, "As a Christian, this stands for everything that is fine and beautiful in life and is worth fighting and dying for.

I say, "This?"

And you say, "Oh, not the piece of paper; what it stands for. It is not a piece of paper now. It is now a symbol of Christianity.

I say, "Well, you are a Christian. You tell me, if this were made of gold would it be worth fighting for more than a cheap piece of paper? If it were made of platinum encrusted with jewels would it have greater value for you?"

"No."

"If it were made of a hunk of wood or a cheaper grade of paper?"

"No."

This is not a piece of paper any longer. This has been wrapped up in emotion. It is not a thing. It is a symbol. It is something we are willing to die and fight for.

Don't be distracted in your daily human relations. A major guidepost is that people are not affected by things. They never get involved with petty things. They will never fight over little things. The thing itself may be nothing but a piece of paper, but it is the meaning of these things which is important and in dealing with people try to find out what conditions and things are symbols of before you try to deal with human problems, because some of them may not have the meaning for you that they have for others. Some of them superficially petty things, people are willing to fight and die for.

This means principles, doesn't it, that we are willing to die and fight for, not money. Ideals, yes; ideas yes; Things wrapped up in emotion.

HOW TO BE IMMORTAL

SESSION FOUR

IN TALKING about symbols, I pointed out it isn't things one meets in life which affect him so much as the meanings which they have for him. Parents take sacrifice in their stride. Religious zealots took suffering in stride. Everybody wraps up his own experiences with all sorts of emotional attachments and it is these that convert things into symbols, to fight for, to fight against, to fight about, to accept calmly and without emotional distress.

One man said to me, "Can you give us an on-the-job example?"

I said, "Well, maybe, we will try a little bit of participation in this last session."

Is there anyone here whose company has a job which pays let us say, $75.00 a week and that is considered fair wages for that kind of work?

Here is a gentleman. "What kind of a job would that be where around your shop they get $75.00 a week and it is considered pretty fair wages, or $80.00 a week, for that kind of work?

Member: That would be our minimum scale. Our janitor would get $70.00 a week.

Dr. Rosenstein: Your janitor would get $70 or $75 a week? That would be the lowest rated job. O.K., do you think that is a pretty good rate of pay for that kind of work?

Member: Yes, sir.

Dr. Rosenstein: Now, let's make believe. We are trying to develop an example. Now, suppose you were doing that kind of work, janitorial work, and you were getting $70 or $75, and you thought it was pretty good pay, and even though you would like to get more money, you still consider it fair pay. O.K?

Do you have the kind of setup in your plant, so that after a couple of years a man is entitled to a week or two of vacation with pay?

Member: Yes.

Dr. Rosenstein: Let's make believe then that you are on the job. You are doing the janitorial work. You are getting $75 a week and you have been there long enough so that you are entitled to two weeks' vacation. Today is the day. Come four o'clock, you are off—two weeks' vacation.

You grab your pay envelope and your wife is waiting out in the car for you and you run out and say, "Let's get going." She is very practical and before she gets going she says, "Did you get your money?"

"Oh yes, here it is."

You tear open the envelope and pull out the check and attached to it is a little slip which says, "Dear Jim, have a wonderful vacation. Be safe. Come home safe. Be careful.

"Here is a check for $150. That is $75 a week for the past two weeks—less deductions. And then underneath it is another check for $150, for your next two weeks while you are on vacation — less deductions of course.

"Have a wonderful time. Come back happy."

Your wife says, "What is that little pink slip underneath?"

You say, "Oh, no, they wouldn't pull that kind of stuff on me." But, you pull it out and it says:

DIFFERENT ATTITUDE NOW

"Dear Jim, because you and all the people in the company have worked so hard and we made so much money during the last year, we want to share our good fortune with you. From now on, you will still have the same job, have the same hours, and same working conditions, everything exactly the same, but instead of $75 a week, you are going to get $175 a week. Here is your check for the next two weeks, for $200.00 less the usual deductions. Have a wonderful vacation."

"Now Jim, tell me how you feel about that? After you decided that those guys upstairs must be insane. That they have all gone mad. How do you feel? Pretty good?"

Member—"You bet."

You know they are crazy, but you still feel pretty good. You don't feel the urge to go up there and say, "How dare you? The very idea of giving me that kind of money for the kind of work I do. If you are that kind of impractical business men, you are not going to be in business long. *I am quitting and looking for a place* where my job is a little more stable and dependable."

You don't do anything like that. You go away and of course yours is a wonderful vacation and you come back and go into the locker room at the end of the vacation and some of the boys say, "Hi, Jim, how are you? Tell us some of those lies about some of the hunting you did. Did you have a good vacation?"

"Sure. Good vacation? Holy cow, imagine getting $175 a week."

The fellows say, "What do you mean $175 a week?"

You say, "Didn't you get a raise?"

"Oh, sure, we all got a raise."

You continue—"$175 a week for a janitor. Imagine. I always wondered if I were ever going to be able to send my boy to college. Now I can. I have always been unhappy about how much insurance I carried. I have always been hoping some day maybe I could save up enough money to buy a house instead of renting it. Boy, 175 bucks."

One of the fellows says, "What is this $175 business?"

You say, "Well you guys say you got a raise."

"What are you getting if you're not getting $175?"

One man says, "I am getting $177.50."

Now, tell me how you feel about it?

Now, you are going to talk to somebody, aren't you? You are going to find out why you are being pushed around. Why is he getting $2.50 more than you? You didn't go and fight, and tell them, "Why am I *getting paid twice as much as my job is* worth?" But that $2.50 is different.

Is it the $2.50?

No. That two and half dollars has suddenly become wrapped up in emotion and it has become a symbol for being pushed around, being taken advantage of, prestige, self esteem and being put at the lower end of some kind of a scale are involved. There is something unfair about it now, and you are willing to fight about that, aren't you?

Talk about symbols. The old timer says, —"They don't make men like they used to in my day. We used to work 70 to 80 hours a week, boy, and we had time for picnics and parties and we raised good families."

So somebody says, "So what! Is it a virtue to die in the saddle, in harness like a horse?"

We have information from research which has already proven to us—research by Dr. Max D. Kossoris, Regional Director at the Bureau of Labor Statistics in San Francisco during the War, concerning the hours of labor and productive efficiency. He discovered as others have since that time, that any time a man works more than eight hours a day or more than 48 hours in a week, you are beginning to pay double time for half-time labor.

I don't say we ought to have a three-day work week, a seven day work week, a two-day work week, or an 18-hour week.

I say, let's find out which is most productive per dollar expended. What is there so holy about 40 hours? Golly, my Dad used to work 70 hours; ten or 12 hours a day, every day except Sunday when he worked a half a day, that was until one o'clock of course.

But there is no virtue in just hours alone. We hold it up as a symbol and the man who works more hours is a better worker.

Do you remember the day, when if you were tired and leaned against something and then saw the boss coming you had to stand up straight because if you tried to do something about your fatigue, you were lazy and something had to be done about you? Do you remember those days? I do.

INCENTIVE IMPORTANT

Now, we think that maybe a man can turn out more work, who is not tired—But the stereotype symbol of good worker is a hard worker, a tired worker isn't it?

I have newspaper clippings, I used to carry around. Up in Flint, Mich., you have high-powered labor boys, who are known as tough cookies. They won't co-operate with anybody. They even fight among themselves.

They say that more than eight hours a day is unfair. More than 40 hours a week is unfair. But along came a tornado a couple of years ago and wiped out *the whole town* of Flint and who rebuilt the town on their own time, using their own materials at their own expense, with their very own tools?

These very same men who wouldn't put in more than eight hours a day. Rather than do that they would go out on a strike. They worked around the clock and their bosses worked side by side with them in a common effort. A symbol of a true sense of humanity, overcoming animosity.

Here is another example. It is *pouring* down rain and the foreman says, "Joe, it is a quarter to five. It is a shame to get you at this time. But it is raining and they just brought in a *load* of cement and it is stacked in those sacks and there is a hole in the roof of that shack and you know what will happen if the rain comes through. I wish *you would go over* there and do this favor for me and put something across the hole, because if the water drips through there we are not going to have cement tomorrow but a bunch of lumpy sacks and that is all."

The man says, "I can't do it. I'm not going to do it. I asked you to get off early. This is Wednesday and we are expecting *some people* for dinner. In the meantime I have to take my daughter to the doctor for her third polio shot, and I have to pick up some beer and take it home and then we are going to watch the fights. I would like to do it, but I can't."

"Well, you are too.

"I can't.

"Yes you can.

"I won't."

If you come along and say, "Why don't you do this for Joe?"

The worker may say, "First of all I'm not a carpenter or maintenance man. Then I have got to do a lot of things." I talked *to him this afternoon* about getting off early.

You say, "Remember, Labor Day is supposed to be a holiday for the worker. Where were you last Labor Day?"

"Gee, I can't remember where I was last Sunday, not last Labor Day."

Well you say, "You remember last Labor Day, you were way up in the air doing a lot of hard work. You were sweating all *right*, like a horse."

"Oh yes," he says, "I remember it."

You say, "Where did you get the tools?"

"They were *my* own."

"Where did you get the materials?"

"Everybody chipped in. I only paid five dollars because I only have two kids. One fellow paid seven dollars and a half because he only has one."

"Where did you get the meals?"

"All the girls got together, cooked and fried chicken."

"And I suppose you got double time? Quadruple time? It was a holiday."

"Oh, no, nobody got paid anything."

"How many hours did you put in?"

"We started at almost sun-up. We wanted to get through. But, we got the job done at sundown."

"What were you doing? Why were you paying for the privilege of working in the hot sun for 16 hours, providing the materials, tools, equipment and work? What were you doing?"

"Putting a new roof on our church."

"Well, you weren't a carpenter then why don't you go up and put that patch on this roof?"

"Well, that is different!"

We are talking about, not the thing but the meaning of *the thing*, and that is what people live by. Not things but the meanings as attached to things. In order to deal with men properly, you have got to find out what *things* mean to them.

When people fight, it is never over anything trivial—trivial to you, but important and vital to them. Well, let's go on with *some more ideas* about symbols.

GUIDEPOST NUMBER SIX

I said we had six guideposts and I left the last one off. Maybe it would have been better, but let's go at it anyway.

This is that you can't cure diseases by dealing with symptoms. It seems to me we have been taking industrial aspirins for industrial headaches for 10,000 years, without doing a thing about the causes of the head-

aches. You know you can take aspirin until you are blue in the face without curing anything. You relieve yourself temporarily. That is exactly what we have been doing with contracts and negotiations and slapping them down and disciplining and doing this and doing that—taking an industrial aspirin to relieve ourselves of the industrial headache without getting back into the causes. We know those causes have always reproduced the same headache again and again and again.

Everything that happens has a cause. That is a basic law of modern science, nothing comes from nothing. Everything that happens has a cause and is the end product of something that happened prior to it. Every human performance is the result of something that came before it and produced it. Human performance is the result of a continuum, a stream of life.

Everything you do has a cause. There is a cause for what you think, the way in which you think, what you do, and the way in which you do things. Whatever you think or feel, your attitude of being for or against something, your desire to co-operate, all sorts of feelings of loyalty or, antagonism, resentment, admiration, hate, rebellion, love, faith mistrust—everything you think and feel and do is the end product and the result of those things which came before. They are only symptoms, all of these feelings and performances.

There have been times when, despite the fact that you are a good management man, you have hated the guts of your boss—. If you haven't ever felt that way you ought to go see a psychiatrist. Something is wrong with you.

There have been times when you have even hated your wife and your children, haven't you? You weren't too proud of feeling that way. You felt kind of guilty about it. You felt that there must be something wrong with you. But, if you are normal, the death wish for yourself as well as for others whom you love, is not uncommon. It is a normal thing. Those of us who know, are not frightened by such things or disturbed by them.

You may be sure that when somebody hates you or hates your guts, something caused that, just as something caused you to hate the guts of your boss. When some man is unco-operative, when a man is resentful, when a man is resistant, something caused it. When a man looks on you as a leader to be trusted and to follow, something caused that, too.

Everything has a cause. Nothing comes from nothing and if that is so, let's follow simple principles. If you deal with a cause, you deal with the end result. That means then, that you can control human behavior by controlling its causes. You can eliminate and prevent behavior of certain kinds by eliminating the causes of those kinds of behaviors.

CONTROL BEHAVIOR CAUSES

We spend most of our time dealing with these behaviors that make us unhappy and irritated and bothered. We don't spend much time with these causes, do we?

It would seem that in our search for understanding and control of people and their actions, most of us have overlooked the truly important aspect of control and understanding. We have been concentrating on people instead of the causes of their actions. We have been trying to manage and control people instead of the causes of their behavior.

By being so concerned with the control of people instead of the causes of their performances, most of us have overlooked the power to action, the power which forces action of so simple a thing as a shrug of a shoulder or movement of a finger or wave of a hand or lift of an eyebrow or a look —that kind of look, the executive look. All of these physical actions are so important.

A dear friend of mine has spent 40 years of his professional life as a psychologist being concerned with these autistic behaviors. The physical manifestations of what goes on inside.

You know what I am talking about. You have heard somebody say or maybe you have said to somebody, "You get that look off your kisser or I'll wipe it off for you."

The man says, "What do you mean? I don't have any look."

You reply, "Don't you tell me. I know what you are thinking. It is written all over you."

You have heard that kind of thing. Or the apocryphal story of the supervisor who was mad—fighting mad and pounding away and laying it into a man and going great guns and suddenly he stopped and said, "And don't you dare talk back to me!"

The man said, "But I haven't said a word."

The foreman said, "No, but you were listening damned aggressive."

On thinking in these terms, you can see that when men are anxious or cheerful or zestful or calm; when men are bored or active or enthusiastic, you must never overlook the fact that something caused them to be so. You must remember that men are not crystallized, static, fixed and unchanging. You must remember, you just can't talk about happy men, unhappy men, co-operative or uncooperative men, loyal or disloyal men.

Normal men and women—I said, normal men and women (only ones who are fixed and static and rigid and crystallized are those we describe as insane—they have reached a fixed, static state) are happy or unhappy, listless or active, bored or enthusiastic, depending on what causes them to be bored or unhappy, listless or active.

Sure, if you are hungry, your hunger causes you to look around for food. If you are normal, orders cause you to do things. If you are normal, unfair criticism makes you angry or resentful. If you are normal, what is going to happen causes you to be unhappy, worried or apprehensive?

Of course, if you are normal, constant nagging causes you to become insubordinate and want to take a poke at somebody. Sure, if you are normal, people who play favorites produce in you a sense of antagonism and disloyalty. You are not an angry man. What makes you angry? You are not a down man. What gets you down? What causes you to lose any incentive to exert yourself beyond what is necessary to get by? What causes you to say to yourself, if not aloud, "Oh, what is the use of knocking yourself out around this place anyway?" If you are normal, you have said that.

What makes you study? What makes you go to church? What causes you to pray? Do you think of yourself as an uncivilized barbarian, a vicious savage? Is that what you think of the people around you who work with you and live with you eight hours a day? Hardly.

You say, "I am not a vicious savage going around attacking people." Well if you are not, what are you doing with your fists up?

You say, "Well, when I have got my fists up, I am not going around attacking people. I have them up to defend myself from being hurt."

Don't ask me what to do about this antagonism on the part of the workers. When they have their mental fists up in your direction, you may be sure that rightly or wrongly, they have them up there to defend themselves against what they think you are trying to do to them, to harm them.

STUDY PEOPLE'S BEHAVIOR

Let me remind you that the psychologist says he isn't concerned with people and he says neither are you. He says he is concerned with people's behavior and you ought to be, too. He is concerned with what causes people to act as they do and what causes people to think as they do. He says, if you study the causes, you will understand the behavior. You will understand the result.

He says, it isn't the people, it is their behavior that bothers you. Why fool around with them? Why not start working on their behavior by dealing with its causes, because there is a straight line in normal people, between the cause and the end product, and if you control the causes, you control their behavior, which is really what you want.

Those of you who would take the time to talk to personnel people and remember these guide posts will find from talking to them that these six guide posts are so important that every man who has ever quit his job, been resistant, been antagonistic to his supervisor, who has stalled or refused to co-operate, has indicated as a cause the violation or abuse of one or more of these six common, simple basic principles.

Living demands constant adjustment and everything a person does, proves that normal men and women are normally dissatisfied and discontented. Men don't like to be bossed by men. They do like to be bossed by the demands of their job.

People will always follow their faith. They are always hungry for someone in whom they can have faith.

Bragging describes basic human needs and hungers and describes the things people would like to achieve.

People live by and would die for symbols.

Everything that happens has a cause and is only the end product of that cause, and will always recur until that cause is removed.

Now, we are practical people, we like to say—and I have never come across a supervisor who doesn't think of himself as a practical man. When you ask him what he means, he says, "I have been working for 30 or 40 years. I never had a chance to go to college. I had to go to a trade school at night. "I got it the hard way and I have had 30 years of experience and as a result of trial and error and getting my nose bumped, I know what is right and what is wrong, what will and what will not work.

You say, "Sure, a man puts in an apprenticeship and gets his card and says now, I am a machinist. But, everybody else says that it will take another 10 or 15 years and then he will be a machinist." Isn't that the way we talk?

But, the mere accumulation of experience doesn't make a man practical. Eisenhower had the answer to that many years ago when he was first running for office and someone asked him whether he thought the 28 or 30 years of experience in military administration would give him the background and the knowledge he needed to become a good civilian administrator in the top administrative job in the country.

Eisenhower said, "Well, I don't know whether my years of experience would or would not. I hope they might. But, I am reminded of this army mule we used to have at Fort Riley in Kansas. You know that thing had 35 years of military experience and it is still nothing but a jackass."

KNOWLEDGE MUST BE APPLIED

It isn't the accumulation of know-how, the collection of knowledge, of knowing what is right and wrong. It is using it, and if you don't use it, you are just as impractical as the man without experience and you might as well not have had any experience at all.

If you were hiring somebody would you think these are important—honesty, loyalty, stability, cooperativeness, reliability, industriousness, sober, no genius but capable of learning?

We all talk about qualifications, don't we? If you were an employer and you were *fighting for existence in tough competition,* would you hire my daughter as an office manager with these qualifications?

Member: "The answer is NO—she needs to know how to run an office too."

Suppose you had the authority to hire truck drivers and you had the big overland trucks that cost maybe $14,000 a piece or something like that. When they are loaded they have $30,000 or $40,000 worth of stuff on them. Would you hire me as a truck driver with these qualifications?

Member: You would still have to be trained.

Dr. Rasenstein: I don't want a job as a trainee. I want to drive a truck. Your truck driver died last night and we have to have a load delivered in Alabama. Would you hire me?

Member: "No. I'd want to be sure before I hire you that you know how to operate a truck."

Somehow or other, whether it is for an office manager or stenographer or truck driver or salesman or clerk or accountant, you want to know in advance. You want to have proven to you that a man can handle the job and know how to do it properly before he is hired.

When you are hiring a stenographer, you want to know in advance that she knows *how to type* and take *shorthand,* and being unreasonable, I would expect her to know how to spell, not all the words, just a few.

Well, let me ask you this question, you people who feel that this is the right way. I know you are doing a good job of supervision right now, but to whom did you ever have to prove yourself in advance? Supervising means leading, teaching, guiding, directing, managing, controlling, disciplining, inspiring, motivating, encouraging and again teaching.

To whom did you ever have to prove that you knew as much about these things as you expect that truck driver or the stenographer or that office manager to know about their jobs before you had the courage to take your job? Sure, you learned from experience. But, everybody knows, who has

good sense, that experience is a pretty poor and a pretty bitter teacher. You wouldn't say to this man, "You come on and get behind the wheel of that truck. *It is only* worth about $50,000 altogether, loaded up. Get out on the highway and learn while you are behind the wheel. After all, experience is the best teacher.

Experience is not a good teacher. You wouldn't say to this girl, "Come in and knock out those important letters to some important business men, customers of ours and potential customers—and in the meantime, go down to the bookstore and get a book that says "Touch Typing" and practice at home and maybe you can study a little shorthand and spelling."

You wouldn't say to this man, "Come in and audit our books and in the meantime go up to the University and take a course in Introduction to Accounting and later on you can take intermediate and later on some tax accounting."

You wouldn't do that. But, when it comes to leading men, guiding, directing, instructing, and motivating them, that's different isn't it? Or would that be too practical?

PROVING ONESELF

You know what you had to prove over a period of years? You had to prove to your employer that you were honest and loyal and industrious and intelligent and cooperative. You had to prove you had wonderful qualities, but you never had to prove that you knew how to manage men. It seems to me no good man should ever be put in the position where having to prove himself to be a good man and having been up-graded to the position of supervisor, he has to be taken away from the job and a finger pointed at him for the rest of his life as a failure. He couldn't make it. That is no way to treat good men. There ought to be a far more intelligent and practical way to select supervisors than trial and error.

You think you are practical? I have never seen a supervisor who didn't think of himself as practical. You want cooperation?—What do you mean?

When you ask some supervisors what they mean by cooperation some say, "Well, when I ask a man to do something I expect him to do it." That is their definition of cooperativeness. The difference between obedience and co-operation is something they haven't yet heard of.

Here is another example to think about—Suppose I am here at the end of a row of machines and over here is the freight elevator and I am working and I am considered a fairly good workman and so on, co-operative and genial.

Then along comes Joe and he is a friend of mine and he says, "Hi, Bill," and comes by me with the hand truck, goes to the elevator, pushes the button, and there are two doors, one goes up and one goes down. He tries to push the load on and the wheel gets stuck in the space between the shop and elevator floors. Joe says, "Give me a hand will you?"

I shut off the machine and go over and help him get it on. It happens once a day or twice a week. It has been happening for a couple of years.

Then one day along comes the boss and he lays me out. He really gives me the dickens for something I had nothing to do with. Later on I am standing at my machine telling him exactly what he can do with my stinking job.

Then along comes Joe. He pushes the truck over to the elevator, pushes the buttons. Tries to get the truck on. And then calls "Hey, give me a hand."

My reply is, "Nuts to you."

Joe says, "O.K. Don't get hepped up. I don't know what's eating you but, take it easy." And he goes to the foreman.

"Mr. Smith, can you get somebody to give me a hand?, I can't get the stuff on the elevator."

"Ask Bill. He always helped you."

"I did ask him. He told me he wasn't going to do it."

"What do you mean?"

"He said, 'Nuts to you.'"

"Well, is that so? I have already had trouble with him today."

Mr. Smith comes along all steamed up.

"Why don't you give Joe a hand?"

"I don't want to."

"What do you mean, you don't want to? That is being insubordinate, uneo-operative."

"I don't think so. I'm no truck pusher. My card says, 'machinist,' and I'm not go-

ing to rupture myself for you or anybody else. That is not part of my job."

Is be unco-operative? I think we ought to stop and think. A couple of months ago, I went to the Blue Ridge Assembly of the Southern Industrial Relations Conference. We had a whole program devoted to discipline, and you know, we spent the greater part of the program just trying to find out what we were talking about. I don't think we know what we are talking about when we talk about co-operation either. I am not going to try and tell you. I don't know. Discipline and cooperation are just words somebody made up.

Are you practical? You want loyalty? Do you think you are capable of being loyal? Do you think you are capable of being loyal to me if I were your employer? Could you be loyal to me if you knew that any time you got into a jam I would kick you around and let you stew there?

Could you be loyal to me if you didn't think I might stick by you and back you up and fight for you and be loyal to you? I should say not. You have always known that loyalty is a reciprocal relationship given only in return for a loyalty you expect. That is true in your life and in the lives of your men. What do you need a new magical formula from some psychologist for? You have always known it and if you don't use it to get loyalty, you are being impractical.

Sure you are co-operative. But could you be co-operative in carrying out some of my programs to a goal far beyond merely what is required, if I were your boss, and could you be loyal to me if you had to keep your back to the wall all of the time so I wouldn't knife you? I should say you couldn't. If you hated my guts, could you be loyal?

If you forget that for even one moment of the eight hours a day you are on the job, you are being impractical.

Do you go around killing off those less fortunate than yourself? I should say not. We devote most of our lives to those less fortunate. Some of us say that we don't even pray. But we offer our prayers in that fashion. In helping those less fortunate than we are, we are saying, "Thank God I can do for someone else. I don't have to have someone else do for me." Even though we don't call it such, it is prayer.

You know, there is no one less than the man who feels that nobody needs him. The world can get along all right without him. You wouldn't dare go home if you didn't think, that over and above the need to provide bread and butter there are other reasons why you are needed at home. They need you emotionally. They need you spiritually. You are needed. That is what gives you stature. The more you are needed, the stronger and finer you feel.

EMPLOYEES MUST FEEL NEEDED

Do you let your people on the job know that you couldn't possibly get your job done without them? You are dependent on them? If you don't, you are impractical because people need to be needed, and you have known that all your life, and they have to be told again and again that they are needed by you.

You work for money like every one else. Is there anything you wouldn't do for money? Sure. There are lots of things you wouldn't do for money. You wouldn't give me your child, and say, "Put him up against the wall and shoot him."

You wouldn't do that for ten million or a hundred million or all the money in Fort Knox or anywhere else. There are just some things you wouldn't do for money.

You know as well as I do, there are lots of things you do for money, but there are some things you wouldn't do for any amount of money.

We send our children off to war knowing that they might never return. Is it for money? We hope they will come back. We pray they will come back. But we know some of them will not come back. Do we send them off because there is money in it? We are letting them go voluntarily even though it may be a kind of a reluctant voluntary feeling, after we have exhausted every angle to try to evade sending them. But when they go we let them go in the belief that they are going to fight or die for what we think is a principle, an ideal, and certainly not money.

We will fight for money, but we won't go out and die or kill our loved ones for it. We will do lots of things for money and we won't do some things for money that we will do for people, for our loved ones, friends, people for whom we have a great affection and admiration.

We will do things for money. But we will do more things for people without money. We will fight and die for principle. People and principles are the non-financial incentives, and they are the most important incentives in your lives and the lives of your men.

Do you think money is the most important incentive? That is the way supervisors usually act on the job. As if they believe it is the most important incentive of all when you have always known that people and ideals and principles are the most important incentives on the job.

Sure, I know you are taught that it isn't wise for a supervisor to be soft and gentle on the job because it isn't manly. It is all right if you have time for that kind of stuff around home, but not on the job. Yet, we know that most people who come to psychologists or psychiatrists don't need psychology or psychiatry. They need kindness and affection.

Over in Kansas we have one of the most successful psychiatric clinics in the world. Do you know what their basic principle is? TLC. TLC. That is the way they shorten it, and they laugh about it. TLC—tender, loving care. Give it to them until it runs out of their ears. Slap them down, but give them tender, loving care.

The National Safety Council some years ago did some research and told us women are not as strong as men. Women are smaller than men, and the woman who is pregnant should stay away from some of the jobs that involve toxic substances. That is about the story.

But, they also found that women are not more susceptible to dermatitis or more likely to have accidents; and women are not more subject to fatigue; and women do not lack mechanical ability; and women do not have greater dexterity than men; and women are not especially better than men at monotonous work; and women do not only work for luxuries; and women do work out well in industrial situations, and women are just as good supervisors as men.

If you don't know it, there were as of a year ago, 29,000 female executives in the United States, 29,000 earning $35,000 or more per year.

Let's be practical. Do you think your company is practical? If I were to go to your personnel men—how much would they pay me to reduce absenteeism 25 per cent? Reduce accidents 35 per cent? Would that be worth a lot of money to you? Don't hesitate, because I do know. And you should know.

What could be more impractical than a man who says, "I know how to reduce accidents 35 per cent, but I will be darned if I am going to do anything about it."

Well, let me tell you something you already know or should have known. Back in 1951 the National Association of Manufacturers published a study of a survey of 3,500 plants in the United States, from small to many thousands of employees, a cross-section of all the industry and employers in the United States—3,500 plants. That was in 1951, six years ago. This report to the members of the National Association of Manufacturers indicated that the average savings from a medical care program was as follows: A 44 per cent drop in accident frequency; a 46 per cent drop in occupational diseases; a 29 per cent reduction in labor turnover; a 39 per cent drop in absenteeism; and 30 per cent drop in compensation insurance premiums.

That is direct dollars and cents. Do you have a good medical program in your plant? If not, what do you mean by being practical? This was published six years ago.

SOME DAY DREAMING

You know, I do a lot of day-dreaming. I think there is more fun in day-dreaming. I get all my problems solved in day-dreaming. Every once in a while I have said or you have said, "Oh, boy, if I were God, what I would do." You know that business. "Boy, if I were only running this outfit—." So, let's day-dream.

We are all managers of men, supervisors, leaders. We are supposed to do things for management, as part of management. Management always selects its supervisors. But wouldn't it be wonderful if a man could select his supervisor? If I were a workman and day-dreaming that I could pick my boss, what would I look for? Boy, if I could take a hunk of clay and model it, what qualifications or attributes or specifications would I build into it? I'll bet that you could think of a thousand specifications.

I would like to tell you about a few of those I would look for. First of all, I would

look for a man who could be described in one word. You could tell me that he is a rock-head, a rough cookie with a sharp and nasty tongue, a tough temper, and hard to get along with, who would push you around and slam you around and make you feel antagonistic at every opportunity, and I would not be too happy about having to work for that man.

But, if in addition to that you would say but one thing about him. If you say that he is a man of integrity, then I might forget everything else. I don't mean a man who is honest because it is good policy to be honest. That kind of honesty is not honesty—that is hypocrisy. But, a man who is honest because it is the only way he knows, who does not have to stick his wet finger in the executive wind to see which way it is blowing before he knows what is the right way and what is the wrong way, who fights for that which is right regardless of who else thinks differently—that man has real honesty.

I would want a man of integrity. That is the first thing I'd be looking for.

Of course, if I had a chance to pick my own boss, I would try to find me a *professional*. I would hate to have him learn his job while he was working out on me.

I would try to find a man who would be concerned with how he could help me instead of himself, who would give me loyalty instead of demanding of me, who would think of himself as my assistant, instead of my boss, who would think it was his job to help me do my job better.

I would pick a man whose pride was peculiar because his pride was in his men. A man who could walk around the shop and say, "Yes, it was well done but not by me. I just happen to be lucky enough to have the best bunch of men in the whole plant." That is where his pride lies. Anything worth while that comes out of the shop, his men did. If something goes wrong, he feels that maybe he was not on the ball. Maybe he had not directed or guided or taught or led the men properly. He will take the blame for anything that goes wrong.

Sure, I would pick a man who never made a promise he didn't intend to keep, merely to slough me off. I would pick a man, who might say, "Gee, I'm so busy, Bill, I just don't know if I'll ever get done. But let's not wait until tomorrow when it is more convenient for me. Let's sit down right now and go at it. Now is the time."

Oh, if I could pick my man, I would pick a man who knew that I was not a genius. If I come to him with an idea, I don't want him to give me that objective stuff. I don't want him to say, "You have a suggestion. Here is the form. Stick it here. Stick it in the box and three months later if it is any good we will give you an award for it."

I want him to get excited about my brain child. I want him to treat my brain child carefully, because it is the most wonderful idea in the world at the moment. I gave birth to this child of mine. I want him to treat it tenderly. Especially tenderly if it is a feeble-minded brain child. The man who is going to get an award, doesn't have to worry. It is I. If I don't get one, I will feel low. I want my boss to pick me up and encourage me.

If I could pick any man, I would try to find a man, who would handle every grievance right now, not like the fellow who has a 40-room mansion, but no garbage pails, and who says, "We just kick it around until it gets lost."

Finally, I would pick a man who in many ways reminded me of my father whom I loved dearly. But who had the knack if I stepped out of line, of lowering the boom so fast I didn't know what struck me until too late. But who if he thought I had been pushed around, would fight for me every step of the way up the line even to the president of the company and the chairman of the board if necessary to see that I got a fair shake and a square break.

I bet you could add other specifications, but these are a few I would look for. I bet you would look for the same ones, and I bet your men would look for the same ones, too.

Well, if we are all agreed—then these qualities are worth working for and developing—so why not take the time?

NATIONAL SAFETY COUNCIL
425 N. MICHIGAN AVE., CHICAGO, Ill.

INDEX

A

Abramsohn, E. R.
Education must redesign the "nut" behind the wheel. 26:47-48.

ABSENTEEISM
Colds and traffic accidents top list of causes of absenteeism in Chicago industries *(Stratton)*. 1:31-32.

ABRASIVE WHEELS
Using American Standards in safety training *(Mobbs)*. 26:20.

ACCIDENT CAUSATION
Human behavior and its relation to traffic accidents *(Wenck)*. 27:47-48.
An elaboration of H. W. Heinrich's accident sequence where a chain of events occurs for every accident *(Stockdale)*. 2:10-12.
A research program must identify the common as well as the specific causes of accidental injuries *(Iskrant)*. 13:16-18.
Three year research program at Northwestern University to study nature and causes of traffic accidents *(Stratton)*. 1:31.

ACCIDENT COSTS, see Economics of Safety

ACCIDENT INVESTIGATION, see Investigation of Accidents

ACCIDENT PRONENESS
Apart from any inherent "accident proneness," attitudes developed because of social or environmental forces, affect human behavior and safety *(Iskrant)*. 13:17-18.
Emotional causes of accidents, some findings by notable authorities *(Tarrell)* 20: 21-22; (panel forum) 20:27.
Eye screening programs in industry reduce accidents *(Marshall)*. 24:21.

ACCIDENT RECORDS, see Accident Statistics—Methods

ACCIDENT STATISTICS
Accident report for all city services except park for a four year period in Minneapolis *(Goodin)*. 7:69-70.
Analysis of haulage fatalities in 1956 in bituminous coal mines in the United States *(Kebbekh)*. 6:14-15.
Aniline oil spillage resulted in serious case of poisoning *(Turner)*. 12:20-22.
The annual toll of accidents on farms and in farm homes in the United States *(Buis)*. 8:7.
Average annual toll of accidents in Great Britain *(Young)*. 1:28.
Back tender fatally injured in dryer roll on paper machine *(Nelson)*. 24:40-41.
Case history of a fatal accident in a Soderberg potroom of an aluminum reduction plant *(Richards)*. 17:19.
Case history of a man who caught his arm in the spreader rolls of a rubber machine *(Turner)*. 12:21.
Case histories in the uses of cylinder gases in oxy-fuel gas welding and cutting *(Saacke)*. 8:26-30.
Comparison of accident experience, compensation and safety incentive costs for ten year period at Asbestos Corporation Limited *(Smith)*. 19:28.
Cowboy highway safety in Oregon *(Dodge)*. 9:12.
Fatalities in the cement, quarry and mineral aggregates industries *(Tienson)*. 4: 6-7.
Frequency and severity for all industry for 1955 *(Hert)*. 12:19.
In forty years, accident frequency rate reduced ninety per cent at Bethlehem Steel company *(Neil)*. 19:41.
Living and dying in the air we breathe—case histories of incidents collected from many sources *(Fawcett)*. 5:23-31.
School bus accident in the courts *(Rosenfeld)*. 26:106-108.
School bus accidents *(Myers)*. 26:101-106.
Ship collisions statistics, indicate that officers do not make proper use of radar *(Thayer)*. 18:42-44.
Ten accident types and typical examples for each from the paper industry *(Marker)*. 24:29-34.
Time and causes of ski accidents *(Judd)*. 28:34.
Time for decision—tomorrow's forecast on the traffic toll *(Johnson)*. 1:40.
Total causes of accidents on freeways in Los Angeles, San Francisco and San Diego for the year 1955 *(Matheson and Severy)*. 14:21.
The two most accident-likely years are the first two years on the job, experience of Homestake Mine *(Orsen)*. 19:38.
Under-ground coal mine records for the years 1953-1956 in Indiana *(Purcell)*. 6:34.
Visualizing ammonia hazards *(Anderson)*. 10:15-18.
We can do more with accident statistics *(Sirois)*. 22:26-27.
We're keeping too many accident record. *(Butler)*. 28:23-24.

ACCIDENT STATISTICS—METHODS
Accident review committee identifies causes and investigates accidents in small store *(Colson)*. 11:37.
Accident reports and analysis maintained by the nurse *(McDermott)*. 11:38.
Drivers sold on use of tachograph charts in their trucks *(Nelson)*. 20:48.
Four items an accident form should have *(Pierie)*. 11:54.
The insurance departments of Alcoa plants serve as accumulation points for all claims of off-the-job injuries. *(Hilland)*. 12:15.
Investigative procedure and report writing *(Corrigan)*. 17:34-36.
Making student accident records work *(Severy)*. 22:32-33.
Man-shifts worked safely basis of incentive awards program of Asbestos Corporation Limited *(Smith)*. 19:20-22.
Need for uniform accident ratings. National Safety Council system not altogether feasible for marine industry *(Renehan)*. 16:31.

An outline aids accident investigation *(Kavanaugh)*. 10:13-14.

Records kept toward evaluating a fork lift operator training program *(Fuder)*. 14:26.

Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 8:18-19.

Schis serious injury index *(Heier)*. 22:42-43.

The value of good records and how to use them *(Ruddick)*. 2:5-8.

Warehouse safety inspection form developed with separate check lists *(Primm)*. 14:44-46.

We can do more with accident statistics—need of the transit industry a collective use of ATA code and classification and Form Vehicle 20 *(Sirois)*. 22:26.

ACCIDENTS

The basic accident hazards to which workers are exposed with suggestions for their control *(Cricksmore)* 16:8; *(Mooney)* 18:11-14.

What to do in case of accident—guide for the operators of highway vehicles in the Virginia department of highways *(Lyell)*. 7:87.

ACIDS

Acids and heavy chemicals (discussion report) *(Allinson)*. 8:54-55.

Chemist developed respiratory congestion from inhaling hydrochloric acid fumes from floor spill *(Fawcett)*. 8:35.

The emergency treatment of chemical injuries to the eye *(Ryan)*. 14:72.

Medical evidence that amine acid causes or contributes to cancer of the bladder, ignored by chemical companies *(Hayes)*. 18:30.

Reducing the hazards of using nitrogen solutions and acids in a fertilizer plant *(Perrine)*. 10:18-21.

ACTION PROGRAM

The Action Program is the recognized charter for traffic accident prevention in America *(Hoffman)* 1:34.

Time for decision *(Johnson)* 1:38-41.

Adams, Forrest H.

Driver training for public employees. 7:22.

AERONAUTICAL INDUSTRIES

AERO safety exchange questionnaire results. 2:11-15.

AIDC guided missile safety techniques *(Boone)*. 2:18-23.

Cost of off-the-job accidents to industry *(Wilkins)*. 2:5-6.

Epoxy resins and catalysts hazards *(Lange)*. 2:7-10.

The new nuclear-equipped guided missile navy *(Will)*. 16:48-49.

Potential hazards of fuselage & component pressurization testing *(Starr)*. 2:15-18.

AERONAUTICAL INDUSTRIES SECTION

Minutes. 2:5-23.
Officers and committees. 2:23-32.

AERONAUTICS

Aero-nautical charts produced by Coast and Geodetic survey, U. S. Dept. of Commerce *(Karo)*. 16:36.

Current developments in inflatable liferafts *(Nash)*. 16:39.

AEROSOLS

Air contaminants and respiratory protection *(Fawcett)*. 8:13-15.

AIR CONTAMINANTS

Factors in exhaust ventilation systems design for the safety engineer *(Morse)*. 14:42-45.

Living in the air we breathe *(Fawcett)*. 8:11-12.

Occupational health control through engineering *(Von Alta)*. 18:11-12.

Safe use of diesel equipment in underground metal mines *(Holtz)*. 10:7-10.

AIR TRANSPORT INDUSTRY

Jet ground handling hazards *(Dymond)*. 2:24-26.

Jet noise on the airport—what to do about it *(Hardy and Ansell)*. 2:29-31.

AIR TRANSPORT SECTION

Minutes. 2:24-31.
Officers and committees. 2:24-28.

AIRPLANES

Jet ground handling hazards *(Dymond)*. 2:24-26.

Jet noise on the airport—what to do about it *(Hardy and Ansell)*. 2:29-31.

Potential hazards of fuselage & component pressurization testing *(Starr)*. 2:15-18.

AIRPORTS

Hurricane preparations at Miami airport *(Flowers)*. 7:83-84.

ALASKA

Safety training for fire protection foremen *(Shanklin)*. 24:28-34; 28:28-32.

ALCOHOL INTOXICATION

Are scientific devices improving traffic enforcement? *(Schmalz)*. 27:29-31.

ALDEHYDES

Odor and eye and nasal irritation of diesel exhaust gas can be removed by ventilation and by conditioner solution *(Holtz)*. 10:9, 12.

ALKALI METALS

Fire control of some of the new pyrophoric metals *(Brown)*. 14:27-29.

ALKALINE PULPING INDUSTRY

Chemical hazards of alkaline pulp liquor making *(Enoch)*. 24:17-19.

ALKALIS

The emergency treatment of chemical injuries to the eye *(Ryan)*. 14:72.

Allen, Homer

Safety through physical education. 26:11-12.

Allison, R. L.

Acids and heavy chemicals (discussion report). 8:54-55.

ALUMINUM REDUCTION PLANTS

Electrical hazards in aluminum reduction *(Richards)*. 17:15-22.

AMERICAN MEDICAL ASSOCIATION

Some current aspects of medical quackery *(Field)*. 21:17-18.

AMERICAN RED CROSS

First aid training—a personal safety program *(Brown)*. 14:71-72.

What Red Cross first aid training has done for our accident control program *(Jones)*. 7:82-84.

AMERICAN SOCIETY OF SAFETY ENGINEERS

Basic steps in accident prevention. 2:5-22.

Officers and committees. 14:108-110.

Opportunities for local safety councils and chapters of ASSE to promote safety activities among business and trade associations *(Kaplan)*. 14:104-106.

Proposed ASSE program for colleges and universities *(Temple)*. 26:76-78.

The subject sessions. 14:6-106.

AMERICAN STANDARDS ASSOCIATION

Using American Standards in safety training *(Lamb)*. 20:20-21.

The value of good records and how to use them. a brief discussion of the ASA code Z16.1—1954 *(Ruddick)*. 2:6.

AMERICAN TRANSIT ASSOCIATION

Nine basic qualities a driver should have as established by the ATA *(Lumpkin)*. 20:26.

Transit companies can do more with accident statistics if they all use the ATA code and classification *(Sirois)*. 22:26-27.

AMERICAN WATER WORKS ASSOCIATION

What's new in water safety—1957? *(Faust)*. 8:32-33.

AMINES

Amine acid factor in cancer of the bladder *(Hayes)*. 18:30.

Epoxy resins and catalysts hazards *(Lange)*. 2:7-10.

AMMONIA

Engineer's respirator inadequate. ice-cream factory flooded with ammonia fumes *(Fawcett)*. 8:29.

Firemen died from ammonia inhalation at cold storage plant disaster *(Fawcett)*. 8:22.

Visualizing ammonia hazards *(Anderson)*. 10:15-16.

AMMONIUM NITRATE

Safe use of ammonium nitrate commercial fertiliser as a blasting agent *(Crafton)*. 19:28-30.

Ansell, James H. and Howard C. Hardy

Jet noise on the airport—what to do about it. 2:29-31.

Appleyard, V. A.

How and where to get started in a water and sewer utilities safety program. 8:33-35.

Armstrong, Ellis L.

Safety and heavy construction. St. Lawrence project and the highway program. 7:9-13.

ASBESTOS

Correlation between asbestos employment and lung cancer, ignored by industry *(Hayes)*. 18:30.

Incentive awards for good safety records in the mining industry *(Smith)*. 19:30-32.

Asbury, S. V.

The use of checklists in safety inspections. 22:40-42.

ASPHYXIATION

Asphyxiants, simple and chemical *(Fawcett)*. 8:14-15.

Fatalities in the cement, quarry and mineral aggregates industries *(Thomsen)*. 4: 4, 6.

Handling problems of asphyxia in industry *(Dunne)*. 21:9-14.

Hazards of 110 and 220 voltage in industrial operations *(Brown)*. 24:27.

ASSOCIATIONS

The association safety program of the Greater Los Angeles Safety Council *(Kaplan)*. 14:108-106.

Florists association's first aid recommendations for chemical poisoning *(Williams)*. 7:46-49.

Ontario Pulp and Paper Maker's Safety Association backed industry's accident control program *(Mobbs)*. 29:15.

Opportunities for cooperation between industrial associations and industrial sections, National Safety Council *(Workman)*. 14:103-103.

The opportunity for state associations and state agencies *(Fulghum)*. 14:101.

The role of national surgical organizations in public safety *(Stack)*. 13:21-26.

The role of the trade association in industrial safety *(Cleland)*. 24:15-16.

Trade association standards *(Lamb)*. 18: 14-19.

What good vision can mean to industry *(Simpson)*. 24:33-36.

ATOMIC ENERGY, see Nuclear Power: Radiation

ATTITUDES

Relationship between driving records, selected personality characteristics, and biographical data of traffic offenders and non-offenders *(Heath)*. 20:32-36.

Safety—a retreat or a challenge *(Foulger)*. 10:3-10.

Significance of safety attitudes in industrial accident prevention *(Hammaford)*. 26: 26-28.

Supervising the youthful worker *(Hargrove)*. 18:4-6.

Training for safety attitudes *(Griffin)*. 29: 17-19.

see also PSYCHOLOGY

AUTOMOTIVE AND MACHINE SHOP SECTION

Minutes. 18:4-19 (Joint session with Power Press and Forging section 18:6-13.)
Officers and committees. 18:21-22.

AWARDS, see Bonuses; Rewards

B

Baker, John A.
Selling safety to the passenger. 28:13-17.

Ballinger, Clinton
Glass furnace repairs. 12:11-12.

BANQUET ADDRESS
The traffic safety fight—assessing our success or failure *(Stratton)*. 1:25-26.

BARGE AND TOWING INDUSTRY
Safety precautions taken on inland water vessels to avoid accidents . . . and still they happen! *(Parent)*. 19:7-9.

BARRICADES AND CUBICLES
Laboratory barricading of high pressure and extra hazardous reactions, basic methods of construction *(Moll)*. 8:32-37.
Safety in high pressure chemical reactions —construction material for cubicles, barricades and other safety equipment *(Kinter)*. 8:7-8.

Bauer, Lee D.
How I train my employees for job safety. 11:31-32.

Beadle, E. N.
Annual report of the Commercial Vehicle Section. 20:4.

Bear, Roger J.
Food retailers safety discussion. 11:41-42.

Beaton, Agnes D.
The public relations aspects of a traffic court program. 27:38-41.

BEHAVIOR
Altering behavior and attitudes by use of group discussion-decision *(Ferris)*. 28:42-43.
Human behavior and its relation to traffic accidents *(Heath)*. 27:47-49.
The human factors in safety, seven types of behavior which are accident hazards. *(Crane)*. 18:29.
The individual is reached through two means, individual wants and group pressures *(Martineau)*. 13:7-10.
Surveys show that drivers deliberately violate highway regulations and safe driving practices; factors contributing to this attitude *(Johnson)*. 27:45-47.
Training for safety attitudes *(Griffin)*. 29:18.
see also Human relations; Personal factors; Psychology.

Bennett, Frank
Preview of evening divisions, plan of rotary groups. 29:6.

Bennett, Richard O.
Promotional idea exchange. 27:65-66.

BENZENE
Two fatal accidents with benzene vapor *(Prescott)*. 6:29-30.

Berry, Donald S.
The engineer's viewpoint. 27:59-60.

BETHLEHEM STEEL COMPANY
The safety program of Bethlehem Steel Company *(Veil)*. 19:39-41.

BIBLIOGRAPHIES
A bibliography of toxic chemicals (Toxic Chemicals Committee, Chemical Section, NSC). 8:44-51.
A critique of fifty-five research studies in safety *(Bookwalter)*. 26:30-38.

BLASTING AGENTS
Evolution of seismic explosives *(Cochran)*. 26:17-21.
Safe use of ammonium nitrate commercial fertilizer as blasting agent *(Overton)*. 19:28-30.

BLEACH PLANTS
Chemical hazards of pulp bleaching *(Mahaney)*. 24:19-21.

Bly, Fred J.
Rural enforcement problems as they relate to speed. 27:33-34.

Boale, T. N.
Report of the traffic and transportation conference. 27:16-18.

BOLTS AND BOLTING
The effects of corrosive electrolysis on metallic roof bolts *(Muchmore)*. 6:3-11.
Safety features in the design and development of Ireland Mine *(McCaa)*. 6:29-38.

BONUS PLANS
Be positive in using incentives *(Wiesel)*. 20:3.
Bonuses paid to shift bosses, and underground employees at Homestake gold mine *(Greene)*. 19:27.
Engineering safety into a material handling system—use of bonus to departmental executives *(Greene)*. 14:27.
A monthly bonus is paid to the shift bosses completing a month's accident-free work at Homestake *(Greene)*. 19:27.

Boone, Harry F.
ABC's of guided missile safety techniques. 2:15-22.

Bookwalter, Karl W.
A critique of selected research studies in safety. 26:30-38.

BOY SCOUTS
Boy Scouts of America 1958 national safety good turn program. 9:15-16.
1958 national safety good turn *(Maland)*. 1:19-20.
What the Boy Scouts' Safety Good Turn means to schools and colleges (discussion session report). 28:10-11.

Bradbury, Arthur
Present day conditions favorable for a successful small safety program. 6:21-28.

Bradley, Preston
Do we drive as we live? 20:53-56; 22:23-26.

BRAKES
What is the industrial safety engineer's responsibility for motor vehicle safety equipment? *(Brown)*. 14:11-13.

Brandaleon, Harold
Panel forum on positive driver testing. 20:34.

Brandt, Robert W.
Built-in safety features — surface mine plant. 19:34-37.

Brayward, Frank C.
Public relations committee report of the Marine Section. 16:12.

Breese, Milton
Safety poster committee report on the Marine Section. 16:12.

Brehm, W. E.
How personal contact with road and yard local service employees is essential to safety. 25:3-8.

Brown, Burt E.
Emergency first aid programs in industry. 27:3-4.
First aid training—a personal safety program. 14:21-23.

BREWING INDUSTRY
Highlights of several sessions for safety personnel *(Mahoney)*. 11:7-8.

BRIDGES
The importance of safety in mechanization—bridges and structures *(Hackett)*. 26:12-14.

Brown, Everard A.
Hazards of 132 and 220 voltage in industrial operations. 24:36-40.

Brown, Hylton E.
Fire control of some of the pyrophoric metals. 14:26-28.

Brown, W. F.
What is the industrial safety engineer's responsibility for motor vehicles safety equipment? 14:10-12.

Bryan, Wendell E.
Research in vision and traffic safety. 27:51-52.

Buchanan, David L.
Great Lakes area report for the Marine Section. 16:12.
"Knowing's not enough." 16:4-7.

Bugbee, Percy
Let's stop these fire deaths! 18:39-41.

BUILDING CODES
Community fire prevention planning *(Fowler)*. 19:27-30.
What are the standards for off-campus housing? *(Holland)*. 26:79-80.

BUILDINGS—INDUSTRIAL
Built-in safety features — surface mine plant *(Brandt)*. 19:34-37.
Noise control by acoustical treatment *(Yerges)*. 14:31-34.
What makes a good plant inspection *(Stubbs)* (Symposium on fire prevention and control.) 11:14-17.
Why industrial plants burn (symposium). 11:19-22.

BUILT-IN SAFETY
Built-in safety features — surface mine plant *(Brandt)*. 19:34-37.
Possibilities vs. probabilities (panel discussion). 18:5-14.

BULLETIN BOARDS
Safety boards mounted on trucks gave days worked without lost time injury *(Reiner)*. 6:32.
Safety communications in the foundry *(Burns)*. 17:26, 33.
Thermometer chart used to present manshifts worked safely for incentive awards plan *(Smith)*. 19:21.

Busch, Booker P.
Chemical hazards of alkaline pulp liquor making. 24:17-19.

Burns, Edwin W.
Safety communications in the foundry. 17:26-33.

BURNS
The emergency treatment of chemical injuries to the eye *(Ryan)*. 14:77-80.
Asphyxia in industry—inhalation of toxic chemicals *(Dunne)*. 24:13-15.
Chemical hazards of alkaline pulp liquor making *(Busch)*. 24:17-19.

Burrows, Frank and others
Demonstration of television techniques for driver education. 26:96-98.

Burt, Frank N.
New ideas in safety switches. 22:6-8.

Butcher, E. J.
Role of the U. S. Department of Labor in occupational safety. 18:24-26.

Butler, E. L.
Inventory—a tool for improving traffic programs. 27:25-26.

Butler, J. C.
We're keeping too many accident records. 28:23-24.

Buts, Earl L.
Safety makes sense. 9:7-10.

Buxton, G. H. E.
Report of the vice general chairman (stevedoring) of the Marine Section. 16:10.

C

Cain, T. J., Jr.
Communications in safety (roundtable discussion). 18:28.

Callahan, William J.
The Oregon safety story. 18:30-32.

Campbell, Loren D.
Evaluating observation time as a part of driving instruction. 26:53-56.

CANCER
Correlations between amine acid and bladder cancer, and asbestos employment and lung cancer, have not led to industrial scientific research. *(Hayes)*. 15:20.
Some current aspects of medical quackery *(Field)*. 21:18.

CARBON DISULPHIDE
Workman overcome by fumes from leak at rotary valve of electric arc furnace *(Fawcett)*. 8:30.

CARBON MONOXIDE
Asphyxia in industry, symptoms and treatment *(Dunne)*. 21:11.
Factor influencing an increase in the concentration of carbon monoxide in diesel engine exhaust gas *(Holtz)*. 19:8-11, 16-17.
Safe operation of industrial furnaces and heat equipment *(Jaffe)*. 18:34-35.

CARBON TETRACHLORIDE
Man cleaning a boiler room with carbon tetrachloride, and wearing poorly adjusted respirator, ill for three weeks *(Fawcett)*. 8:26.
Use of carbon tetrachloride eliminated on board freighters, except for fire extinguishers *(Terry)*. 18:27.

Card, Read H.
The hazards of radio transmitters and their correction. 8:8-12.

CAREERS
Careers in safety *(Hill)*. 9:25-30.

Carter, W. P.
345 Kv. hot line maintenance. 6:20-22.

Carter, William W.
Orientation—the beginning of driver supervision. 20:41-44.

CASE HISTORIES
Case method of teaching safety, a supplemental device used in school shop safety *(Ingram)*. 26:2.
Living and dying in the air we breathe—case histories of incidents collected at random from many sources *(Fawcett)*. 8:22-31.
Some brief case histories of emotional causes of accidents to commercial drivers *(Farrell)*. 20:21.
Stimulation—the framework of driver supervision (use of slides with descriptions of serious accidents) *(Nelson)*. 20:47-48.
see also Accident statistics.

CATARACTS
The hazards of radio transmitters and their correction *(Card)*. 8:10.

CAUSTIC SODA
Chemical hazards of alkaline pulp liquor making *(Bunch)*. 24:17-19.
Chemical hazards of pulp bleaching *(Nelson)*. 24:20.

CEMENT, QUARRY AND MINERAL AGGREGATES INDUSTRIES
Fatalities in the cement, quarry and mineral aggregates industries *(Tenson)*. 4:4-7.
Minutes: 4:4-10.
Officers and committees. 4:11.

CHANGE ROOMS
Built-in safety features—surface mine plant *(Freund)*. 19:23.

CHEMICAL INDUSTRY
Acids and heavy chemicals (discussion report) *(Allinson)*. 8:54-66.
Chemical hazards of alkaline pulp liquor making *(Bunch)*. 24:17-19.
Controlling health hazards in a chemical plant *(Kehoe)*. 8:9-11.
Industrial gases discussion group *(Reinhard)*. 8: 56-58.
Is "hot electrical work necessary? *(Lippincott)*. 8: 5-8.
Laboratory and pilot plant safety (a symposium). 8:33-54.
Living in the air we breathe *(Fawcett)*. 8:11-32.
Medical evidence that amine acid causes or contributes to cancer of the bladder ignored by chemical companies *(Hayes)*. 18:30.
Operator selection and training in developing material handling safety *(Fuder)*. 14:32-35.
The safety engineer's responsibility in fire protection—the program of the Eastman Kodak Company *(Cobb)*. 14:22-25.
Safety in high pressure chemical reactions *(Kinzer)*. 8:5-9.

CHEMICAL LABORATORIES
Laboratory and pilot plant safety (a symposium). 8:33-54.
a) Laboratory barricading of high pressure and extra hazardous reactions *(Mott)*. 8:33-37.
b) Flammable materials—system for rating *(Wood)*. 8:38-41.
c) Toxic chemicals *(Monteilo)*. 8:42-44.
d) A bibliography of toxic chemicals. 8: 44-51.
e) Waste disposal *(Wallace)*. 8:52-54.
Living in the air we breathe *(Fawcett)*. 8:11-32.
Safety in high pressure chemical reactions *(Kinzer)*. 8:5-6.

CHEMICAL SECTION
Minutes. 8:5-60.
Officers and committees. 8:59.
Toxic Chemicals committee of the laboratory sub-section of the Chemical Section of the National Safety Council, studying problems of toxicology *(Monteilo)*. 8: 42-44.

CHEMICAL TESTS FOR ALCOHOL INTOXICATION
Are scientific devices improving traffic enforcement? *(Schmeig)*. 27:30-31.

CHEMICALS
Acids and heavy chemicals (discussion report) *(Allinson)*. 8:54-66.
A bibliography of toxic chemicals (Toxic Chemicals Committee, Chemical Section, NSC). 8:44-51.
The emergency treatment of chemical injuries to the eye *(Ryan)*. 14:77-80.
Flammable materials — system for rating *(Wood)*. 8:38-41.
Fire control of some of the new pyrophoric metals *(Brown)*. 14:26-31.
Parks maintenance safety—first aid recommendations for pesticides poisoning *(Williams)*. 7:46-49.
Toxic chemicals *(Monteilo)*. 8:42-44.
Waste disposal (summary of information from questionnaire). 8:52-54.
see also specific chemical.

CHICAGO, ILLINOIS
New safety problems from the expanding use of school buses in urban areas *(Hayes)*. 26:108-115.
Parks maintenance safety—tree trimming brush handling and related subjects *(Williams)*. 7:37-45.
Selling safety to the transit passenger *(Baker)*. 22:13-17.

CHILD SAFETY
The changing world in which our elementary school children are living *(Utley)*. 26:58-62.
Telephone company to launch safety essay contest for children *(Frese)*. 1:22.
What are the facts of population mobility today (a symposium). 26:63-67.
see also Colleges and universities: Poison control centers; School buses: School safety: School shops.

CHLORINE
Chemical hazards of pulp bleaching *(Nelson)*. 24:19-20.
Four cases of chlorine poisoning aggravated by previous chest conditions *(Fawcett)*. 8:38.
Maladjustment of face mask, resulted in chloride inhalation *(Fawcett)*. 8:38.

CHLORINE DIOXIDE
Chemical hazards of pulp bleaching *(Nelson)*. 24:19-21.

Churchill, J. A.
Corporate standards. 18:15-17.

CIVIL DEFENSE
Gas mask (D) V-200 for war gases *(Fawcett)*. 8:17-18.
Loss of life at sea shows need for re-evaluating of lifesaving gear *(Nash)*. 16:38.
The new nuclear-equipped guided missile navy *(Will)*. 16:46-48.

Clewis, Robert J.
Safety with firearms. 8:16-17.

CLEARANCES
Fourteen fatalities occurred in United States coal mines in 1956, because men came in contact with low roofs or crossbars *(Kebbish)*. 6:16.
Steel ties used on mine track where vertical clearances are critical *(Evans)*. 18:32.

Cleland, Thomas
The role of the trade association in industrial safety. 24:13-16.

CLOTHING
Control of health hazards of electrical insulating materials *(Meiler)*. 8:15-16.
Epoxy resins and catalysts hazards *(Lange)*. 2:9.
Hazard of shock from charged electric field at high voltages, eliminated by use of conductive soled shoes and metal ladders *(Carter)*. 8:21.
Jet ground handling hazards *(Dyment)*. 2: 34, 35.
Parks maintenance safety *(Williams)*. 7: 37-49.
Protection against caustic soda *(Bunch)*. 24: 18-19.
Rubber clothing protection for handlers of chemicals in pulp bleaching *(Peterson)*. 24:20.
Safe trolley maintenance on electric railroads *(Kirk)*. 28:17-20.
Visualizing ammonia hazards *(Anderson)*. 19:17.

CLUBS
How the Safe Drivers of America was born *(Hughes)*. 20:12.
Quarter Century club took active part in safety committee of Abitibi Power & Paper company *(Mobbs)*. 22:15.
Women clubs promote public relations for traffic courts (panel discussion). 27:33-44.
Coal mining industry, see Mining industry Coal.

COAL MINING SECTION
Minutes. 6:4-39.
Officers and committees. 6:41-42.

COAST AND GEODETIC SURVEY
Nautical charts for safe navigation *(Kero)*. 16:35-36.

Cobb, Allen L.
Fire standards. 18:18-19.
The safety engineer's responsibility in fire protection. 14:22-25.

Cochran, J. W.
Evolution of seismic explosives. 22:17-21.

Coleman, Thomas E.
Plant construction and maintenance. 8: 19-21.

Collet, W. W.
Safing of storage tanks by the absorption method. 22:13-16.

COLLEGES AND UNIVERSITIES
An analysis of graduate theses in school safety in the United States from 1926-1950 *(Yost)*. 22:12-17.
Automobile collision injury research findings from Cornell University, and University of California *(Matheson and Severy)*. 14:17-30.
An experiment at the Traffic Institute in the use of the Smith-Cummings system—"training your eyes for expert driving" *(Bugman)*. 26:48-52.
Extension service of State Agricultural College in North Dakota, has farm safety program *(Ryan)*. 18:27.
Human behavior and its relation to traffic accidents (Center for Safety studies) *(Heath)*. 27:47-49.
Making student accident records work *(Sisera)*. 28:85-90.
Occupational safety—a challenge to the colleges *(Cutler)*. 28:69-72.
Proposed ASSE program for colleges and universities *(Temple)*. 28:76-78.
Recommended off-campus fire protection procedures *(Quinlan)*. 28:95-82.
Responsibilities of colleges for safety preparation *(Dretz)*. 28:67-68.
Safety in dormitory living *(Holmes)*. 28: 91-95.
School and college division. Minutes. 26: 6-120.
Three year research program at Northwestern University, to determine nature and causes of traffic accidents *(Stratton)*. 7: 31.
U. S. Public Health Service aids educational institutions in accident prevention *(Goddard)*. 18:30.
What are the standards for off-campus housing? *(Holland)*. 28:78-80.
What the Boy Scouts' Safety Good Turn means to schools and colleges (discussion session report). 28:10-11.

COLLISIONS
Automobile collision injury research findings from Cornell University, and University of California *(Matheson and Severy)*. 14:17-30.
A guide to accident preventability for the operators of highway vehicles in the Virginia Department of Highways *(Lyell)*. 7:66-67.

COLOR BLINDNESS
Total color blindness in a driver, should be a disqualifying factor *(Payne)*. 20: 18-19; 20:28-36 (panel forum).

Colson, Paul M.
The how of organizing a safety program in a department store. 11:28-29.
Commercial vehicle drivers, see Drivers and driving—Commercial.

COMMERCIAL VEHICLE SECTION
Annual report *(Beadle)*. 29:4.
Joint session with Transit Section. 29: 53-57; 28:33-37.
Minutes. 29:4-57.
Officers and committees. 29: 29-30.
Report of the National Fleet Safety Contest Committee *(Coe)*. 29:37; 28:37.

COMMITTEES
Flexibility and feedback programming for a multi-location operation *(Devine)*. 13: 45-47.
How the Congressional Special Subcommittee on Traffic Safety can serve a valuable function in the field of safety *(Roberts)*. 27:5-7.
How the safety committee of an equipment and stores operation of a railroad, operates *(Forbes)*. 28:31-32.
Labor-management safety committee inspections and accident investigations are factors in safety communication *(Soriano)*. 15:22.
The mechanical department's role in transit safety *(Feldman)*. 28:28-29.
The place of safety committees in the program of a small department store *(Colson)*. 11:26-28.
President's Committee for Traffic Safety set up special committee for planning public officials traffic safety conferences *(Marsh)*. 27: 8-9.
A review of some safety problems encountered and solved by the ship safety committee of a freighter *(Tarr)*. 16:31-32.
The safety committee's duties at Albers Milling division of Carnation company *(McClure)*. 11:34-35.
Safety communications in the foundry *(Burns)*. 17:29-31.
Some results of the work of the Highway Safety Committee of the Governor's Conference *(Smothers)*. 27:13-16.
Three types of committees aid safety in a hotel program *(Petrie)*. 11:23-24.
U. S. Department of Labor publication "Union Safety Guide" explains procedures for establishing safety committees *(Butcher)*. 18:25.
Wyoming State Farm Safety committee with its 23 local county committees active in highway safety *(Dodge)*. 8:13-14.

COMMUNICATIONS
Communications in safety (round table discussion). 12:26.
Flexibility and feedback programming for a multi-location operation *(Devine)*. 13: 45-47.
Good communications help safety *(Soriano)*. 13:21-24.
How to interest people in what they don't want to know (Symposium). 13:5-12.
1) Remarks of Fairfax M. Cone. 13:5-6.
2) Remarks of Pierre Martineau. 13:7-10.
3) Remarks of Victor M. Ratner. 13:10-12.
The importance of safety in mechanization—signal and communications *(Reeves)*. 28:15-17.
Inland vessels using radio-telephone as an aid to navigation to prevent possible collisions *(Fennell)*. 16:5.
Locomotives at TCI's ore and coal mines equipped with radio-telephones *(Evans)*. 19:22.
Mining with the coal planer including safety aspects *(Harris)*. 6:13-14.
Safety communications in the foundry *(Burns)*. 17:29-31.
Safety is a state of mind *(Fenton)*. 24:5-8.
Safety needs communicating, too *(Thrig)*. 28:4-7.
Signals, and two-way radios used for communication between base and field party where respiratory apparatus is used *(Fawcett)*. 5:22.
Trolley phones and block signal lights aid production and safety in a modern haulage system in a coal mine *(Robbins)*. 6:15.
see also Signs and signals.

COMMUNITY SAFETY
Alcoa's approach to the off-the-job safety problem *(Gilliland)*. 12:15-16.
Community fire prevention planning *(Fowler)*. 13:27-29.
District safety councils outgrowth of the Columbia Basin Loggers training program, are aided by Oregon industrial commission *(Callahan)*. 18:31.
Inventory—a tool for improving traffic programs *(Butler)*. 27:25-26.
Mississippi Manufacturers Association asked to do the formative and organizational work in developing the new Mississippi Safety Council *(Fulghum)*. 14:102.
The opportunities for local safety councils and chapters of ASSE to promote safety activities among business and trade associations *(Kaplan)*. 14:104-106.
Regional traffic safety conferences tailored for civic leaders *(Marsh)*. 27:11.
Safety council sponsorship of small plant program, gives best results *(Ryan)*. 15: 24.
Women's safety councils—the best way to the men *(Williams)*. 13:51-52.

COMPRESSED AIR
Use of air pressure to transfer acids from carboys described at "Acids and Heavy Chemicals" meeting *(Allhusen)*. 6:54.

CONCRETE
Laboratory barricading of high pressure and extra hazardous reactions *(Moll)*. 5:33-37.

CONDITIONERS
Approved diesel machines in mines must be equipped with conditions to cool the exhaust gases *(Hollis)*. 19:13-15.
Cone, Fairfax M.
How to interest people in what they don't want to know (Symposium). 13:5-6.

CONFERENCES
The highway safety program of the Governor's Conference *(Smothers)*. 27:13-16.
Labor-management conferences in Toronto highlight safety and accident prevention for the paper industry *(Mobbs)*. 28:16.
Oregon Accident Commission sponsors the Governor's Industrial Safety Conferences *(Callahan)*. 18:32.
Regional traffic conferences in 1956 *(Marsh)*. 27:10-11.
Report on plans for 1957 public officials traffic safety conference *(Marsh)*. 27:8-12.

CONSERVATION
Safety training for fire protection foresters *(Shanklin)*. 24:50-56; 20:30-32.

CONSTRUCTION INDUSTRY
The ethics of safe construction *(Hartnett)*. 7:7-8.
Look up and live—electric utility companies ask construction industry to join campaign for reducing overhead power line accidents *(White)*. 7:19-20.
Men, machines and methods *(Wilcox)*. 8: 10-12.
Safety and heavy construction, St. Lawrence project and the highway program *(Armstrong)*. 7:9-12.
Use of mechanized equipment for construction of mine and haulage systems *(Evans)*. 19:21.

CONSTRUCTION SECTION
Minutes. 7:7-21.
Officers and committees. 7:74.
Remarks of general chairman *(Hawkins)*. 7:21.

CONTACT LENSES
Contact lenses are not safe for automobile drivers *(Highstower)*. 20:29.
Contardo, Peter
Principles of industrial housekeeping. 9:23-26.

CONTESTS
The annual business and industry safety contest of the Greater Los Angeles Safety Council *(Kaplan)*. 14:104-106.
Family safety cartoon contest *(Eidinger)*. 17:11.
Report of the National Fleet Safety Contest Committee *(Coe)*. 29:37; 28:37.
Safety communications in the foundry *(Burns)*. 17:29-31.
Telephone company to launch safety essay contest for children *(Fyree)*. 1:22.
Transit authority awards passengers cash for slogans *(Baker)*. 28:18.
see also Rewards.

CONTRACTORS
Men, machines and methods *(Wilcox)*. 7: 10-12.
Safety and heavy construction, St. Lawrence project and the highway program *(Armstrong)*. 7:9-12.

CONVEYORS
Materials handling by conveyors without accident *(Webb)*. 14:90-92.
Scraper bars, speed control devices built-in safety features—surface mine plant *(Brumm)*. 19:27.
Cornelius, Jack H.
Consumer education and protection. 18: 48-50.

CORNELL AERONAUTICAL LABORATORY
Automobile crash safety research *(Dye)*. 27:50-51.
Corrigan, William H.
Investigative procedure and report writing. 17:34-36.

CORROSION
The effects of corrosive electrolysis on metallic roof bolts *(Maskeik)*. 6:5-11.
Cottrell, E. Louise, 1888-1957
A tribute to E. Louise Cottrell, pioneer in research for elementary school safety *(Black)*. 26:29-30.

COURSES, see Training

COURTS
Promoting public relations of traffic courts (panel discussion). 27:43-44.
Protecting oil tanker crews from accidents *(Vander Clute)*. 16:17-18.
see also Enforcement.
Coe, H. C.
Panel forum on positive driver testing. 29: 34.
Report of the National Fleet Safety contest committee. 29:37; 28:37.
Crane, Robert L.
The human factors in safety. 12:29-30.

CRANES
Insulating methods used in an aluminum reduction plant *(Ricketts)*. 17:30-31.
Flannel board demonstration *(Meteer)*. 14: 94.
Hook-on crane disabling accidents 1948-1955 inclusive, ten year study shows value of good records in selling management on safety *(Haddick)*. 2:2.
Look up and live—electric utility companies ask construction industry to join campaign for reducing overhead power line accidents *(White)*. 7:19-20.
Some simple measures to eliminate the perils of construction machinery *(Wilcox)*. 7:14.

CRASH SAFETY RESEARCH
Automobile crash safety research *(Dye)*. 27: 50-51.

CREAMS
Barrier and refattening creams for workers in epoxy resins *(Lange)*. 2:3.
Creel, W. C.
How to set up an industry safety training conference. 24:56-58; 20:29-34.
Crofford, Dwight C.
Engineering committee report for Public Employee Section. 7:72-73.
Cronkhite, D. L.
Freight and passenger car maintenance. 28:29-30.
Croushorn, J. Edwin
Inventory of occupational accident prevention activities. 12:5-10.

CUBICLES, see Barricades and Cubicles

CULTURE, see Socio-economic and Culture Patterns

Culver, Charles A.
Tanker safety discussion group report for the Marine Section. 16:14.

CUTTING MACHINES
Knife changing operation on cutters, safer *(McConnaughey)*. 22:12.
Limit switches give automatic upstroke on paper cutting machine *(Burt)*. 22:2.

CUTS
Plastic covered glass trays and knife racks in galleys, lessen cutting injuries *(Terr)*. 16:26.

Cutter, Walter A.
Occupational safety—a challenge to the colleges. 26:69-76.

CYLINDERS
Compressed gas cylinder safety (discussion report) *(Reinhard)*. 5:56-58.
Safety in the uses of cylinder gases in oxy-fuel gas welding and cutting *(Sacks)*. 8:26-32.
Visualizing the hazards of ammonia cylinders *(Anderson)*. 16:16-17.

D

Dane, C. Wesley
The national school bus program—what it means to a state department of education. 28:118-119.

Dankey, W. J.
How to train loggers. 29:7-9.

Dearborn, Ned H.
Have we failed? (The president's report). 1:16-18.

Debenon, E. L.
A safety program for an extrusion plant. 17:35-36.

DECK COATING
Coal tar product for weather deck coating eliminated slipping, noise of scaling, odor of fish oil and high maintenance costs *(Terr)*. 16:24.
Tanker crew sprayed Fuller's Earth on wet paint of deck surfaces to prevent slipping accidents *(Vander Clutz)*. 16:19.

De Pew, John A.
Driver safety is improved by your investigation. 20:35-37.

DERAILMENTS
Derailment problems in a modern coal haulage system *(Keedwell)*. 6:17-18.

DERMATITIS
Control of health hazards of electrical insulating materials *(Holder)*. 8:14-16.
Epoxy resins and catalysts hazards *(Lange)*. 27:7-10.
Poison ivy immunization experiment—1956 results *(Hueper)*. 7:34-35.

DERMATITIS, see also Burns

Devine, M. Frances
Flexibility and feedback programming for a multi-location operation. 28:65-67.

De Vivier, J. F.
Remarks at the job training and placement panel discussion. 7:32.

Devlin, James F., Jr.
Report of the general chairman of the Marine Section. 16:10.

DIABETES
Diabetes and drivers *(Owen)* 20:13, 15; (panel forum) 20:35, 36, 37, 38.

DILUTION SYSTEMS
Physiological effects of oxides of nitrogen emphasizes need for diesel exhaust gas dilution system on mine equipment *(Holtz)*. 19:13-14.

DISASTER ORGANIZATION PLANS
Digging out after mother nature goes on a rampage (a symposium). 7:50-56.
See also First aid.

DISEASES
Effect of flu shots on driving ability not determined *(Owen)*. 20:31.
Food-borne diseases may be controlled through atomic energy radiation *(Jackson)*. 9:21, 34.
The inadequacies of occupational disease control, research, and legislation in the U. S. *(Hayes)*. 15:18-21.
Mental, nervous, organic or functional diseases are physical factors affecting safe driving *(Owen)*. 20:13-16.
1937 was the year of legal awareness of the disease silicosis *(Gardiner)*. 21:14.
Occupational health control through engineering *(Von Ahlz)*. 15:11-17.
A résumé of occupational disease control since 1937 *(Gardiner)*. 21:14-17.
See also specific diseases.

DISCIPLINE
Disciplining for safety *(Rinderknecht)*. 11:10-12.
Men who are unwilling to comply with conditions for safe work, should be transferred, or their services terminated *(Coleman)*. 3:30, 31.
Mental, emotional and physical inadequacies and ineptitudes of people are not changed by punishment, warning nor instruction, but only by self-imposed discipline *(Easterbrook)*. 20:15-16.
Safety discipline *(Heinrichs)*. 4:7-10.

DISTILLERIES
How I train my employees for job safety *(Bauer)*. 11:31-33.

Dittmar, Paul O.
It isn't the coach, it's the team. 22:5-7.

Dodge, Calvert R.
Cowboy highway safety. 9:12-14.

Dodson, Frederick J., Jr.
Behind the scenes—the insurance company's role in industrial safety. 22:15-20.

DONORA DISASTER
Gas mixtures factor in air pollution deaths *(Holtz)*. 19:14.

DOORS
Air-actuated nat-type doors for light delivery trucks *(Mathewson and Emery)*. 14:20.
Handles, replacing knobs on heavy ship doors, afford safe finger clearance *(Terr)*. 16:29.
Plastic doors for ship refrigerators cut down on weight hazard in rough weather *(Terr)*. 16:26.

DRAINAGE
Draining water from mine trucks *(Kobush)*. 6:15-16.

Drain, Rex M.
Responsibilities of colleges for safety preparation. 26:67-68.

DRIVER EDUCATION
Advantages and disadvantages of the Aetna Drivotrainer and multiple car plan for driver education *(Kemm, panel moderator)*. 26:45-47.
Children in Phoenix elementary school get driver training *(Freng)*. 1:22.
Demonstration of television techniques for driver education *(Burrows, Michelsen, Tucker)*. 26:96-98.
Developing a summer driver education program *(Paulsrud)*. 26:55-57.
Education must redesign the "nut" behind the wheel *(Abramowski)*. 26:47-49.
Effects of driver education on driver knowledge and attitudes in secondary schools *(Loft)*. 26:17-22.
Evaluating observation time as a part of driving instruction *(Campbell)*. 26:53-54.
Evaluating student performance in driver education *(Heath)*. 26:53-52.
An experiment in the use of the Smith-Cummings system, "training your eyes for expert driving" *(Hugunin)*. 26:42-43.
Using the dual car plan *(Gibson)*. 26:57.

DRIVER TESTING
Effects of driver education on driver knowledge and attitudes in secondary schools *(Loft)*. 26:17-22.
Panel forum on positive driver testing *(Nichols, moderator)*. 20:34-41.
Relationship between driving records, selected personality characteristics, and biographical data of traffic offenders and non-offenders *(Heath)*. 26:23-26.
Use of visual tests in driver training *(Switzer)*. 7:26-27.

DRIVERS AND DRIVING
Are drivers failing our national safety movement? *(Johnson)*. 27:45-47.
Cowboy highway safety in Wyoming *(Dodge)*. 9:12-14.
Do we drive as we live? *(Bradley)*. 20:53-56; 26:25-26.
Education must redesign the "nut" behind the wheel *(Abramowski)*. 26:47-49.
Have you met Otto? *(Cotzen)*. 9:15-19.
Human behavior and its relation to traffic accidents *(Heath)*. 27:47-49.
Iowa driver improvement schools course of study *(Woodcock)*. 27:50-53.
Minimal visual requirements for private car operators *(Payne)*. 20:19-20.
The national school bus program (a symposium). 28:115-120.
New safety problems from the expanding use of school buses in urban areas *(Hayes)*. 28:108-113.
Promoting public relations of traffic courts through driver improvement schools *(Krueger)*. 27:41-44.
Recommendations for the establishment of driver improvement clinics *(Heath)*. 26:25-26.
Relationship between driving records, selected personality characteristics, and biographical data of traffic offenders and non-offenders *(Heath)*. 26:23-26.
School bus accidents: How much do we know about them? How can we find out more about them? *(Myers)*. 28:101-103.
Traffic patterns and safety problems at service stations *(Splete)*. 22:26-27.
Women in industry—the safe driving crusade of the New York Telephone Company *(Prose)*. 1:23-28.

DRIVERS AND DRIVING—COMMERCIAL
Accentuate the positive *(Purves)*. 20:5-6.
Be positive in driver testing *(Houck)*. 20:6-7.
Be positive in using incentives *(Waspi)*. 20:8-10.
Be positive in using safe driver awards *(Hughes)*. 20:10-12.
A clinical approach to retraining transit operators *(Ramsey)*. 22:20-22.
Commercial vehicle safety can be improved *(Schulz)*. 14:5-9.
Driver training and/or refresher courses (a panel discussion). 7:28-36.
Driving accidents can be stopped at the hiring line (a symposium). 20:39-40.
Effective supervision is positive (a symposium). 20:41-52.
a) Orientation — the beginning *(Carter)* 20:41-44.
b) Education—the foundation *(Lake)* 20:44-46.
c) Stimulation—the framework *(Nelson)* 20:47-49.
d) Human relations — the key *(Newton)* 20:50-52.
Employee safety training at the New Orleans Public Service *(Little)*. 22:30-32.
Our auto fleet drives for safety *(Emond)*. 14:6-7.
Panel forum on positive driver testing *(Nichols, moderator)*. 20:34-41.
The positive approach to driver physical requirements (a symposium). 20:19-31.
a) Physical factors *(Owen)* 20:13-18.
b) Visual factors *(Payne)* 20:17-20.
c) Emotional factors *(Turrell)* 20:20-22.
d) Panel forum *(Nichols, moderator)* 20:34-41.
Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 8:17-20.
Report of the National Fleet Safety Contest Committee *(Coe)*. 20:37; 22:37.
Selling passenger safety to the operator *(Ward)*. 22:17-19.
Visual committee recommendations for minimal visual standards for commercial drivers *(Payne)*. 20:19.
What the Virginia Department of Highways expects from its operators of highway vehicles *(Lyell)*. 7:64-67.
What we expect from operators of highway vehicles as defensive drivers *(Lyell)*. 7:64-67.

DRUGS

Conditions affecting safe driving—some dangerous drug effects *(Owen)*. 20:15; (panel forum) 20:28, 31.

Some current aspects of medical quackery *(Field)*. 21:17-18.

Dugger, C. E.
Opening remarks of general chairman of the Power Press and Forging Section. 19: 20-21.

Dunne, John B.
Handling problems of asphyxia in industry. 21: 9-14.

Dunniddie, Charles P.
Sand storms. 7:54-56.

DUST

Air contaminants and respiratory protection *(Fawcett)*. 8:13-14.

Changes in the NFPA code for the prevention of dust explosives in starch factories *(Gomoll)*. 11:5-7.

Collection efficiencies tabulated for the portable Joy Microdyne Dust collector in continuous mining operations *(McCoy)*. 6: 33-36.

Dust and fumes from catalyst bed being rodded out, caused nausea, vomitting and coughing to operator *(Fawcett)*. 8:36.

Dust collection at the coal mine face with continuous mining operations *(Wacht)*. 6:31-35.

Epoxy resins and catalysts hazards *(Lange)*. 21:8.

Factors in exhaust ventilation system design for the safety engineer *(Morse)*. 14: 15-19.

Fire control of some of the new pyrophoric metals *(Brown)*. 14:26-31.

Dust, Harry J.
How to auger mine safely. 6:18-21.

Dye, Edward R.
Automobile crash safety research. 27: 50-51.

Dyment, J. T.
Jet ground handling hazards. 2:24-26.

E

EAR PLUGS

Medical control for hearing losses *(Ford)*. 14:66-67.

EARLY MORNING LECTURES

Human relations and man-management *(Rosenstein)*. 20:9-44.

EDUCATION

Developing a safety-consciousness in the family through an extended health and safety program for industry *(Shute)*. 22: 9-10.

Education—the foundation of driver supervision *(Lake)*. 20:44-46.

Educational committee orients and trains new employees in small department store *(Colson)*. 11:57.

The national school bus program—what it means to a state department of education *(Dent)*. 22:112-113.

See also Public education: Safety education.

EDUCATORS

Oil tanker experimenting with light weight deck educator *(Vander Clute)*. 16:30.

ECONOMICS

Food preservation by atomic energy, what it will do for our food economy *(Jackson)*. 9:32-34.

ECONOMICS OF SAFETY

Accidents reduced, production increased after improvements to underground haulage systems at TCI's ore and coal mines *(Rome)*. 19:34.

Case histories illustrate effect of off the job accidents upon industrial productivity *(Ridinger)*. 13:42-48.

Companies and supervisors more safety minded when employee accident records are tied into operation costs *(Crenshore)*. 12:8.

Comparison of accident experience, compensation and safety incentive costs for ten year period at Asbestos Corporation Limited *(Smith)*. 19:22.

Compensation premiums cut as a result of a city program of health and safety for governmental employees *(Pegnard)*. 7: 61-66.

Considering injuries as "job costs" will show management actual earnings, and place responsibility on supervisory personnel *(O'Donnell)*. 16:26.

Cost of off-the-job accidents to industry *(Wilkins)*. 2:5-6.

Driver training for public employees in the County of San Diego *(Adams)*. 7:22.

A food store loses from fire and customer accidents *(Porter)*. 11:49-50.

$11,200,000,000 for accidents, injuries and deaths in 1936—illustrations of the constructive use to which this money could have been put *(Hamilton)*. 12:16.

Eye harassing programs in industry *(Marshall)*. 24:20-23.

Industries in Chicago lost seven million dollars in 1936 from off-the-job accidents *(Esmond)*. 14:6.

Instances of costs to a food store from customer accidents *(Porter)*. 11:49-50.

An insurance company's loss prevention services have role in industrial safety *(Dodson)*. 23:17-20.

Large fire losses in 1936-37, some case histories *(Crosby)*. 11:21-22.

The main elements of the cost picture of accidents *(Webb)*. 2:46.

Reducing the hazards of using nitrogen solutions and acids—carelessness can be costly *(Perrine)*. 10:18-21.

The role of the trade association in selling safety to management through "cut accidents—cut costs" emphasis *(Cleland)*. 24: 16.

Safety—a moral responsibility *(Hall)*. 18: 12-16.

Selling safety to management by reducing maintenance expenditures *(Simpson)*. 23: 14-15.

Sickness and accident payments dropped when glass company had off-the-job safety program *(Mansfield)*. 12:14.

Survey reveals close relationship between quality of production and level of visual efficiency *(Simpson)*. 24:32-36.

Transit para improves program *(Dittmer)*. 23:6-7.

Use cost statistics to encourage a continued interest in a shipboard safety program on passenger vessels *(Monahan)*. 16:31.

Water works safety program to cost department 30 man days/month of non-productive work, severity rate for first three months of the year—lost 180 man days/month *(Appleyard)*. 8:38.

What does an eye program in industry cost? Some figures available from Shell Pipe Line, and Sperry Gyroscope *(Marshall)*. 24:32.

Elder, Lorin J.
Remarks at the job training and placement panel discussion. 7:21.

ELECTRICAL EQUIPMENT

Control of health hazards of electrical insulating materials *(Mosier)*. 8:13-16.

The hazards of radio transmitters and their correction *(Oard)*. 8:8-12.

Is "hot electrical work necessary? *(Lippincott)*. 8:2-6.

Low voltages recommended for supplying cords for lights used in damp places *(Brown)*. 24:48.

Resume of gas ignitions and fires in coal mines since enactment of the Federal Coal Mine Safety act; recommendations to prevent recurrence *(Wasser)*. 6:36-39.

ELECTRICAL EQUIPMENT SECTION

Minutes. 8:5-16.

Officers and committees. 8:42-43.

ELECTRIC RAILROADS

The importance of safety in mechanization—safe trolley maintenance *(Kirk)*. 23: 17-20.

ELECTRIC UTILITIES

Look up and live—electric utility companies ask construction industry to join campaign for reducing overhead power line accidents *(White)*. 7:18-20.

ELECTRICITY

Asphyxia in industry—electric shock *(Dunne)*. 21:11-13.

Case history of salesman demonstrating a boom equipped truck for tree trimming, killed when bucket touched volt line *(White)*. 7:18-20.

Electrical fatalities at Edison Electric Institute compared with those at Chamber Works of DuPont *(Lippincott)*. 8:5.

Electrical hazards in aluminum reduction *(Ricketts)*. 17:15-20.

Fatalities in the cement, quarry and mineral aggregates industries *(Greaves)*. 4:4, 6.

Hazards of 110 and 220 voltage in industrial operations *(Brown)*. 24:20-29.

The hazards of radio transmitters and their correction *(Oard)*. 8:8-12.

Hosing down a galley invites shock if contact is made with electric range *(Torr)*. 16:26.

Physical aspects of low voltage electric shock *(Koutsoheeva)*. 14:28-41.

Safe trolley maintenance on electric railroads *(Kirk)*. 23:17-20.

Use of A.C. power a safety feature at the Ireland Coal Mine *(McCue)*. 6:30.

ELECTROCHEMISTRY

The effects of corrosive electrolysis on metallic roof bolts *(Meahanik)*. 6:9-11.

Esmond, E. J.
Our auto fleet drives for safety. 14:6-7.

EMOTIONAL FACTORS, see Attitudes; Personal factors; Psychology

EMPLOYEE PUBLICATIONS

Company publications written with a touch of humor get the safety message across to shops' personnel *(Renchen)*. 16:32.

Employee safety promoted through monthly magazine "Transit Service" *(Little)*. 23: 23.

Safety bulletins, contact topic cards push for safety at Bethlehem Steel Company *(Neil)*. 19:40.

Safety communications in the foundry *(Burns)*. 17:21-23.

Survey shows only 48 per cent of plants having publications, devote space for safety items *(Crenshore)*. 12:9-10.

Use house organs to extend the health and safety program of industry into the home *(Shute)*. 23:10.

EMPLOYEES

Assigning crews to a glass furnace repairs job *(Ballinger)*. 12:11.

Be positive in driver testing *(Heuck)*. 20: 6-7.

Candy company employees required to verify proper condition of workplace and equipment *(Wahl)*. 11:25.

Case history where apprehension toward job requiring respiratory equipment, resulted in employee panic and gas inhalation *(Peacock)*. 8:38.

Eliminating employee opposition to incentive award plans *(Smith)*. 19:21.

How I train my employees for job safety (panel discussion). 11:21-26.

The human factors in safety *(Crane)*. 12: 28-30.

Operator selection and training in developing material handling safety *(Purdy)*. 14:23-26.

Personal contact with road and yard train service employees is essential to safety (a symposium). 25:7-11.
a) Why . . . *(Thomas)*, 25:7.
b) How . . . *(Brehm)*, 25:8-9.
c) When . . . *(Wiederroud)*, 25:9-11.

Plant construction and maintenance *(Coleman)*. 2:18-21.

Practical safety education and training *(Reeve)*. 2:30-32.

Safety for school personnel *(Wasserburger)*. 25:7-8.

Safety training for fire protection foresters *(Shanklin)*. 24:50-56; 29:28-32.

Significance of safety attitudes in industrial accident prevention *(Hammford)*. 26:26-28.

Togetherness in transportation *(Urban)*. 25:4-6.

Training for safety attitudes, a four point approach *(Griffin)*. 29:17-19.

EMPLOYEES—NEW

AERO safety exchange questionnaire results. 2:11-12.

How I train my employees for job safety *(Hauser)*. 19:25-26.
Inventory of occupational accident prevention activities *(Greenshore)*. 12:6-8.
Orientation and training program intensified at Butte District of the Anaconda Company *(Wendel)*. 19:65-68.
Orientation—the beginning of driver supervision *(Carter)*. 20:41-44.
Promoting woods safety *(Pearce)*. 24:28-30; 29:24-28.
Safety discipline *(Heinsohn)*. 4:7-18.
Safety needs communicating, too. *(Ihrig)*. 20:4-7.
Selection, placement and training of employees in a shoe plant *(McDermott)*. 11: 27-28.
Steps in the orientation of employees in a hotel safety program *(Peets)*. 11:54.
Supervising the youthful worker *(Hargreaves.)*. 18:4-6.
Training to control unsafe acts *(Nelson)*. 24:40-42.
What we are doing to prevent falls-of-ground accidents at Homestake *(Greene)*. 19:26-27.

EMPLOYERS—SELECTION

Driving accidents can be stopped at the hiring line (a symposium). 20:23-40.
a) Safety starts with your employment application form *(Mogle)*. 20:33-34.
b) Safety grows with your interview. *(Taylor)*. 20:34-36.
c) Safety is improved by your investigation *(De Poe)*. 20:36-37.
d) Safety is influenced by your decision *(Lumpkin)*. 20:37-40.

Job safety analysis and pre-placement physical examinations *(Gruber)*. 2:28-29.
Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 8:17-20.
Safety in ship repair—watching for the human elements, the intangibles of safety *(O'Donnell)*. 16:32-34.

EMPLOYMENT

Driver safety is influenced by your decision —to hire or not to hire him *(Lumpkin)*. 20:37-40.
Driver safety starts with your employment application form *(Mogle)*. 20:33-34.
Foremen think employment interviews make for better selection of personnel *(Crowshore)*. 12:2-7.
Hiring a driver supervisor *(Lake)*. 20:45-46.
See also Labor turnover.

ENFORCEMENT

Promoting public relations of traffic courts (panel discussion). 27:23-44.
Are scientific devices improving traffic enforcement? *(Schmeig)*. 27:29-31.
Rural enforcement problems as they relate to speed *(Ely)*. 27:22-24.
Urban enforcement problems as they are related to speed violations and their apprehension *(Werner)*. 27:27-28.

ENFORCEMENT, see also Police

ENGINE HOUSE

Built-in safety features—surface mine plant *(Brumad)*. 19:26.

ENGINE ROOMS

Prevention of accidents to crew aboard freighters *(Tarr)*. 16:26, 27-28.

ENGINEERING

Controlling health hazards in a chemical plant *(Kehoe)*. 5:18.
The engineer's viewpoint on speed and traffic safety *(Berry)*. 27:29-30.
Occupational health control through engineering *(Van Atta)*. 18:11-13.
Occupational safety—a challenge to the colleges *(Cutler)*. 26:74-75.
A study of engineering features of roadways could design out the hazards of confusing signs, and lights *(Turrell)*. 20:28.

ENGINEERS—FIRE PREVENTION

What makes a good plant inspection? (symposium) *(Stubbs)*. 11:14-17.

ENGINEERS—INSURANCE

How we can profit from thorough accident investigation *(Kenneaugh)*. 16:15-16.

ENGINEERS—SAFETY

AERO safety exchange questionnaire results. 2:12-13.
Are traffic accidents crippling your industrial safety program? 14:6-21.
Basic steps in accident prevention (the sessions of the American Society of Safety Engineers). 2:5-25.
Behind the scenes—the insurance company's role in industrial safety *(Dodson)*. 22: 15-20.
Careers in safety *(ESU)*. 2:25-30.
The duties of safety engineers at the Butte District of the Anaconda *(Wendel)*. 19:42.
Factors in exhaust ventilation systems design for the safety engineer *(Morse)*. 14:42-48.
14 day course for safety officers in Great Britain *(Young)*. 1:32.
Front office safety *(Gerard)*. 19:7-8.
Machine tools and principles of guarding *(Moore)*. 2:18-19.
Man, machines and methods—what the industrial engineer has to offer the construction industry *(Wilcox)*. 7:14-18.
Motor vehicle safety measures and devices—what can the safety engineer support and recommend? *Mathewson and Severy)*. 14:14-21.
Possibilities vs. probabilities (panel discussion). 12:8-14.
The safety engineer's responsibility in fire protection *(Cobb)*. 14:25-26.
The safety engineer's viewpoint on the accomplishments of a city program of health and safety for governmental employees *(Pagnard)*. 7:21-22.
The safety program of Bethlehem Steel company *(Nal)*. 19:29-30.
Shoreside safety director functions as link between ship safety committee and operating management *(Farr)*. 16:32-33.
The similarity between what safety men do for their companies, and how the association man does what he does for his industry *(Cleland)*. 24:13-14.

We can do more with accident statistics *(Strole)*. 22:25-27.
We're keeping too many accident records *(Butler)*. 22:22-24.
What's my line in safety, a safety director speaks *(Russo)*. 11:46.
What is the industrial safety engineer's responsibility for motor vehicle safety equipment? *(Brown)*. 14:10-13.

ENTERTAINMENT

Family night program in a glass plant aids off-the-job safety *(Neufeld)*. 12:13-14.
Family programs part of railroad's off the job safety plans *(Hamilton)*. 12:16-17.
Safety rallies type of educational activity promoted by Oregon industrial commission *(Callahan)*. 16:21-22.
See also Skits.

ENVIRONMENT

New trends in occupational health programs *(Gardiner)*. 21:18.
The role of environment must be included in research in general and specific home injuries *(Abrasol)*. 12:18.
Training for safety attitudes *(Griffs)*. 20:18.

EPIDEMIOLOGY OF ACCIDENTS

Epidemiologic studies into accident examination is an area of research of the U. S. Public Health Service *(Goddard)*. 18:32.
A team approach should be used in epidemiologic studies of home accident injuries *(Zabrosa)*. 12:16-18.

EPILEPSY

Epilepsy as an accident factor for the driver (Open) 20:12, 14; (panel forum) 20:26-27, 28.

EPOXY RESINS

Control of health hazards of electrical insulating materials *(Keller)*. 6:13-14.
Epoxy resins and catalysis hazards *(Lange)*. 2:7-10.
Process in cementation of coal-mine roof *(Mates)*. 6:5-7.

Ernest, Eugene P.

Opening remarks by retiring general chairman of the Printing and Publishing section. 23:5-6.

ESCALATORS

Suggestions on how to introduce the public to the proper use of escalators *(Prince)*. 11:43.

Esmon, A. L.

The importance of safety in mechanization —signal and communications. 25:15-17.

ETHICS

The ethics of safe construction *(Harinett)*. 7:7-8.
An indictment of the ethics and morals of the business community as related to the inadequacies of workmen's compensation, factory inspection, and occupational disease legislation *(Hayes)*. 16:19-21.
Safety—a moral responsibility *(Hall)*. 18: 12-16.

Evans, J. D. F.

Improvements to underground haulage systems at TCI's ore and coal mines. 19: 30-34.

EXPLOSIONS

Carbon dioxide gas added to crank case of ship engine when white smoke is seen, creates non-explosive mixture *(Farrell)*. 16:8.
Changes in the NFPA code for the prevention of dust explosions in starch factories *(Gemmill)*. 11:6-7.
Explosion possibilities of nuclear power pressure vessels *(Keene)*. 14:56.
Fire control of some of the new pyrophoric metals *(Brown)*. 14:26-27.
Laboratory barricading of high pressure and extra hazardous reactions *(Moll)*. 5:39-57.
Safe operation of industrial furnaces and heat equipment *(Jaffe)*. 18:22-24.
Safety in high pressure chemical reactions —cubicles, barricades and other safety protection *(Kistler)*. 5:5-9.
Two visual aids used by Bureau of Mines for demonstrating damnable limits of gasoline and ignition sources *(Kuhn)*. 14:94-95.
Visualizing ammonia hazards *(Anderson)*. 19:15-16.
Why industrial plants burn *(Crosby)*. 11: 21-22.

EXPLOSIVES

Evolution of seismic explosives *(Cochran)*. 22:17-21.
Safe use of ammonium nitrate commercial fertilizer as a blasting agent *(Grafton)*. 19:28-30.
Safety record of the explosives industry, due to cooperative efforts of manufacturers *(Cochran)*. 22:26.

EXTINGUISHERS

Bureau of Mines has progress report on experiments with foam plugs for mine fire fighting *(Weaver)*. 6:17.
Fire control of some of the new pyrophoric metals *(Brown)*. 14:26-28.

EXTINGUISHERS, see also Fire Protection

EXTRACTION PLANTS

The new solvent extraction plants NFPA code no. 36-T *(Steel)*. 11:9-11.

EYES

Contact eye lenses not safe for automobile drivers *(Eichhorn)*. 20:38.
"Let's Pretend Blindness Kit" sold 100 per cent eye protection to Union leadership at United Auto Workers *(Grudem)*. 18:8.
Respirators must combine to give eye protection in certain atmospheres *(Fawcett)*. 8:18.

EYES, see also Goggles; Vision

F

FALLS

Falls prevented in food store by planned arrangements of packaged and unpackaged foods *(Parker)*. 11:30.
Prevention of accidents to crew aboard freighters *(Tarr)*. 16:26-28, 27.
Protecting oil tanker crews from accidents *(Vander Chute)*. 16:19-20.

FALLS-OF-GROUND, see Roof Control

FARM SAFETY
Different opinions on causes of spontaneous ignition associated with fires in agricultural products *(Brown)*. 14:36.
Farm safety makes sense, its achievement begins with broad safety education programs *(Buis)*. 9:7-10.
Institute to conduct workshop sessions in 1958 *(Buis)*. 9:8.
Occupational safety—a challenge to the colleges *(Cutler)*. 20:76.
The Ohio story—a rural accident survey. 9:11-12.
Peaceful and safe uses of atomic energy *(Jackson)*. 9:13-35.
Population mobility—problems of the agricultural migrant workers *(Ried)*. 20: 63-65.
Research—a key to safer farming (panel discussion). 9:10.
See also Rural Traffic.

FARM SECTION
Minutes. 9:7-20.
Officers and committees. 9:20-21.

FATIGUE
How corrosion fatigue occurs in metallic structures *(Mochnek)*. 6:18.

Faust, Raymond J.
What's new in water safety—1957? 8:23-32.

Fawcett, H. H.
Living in the air we breathe. 8:11-22.

FEAR
A famous study in dental hygiene showed how the various intensities of fear influence the receivers of a message *(Marlinson)*. 13:9.
Safety—a retreat or a challenge *(Pewlger)*. 10:5-10.

FEDERAL-AID HIGHWAY ACT
Road design and its relation to traffic accidents *(Frick)*. 27:54-62.

Feldman, Hyman
The mechanical department's role in safety. 22:28-29.

Ferguson, Charles W.
The philosophy of the beaded shoes. 1: 53-62.

Ferguson, H. W.
A management look at petroleum industry safety. 22:7-15.

Ferriss, Abbott L.
Reducing traffic accidents by use of group discussion-decision. 26:36-42.

FERTILIZER INDUSTRY
Proof office safety *(Coward)*. 10:7-8.
Reducing the hazards of using nitrogen solutions and acids *(Ferriss)*. 10:12-21.
Safe use of ammonium nitrate commercial fertilizer as a blasting agent *(Grafton)*. 19:28-30.
Visualizing ammonia hazards *(Anderson)*. 10:15-18.

FERTILIZER SECTION
How to set up an industry safety training conference *(Creel)*. 24:54-58; 29:33-34.
Minutes. 10:7-21.
Officers and committees. 10:22-23.

Field, Oliver
Some current aspects of medical quackery. 21:17-18.

FILMS, see Visual Education

FIRE PROTECTION
The big fire of the Fisher Bros. Master Market in Cleveland, February, 1949 *(Porter)*. 11:28.
Case history of firemen who died from ammonia inhalation at cold storage plant disaster *(Fawcett)*. 8:22.
Changes in the NFPA code for the prevention of dust explosions in starch factories *(Cornell)*. 11:24-7.
Community fire prevention planning *(Fowler)*. 13:27-28.
Compressed gas cylinder safety (discussion report) *(Eschbach)*. 8:25-26.
Consumer education and protection program of the gas industry *(Cornelius)*. 13:29.
Fire and chemical hazards of pulp bleaching process *(Pedersen)*. 24:25-31.
Fire and explosions hazards of self-contained breathing apparatus *(Fawcett)*. 8:29-31.
Fire control of some of the new pyrophoric metals *(Browne)*. 14:26-31.
Fire prevention and fire control (symposium). 11:16-19.
a) What makes a good plant inspection? *(Stubbe)*. 11:16-17.
b) Can you walk for the fire department? *(Snyder)*. 11:17-18.
Fire standards *(Cobb)*. 13:18-19.
Firemen overcome by smoke with high CO and CO 2 content in drying-storage room *(Fawcett)*. 8:22.
Flammable materials in the chemical laboratory—system for rating *(Wood)*. 8: 36-41.
Home fire inspection by fire departments *(Malmquist)*. 13:24-26.
Industrial school in Des Plaines, Illinois, has lessons on fire prevention *(Kolze)*. 11:20.
Jet ground handling hazards *(Dymont)*. 8:34-36.
Let's stop these fire deaths! *(Bugbee)*. 13:24-41.
The new solvent extraction plants NFPA code no. 36-T *(Steel)*. 11:9-10.
Problems in the use of "fire-stopped" pallets as against their purported advantages *(Prince)*. 11:42-44.
Recommended off-campus fire protection procedures *(Quinlan)*. 26:28-32.
Restrictive regulations at service stations *(Woodworth)*. 22:22-26.
Résumé of gas ignitions and fires in coal mines since enactment of the Federal Coal Mine Safety act; recommendations to prevent recurrence *(Wenner)*. 6:26-39.
Safe operation of industrial furnaces and heat equipment *(Safe)*. 18:22-24.
Safe use of ammonium nitrate commercial fertilizer as a blasting agent *(Grafton)*. 19:28-30.
Safe use of diesel equipment in underground metal mines *(Hoke)*. 19:7-12.
The safety engineer's responsibility in fire protection *(Cobb)*. 14:22-25.
Safety in ship repair *(O'Donnell)*. 16:34.

Safety in the uses of cylinder gases in oxy-fuel gas welding and cutting *(Bamke)*. 8:26-30.
Safety training for fire protection foresters *(Hamblin)*. 24:26-28; 29:34-35.
Sales of storage tanks by the absorption method *(Colbert)*. 22:18-19.
Smoking, welding and burning constant fire hazards on board ship *(Terr)*. 16:26, 28.
Smokey Bear fire prevention campaign showed effectiveness of planned national program *(Cone)*. 13:6.
Two visual aids used by Bureau of Mines for demonstrating flammable limits of gasoline and ignition sources *(Kintz)*. 14:94-96.
Visualizing ammonia hazards *(Anderson)*. 10:15-18.
Water and dry chemicals used for fire protection in mine haulage fires *(Kobbiah)*. 6:16, 17.
What are the standards for off-campus housing? *(Holland)*. 26:78-80.
Why industrial plants burn (symposium). 11:19-28.

FIREARMS
Safety with firearms *(Clewis)*. 9:16-17.

FIRST AID
The Bureau of Mines course in first aid, and in mine rescue, are aids to a successful mine safety program *(Westfield)*. 6: 26-27.
Chemical hazards of pulp bleaching (Mason-Ger). 24:20.
Emergency first aid program in industry *(Erson)*. 21:7-8.
The emergency treatment of chemical injuries to the eye *(Kyes)*. 14:77-80.
First aid included in foremen training for small plants in North Dakota, lives saved *(Ryan)*. 16:37-38.
First aid and mine rescue rooms features of built-in safety of surface mine plant *(Brumm)*. 19:32.
First aid for caustic burns *(Busch)*. 24: 17-18.
First aid reports may reveal a trend of minor injuries that carry potentials for fatal accidents *(Nelson)*. 24:45.
First aid training—a personal safety program *(Breen)*. 14:71-72.
Handling problems of asphyxia in industry *(Deane)*. 21:9-14.
Parks maintenance safety—first aid recommendations for chemical poisoning *(Williams)*. 7:46-49.
Participation in first aid skills activities generates safety awareness *(Breen)*. 21:9.
Plug-in attachments carried with demand-type breathing apparatus, for on-the-spot resuscitation *(Fawcett)*. 8:25.
The procedure to be followed in case a customer is injured, at the Hecht company *(Prince)*. 11:44-46.
Responsibilities and limitations of the industrial nurse in the vision program *(Hargreaves)*. 14:75-76.
Some policies on employee injuries in food retail stores *(Beer)*. 11:45.
20,000 people received first aid training as part of the Oregon Industrial Accident Commission educational program *(Callaway)*. 18:21.
U. S. Public Health Service to study methods of secondary prevention *(Goddard)*. 13:26.
What Red Cross first aid training has done for our accident control program *(Jones)*. 7:62-64.

Flad, Mark
How to set up and maintain a gas utility safety program. 8:30-32.

FLAGS
The yellow flag is the theme of "Knowing's Not Enough" safety program of United States Steel *(Buskenes)*. 16:6.

FLAMMABLE LIQUIDS
Characteristics of diesel fuels *(Holts)*. 19: 7-8.
Heat treat quenching oils have all the hazards of flammable liquids *(Jaffe)*. 18:24.
Restrictive regulations at service stations *(Woodworth)*. 22:22-26.
See also Gasoline: Tanks and Tankers.

FLAMMABLE MATERIALS
Flammable materials in the chemical laboratory—system for rating *(Wood)*. 8: 36-41.

FLEETS, see Drivers and Driving—Commercial; Motor Transportation Industry

FLOODS
Lessons learned by giving service during and after the recent flood *(Lyell)*. 7:57-58.

Flowers, Jackson G.
Hurricanes and government. 7:59-64.

FOOD INDUSTRY
Changes in the NFPA code for the prevention of dust explosions in starch factories *(Cornell)*. 11:24-7.
Food retailers safety discussion *(Beer)*. 11:41-42.
How I train my employees for job safety (panel discussion). 11:31-32.
The new solvent extraction plants NFPA code no. 36-T *(Steel)*. 11:9-10.
Peaceful and safe uses of atomic energy *(Jackson)*. 9:31-34.
Safety to sell—the how of organizing a safety program in a retail food store *(Porter)*. 11:43-51.
Why industrial plants burn (symposium). 11:19-28.

FOOD PRESERVATION
Food preservation by atomic energy—preservation prerequisites, radiation sources, wholesomeness studies *(Jackson)*. 9:31-34.

FOOD SECTION
Minutes. 11:5-26.
Officers and committees. 11:26-29.

Ford, William
Medical control of hearing losses. 14:64-70.

FOREMEN
Brainstorming for safety, a list of unedited replies to the question "How to get supervisors to accept their safety responsibilities" *(Rudy)*. 11:38.
Duties of the section manager or supervisor as outlined in warehouse safety inspection form when customer is injured *(Prince)*. 11:44.

Effective driver supervision is positive (a symposium). 20:41-52.

a) Orientation — the beginning *(Carter)*. 20:41-44.

b) Education—the foundation *(Lake)*. 20: 44-46.

c) Simulation — the framework *(Nelson)*. 20:47-49.

d) Human relations — the key *(Heaton)*. 20:50-52.

A first line supervisor's safety program is a water utility *(Remer)*. 8:35-38.

How I train my employees for job safety *(Remer)*. 11:31-32.

How to set up an industry safety training conference *(Crest)*. 24:52-53; 29:23-24.

How to set up and maintain a gas utility safety program, the role of the supervisor *(Field)*. 8:31.

The human factors in safety—a program presented 3,000 supervisors in 15 Goodyear plants *(Crane)*. 12:29-30.

Inventory of occupational accident prevention activities *(Crenshaw)*. 12:5-10.

Job descriptions or accident investigation reports tell how well a foreman or supervisor instructs his men *(Nelson)*. 24: 41-43.

Monthly bonus is paid shift bosses completing a month's accident-free work at Homestake *(Owens)*. 19:37.

Practical safety education and training *(Reeve)*. 2:32-33.

Safety and the foreman *(Wilson)*. 24:26-28.

Safety performance — the barometer of good supervision *(Rich)*. 17:7-9.

The selection and education of road supervisors and terminal supervisors *(Lake)*. 20:42-45.

Supervising the youthful worker *(Hargreaves)*. 18:4-6.

Training for safety attitudes *(Griffin)*. 20:12.

Training programs for supervisors intensified at Butte District of the Anaconda company *(Wendal)*. 19:43.

FOREIGN COUNTRIES, see Safety Movement—Foreign

FORESTS

Safety training for fire protection foresters *(Shanklin)*. 24:30-34; 29:36-38.

Smokey Bear fire prevention campaign *(Cone)*. 18:6.

FORK LIFT TRUCKS

The fork lift operator training program of the materials handling department of E. I. du Pont *(Prader)*. 14:33-36.

Forney, R. L.
Introduction. 20:2.

Forney, R. L.
Minutes of the annual council meeting. 1:13-12.

Fowler, John M.
Safety—a retreat or a challenge. 10:2-12.

FOUNDATIONS

W. K. Kellogg Foundation grants sponsored home safety demonstration projects *(Goddard)*. 13:27.

FOUNDRIES

Control of noise at the source *(Young)*. 14:28.

Opportunities for cooperation between industrial associations and industrial sections of the National Safety Council *(Workman)*. 14:105-108.

Pyrophoric metals factor in die casting explosions *(Brown)*. 14:27, 29.

Safety communications in the foundry *(Burns)*. 17:28-29.

FOUR IMPS

The four Imps of U. S. Steel safety program *(Buchanan)*. 16:5-6.

Fowler, E. W.
Community fire prevention planning. 18: 37-39.

FREEWAYS

Road design and its relation to traffic accidents; comparisons between rural freeways and conventional routes *(Frish)*. 27:56-57.

Total causes of accidents on freeways in Los Angeles, San Francisco, and San Diego for the year 1955 *(Mathewson and Severy)*. 14:21.

Fries, Gertrude E.
Women in industry. 1:28-34.

FUELS

Characteristics of diesel fuels, exhaust-gas composition, and fuel-air ratios *(Holtz)*. 19:7-10.

Jet ground handling hazards *(Dyment)*. 8: 26-28.

Types of formal training given in the use of LPG (Insulating and roofing round table). 24:44.

See also Gasoline: Nuclear power.

Fulghum, Charles H.
The opportunity for state associations and state agencies. 14:101.

FURNACES

Fire control with boron trifluoride gas in heat-treating furnaces at magnesium plant *(Brown)*. 14:30.

Glass furnace repairs *(Ballinger)*. 12:11-12.

Safe operation of industrial furnaces and heat equipment *(Jaffe)*. 18:25-26.

GALLEYS

Galley safety aboard a freighter *(Terr)*. 16:36.

GANGWAYS

Gangway problems and solutions aboard a freighter *(Terr)*. 16:22-23.

Protecting oil tanker crews from accidents *(Sunoco Chiefs)*. 16:19.

Gardiner, E. Glenn
New trends in occupational health programs. 21:14-17.

Gardner, Merle R.
Off-the-job safety *(roundtable discussion)*. 12:21.

GAS INDUSTRY

Consumer education and protection *(Cornelius)*. 12:48-50.

How to set up and maintain a gas utility safety program *(Field)*. 8:30-32.

GAS MASKS

Gas mask CD V-800 for war gases *(Fawcett)*. 8:17-18.

Gas masks necessary in pulp bleaching plants *(Hartzog)*. 24:31.

The limitations of canister-type gas masks *(Fawcett)*. 8:16-17.

Use of isoamyl acetate to indicate leakage in facepiece *(Fawcett)*. 8:17.

GASES

Artificial gas escaping caused near fatality to inspector *(Fawcett)*. 8:26.

Asphyxia in industry—inhalation of toxic chemicals *(Dunne)*. 21:9-14.

Case history of workers overcome by illuminating gas released by slipping drill *(Fawcett)*. 8:28.

Case histories of death and injury from inert gas used in tanks and kettles *(Fawcett)*. 8:27.

Chemical hazards of pulp bleaching (Hartzog). 24:19-21.

Chemist wearing Type N universal canister mask suffered major injury from phosgene fumes *(Fawcett)*. 8:26.

Flammable materials in the chemical laboratories — system for rating *(Weed)*. 8:48.

Gas and vapor air contaminants, and respiratory protection *(Fawcett)*. 8:14-22.

Gases as insulating materials for electric equipment *(Heiler)*. 8:16.

Hazard of black damp in auger holes of abandoned mines *(Diaz)*. 6:18.

Industrial gases discussion group *(Reinhard)*. 8:56-58.

Inert gases used in fire control of some pyrophoric metals *(Brown)*. 14:28-30.

A planned gas job (a skit). 17:39-42.

Résumé of gas ignitions and fires in coal mines since enactment of the Federal Coal Mine Safety act; recommendations to prevent recurrences *(Weaver)*. 6:36-39.

Safe use of diesel equipment in underground metal mines *(Holtz)*. 19:7-19.

Safety in the uses of cylinder gases in oxy-fuel gas welding and cutting *(Sanchis)*. 8:25-30.

Use of orsat gas analyzer, or a Beckman paramagnetic oxygen analyzer, to verify contents of certified breathing air cylinders *(Reinhard)*. 8:57.

Visualizing ammonia hazards *(Anderson)*. 19:15-16.

See also Tanks and tankers.

GASOLINE

Gasoline-powered equipment has disappeared from modern mines *(Holtz)*. 19:7.

Motor lifeboats should be sired of gasoline fumes when covers are removed *(Terr)*. 16:36.

Two visual aids used in Bureau of Mines for demonstrating flammable limits of gasoline and ignition sources *(Kuhl)*. 14:34-36.

GAUGES

High pressure gauges *(Kinder)*. 8:8.

In the use and maintenance of beta gauges, the integrity of the source containment must be maintained *(Hennig)*. 12:25-26.

Radioactive gauges and tracers aid industry's production line *(Jackson)*. 9:20.

Gaymon, L. Vaughn
Meat, potatoes and dessert in your safety menu.

GENERAL FEDERATION OF WOMEN'S CLUBS

The GFWC traffic court program *(Todd)*. 27:33-34.

Nation-wide traffic court improvement program *(Heaton)*. 27:60-61.

Gibson, J. A.
Using to dual car plan. 26:37.

Gilliland, W. R.
Alcoa's approach to the off-the-job safety problem. 12:14-16.

GLASS AND CERAMICS INDUSTRY

Glass furnace repairs *(Ballinger)*. 12:11-12.

How to control off-the-job accidents in the glass and ceramics industries (a symposium). 12:12-17.

Inventory of occupational accident prevention activities *(Crenshaw)*. 12:5-10.

The value of good records and how to use them *(Ruddick)*. 2:5-8.

GLASS AND CERAMICS SECTION

Minutes. 12:5-17.

Officers and committees. 12:21.

GLOVES

Meat markets increased production, reduced knife cuts through use of gloves *(Bear)*. 11:41.

Rubber gloves still used at Chamber Works in their "no hot work" program *(Lippincott)*. 8:6.

GLOVES, see Clothing

Goddard, James L.
The accident prevention program of the Public Health Service. 12:27-31.

GOGGLES

Goggles prevent eye injuries during anchoring operations *(Terr)*. 16:36.

Goggles recommended for men working with epoxy resins *(Lange)*. 2:9.

The prescription safety goggle problem *(Schoemaker)*. 14:31-32.

Safety goggles a must in caustic soda plants *(Busch)*. 24:17.

GOLD MINING

What we are doing to prevent falls-of-ground accidents *(Owens)*. 19:34-36.

Gomoll, Earl
Changes in the NFPA code for the prevention of dust explosions in starch factories. 11:5-7.

Goodin, H. P. "Pat"
Legislation as it affects public employee safety programs. 7:68-71.

GRADE CROSSINGS

Highway-railroad crossing safety. 28:30-32.

Grafton, H. J.
Safe use of ammonium nitrate commercial fertilizer as a blasting agent. 19:28-30.

Grasse, Philip
What we are doing to prevent falls-of-ground accidents. 19:34-36.

Grasse, Rideon M.
Engineering safety into a material handling system. 14:26-28.

Gray, C. H.
Railroad locomotive maintenance. 25:27-29.

GRAY IRON FOUNDERS' SOCIETY
Opportunities for cooperation between industrial associations and industrial sections of the National Safety Council *(Workmen)*. 14:108-109.

GREEN HOUSES AND CONSERVATORIES
Parks maintenance safety *(Williams)*. 7: 43-46.

Greer, Scott A.
Population mobility—change of residence. 26:82-85.

Griffin, Glenn F.
Training for safety attitudes. 29:17-19.

GROUNDING
Grounding portable tools, or stationary electrical equipment *(Brown)*. 24:30-36.
The hazards of radio transmitters and their correction *(Card)*. 6:11.

GROUP EFFORT
Center for Safety Education experimenting with idea for attacking traffic accidents through educational method of group discussion-decision *(Heath)*. 27:65.
How to interest people in what they don't want to know *(Martineau)*. 13:8-10.
Incentive awards for good safety records in the mining industry *(Smith)*. 19:30-33.
Reducing traffic accidents by use of group discussion-decision *(Perrine)*. 26:39-43.
Useful and useable safety meeting techniques (a demonstration) *(Hammaford)*. 22:24-26.

Gruber, William H.
Job safety analysis and pre-placement physical examinations. 2:28-29.

Gruden, John
Accident investigation. 15:7-9.

GUARDS
The basic accident hazards to which workers are exposed with suggestions for their control *(Crichmore)* 18:8; *(Mooney)*: 11-14.
Building safety into the printing press *(Kuehn)*. 23:30-31.
Machine tools and principles of guarding *(Moore)*. 3:16-18.
Required hand-positions of operators of Harris-Seybold cutters and trimmers *(McConnaughey)*. 23:12.
See also Barricades and Cubicles.

GUIDED MISSILES
ARDC guided missile safety techniques *(Boone)*. 2:18-23.
The new nuclear-equipped guided missile navy *(Will)*. 16:48-49.

GUILLOTINE CUTTERS
Trip control systems *(Burt)*. 23:7-8.

Guilmartin, John L.
Hurricanes—those wild women of the Atlantic. 7:50-52.

H

HABITS
Four categories of habits, defensive, compensatory and protective, that function to cover up people's inadequacies and ineptitudes *(Rosenstein)*. 20:17-24.

Hackert, E. P.
The importance of safety in mechanization —bridges and structures. 22:13-14.

Hafer, O. C.
Sobie serious injury index. 22:45-46.

Hall, Cameron P.
Safety—a moral responsibility. 18:12-16.

Hall, Robert W.
Population mobility — the military family. 26:86-87.

Hamblen, J. B.
Stiggette used in "The Destrehan Story." 14:97-98.

Hamilton, E. P.
Are off-the-job safety programs needed in industry today? 12:16-17.

HANDICAPPED PERSONS
Drivers with amputated extremities, or the loss of the function of an extremity, should not be issued certificates *(Owen)*. 20:15.
Everybody is a handicapped worker who needs praise, buildup, maintenance and psychic maintenance *(Rosenstein)*. 20: 16, 17.

HANDLING MATERIAL
Engineering safety into a material handling system—a supervisory appraisal program *(Grasse)*. 14:26-28.
Loading elevator accident demonstrates the needs of thorough accident investigation *(Kavanaugh)*. 19:12.
Maintenance and modernization of cargo handling and related gear *(Terr)*. 16: 24-26.
Materials handling by conveyors without accident *(Webb)*. 14:30-32.
Operator selection and training in developing material handling safety *(Puder)*. 14: 23-25.
Problems of pallets falling, and defective pallets (insulating and roofing round table discussion). 24:44.
Problems in the use of "fire-stopped" pallets as against their purported advantages *(Prince)*. 11:43-44.
Use of air pressure to transfer acids from carboys described at "Acids and Heavy Chemicals" meeting *(Allinson)*. 5:54.
See also Cranes: Haulage systems.

HANDLING PEOPLE, see Attitudes, Human Relations: Personal Factors: Psychology

Hannaford, Earle S.
Significance of safety attitudes in industrial accident prevention (Ph.D. thesis). 28: 26-28.
Skills for safety say scat to accidents. 14: 96-100.
Useful and useable safety meeting techniques (a demonstration). 22:21-26.

Hans, A. F.
Company made films. 14:96-97.

Hardy, Howard C. and James H. Ancell
Jet noise on the airport—what to do about it. 2:30-31.

Hargreaves, R. L.
Supervising the youthful worker. 18:4-6.

Hargreaves, Margaret H.
Responsibilities and limitations of the industrial nurse in the vision program. 14:74-77.

Harriett, Robert C.
The ethics of safe construction. 7:7-9.

Hensel, A. L.
Be positive in driver testing. 29:6-7.

HAULAGE SYSTEMS
Improvement to underground haulage system at TCI's ore and coal mines *(Evans)*. 19:30-34.
Safety and operating problems of a modern haulage system *(Robbins)*. 6:14-19.
Safety features in the design and development of Ireland Coal Mine *(McCue)*. 8: 20-21.

Hayes, A. J.
Labor's stake in safety—the inadequacies of our present systems of workmen's compensation, factory inspection, and occupational disease legislation *(Hayes)*. 15: 16-21.

Hayes, H. G. J.
Highway-railroad crossing safety. 25:30-31.

Hayes, John
Remarks on the Boy Scout safety good turn program. 9:18.

Hayes, Robert C.
New safety problems from the expanding use of school buses in urban areas *(Hayes)*. 26:108-118.

HEALTH
Mental health for safety production (session three) *(Rosenstein)*. 20:25-34.
Population mobility—problems of the agricultural migrant workers *(Field)*. 26: 62-66.
The positive approach to driver physical requirements (a symposium). 20:13-21.
Some current aspects of medical quackery *(Field)*. 21:17-18.
Specific standards for the health of drivers must be formulated; three papers cited which do this (panel forum). 20:28.

HEALTH DEPARTMENTS
The accident prevention program of the Public Health Service *(Goddard)*. 13: 37-41.
Food-borne disease control by use of atomic energy *(Jackson)*. 9:21, 24.

HEALTH HAZARDS
A bibliography of toxic chemicals (Toxic Chemicals Committee, Chemical Section, NSC). 5:44-61.
Controlling health hazards in a chemical plant *(Kehoe)*. 5:9-11.
Definitions of hazards, mechanical and personal *(Crichmore)* 18:9-10; *(Mooney)* 18: 11-14.
The emergency treatment of chemical injuries to the eye *(Ryan)*. 14:77-80.
Epoxy resins and catalysts hazards *(Lange)*. 2:7-10.
Handling problems of asphyxia in industry *(Dunn)*. 21:9-14.
Hazards of 110 and 220 voltage in industrial operations *(Brown)*. 24:36-40.
Living in the air we breathe *(Fawcett)*. Some harmful gases and vapors, and temperature extremes with suggestions for their control *(Mooney)*. 18:13.
See also Diseases.

HEALTH PROGRAMS
Controlling health hazards in a chemical plant *(Kehoe)*. 5:10.
Eye screening programs in industry *(Marshall)*. 24:36-42.
Health and safety for governmental employees (a symposium). 7:60-62.
a) The professional viewpoint on a city program *(Herrington)*. 7:60-61.
b) The safety engineer's viewpoint on accomplishments *(Pepperd)*. 7:61-62.
Medical control of hearing losses *(Ford)*. 14:84-70.
Motor transportation companies should have a medical section to determine whether the drivers are meeting adequate standards for safe driving *(Owen)*. 20:16.
New trends in occupational health programs *(Gardner)*. 21:14-17.
Occupational health control through engineering *(Von Alle)*. 15:11-12.
Rehabilitation in Ontario, Canada *(Young)*. 24:46-50; 29:25-26.
Responsibilities and limitations of the industrial nurse in the vision program *(Hargreaves)*. 14:74-77.
Safety 'round the clock—an extended health and safety program for industry *(Shute)*. 22:9-10.
What's my line in safety, a nurse speaks *(McDermott)*. 17:27-28.
See also First aid: Vision.

HEARING
Jet noise on the airport—what to do about it *(Hardy and Ancell)*. 2:30-31.
Medical control of hearing losses *(Ford)*. 14:84-70.

HEART DISEASE
Handling problems of asphyxia in industry *(Dunn)*. 21:12.
Heart disease in industry *(McCausland)*. 18:29-34.
Vascular conditions dangerous to safe driving *(Owen)*. 20:14; (panel forum) 20:26.

HEAT TREATING, see Foundries; Furnaces

Heath, Earl Davis
Evaluating student performance in driver education. 26:52-58.
Human behavior and its relation to traffic accidents. 27:67-69.
Protecting school bus passengers through instruction. 28:100-101.
Relationship between driving records, selected personality characteristics and biographical data of traffic offenders and non-offenders. 28:22-26.

Haywood, Eunice
Fundamentals of home safety activities. 1:51.

Hiatt, Naomi
Population mobility — agricultural migrant worker. 26:69-82.

Higgins, Donald M.
Remarks on the Bay Scout safety good turn program. 9:12.

Hightower, J. P.
Panel forum on positive driver testing. 20:94.

HIGHWAYS
The engineer's viewpoint on speed and traffic safety *(Berry)*. 27:88-89.
Lessons learned by giving service during and after the recent flood *(Lyell)*. 7: 57-58.
Road design and its relation to traffic accidents *(Price)*. 27:84-86.
Sanding, salting, snow removal (park maintenance *(Williams)*. 7:48.
Total causes of accidents on freeways in Los Angeles, San Francisco and San Diego for the year 1955 *(Matheson and Severy)*. 14:21.

Hill, James D.
Careers in safety. 9:35-39.

Hill, James D.
The traffic problem. 1:41-50.

Hoben, John J.
Seattle's program of placement and training for public employees. 7:33-38.

Hoffman, Paul C.
Award presentation. 1:33-35.

Holland, William J.
What are the standards for off-campus housing? 26:78-80.

Holmes, Merle
Safety in dormitory living. 26:81-85.

Holte, John C.
Safe use of diesel equipment in underground metal mines. 19:7-19.

HOME SAFETY
The accident prevention program of the Public Health Service *(Goddard)*. 13: 27-31.
Community fire prevention planning *(Fowler)*. 13:27-29.
Consumer education and protection program of the gas industry *(Cornelius)*. 13:49-50.
Fundamentals of home safety activities *(Haywood)*. 1:51.
Home fire inspections by fire departments *(Malmquist)*. 13:34-36.
Let's stop these fire deaths! *(Hughes)*. 12: 39-41.
The need for research in home accident prevention (Symposium). 13:14-21.
1) Remarks of Fay M. Hemphill. 13: 14-15.
2) Remarks of Albert P. Iskrant. 13: 16-18.
3) Remarks of Floyd A. Van Atta. 13: 19-21.
The 1956 home safety inventory *(Schaplowsky)*. 13:22-24.
Safe at home *(Kahler)*. 13:53-57.
Safety 'round the clock—an extended health and safety program for industry *(Shute)*. 23:5-10.
United for safety in the United Kingdom *(Young)* 1:27.
Women's safety councils—the best way to the men *(Williams)*. 13:51-52.

HOME SAFETY CONFERENCE
Minutes. 13:5-57.
Officers and committees. 13:58.

HORSEPLAY
The factory clown is a menace to every other job *(Smith)*. 17:27.
Handling of hot bricks in a glass furnace repair job, requires watching *(Ballinger)*. 12:11.

HOTELS
Conclusions of the roundtable discussion of the Hotel Division on "What can we do about public liability claims?" *(Nordhausen)*. 11:48.
The how of organizing a safety program in a hotel *(Petrie)*. 11:53-56.

HOUSEKEEPING
Chemical hazards of alkaline pulp liquor making *(Busch)*. 24:19.
Engine room housekeeping on a freighter *(Terr)*. 16:27.
Glass company encourages housekeeping through weekly drawing for modest prize *(Ballinger)*. 12:12.
Principles of industrial housekeeping *(Conerde)*. 8:23-26.
Safety and the foreman *(Wilson)*. 24:27.
Suggestions on plant housekeeping (Insulating and roofing round table discussion). 24:43-44.
Top management's responsibility for safety *(Smith)*. 17:27.

HOUSING
Recommended off-campus fire protection procedures *(Quinlan)*. 26:80-82.
Safety in dormitory living *(Holmes)*. 26: 81-85.
What are the standards for off-campus housing? *(Holland)*. 26:78-80.

Housel, Bruce B.
Can safety be news? 26:8-12.

Hughes, John L.
Be positive in using safe driver awards. 26:10-12.

Huguniu, Elbert
An experiment in the use of the Smith-Cummings system, "training your eyes for expert driving." 26:49-52.

Hule, William H.
Developing safe work methods. 20:13-13.

HUMAN BEHAVIOR
Asset of "Knowing's not enough" program of U. S. Steel, is identification of accidents with the four imps *(Buchanan)*. 16:3-6.
The positive approach to driver physical requirements—emotional factors *(Terrell)*. 20:30-32; (panel forum) 20:37-38.

HUMAN BEHAVIOR, see also Psychology

HUMAN ENGINEERING
An equation for simple human engineering: MAN + MOTION = ACCIDENT *(Brown)*. 21:3.
New ideas in safety switches cut-think careless employees *(Burt)*. 22:7.

HUMAN RELATIONS
Accentuate the positive *(Purves)*. 20:5-6.
Human relations and man-management *(Rosenstein)*. 20:3-44.
Human relations course for supervisors and foremen at Allied Kid Company *(Russo)*. 11:46.
Human relations—the key to driver supervision *(Heaton)*. 20:50-52.

Huntington, A. E.
Clutch—brake control valving. 18:26-30.

HURRICANES
Digging out after mother nature goes on a rampage (a symposium). 7:50-60.
a) Hurricanes—those wild women of the Atlantic *(Guilmartin)*. 7:50-52.
b) Hurricanes and government *(Flowers)*. 7:53-54.

Hutsler, E. G.
How I train my employees for job safety (introductory remarks to panel session). 11:31.

Hurner, J. F.
Poison ivy immunization experiment—1956 results. 7:34-36.

Hyde, Wallace N.
The national school bus program—what it means to a state motor vehicle department. 26:113-120.

HYDRAULIC SYSTEMS
Flammable liquids in hydraulic controlled mine equipment a hazard when fires occur *(Weaver)*. 6:36.

HYDROCARBONS
Handling problems of asphyxia in industry *(Dunne)*. 21:12.

HYDROGEN SULFIDE
Case history man suffocated result uncontrolled chemical process of an acid and sulfide generating H2S *(Fawcett)*. 8: 28-29.
Chemist attempted to close valve releasing ignited hydrogen sulfide, was overcome, hospitalized *(Faucett)*. 8:30.

HYDROGRAPHIC SURVEYS
Nautical charts for safe navigation *(Kane)*. 16:35-36.

I

ICE MAKING
Parks maintenance safety *(Williams)*. 7:48.

IGNORANCE
The traffic problem *(Hill)*. 1:42.

INCENTIVES, see Awards; Bonuses; Contests; Motivation

Ihrig, Herbert R.
Safety needs communicating, too. 20:4-7.

IMPS
"Knowing's not enough"—U. S. Steel film personifies the four imps that cause accidents *(Buchanan)*. 16:4.

INATTENTION
Case history of driver's accidents that were traced to unresolved family situation *(Cox)*. 20:28-30.
The five common distractions in driving, one or more generally present when A driver makes a wrong move in traffic *(Huguniu)*. 26:49-50.
Outside influences add to factors responsible for unsafe acts *(Nelson)*. 24:43-45.

INDUSTRIAL ACCIDENT COMMISSIONS
The Oregon safety story *(Callahan)*. 15: 26-28.

INDUSTRIAL SAFETY
Occupational safety—a challenge to the colleges *(Cutler)*. 26:73-76.
Significance of safety attitudes in industrial accident prevention *(Hammaford)*. 26:26-28.

Ingram, J. F.
Safety in vocational and industrial arts education. 26:8-9.

INSPECTION
American Standard inspection requirements aid motor vehicle inspection programs *(Erwin)*. 14:12.
Bureau of Factory Inspection inadequacies due to lack of strong and equitable workman's compensation system *(Hayes)*. 15:12.
Check list inspections held aboard oil tanker *(Vander Chute)*. 16:36.
Control of safe working conditions in a shoe plant *(McDermott)*. 11:37.
Fire prevention and fire control (Symposium). 11:14-19.
a) What makes a good plant inspection? *(Stubbs)*. 11:14-17.
b) Can you wait for the fire department? *(Snyder)*. 11:17-18.
A guide for plant inspections in the paper industry *(Mosher)*. 24:26-36.
Home fire inspections by fire departments *(Malmquist)*. 13:34-36.
Inspection committees should follow checklist technique to avoid oversights, to provide a complete record *(Erwin)*. 15:28.
Inspection tour checklist of the United Auto Workers health and safety department *(Gruden)*. 15:8.
Inspections—responsibility—training *(Marker)*. 24:21-26.
Let's stop these fire deaths! *(Hughes)*. 12: 39-41.
Medical and safety personnel team to inspect work areas where public employees operate *(Pagnard)*. 7:62.
Methods correction committee functions as inspection team in small store *(Colson)*. 11:37.
North Dakota takes safety to the small communities through its Workmen's Compensation Bureau *(Byers)*. 15:35-39.
Radiation exposure in the rubber industry and control measures *(Manning)*. 12: 25-26.
Recommended off-campus fire protection procedures *(Quinlan)*. 26:80-82.
"Red Tag" marks hazard in Oregon plants *(Callahan)*. 15:29-32.
Resume of gas ignitions and fires in coal mines since enactment of the Federal Coal Mine Safety act; recommendations to prevent recurrences *(Weaver)*. 6:36.
Safety communications in the foundry *(Burns)*. 17:21-22.

Testing for leakage of dangerous fission products and radioactive materials from reactor pressure vessels *(Kasse)*. 14:56.

The use of checklists in safety inspections in the petroleum industry *(Asbury)*. 22: 40-42.

Warehouse safety inspection form developed with separate check lists *(Prince)*. 11: 44-46.

What we are doing to prevent falls-of-ground accidents *(Crewes)*. 19:37.

Why set up inspection programs? *(Kelsey)*. 2:13-16.

INSTRUMENTATION

Are scientific devices improving traffic enforcement? *(Schmelig)*. 27:28-31.

INSULATING AND ROOFING INDUSTRY

A round table discussion. 24:43-45.

INSULATION

Control of health hazards of electrical insulating materials *(Meiter)*. 8:13-16.

Copper coating on zirconium and titanium powders, lessened ignition possibility *(Brown)*. 14:29.

Insulation methods used in an aluminum reduction plant *(Ricketts)*. 17:12-22.

Insulators on 345 Kv. maintenance work washed and cleaned with high pressure water jet *(Carter)*. 8:22.

INSURANCE

Disability benefits paid to employees of Alcoa for lost time due to off the job injuries, plus life insurance in 1954 *(Oilliland)*. 12:15.

Group insurance provides disability benefits for non-occupational illness *(McDermott)*. 11:29.

Safety pays off. East Bay Municipal Utility District recovered $213,000 insurance since 1943 *(Webb)*. 8:40.

See also Workmen's Compensation.

INSURANCE COMPANIES

Behind the scenes—the insurance company's role in industrial safety *(Dodson)*. 23: 15-30.

Safety 'round the clock—an extended health and safety program for industry *(Rhude)*. 23:10.

INTERLOCKS

Interlock to prevent slaker boil-over *(Bunch)*. 24:18.

INTERNATIONAL ASSOCIATION OF FIRE CHIEFS

Home fire inspections by fire departments *(Malmquist)*. 13:34-36.

INTERSTATE COMMERCE COMMISSION

ICC regulation of the physical requirements of drivers *(Owen)*. 20:14; (panel forum) 20:25, 30.

INTERVIEWS

Commendary interviews for achievements of transit operators having no accidents *(Kenney)*. 23:21.

Driver safety grows with your interview *(Taylor)*. 20:34-35.

Some psychological problems may be approached effectively through therapeutic interviews *(Owen)*. 20:29.

The supervisor can give the employee "who blew his top," a second chance by talking it out *(Kosmatsis)*. 20:31-32.

INVENTORY

Fundamentals of home safety activities *(Haywood)*. 1:31.

Inventory—a tool for improving traffic programs *(Butler)*. 27:32-34.

Inventory of occupational accident prevention activities *(Crowshore)*. 12:5-10.

The 1956 home safety inventory *(Schaplowsky)*. 13:33-34.

The value of self-inventory to improve our inadequacies and inspitudes *(Rosenstein)*. 20:19-20.

INVENTORY—TRAFFIC

The states with the highest performance in the Annual Inventory, are preventing the most traffic accidents *(Hill)*. 1:50.

INVESTIGATION OF ACCIDENTS

Accident—cause, investigation and prevention *(Turner)*. 12:28-32.

Accident investigation *(Ormsbee)*. 15:7-9.

Accident investigation *(Reilly)*. 24:9-12.

Accident investigation *(Seward)*. 24:8-9.

Accident investigation is a part of good communications in safety *(Scriven)*. 18: 23.

Conclusions of the roundtable discussion of the Hotel Division on "What can we do about public liability claims?" *(Nordhausen)*. 11:48.

Driver safety is improved by your investigation *(De Pew)*. 20:36-37.

How do you investigate an accident *(Stockdale)*. 3:5-12.

How we can profit from thorough accident investigation *(Kossmaugh)*. 10:10-15.

Investigative procedure and report writing *(Corrigan)*. 17:34-36.

Safety and the foreman *(Wilson)*. 24:26.

IRON AND STEEL

Inland Steel company's off the job safety programs *(Riddiger)*. 13:43-44.

"Knowing's not enough," the safety program of U. S. Steel *(Buchanan)*. 10:4-7.

A planned gas job (skit). 17:30-32.

The pros and cons of safety merit award programs (discussion). 17:5-15.

Safety performance . . . the barometer of good supervision *(Rich)*. 17:7-9.

Top management's responsibility for safety *(Smith)*. 17:25-28.

Why set up inspection programs? *(Kelsey)*. 2:13-16.

J

JACKS

Mining with the coal planer including safety aspects *(Marra)*. 6:12-13.

Jackson, Hugh M.
Insulating and roofing (round table discussion). 24:43-45.

Jackson, William D.
Peaceful and safe uses of atomic energy. 2:19-26.

Jaffe, Larry I.
Safe operation of industrial furnaces and heat equipment. 16:29-36.

JEWELRY

Ruling on wearing rings at work (Insulating and reeding round table discussion). 24:46.

JOB ANALYSIS

Developing safe work methods in sawmills *(Hale)*. 22:13-18.

Inventory shows that the precautions of preparing job breakdowns ignored by many plants *(Crowshore)*. 12:5-9.

Job safety analysis and pre-placement physical examinations *(Gruber)*. 1:26-28.

Jobs studied, recorded analysis of each job made by supervisor with workers at Bethlehem Steel company *(Neal)*. 19:36-40.

Safety must be written into job descriptions, establishment of man specifications, and recruiting and selection procedures *(Haig)*. 23:6.

JOB INSTRUCTION

Training for safety attitudes *(Griffin)*. 23: 13.

See also Training.

JOB PLACEMENT

Job training and placement for public employees (a panel discussion). 7:28-32.

Pre-placement examinations to match the man to the job *(Nelson)*. 24:41.

Johnson, Arthur E.
Are drivers failing our national safety movement? 27:45-47.

Johnson, William G.
Time for decision. 1:36-41.

Jones, Tarvis
What Red Cross first aid training has done for our accident control program. 7:28-34.

Judd, William R.
School responsibilities for ski safety. 26: 33-36.

K

Kahler, William V.
Safe at home. 13:53-57.

Kapian, Joseph M.
The opportunities for local safety councils and chapters of ASSE to promote safety activities among business and trade associations. 14:104-106.

Karo, H. Arnold
Nautical charts for safe navigation. 16: 29-32.

Kassmaugh, James E.
How we can profit from thorough accident investigation. 10:10-15.

Kebblish, William
Safety and operating problems of a modern haulage system. 6:18-19.

Keene, Clair E.
Nuclear power pressure vessels. 14:54-57.

Kehoe, Robert A.
Controlling health hazards in a chemical plant. 3:9-11.

Kelsey, Frank W.
Why set up inspection programs? 2:13-16.

KICKBACKS

Description of a dangerous kickback in a small sawmill operation *(Malcolm)*. 20:11.

Kiessle, E. O.
Highway-railroad crossing safety. 28:29-32.

Kihn, A. E.
Pacific area report for the Marine Section. 16:16-17.

Kinter, M. E.
Safety in high pressure chemical reactions. 8:5-8.

Kintz, C. M.
Two visual aids used in Bureau of Mines safety demonstrations. 14:94-96.

Kniss, Raymond
Why industrial plants burn. 11:30-31.

Koussakoues, W. E.
Physical aspects of low voltage electric shock. 14:39-41.

Krueger, John E., (Mrs.)
Driver improvement schools, an effective public relations and safety promotion instrument of our traffic courts. 27:41-44.

Kuehn, Albert T.
Building safety into the printing press. 23: 20-21.

Kuhns, George F.
Job training and placement in the Illinois division of Highways. 7:28-31.

L

LABELING

Safe labeling practices for gas cylinders *(Reinhard)*. 8:37.

LABOR AND LABOR UNIONS

Accident investigation *(Ormsbee)*. 15:7-9.

Eye screening programs in industry *(Marshall)*. 24:36.

Good communications help safety *(Scriven)*. 18:21-24.

How the Safety Division of the United Mine Workers of America has aided the accident prevention program of coal mines *(Schuler)*. 8:24-26.

A joint labor-management safety committee should assume the status of the official investigating party in handling accidents *(Turner)*. 12:32.

Labor-management conferences in Toronto highlight safety and accident prevention for the paper industry *(Mobbs)*. 29:16.

Labor's stake in safety—the inadequacies of our present systems of workmen's compensation, factory inspection, and occupational disease legislation *(Hayes)*. 18: 16-21.

North Dakota takes safety to the small communities *(Eyan)*. 15:25-28.

Occupational health control through engineering *(Van Atta)*. 19:11-12.

The Oregon safety story *(Callahan)*. 18: 25-28.

Organized labor will help spearhead accident prevention programs when management provides the fundamental elements of that program *(Reilly)*. 24:11-12.

Population mobility . . . agricultural migrant worker *(Hoist)*. 26:29-32.

Recognition and utilization of union safety committees result in amicable relationship between management and labor at Butte District of Anaconda *(Wendel)*. 19:45.

Role of the U. S. Department of Labor in occupational safety *(Butcher)*. 18:34-36.

Safety—a moral responsibility *(Hall)*. 18: 12-16.

Supervising the youthful worker *(Hargreaves)*. 18:4-6.

The union's role in safety *(Brown)*. 18: 9-11.

LABOR CONFERENCE,

Bureau of Labor Standards' field staff will assist in implementing the projects of the Conference *(Butcher)*. 18:26.

Minutes. 18:7-32.

Officers and committees. 18:34-36.

LABOR TURNOVER

The causes of labor turnover, as they can affect an employing officer's decisions on hiring or not hiring new drivers *(Lamphier)*. 20:40.

Incentives that could stabilize the labor turnover in the logging industry *(Dooley)*. 29:7.

LADDERS

Hazard of shock from charged electric field at high voltages, eliminated by use of metal ladders and conductive soled shoes *(Carter)*. 8:21.

Parks maintenance safety *(Williams)*. 7:22.

Portable metal ladders used aboard freighters *(Terr)*. 16:24, 32.

Using American Standards in safety training *(Mobbs)*. 29:21.

Lake, F. S.

Education—the foundation of driver supervision. 20:44-46.

Lamb, Henry G.

Trade association standards. 16:14-15.

Using American Standards in safety training. 29:30-31.

Lange, Paul

Epoxy resins and catalysts hazards. 2:7-10.

LATHE OPERATORS

Ratings showed relationship between quality of production and level of visual efficiency *(Simpson)*. 24:32-34.

LEADERSHIP

Human relations and man-management *(Rosenstein)*. 20:3-44.

Our role in safety leadership *(Sayre)*. 1:37.

LEATHER PRODUCTS INDUSTRY

What's my line in safety (symposium). 11: 37-40.

a) Remarks of a nurse *(McDermott)*. 11: 37-39.

b) Remarks of a safety director *(Russo)*. 11:40.

LEGISLATION

How the Congressional Special Subcommittee on Traffic Safety can serve a valuable function in the field of safety *(Roberts)*. 27:5-7.

Legislation as it affects public employee safety programs *(Caudle)*. 7:68-71.

Regulations set up for life saving equipment by the International Convention for the Safety of Life at Sea, forbids use of inflatable equipment *(Nash)*. 16:41.

Some legislation is necessary, but laws can't make a ship safe *(Renehan)*. 16:22.

Lemon, Bill

Protecting school bus passengers through education. 26:99-100.

LETTERS

Home mailing program, an extension of Liberty Mutual's health and safety program for industry *(Rowe)*. 23:18.

"Letter" to insurance company by man who had five accidents in one minute, has comic-serious impact *(McClure)*. 11:33-34.

LIABILITY

Conclusions of the roundtable discussion of the Hotel Division on "What can we do about public liability claims?" *(Hovhannes)*. 11:48.

School bus accident in the courts *(Moorefield)*. 26:106-108.

Settlement of minor claims at store level *(Esser)*. 11:41.

What not to do in case of a motor vehicle accident happening to employees of the Virginia department of highways *(Lyell)*. 7:67.

See also Workmen's compensation.

LICENSES

Gallup poll shows public favors stricter licensing examinations on vision, health, driving ability *(Bryan)*. 27:52.

United States and Great Britain requiring ship officers to know radar plotting *(Thayer)*. 16:44-46.

LIFE SAVING AND RESCUE

Current developments in inflatable liferafts *(Nash)*. 16:38-41.

Forty-two inch auger used to rescue fire man from a cave-in at an "island mine" *(Dean)*. 6:21.

See also Crash safety research; Disaster organization; First aid; Respirators.

LIFEBOATS

Current developments in inflatable liferafts *(Nash)*. 16:38-41.

Ladders help in problem of securing lifeboat covers safely *(Terr)*. 16:27.

LIFTING

Chute on freighter for dry stores stopped lifting injuries to steward personnel *(Terr)*. 16:26.

Protecting oil tanker crews from accidents *(Vander Chute)*. 16:26.

Raising and lowering windows source of injury to transit operators *(Little)*. 26: 31.

LIGHTNING

Possible hazard of lightning in 345 Kv. hot line maintenance *(Carter)*. 8:21.

LIME

Chemical hazards of alkaline pulp liquor making *(Busch)*. 24:18.

Water on lime produces enough heat to cause fire if a combustible is present *(Brown)*. 14:27.

Lipsincott, W. F.

Is "hot electrical work necessary? 8:5-6.

LIQUEFIED PETROLEUM GAS

Types of formal training given in the use of LPG (insulating and roofing round table discussion). 24:44.

LIQUID OXYGEN

Term LOX abolished in all Air Force technical orders and contracts, liquid oxygen replaces term LOX *(Reinhard)*. 8:52.

Little, William I.

Employee safety. 28:30-32.

LOCK OUT SYSTEMS

"Blocking-out" tags and "Out of service" tags used in addition to lock[illegible] blocking out electrical circuits at [illegible]nbers Works *(Lippincott)*. 8:7.

The hazards of radio transmitters ... their correction *(Card)*. 8:10-12.

Inland Steel has lock-out program that saved lives *(Rich)*. 17:2-3.

LOCOMOTIVES

Improvement to underground haulage system at TCI's ore and coal mines *(Evans)*. 19:33-32.

Safety features of the locomotives used in the Mathies Coal Mine *(Kebblish)*. 6: 16-17.

Loft, Bernard I.

Effects of driver education on driver knowledge and attitudes in secondary schools. 28:17-22.

LOGGING

How to train loggers *(Dooley)*. 29:7-8.

Promoting woods safety *(Pearce)*. 24:82-80; 29:34-36.

LOOK UP AND LIVE CAMPAIGN

Look up and live—electric utility companies ask construction industry to join in reducing overhead power line accidents *(White)*. 7:15-20.

Lumpkin, J. Wylie

Driver safety is influenced by your decision —to hire or not to hire him. 20:37-40.

Lyell, Melvin G.

Lessons learned by giving service during and after the recent flood. 7:57-58.

Lyell, Melvin G.

What we expect from operators of highway vehicles. 7:64-67.

M

McCee, G. W.

Safety features in the design and development of Ireland Mine. 6:28-31.

McCarthy, Mike

Safety—a national necessity. 22:11-12.

McCausland, W. A.

Heart disease in industry. 12:23-24.

McClure, Dean

How I train my employees for job safety. 11:33-35.

McConnaughey, Joseph, Jr.

Practical safety devices included in Harris-Seybold products. 23:11-12.

McDermott, Bernice

What's my line in safety, a nurse speaks. 11:37-39.

McDonald, J. C., Jr.

Remarks on disaster organization for storms. 7:38.

MACHINE AND REPAIR SHOP

Built-in safety features—surface mine plant *(Brownd)*. 18:25-26.

MACHINERY

The basic accident hazards to which workers are exposed with suggestions for their control *(Grinsmore)* 18:8; *(Mooney)* 11-14.

Men, machines and methods—some simple measures which enforced can eliminate the perils of construction machinery *(Wilson)*. 7:18.

Moving machinery accident in a super hydrate department *(Tienzen)*. 4:5.

Noise control by acoustical treatment *(Yerges)*. 14:62-62.

MAGISTRATES

How women can help build public understanding and support for traffic court modernization *(Easton)*. 27:38-41.

Small town traffic courts and their administration *(Rushing)*. 27:34-38.

MAGNESIUM

Factors in spontaneous heating of powdered or molten magnesium *(Brown)*. 14:27-28, 30.

MAINTAINING INTEREST

How to maintain interest in safety through a program of education *(Russo)*. 11:60.

See also Committees; Group effort; Meetings; Rewards.

MAINTENANCE AND REPAIR

Chemical hazards of alkaline pulp liquor making *(Busch)*. 24:18.

Coal tar product for weather deck coating eliminated slipping, noise of scaling, odor of fish oil and high maintenance costs *(Terr)*. 16:24.

Freighter fleet uses paint float instead of stagings to maintain the hulls of ships *(Terr)*. 16:27.

High voltage switch *(Burt)*. 22:6.

How I train my employees for job safety *(Bauer)*. 11:31-32.

The importance of safety in maintenance of equipment and stores (a symposium). 28:27-33.

a) Locomotive maintenance *(Gray)*. 28: 27-30.

b) Freight and passenger car maintenance *(Cronkhite)*. 28:29-30.

c) Stores operation *(Forbes)*. 28:31-33.

The importance of safety in mechanization —safe trolley maintenance *(Kirk)*. 28: 17-20.

The importance of safety in mechanization —track maintenance *(Vallette)*. 28:11-13.

Installation and maintenance costs reduced at TCI's mines using welded mine track and steel ties *(Evans)*. 19:32.

Is "hot" electrical work necessary? *(Lippincott)*. 8:5-6.

Jet ground handling hazards *(Dyment)*. 2: 24-26.

Job training and placement for the Illinois Division of Highways employees *(Kubas)*. 7:28-31.

Maintenance of respiratory protection *(Fescett)*. 8:22.

The mechanical department's role in transit safety *(Feldman)*. 26:28-29.

Parks maintenance safety—tree trimming—brush handling and related subjects (a panel discussion). 7:34-40.

Plant construction and maintenance *(Coleman)*. 8:19-21.

Poor maintenance cause of high percentage of accidents with cylinder gases in oxy-fuel gas welding and cutting *(Saacke)*. 8:36.

Safe use of diesel equipment in underground metal mines *(Hollis)*. 19:8, 11, 16-17.

Safety in ship repair *(O'Donnell)*. 16:32-34.

Sand storms *(Dunwiddie)*. 7:54-56.

Selling safety to management by reducing maintenance expenditures *(Simpson)*. 23: 14-15.

345 Kv. hot line maintenance *(Carter)*. 8: 30-32.

Three phases of an adequate maintenance program for an exhaust ventilation system *(Horne)*. 14:47-48.

Meine, E. H.
Process in cementation of coal-mine roof. 8:4-7.

Malcolm, Frederick H.
Safety in the small sawmill. 20:9-12.

Malley, W. A.
Better safety meetings through training courses for chairmen and secretaries. 22: 43-44.

Malmquist, Reynold C.
Home fire inspections by fire departments. 13:34-35.

MAN-MANAGEMENT

Human relations and man-management *(Roecuistein)*. 20:3-44.

MANAGEMENT

Accident—cause, investigation and prevention *(Turner)*. 12:20-23.

Be positive in using safe driver awards *(Hughes)*. 20:11.

Behind the scenes—the insurance company's role in industrial safety *(Dodson)*. 22: 15-20.

The elements of a good safety program *(Reilly)*. 24:10-12.

Front office safety *(Gerard)*. 10:7-8.

The how of organizing a safety program in a small department store *(Colson)*. 11: 55-58.

How to sell management on safety *(Russo)*. 11:40.

An indictment of the ethics and morals of the business community as related to the inadequacies of workmen's compensation, factory inspection and occupational disease legislation *(Hayes)*. 18:16-21.

Is "hot" electrical work necessary? *(Lapsincott)*. 8:6.

It isn't the coach, it's the team *(Dittmer)*. 22:5-7.

A management look at petroleum industry safety *(Carrgusos)*. 22:7-10.

The opportunities for local safety councils and chapters of ASSE to promote safety activities among business and trade associations *(Kaplan)*. 14:104-106.

Present day conditions favorable for a successful mine safety program *(Bradbury)*. 8:21-23.

Prevention of accidents to crew aboard freighters *(Terry)*. 16:21-23.

Principles of industrial housekeeping *(Costardo)*. 2:22-25.

Qualifications and attributes of the perfect boss *(Roecuistein)*. 20:43-44.

Quality control the key to top management's interest in and support of safety programs *(Simpson)*. 24:28-96.

Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 2:17-20.

The role of the trade association in selling safety to management through "cut accidents—cut costs" emphasis *(Cleland)*. 24: 16.

Safety and semantics *(Simpson)*. 23:13-15.

Safety discipline *(Heinrichs)*. 4:7-10.

The safety program of Bethlehem Steel company *(Neal)*. 19:39-42.

A supervisory appraisal program for engineering safety into a material handling system *(Orrene)*. 14:36-38.

Top management's responsibility for safety *(Smith)*. 17:36-38.

The use of checklists in safety inspections in the petroleum industry *(Asbury)*. 22: 40-42.

The union's role in safety *(Brown)*. 15: 10-11.

MANHOLES

Artificial gas escaping in the hold, caused near fatality to inspector *(Fawcett)*. 8:28.

Mann, James W.
The Elementary School Section's viewpoint on safety education. 26:58-59.

Manning, R. A.
Radiation exposure in the rubber industry and control measures. 12:26-27.

MANUFACTURING

Control of noise at the source *(Young)*. 14: 58-59.

Dust collection at the coal mine face with continuous mining operations *(Wachi)*. 6:31-35.

Materials handling by conveyors without accident *(Webb)*. 14:50-53.

Practical safety education and training *(Reeve)*. 2:26-32.

Principles of industrial housekeeping, the seven steps policy in effect at Roebling *(Costardo)*. 2:24-25.

Marconi, E. P.
Overhead projection. 14:92-93.

MARINE INDUSTRY

Accident prevention in passenger vessels *(Reusken)*. 16:28-32.

Current developments in inflatable liferafts *(Nash)*. 12:38-42.

Fishing vessels in Great Britian required to carry inflatable liferafts *(Nash)*. 16:41.

"Knowing's not enough" safety program of U. S. Steel *(Buchanan)*. 16:4-7.

Nautical charts for safe navigation *(Kerr)*. 16:36-38.

The new nuclear-equipped, guided missile navy *(Will)*. 16:45-48.

Prevention of accidents to crew aboard freighters *(Terry)*. 16:21-23.

Protecting oil tanker crews from accidents *(Vander Clute)*. 16:17-21.

Radar plotting on merchant ships *(Thayer)*. 16:42-45.

Safety in ship repair *(O'Donnell)*. 16:32-34.

Safety precautions taken on inland water vessels to avoid accidents . . . and still they happen! *(Perrell)*. 16:7-9.

MARINE SECTION

Minutes. 16:4-60.

Officers and committees. 16:51-54.

Marker, Sherman T.
Inspections — responsibility — training. 24: 21-26.

Marre, Robert J.
Mining with the coal planer including safety aspects. 6:11-14.

Marsh, Burton W.
Report on plans for 1957 public officials traffic safety conference. 27:9-12.

Marshall, Don
Eye screening programs in industry. 24:28-32.

Martineau, Pierre
How to interest people in what they don't want to know (symposium). 13:7-16.

MASS MEDIA

It is more difficult to communicate via one of the mass media than it is on a face to face basis *(Martineau)*. 13:9-10.

Mass media are intrinsically weak media for moving serious ideas into people's heads, deeply enough to change people's behavior *(Kainer)*. 13:10-12.

Mateer, D. D.
Flannel board demonstrations. 14:94.
The pros and cons of safety merit award programs. 17:15-15.

Mathewson, J. H. and D. M. Savery
Motor vehicle safety measures and devices —what can the safety engineer support and recommend? 14:14-21.

MEAT INDUSTRY

Meat market increased production, reduced knife cuts through use of gloves *(Kerr)*. 11:41.

Our auto fleet drives for safety *(Emond)*. 14:6-7.

MEAT PACKING, TANNING AND LEATHER PRODUCTS SECTION

Minutes. 11:37-40.

Officers and committees. 11:61.

Mechling, F. A.
Inland waterways committee report for the Marine Section. 16:14.

MEDICAL PROGRAMS, see First Aid; Health Programs; Physicians

MEETINGS

Better safety meetings through training courses for chairmen and secretaries *(Malley)*. 22:43-44.

Brainstorming for safety *(Studt)*. 11:23-30.

Education committee in hotel safety program holds monthly meetings *(Ferris)*. 11:84-84.

Management meetings and departmental meetings help control off-the-job accident problems in glass plant *(Mansfield)*. 12: 13.

Mock safety meeting conducted at industry safety training conference *(Crest)*. 24: 37; 29:33.

Preview of evening divisions, plan of rotary groups *(Kennett)*. 26:6.

Reducing traffic accidents by use of group discussion-decision *(Ferris)*. 26:26-32.

Safety communications in the foundry *(Burns)*. 17:28-30.

Skits for safety may scat to accidents *(Henneford)*. 14:96-100.

Useful and usable safety meeting techniques (a demonstration) *(Henneford)*. 22:21-30.

The values of safety meetings in the plant or in association safety work *(Cleland)*. 24:16.

Meiter, H. G.
Control of health hazards of electrical insulating materials. 8:13-16.

Meland, Warren
1958 national safety good turn. 1:19-20.

MENTAL HEALTH

Mental health for safety production (session three) *(Roecuistein)*. 20:28-34.

MERCANTILE ESTABLISHMENTS

The how of organizing a safety program in a small department store *(Colson)*. 11: 55-58.

Stores promote National Safety Council's falls campaign *(Prince)*. 11:42.

METAL MINING, see Mining Industry—Metal

METAL PRODUCTS INDUSTRY

Alcoa's approach to the off-the-job safety problem *(Williams)*. 12:14-16.

Clutch—brake control valving *(Huntington)*. 18:36-38.

Electrical hazards in aluminum reduction *(Ricketts)*. 17:15-22.

Freons and Genetrons, if heated in degreasing operations, give off toxic decomposition products *(Fawcett)*. 8:15.

Molten metal-water explosions *(Brown)*. 14:28.

Possibilities vs. probabilities (panel discussion). 18:6-14.

Pressed Metal Institute gives Ike, Ida awards to district having best safety record *(Workman)*. 14:108.

Safe operation of industrial furnaces and heat equipment *(Jaffe)*. 18:23-26.

A safety program for an extrusion plant *(Dobenon)*. 17:32-36.

See also Foundries: Iron and Steel.

METAL-WATER REACTIONS

Combinations of metals and water that ignite spontaneously or produce explosive reactions *(Brown)*. 14:27-30.

METALS

The effects of corrosive electrolysis on metallic roof bolts *(Muehnok)*. 6:9-11.

Fire control of some of the new pyrophoric metals *(Brown)*. 14:26-31.

METALS SECTION

Minutes. 17:7-42.
Officers and committees. 17:45-47.

METHYL CHLORIDE

Leak in methyl chloride compressor caused injury to two men *(Fawcett)*. 8:28.

Michalski, Charles and others
Demonstration of television techniques for driver education. 26:36-38.

Matzanger, Chester, Jr.
Chemical hazards of pulp bleaching. 24: 19-21.

MIGRANT WORKERS
Population mobility—agricultural migrant worker *(Hiett)*. 22:69-75.

MILITARY SEA TRANSPORTATION SERVICE
The new nuclear-equipped, guided missile navy *(Will)*. 16:45-49.

MINERAL AGGREGATES INDUSTRY, see Cement

MINING INDUSTRY
A cooperative program in accident prevention (panel discussion). 6:21-27.
a) Present day conditions favorable for a successful program *(Bradbury)*. 6:21-22.
b) The Indiana Joint Committee for Coal Mine Safety *(Purcell)*. 6:22-24.
c) Safety Division, United Mine Workers of America *(Schuler)*. 6:24-26.
d) Federal Bureau of Mines *(Westfield)*. 6:26-27.
How to auger mine safely (regulations developed by the Division of Mines in Ohio) *(Duse)*. 6:18-20.
Improvements to underground haulage system at TCI's ore and coal mines *(Evans)*. 19:30-34.
Incentive awards for good safety records in the mining industry *(Smith)*. 19:30-32.
Safe use of ammonium nitrate commercial fertilizer as blasting agent *(Crawlow)*. 19: 28-30.
Two visual aids used by Bureau of Mines for demonstrating flammable limits of gasoline and ignition sources *(Kiesle)*. 14: 34-36.

MINING INDUSTRY—COAL
A cooperative program in accident prevention *(Bradbury)*. 6:21-22.
Dust collection at the coal mining face with continuous mining operations *(Wachs)*. 6:31-35.
The effects of corrosive electrolysis on metallic roof bolts *(Mushanok)*. 6:8-11.
How to auger mine safety *(Duse)*. 6:18-21.
Mining with the coal planer including safety aspects *(Morra)*. 6:11-14.
Process in cementation of coal-mine roof *(Melze)*. 6:4-7.
Résumé of gas ignitions and fires in coal mines since enactment of the Federal Coal Mine Safety Act: recommendations to prevent recurrences *(Weaver)*. 6:36-39.
Safety and operating problems of a modern haulage system *(Rebblish)*. 6:14-18.
Safety features in the design and development of Ireland Mine *(McCoa)*. 6:28-31.

MINING INDUSTRY—METAL
Built-in safety features—surface mine plant *(Braund)*. 19:24-27.
Safety program for the Butte District operations of the Anaconda Company *(Wendel)*. 19:41-45.
What we are doing to prevent *falls-of-ground* accidents *(Crowe)*. 19:34-38.

MINING SECTION
Minutes. 19:5-45.
Officers and committees. 19:46-47.

Mobbs, A. E.
Does safety training pay? 20:14-17.

Moffe, D. J.
Driver safety starts with your employment application form. 20:23-24.

Moll, Godfrey J.
Laboratory barricading of high pressure *extra hazardous reactions*. 8:36-37.

Montalla, R. V.
Toxic chemicals. 5:42-44.

Moore, Harold
Machine tools and principles of guarding. 2:15-18.

MORAL RESPONSIBILITY
Safety—a moral responsibility *(McR)*. 15: 13-16.
The traffic problem *(Hill)*. 1:47-49.

Morse, E. M.
Factors in exhaust ventilation system design for the safety engineer. 14:42-48.

MOTIVATION
Drivers deliberately violate highway regulations and safe driving practices: factors contributing to this attitude *(Johnson)*. 27:45-47.
How to interest people in what they don't want to know (Symposium). 13:5-13.
1) Remarks of Fairfax M. Cone. 13:5-6.
2) Remarks of Pierre Martineau. 13:7-10.
3) Remarks of Victor M. Ratner. 13:10-13.
Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 8:19.
Sentiments and emotions are the most important motivators of us all *(Rosenstein)*. 20:9-14.
The traffic safety fight, the need for motivational research *(Strother)*. 1:30-31.

MOTOR TRANSPORTATION INDUSTRY
Accentuate the positive *(Furnee)*. 20:5-6.
Accidents can be *stopped* at the hiring line (a symposium). 20:33-40.
a) Safety starts with your employment application form *(Moffe)*. 20:23-24.
b) Safety grows with your interview *(Taylor)*. 20:24-25.
c) Safety is improved by your investigation *(De Fee)*. 20:25-27.
d) Safety is influenced by your decision *(Langdon)*. 20:27-28.
Be positive in driver testing *(Henak)*. 20: 6-7.
Be positive in using incentives *(Wiegt)*. 20:8-10.
Be positive in using safe driver awards *(Hughes)*. 20:10-12.
Effective supervision is positive (a symposium). 20:41-52.
a) Orientation — the beginning *(Carter)*. 20:41-44.
b) Education—the foundation *(Lake)*. 20: 44-46.
c) Stimulation—the framework *(Nelson)*. 20:47-49.
d) Human relations — the key *(Heaton)*. 20:50-52.
Panel forum on positive driver testing *(Nichols, moderator)*. 20:34-41.
The positive approach to driver physical requirements (a symposium). 20:12-21.
a) Physical factors *(Owen)*. 20:12-16.
b) Visual factors *(Payne)*. 20:17-20.
c) Emotional factors *(Turrell)*. 20:20-22.
d) Panel forum *(Nichols, moderator)*. 20: 34-41.

MOTOR VEHICLE INDUSTRY
Accident investigation *(Gruden)*. 15:7-9.
Investigative procedure and report writing *(Corrigan)*. 17:34-38.
Occupational Health control through engineering *(Van Atta)*. 15:11-12.
Possibilities vs. probabilities (panel discussion). 15:6-14.
Safe operation of industrial furnaces and heat equipment *(Jaffe)*. 15:23-26.

MOTOR VEHICLES
Automobile crash safety research *(Dye)*. 27:50-51.
A guide to accident preventability for the operators of highway vehicles in the Virginia Department of Highways *(Lyell)*. 7:66-67.
Have you met Otto? *(Peters)*. 9:18-19.
Motor vehicle safety measures and devices—what can the safety engineer support and recommend? *(Mathewson and Severy)*. 14:14-21.
The national school bus program—what it means to a state motor vehicle department *(Hyde)*. 26:113-120.
Total causes of accidents on freeways in Los Angeles, San Francisco and San Diego for the year 1956 *(Mathewson and Severy)*. 14:21.
What is the industrial safety engineer's responsibility for motor vehicle safety equipment? *(Brown)*. 14:15-13.
What to do in case of accident—guide for the operators of highway vehicles in the Virginia department of highways *(Lyell)*. 7:67.
See also School Buses.

Mushnok, John M.
The effects of corrosive electrolysis on metallic roof bolts. 6:8-11.

Muir, J. L.
Safety through the eyes of a camera. 22: 30-33.

Mulvena, William A.
Highlights of several sessions for safety personnel in the brewing industry. 11:7-8.

Murphy, George C.
Snow and ice control. 7:28.

Myers, Hallie L.
School bus accidents: how much do we know about them? How can we find out more about them? 26:101-108.

Nebb, Joseph W., Jr.
Current developments in inflatable liferafts. 16:38-41.

Neufeldt, John
On-the-job accident control in a single location company. 12:13-14.

N

NATIONAL AMERICAN RED CROSS
Emergency first aid programs in industry *(Bryson)*. 21:7-8.

NATIONAL BOARD OF FIRE UNDERWRITERS
Community fire prevention planning *(Fowler)*. 13:87-88.

NATIONAL FIRE PROTECTION ASSOCIATION
Flammable materials in the chemical laboratories—system for rating *(Wood)*. 8: 38-41.

Let's *stop* these fire deaths! *(Hughes)*. 12:38-41.
Restrictive regulations at service stations *(Woodworth)*. 22:33-35.

NATIONAL SAFETY COUNCIL
Annual council meeting. 1:12-28. Minutes. 1:12-13; Invocation. 1:13; President's report. 1:14-18; Keynote address. 1:25-28.
Officers, trustees and board of directors. 1:8-11.

NAVIGATION
Agencies that have important part in furthering the safety of marine safety *(Kerr)*. 16:26.
Nautical charts for safe navigation *(Kero)*. 16:35-38.
Radar plotting on merchant ships *(Thayer)*. 16:43-45.

NATIONAL SAFETY COUNCIL
Opportunities for cooperation between industrial associations and industrial sections of the National Safety Council *(Workman)*. 14:103-108.
See also Rewards—National Safety Council.

Neil, Charles E.
The safety program of Bethlehem Steel company. 19:39-41.

Nelson, Ned
Training to control unsafe acts. 24:40-42.

Why industrial plants burn. 11:19-20.

NEWSPAPERS
Can safety be news? *(Hoest)*. 22:8-12.
See also Employee Publications.

Nichols, A. E. (moderator)
Panel forum on positive driver testing. 20: 34-41.

NITRATES
Nitrates used in salt baths should be procured with a red dye for identification to prevent explosions from erroneous additions to mixture *(Jaffe)*. 18:24.

NITROCARBONITRATE
Blasting agent in use in seismic prospecting *(UcoArco)*. 22:19.

NITROGEN
Employee died from nitrogen inhalation in air-line respirator *(Peacock)*. 8:26.
Reducing the hazards of using nitrogen solutions and acids in a fertilizer plant *(Perrine)*. 19:18-21.
Toxic oxides of nitrogen in diesel exhaust gases are weakened by dilution systems *(Holtz)* 19:9-10, 13-14.

NOISE
Control of noise at the source *(Young)*. 14:58-61.
Jet ground handling hazards *(Dyment)*. 2:25-26.
Jet noise on the airport—what to do about it *(Hardy and Ansell)*. 2:29-31.
New trends in occupational health programs *(Gardiner)*. 27:18.
Noise control by acoustical treatment *(Yerges)*. 14:62-64.

Safety award systems mining industry (Hecker). 19: 5-8.

NON-FERROUS METAL INDUSTRY
Engineering safety into a material handling system *(Orozco)*. 14:30-38.

Nordhausen, Robert C.
Conclusions of the roundtable discussion of the Hotel Division on "What can we do about public liability claims?" 11:42.

Norman, R. E.
Food retailers safety discussion. 11:41-42.

Noyes, Alfred M.
Selling the driver on the need for driver training. 7:23-26.

Nuckolls, A. H.
A summary of Mr. Nuckolls's congress paper of 1927 on spontaneous ignition *(Brown)*. 14:26-27.

NUCLEAR POWER
The new nuclear-equipped guided missile navy *(Will)*. 16:45-46.
Nuclear power pressure vessels *(Keene)*. 14:54-57.
Peaceful and safe uses of atomic energy *(Jackson)*. 9:19-26.

NURSING SECTION, see Occupational Health Nursing Section

NURSES
Duties of the store nurse as outlined in warehouse safety report *(Prince)*. 11:44.
Emergency first aid programs in industry *(Bryson)*. 21:7-9.
Handling problems of asphyxia in industry *(Dunne)*. 21:9-14.
New trends in occupational health programs *(Gardner)*. 21:14-17.
Responsibilities and limitations of the industrial nurse in the vision program *(Hargreaves)*. 14:74-77.
What's my line in safety, a nurse speaks *(McDermott)*. 11:27-29.

Nutt, Henry
How I train my employees for job safety. 11:35-36.

O

OBITUARIES
A tribute to H. Louise Cottrell, pioneer in research for elementary school safety *(Slack)*. 26:29-30.

OCCUPATIONAL HEALTH NURSING SECTION
Introductory remarks *(Paskusa)*. 21:7.
Minutes. 21:7-12.
Officers and committees. 21:19.

O'Donnell, James R.
Safety in ship repair. 16:33-34.

OFF-THE JOB SAFETY
Are traffic accidents crippling your industrial safety program? 14:6-21.
Cost of off-the-job accidents to industry *(Wilkins)*. 2:5-8.
Emergency first aid programs in industry must be extended in to the home and community *(Brown)*. 21:5-6.
Flexibility and feedback programming for a multi-location operation *(Devine)*. 12:45-47.
How to control off-the-job accidents in the glass and ceramics industries (symposium). 12:12-17.
a) Off-the-job accident control in a single location company *(Mansfield)*. 12:13-14.
b) Alcoa's approach to the off-the-job safety problem *(Quikkend)*. 12:14-16.
c) Are off-the-job safety programs needed in industry today? 12:16-17.
Inventory of occupational accident prevention activities *(Crenshaw)*. 12:18.
Off-the-job accidents hurt industry too *(Riddagar)*. 12:61-65.
Off-the-job safety—help from civic groups: starting a program, reaching the home *(Gardner)*. 12:22.
Safety 'round the clock—an extended health and safety program for industry *(Rhute)*. 22:2-10.
Traffic safety education shares small part of company off-the-job accident prevention programs *(Hendrick)*. 7:22.
Women in industry — telephone companies promote home and traffic safety *(Frost)*. 7:22.

OFFICE SAFETY
Safety activities in the New York Telephone Company *(Frost)*. 7:24.

ORGANIZATION
Are traffic accidents crippling your industrial safety program? 14:6-21.
Basic steps in accident prevention. 2:5-22.
Behind the scenes—the insurance company's role in industrial safety *(Dodson)*. 22: 15-20.
Communications in safety (roundtable discussion). 12:22.
The elements of a good safety program *(Reilly)*. 24:10-12.
Engineering safety into a material handling system *(Orozco)*. 14:36-38.
Features of a motor vehicle accident prevention program *(Schulz)*. 7:9.
Findings of graduate theses in school safety in various areas *(Yost)*. 26:14-15.
A first line supervisor's safety program in the Los Angeles water utility organization *(Kerr)*. 2:36-39.
Flexibility and feedback programming for a multi-location operation *(Devine)*. 12: 45-47.
Highlights of several sessions for safety personnel in the brewing industry *(Mulvena)*. 11:7-8.
How and where to get started in a water and sewer utilities safety program *(Applegard)*. 2:32-35.
The how of organizing a safety program. 11:49-52.
a) Food retail stores *(Porter)*. 11:49-51.
b) Hotels *(Petrie)*. 11 52-55.
c) Mercantile and warehousing establishments *(Colson)*. 11:55-58.
How to set up and maintain a gas utility safety program *(Flad)*. 2:30-32.
Inspections — responsibility — training, the fundamental principles of our accident prevention philosophy *(Marker)*. 24:31-36.
Inventory of occupational accident prevention activities *(Crenshaw)*. 12:18.
"Knowing's not enough" safety programs of U. S. Steel *(Buchanan)*. 16:6-7.
Men, machines and methods—the industrial engineer in the construction industry *(Wilcox)*. 7:14-18.
Occupational safety—a challenge to the colleges *(Cutter)*. 26:68-76.
Parallel functions and activities of the safety programs of the trade associations and the large company *(Cleland)*. 24: 13-14.
Possibilities vs. probabilities (panel discussion). 16:6-14.
Role of the U. S. Department of Labor in occupational safety *(Butcher)*. 16:34-36.
Safety and heavy construction. St. Lawrence project and the highway program *(Armstrong)*. 7:9-12.
Safety and the foreman *(Wilson)*. 24:36-38.
Safety discipline starts at the top of the organization and depends upon the supervisory organization for its success *(Kendrick)*. 4:7-10.
The safety engineer's responsibility in fire protection *(Cobb)*. 14:32-35.
Safety for school personnel *(Wasserburger)*. 26:7-8.
Safety performance ... the barometer of good supervision *(Nish)*. 17:7-8.
A safety program for an extrusion plant *(Dobeman)*. 17:32-35.
Safety programs for the Butte District operations of the Anaconda Company *(Wrendel)*. 16:41-45.
The safety program of Bethlehem Steel company *(Reid)*. 16:38-41.
Safety 'round the clock—an extended health and safety program for industry *(Rhute)*. 22:2-10.
Safety suggestions for the cement, quarry and mineral aggregates industries *(Tiemann)*. 4:4-7.
Safety to sell—the how of organizing a safety program in a retail food store *(Porter)*. 11:49-51.
Training, teamwork, tenacity, the three T's of an effective farm safety program *(Butz)*. 8:2.
What's my line in safety (symposium). 11: 27-48.
a) Remarks of a nurse *(McDermott)*. 11: 27-29.
b) Remarks of a safety director *(Russo)*. 11:40.
The whole pattern and fabric of our industrial safety program rests on workmen's compensation and occupational disease laws *(Hayes)*. 16:17-21.

Orth, Lowell E.
The developmental method of training for safe pole climbing, "you learn before you go aloft." 2:22-24.

Owen, Eugene F.
The positive approach to driver physical requirements—physical factors. 20:15-16; (panel forum) 20:34.

OXYGEN DEFICIENCY
Asphyxia in industry—exposure to oxygen deficient atmosphere *(Dunne)*. 21:13-14.
Chlorine tank car washer passed out due to insufficient oxygen *(Fawcett)*. 2:36.
Man who fell into tank and would be rescuer both suffocated in oxygen deficient atmosphere *(Fawcett)*. 2:25.
Tank atmosphere must be checked and rechecked, nothing taken for granted *(O'Donnell)*. 16:33.

P

Pagnard, John E.
The safety engineer's viewpoint on the accomplishments of a city program of health and safety for governmental employees *(Pagnard)*. 7:81-82.

PAPER CUTTING MACHINES
Fatal injury averted by electric safety device installed on Seybold continuous trimmer *(Wrnzel)*, 22:8.
Practical safety devices included in Harris-Seybold products *(McConnaughay)*. 22: 11-12.
Trip controls for guillotine cutters *(Burt)*. 22:7-8.

PAPER INDUSTRY
Accident investigation *(Reilly)*. 24:5-12.
Chemical hazards of alkaline pulp liquor making *(Brasch)*. 24:17-19.
Chemical hazards of pulp bleaching (methods). 24:19-21.
Control of noise at the source *(Young)*. 14:60.
Does safety training pay? Ahlibi campaign proved what sustained efforts can do *(Mebbe)*. 22:14-17.
How to set up an industry safety training conference *(Creel)*. 24:36-42; 22:22-24.
How to train loggers *(Denbey)*. 22:7-9.
Inspections — responsibility — training *(Marker)*. 24:21-30.
Insulating and reeding (round table discussion). 24:43-46.
Medical control of hearing losses *(Ford)*. 14:64-70.
Promoting woods safety *(Pearce)*. 24:58-60; 22:24-26.
Rehabilitation in Ontario, Canada *(Young)*. 24:46-50; 22:22-28.
The role of the trade associations in industrial safety *(Cleland)*. 24:13-18.
Safety training for fire protection foresters *(Shanklin)*. 24:50-56; 22:26-32.
Training to control unsafe acts *(Nelson)*. 24:40-43.
The union's role in safety *(Brown)*. 16: 9-11.
Using American Standards in safety training *(Mebbe)*. 22:21.
What good vision can mean to industry *(Simpson)*. 24:33-36.

PARKS
Hurricanes and government *(Fleurov)*. 7: 83-84.
National Park Service activities for the health and safety of visitors, and employees *(Shanklin)*. 24:54-55; 22:30-31.
Parks maintenance safety—tree trimming—brush handling and related subjects (a panel discussion). 7:34-38.
a) Immunization experiment—1956 results *(Wrnzer)*. 7:34-35.
b) Tree trimming, brush handling *(Wickless)*. 7:36-37.
c) Chicago Park District *(Williams)*. 7: 37-38.

Parsell, E. B.
Safety precautions taken on inland water vessels to avoid accidents . . . and still they happen! 16:7-9.

Paskuna, Verna
Introductory remarks before the Occupational Health Nursing section meeting. 21:7.

PASSENGERS
Protecting school bus passengers through education *(Lewen)*. 26:99-100.
Protecting school bus passengers through education *(Smith)*. 26:96-98.
Protecting school bus passengers through instruction *(Heath)*. 26:100-101.
School bus accident in the courts *(Rosenfield)*. 26:1-6-108.
Selling passenger safety to the operator *(Ward)*. 26:17-19.
Selling safety to passengers *(Baker)*. 26:12-17.

Pavlousaki, Joseph G.
Developing a summer driver education program. 26:56-57.

Parton, Rex
Safety is a state of mind. 24:5-6.

Payne, Britain F.
The positive approach to driver physical requirements — visual factors. 20:17-20; (panel discussion) 20:24.

Pearce, J. Kenneth
Promoting woods safety. 24:58-60; 26:24-26.

Pennington, Maitland S.
Ship safety achievement award committee report for the Maritime Section. 16:12.

Perrine, Elmer C.
Reducing the hazards of using nitrogen solutions and acids—carelessness can be costly. 10:18-21.

PERSONAL FACTORS
Do we drive as we live? *(Bradley)*. 20:52-56; 22:32-36.
The human factors in safety *(Crane)*. 12:29-30.
Human relations and man-management *(Rosenstein)*. 20:3-44.
The personnel factor hazards that cause 90 per cent of all industrial accidents *(Drinkwater)*. 16:9-10.
Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 8:17-20.
Safety in ship repair—watching for the human elements, the intangibles of safety *(O'Donnell)*. 16:33-34.
See also Psychology.

PERSONAL PROTECTION
A shoe company's personal protection program *(McDermott)*. 11:38.
See also Clothing; Respirators; Safety equipment.

PERSONALITY
Do we drive as we live? *(Bradley)*. 20:52-56; 22:34-36.
Personality types that can cause difficulties *(Crane)*. 12:30.

PESTICIDES
Parks maintenance safety—first aid recommendations for chemical poisoning *(Williams)*. 7:46-49.

Peters, Elaine
Have you met Otto? 9:18-19.

Petrie, Robert C.
The how of organizing a safety program in a hotel. 11:53-55.

PETROLEUM INDUSTRY
Better safety meetings through training courses for chairmen and secretaries *(Malloy)*. 22:43-44.
Commercial vehicle safety can be improved *(Schulze)*. 14:3-9.
Company made films *(Hesse)*. 14:86-87.
Evolution of seismic explosives *(Cochran)*. 22:17-21.
How do you investigate an accident? *(Stockdale)*. 3:9-12.
A management look at petroleum industry safety *(Ferguson)*. 22:7-10.
The petroleum industry's stake in the public support effort *(Remmel)*. 22:27-29.
Restrictive regulations at service stations *(Woodworth)*. 22:25-26.
Safety through the eyes of a camera *(Muir)*. 22:30-33.
Safing of storage tanks by the absorption method *(Calkot)*. 22:13-16.
Sohio serious injury index *(Meier)*. 22:45-46.
Stagnite used in "The Destrehan Story" *(Hamblen)*. 14:87-88.
Traffic patterns and safety problems at service stations *(Splain)*. 22:25-27.
The use of checklists in safety inspections *(Asbury)*. 22:40-42.

PETROLEUM SECTION
Minutes. 22:7-48.
Officers and committees. 22:69-90.

PHARMACEUTICAL INDUSTRY
Laboratory barricading of high pressure and extra hazardous reactions *(Moll)*. 8:33-37.

PHOTOGRAPHY
Safety through the eyes of a camera *(Muir)*. 22:30-33.

PHYSICAL EDUCATION
Findings of graduate theses in school safety in various areas *(Yost)*. 26:15-16.
Safety through physical education *(Allen)*. 26:11-12.

PHYSICAL EXAMINATIONS
Job safety analysis and pre-placement physical examinations *(Gruber)*. 3:26-30.
Medical control of hearing losses *(Ford)*. 14:64-70.
Need for proper physical examinations for persons wearing emergency respiratory equipment: *(Fawcett)*. 8:38.
Physical examinations for public employees emphasis of municipal safety program *(Herrington)*. 7:60-61.
The positive approach to driver physical requirements (a symposium). 20:13-31.
a) Physical factors *(Owen)*. 20:13-16.
b) Visual factors *(Payne)*. 20:17-20.
c) Emotional factors *(Turrell)*. 20:20-22.
d) Panel forum *(Nichols, moderator)*. 20:24-31.

Index

Schedule of examinations for employees of inland water vessels *(Fersell)*. 16:8.
Use of visual tests in driver training *(Switzer)*. 7:26-27.

PHYSICIANS
Company doctors support industry in covering up occupational diseases, rather than isolate, prevent and care for them *(Hayes)*. 15:20.
Eye screening programs in industry *(Marshall)*. 24:29-32.
Heart disease in industry *(McCausland)*. 12:32-34.
The positive approach to driver physical requirements (a symposium and forum). 20:13-31.
The professional viewpoint on a city program of health and safety for governmental employees *(Herrington)*. 7:60-61.
The role of national surgical organizations in public safety *(Stack)*. 12:21-26.
Safety—a retreat or a challenge *(Feulner)*. 10:5-16.
Some current aspects of medical quackery *(Field)*. 21:17-12.

PIPE LINES
Reducing the hazards of using nitrogen solutions and acids in a fertilizer plant *(Perrine)*. 10:19-20.

PLANT LAYOUT, see Buildings

PLEDGES
Oregon Industrial Accident Commission pledge and program awards firms who achieve 100 per cent "sign-up" of employees *(Callahan)*. 15:32.
Signed safety pledges required of men in hazardous occupations at the Butte District of the Anaconda Company *(Wendel)*. 19:48.

POISON CONTROL CENTERS
The accident prevention program of the Public Health Service *(Goddard)*. 12:30-31.
Chicago Poison Control Center *(Stack)*. 12:26.
National Clearinghouse of Poison Control Centers *(Goddard)*. 12:30-31.

POISON IVY
Immunization experiment — 1955 results *(Warner)*. 7:34-35.

POISONS AND POISONING
A bibliography of toxic chemicals (Toxic Chemicals Committee, Chemical Section, NSC). 8:44-61.
Occupational health control through engineering *(Von Alta)*. 12:11-13.
Parks maintenance safety—first aid recommendations for chemical poisoning *(Williams)*. 7:46-49.

POLICE
Are scientific devices improving traffic enforcement? *(Schmeig)*. 27:29-31.
A practical approach to police training *(Warren)*. 27:19-21.
Smith-Cummings plan used in London Metropolitan Police Driver School, accidents dropped *(Hugunin)*. 26:50-51.
Urban enforcement problems as they are related to speed violations and their apprehension *(Warner)*. 27:27-28.

POPULATION
What are the facts of population mobility today? (A symposium). 26:62-67.
a) Change of residence *(Greer)*. 26:62-63.
b) Agricultural migrant worker *(Hiett)*. 26:63-66.
c) The military family *(Hall)*. 26:65-67.

Porter, Kenneth T.
Safety to sell—the how of organizing a safety program. 11:49-51.

POWER MOWERS
Parks maintenance safety *(Williams)*. 7:41.

POWER PRESS AND FORGING SECTION
Minutes. 12:6-20 (Joint session with Automotive and Machine Shop Section 12: 6-19).
Officers and committees. 12:33-34.
Opening remarks of general chairman, C. H. Dugger. 12:20-21.

POWER PRESSES
Clutch—brake control valving *(Huntington)*. 12:26-30.
The first speech on power press safety was made by August Kasens in 1919 *(Dugger)*. 12:20.

PRAYERS
The invocation for the annual council meeting *(Robinson)*. 1:18.

PRESSURE AND PRESSURE VESSELS
Laboratory barricading of high pressure and extra hazardous reactions *(Moll)*. 8:33-37.
Nuclear power pressure vessels *(Keene)*. 14:54-57.
Potential hazards of fuselage and component pressurization testing *(Starr)*. 2:15-18.
Safety in high pressure chemical reactions *(Hunter)*. 8:5-9.
To maintain operation of a diesel engine in desirable range of fuel:air ratio, the maximum fuel rate must be reduced in direct proportion to the barometric pressure *(Holtz)*. 19:11.

Prince, J. Donald
Mercantile and warehousing safety discussion. 11:42-48.

Prince, Ray
The national school bus program—what it is. 26:115-118.

PRINTING AND PUBLISHING SECTION
Minutes. 23:5-21.
Officers. 23:22.
Opening remarks by retiring general chairman *(Ernest)*. 23:5-6.

PRINTING INDUSTRY
Building safety into the printing press *(Kuehn)*. 23:20-21.
Eye screening programs in industry *(Marshall)*. 24:32.
New ideas in safety switches *(Burt)*. 23:6-8.

Practical safety devices included in Harris-Seybold Products *(McConnaughey)*. 28: 11-12.

Prisk, Charles W.
Roid design and its relation to traffic accidents. 27:34-38.

PRODUCTION
Eye screening programs in industry *(Marshall)*. 24:30-33.
Some hazardous conditions that cause production slowdowns in small sawmill operations *(Malcolm)*. 29:12.
Survey reveals close relationship between quality of production and level of visual efficiency *(Simpson)*. 24:33-36.

PROGRAMS, see Organization; Small Plants

PROMOTERS
Some current aspects of medical quackery *(Field)*. 21:17-18.

PSYCHOLOGICAL TESTS
Siebrecht Attitude Scale and AAA Traffic and Driving Knowledge — driver testing *(Luft)*. 26:17-23.
Thurstone Temperament Schedule — driver testing *(Heath)*. 26:23-24.

PSYCHOLOGY
Do we drive as we live? *(Bradley)*. 20: 33-36; 28:29-30.
Guideposts to the understanding of people, their attributes and limitations *(Rosenstein)*. 30:31-34, 37-40.
Human relations and man-management *(Rosenstein)*. 30:3-44.
The positive approach to driver physical requirements—emotional factors *(Turrell)*. 20:30-35; (panel forum) 20:27, 28, 30.
The traffic problem *(Hill)*. 7:42-43.
The true psychological measure of every person is what he thinks of himself—these pictures of himself he holds up as his standards of values *(Rosenstein)*. 30: 9-13.

PUBLIC EDUCATION
Inventory—a tool for improving traffic programs *(Butler)*. 27:25-26.
The question of speed *(Shuler)*. 27:58-59.
Urban enforcement problems as they are related to speed violations and their apprehension *(Warner)*. 27:37-39.

PUBLIC EMPLOYEE SECTION
Engineering committee report *(Crafford)*. 7:73-75.
Minutes. 7:23-22.
Officers and committees. 7:75.
Statistical committee report *(Witt)*. 7: 71-72.

PUBLIC EMPLOYEES
Digging out after mother nature goes on a rampage (a symposium). 7:50-58.
Driver training and/or refresher courses (a panel discussion). 7:25-28.
Health and safety for governmental employees (a symposium). 7:60-62.
a) The professional viewpoint on a city program *(Harrington)*. 7:60-61.
b) The safety engineer's viewpoint on accomplishments *(Pagnard)*. 7:61-62.

Job training and placement (a panel discussion). 7:28-32.
Legislation as it affects public employee safety programs *(Goodin)*. 7:68-71.
Parks maintenance safety—tree trimming—brush handling and related subjects (a panel discussion). 7:34-48.
What we expect from operations of highway vehicles *(Lyell)*. 7:64-67.
What Red Cross first aid training has done for our accident control program *(Jones)*. 7:62-64.

PUBLIC RELATIONS
Men, machines and methods—how the industrial engineer can be effective in the construction industry *(Wilson)*. 7:17-18.
"Non-transit" safety activities in which a transit company can be of service to a community *(Howell)*. 28:11.
Promoting public relations of traffic courts (panel discussion). 27:33-44.
a) The GTWC traffic court program *(Todd)*. 27:33-34.
b) Small town traffic courts *(Rushing)*. 27:34-36.
c) How women can help build public understanding and support *(Bailey)*. 27: 36-41.
d) The driver improvement schools of our traffic courts *(Krueger)*. 27:41-44.
Safety is a state of mind *(Parton)*. 24:5-8.
Safety through the eyes of a camera *(Muir)*. 22:22.

PUBLIC SUPPORT
Have we failed? *(Dearborn)*. 7:16-18.
The importance of public support in the traffic safety fight *(Stratton)*. 7:31-32.
The petroleum industry's stake in the public support effort *(Rommel)*. 22:37-38.
Selling safety to the passengers: transit program coordination with civic and citizens groups *(Baker)*. 28:18.

PUBLIC UTILITIES
The developmental method of training for safe pole climbing. "you learn before you *go aloft*" *(Orth)*. 8:22-25.
How to set up and maintain a gas utility safety program *(Pied)*. 8:30-32.
Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 8:17-30.
345 Kv. hot line maintenance *(Carter)*. 8:20-22.
Water utility safety (symposium). 8:33-46.
a) What's new in water safety — 1957? *(Faust)*. 8:33-33.
b) How and where to get started *(Appleyard)*. 8:36-38.
c) A first line supervisor's safety program *(Hemer)*. 8:36-39.
d) Safety pays off *(Webb)*. 8:39-40.
See also Gas industry; Telephone industry.

PUBLIC UTILITIES SECTION
Minutes. 8:17-40.
Officers and committees. 8:44-46.

PUBLICITY
Be positive in using safe driver awards *(Hughes)*. 20:11.

Can safety be news? Safety activities which could be news-making safety events for a transit company *(Howell)*. 28:10-11.
Meat, potatoes and dessert in your safety menu *(Cayman)*. 26:42-45.
Promotional idea exchange in traffic safety (panel discussion) *(Bennett)*. 27:05-06.
Selling safety to the passenger *(Baker)*. 28:12-17.

PUBLISHING INDUSTRY, see Printing Industry

Puder, Roland W.
Operator selection and training in developing material handling safety. 14:29-36.

PULP AND PAPER SECTION
Joint session with the Wood Products Section. 24:46-60.
Minutes. 24:3-60.
Officers and committees. 24:61-62.

PUMP ROOMS
Protecting oil tanker crews from accidents *(Vander Clute)*. 16:20.

Purcell, Charles J.
The Indiana Joint Committee for Coal Mine Safety. 6:23-24.

Purves, Lorne F.
Accentuate the positive. 20:5-6.

Q

QUACKERY
Some current aspects of medical quackery *(Field)*. 21:17-18.

QUARRY INDUSTRY, see Cement

QUESTIONNAIRES
AERO safety exchange questionnaire results. 2:11-15.
Driver safety is improved by your investigation *(DePew)*. 20:36-37.
National Fire Protection Association questionnaire with notes and comments on proposed classification system of flammable materials *(Wood)*. 8:38-41.
Transit questionnaires aid industry in selling safety to the passenger *(Baker)*. 28: 13-14.
Waste disposal (Laboratory Subsection of Chemical Section of National Safety Council). 8:52-54.

Quinlan, Francis J.
Recommended off-campus fire protection procedures. 26:80-82.

R

RADAR
Jet ground handling, precautions required to avoid fire and other hazards with nearby objects within the beam of the antenna *(Dymant)*. 2:27-28.
Radar plotting on merchant ships *(Thayer)*. 16:43-45.

Rader, Robert F.
Gulf area report for the Marine Section. 16:15-16.

RADIO TRANSMITTERS
The hazards of radio transmission and their correction *(Card)*. 8:8-12.

RADIATION
Comment that employees receiving dental X-rays four times a year, were getting more than recommended amount of radiation (discussion report) *(Allinson)*. 8:56.
The emergency treatment of chemical injuries to the eye *(Ryan)*. 14:79.
Nuclear power pressure vessels *(Keene)*. 14:54-57.
1,500 industrial plants using atomic materials—is state inspection and compensation ready to care for workers exposed to radiation hazards *(Hayes)*. 18:19.
Radiation exposure in the rubber industry and control measures *(Manning)*. 12: 26-27.

RADIATION HAZARDS
The hazards of radio transmitters and their correction *(Card)*. 8:8-12.

RADIOISOTOPES
Peaceful and safe uses of atomic energy *(Jackson)*. 8:20.

RAILROAD INDUSTRY
Are off-the-job safety programs needed in industry today? *(Hamilton)*. 18:16-17.
Final session address *(Tuck)*. 25:34-36.
Highway-railroad crossing safety. 25:30-32.
a) Remarks of E. Hayes. 25:30-31.
b) Remarks of E. Kiesele. 25:32-32.
The importance of safety in maintenance of equipment and stores (a symposium). 25: 27-32.
The importance of safety in mechanization (a symposium). 25:11-30.
a) Track maintenance *(Villella)*. 25:11-13.
b) Bridges and structures *(Heckert)*. 25: 13-14.
c) Signals and communications *(Rasmus)*. 25:15-17.
d) Safe trolley maintenance *(Kirk)*. 25: 17-20.
Personal contact with road and yard train service employees *is essential to safety* (a symposium). 25:7-11.
Togetherness in transportation *(Urban)*. 25:4-6.
Women's safety councils—the best way to the men *(Williams)*. 18:61-62.
See also Haulage.

RAILROAD SECTION
Minutes. 25:4-32.
Officers and committees. 25:33-34.

Ramsey, Carl F.
A clinical approach to retraining. 22:30-39.

Ratner, Victor M.
How to interest people in what they don't want to know (Symposium). 12:10-12.

RECTIFIER STATION
Insulation methods used in an aluminum reduction plant *(Ricketts)*. 17:31-32.

Reese, Robert G.
Practical safety education and training. 8: 30-31.

REFINERIES
Sohio serious injury index *(Heiser)*. 22: 45-48.

REFRIGERATION
Firemen died from ammonia inhalation at cold storage plant disaster *(Fawcett)*. 6:22.
Visualizing ammonia hazards *(Andersen)*. 10:18.

REHABILITATION
Rehabilitation in Ontario, Canada *(Young)*. 24:46-50; 28:22-26.
Reilly, Patrick J.
Accident investigation. 24:9-12.
Reinhard, H. F.
Industrial gases discussion group. 5:56-58.

RELIGIOUS LEADERS
Do we drive as we live? *(Bradley)*. 20: 53-56; 28:33-36.
The ethics of safe construction *(Herbert)*. 7:7-9.
Human relations—the key to driver supervision *(Heaton)*. 20:60-62.
Safety—a moral responsibility *(Hall)*. 18: 13-16.
Renshaw, L. A.
Accident prevention in passenger vessels. 18:30-32.
Renwick, Alexander C.
A first line supervisor's safety program. 8:38-39.

REPAIR AND MACHINE SHOPS
Built-in safety features—surface mine plant *(Breund)*. 19:26-36.

RESEARCH
The Accident Prevention Program of the Public Health Service, to emphasize research and consultation *(Goddard)*. 18: 32-33.
An analysis of graduate theses in school safety in the United States from 1926-1956 *(Yost)*. 28:13-17.
Automobile crash safety research *(Dye)*. 27:50-51.
A critique of fifty-five research studies in safety *(Bookwalter)*. 28:30-38.
Driver safety starts with your employment application form—a study made through North Carolina State College for McLean Trucking company *(McKee)*. 20:33-34.
Effects of driver education on driver knowledge and attitudes in secondary school *(Lott)*. 28:17-22.
Fire control of some of the new pyrophoric metals *(Brown)*. 14:30-31.
Human behavior and its relation to traffic accidents *(Heath)*. 27:47-49.
Industry opposes objective research and exchange of information on occupational diseases because it fears compensation payments more than it does deaths of workers *(Heyns)*. 15:32.
Liberty Mutual's Research Center at Hopkinton, Massachusetts, devoted to solving real or potential accident problems *(Dodson)*. 28:15.
Motor vehicle safety measures and devices —what can the safety engineer support and recommend? *(Matheweon and Sperry)*. 14:14-21.
The need for research in home accident prevention (Symposium). 19:14-33.
1) Remarks of Fay M. Hemphill. 18: 14-15.
2) Remarks of Albert P. Iskrant. 18: 16-18.
3) Remarks of Floyd A. Van Atta. 18: 19-21.
Need for scientific appraisal of the basic accident causes *(Dearborn)*. 1:12.
Peaceful and safe uses of atomic energy *(Jackson)*. 8:19-25.
Process in cementation of coal-mine roof *(Meise)*. 6:4-7.
Relationship between driving records, selected personality characteristics and biographical data of traffic offenders and non-offenders *(Heath)*. 28:23-26.
Research—a key to safer farming (panel discussion). 9:10.
Research in vision and traffic safety *(Brysm)*. 27:51-52.
Road design and its relation to traffic accidents *(Frisk)*. 27:54-56.
Significance of safety attitudes in industrial accident prevention *(Hammaford)*. 26:26-28.
Three year research program at Northwestern University to study nature and causes of traffic accidents *(Stratton)*. 1:21.
Traffic patterns and safety problems at service stations *(Splain)*. 22:26-27.
The traffic safety fight, the need for motivational research *(Stratton)*. 1:26-31.

RESINS
Control of health hazards of electrical insulating materials *(Meiser)*. 8:14-16.
Epoxy resins and catalysts hazards *(Lampe)*. 2:7-10.

RESPIRATORY PROTECTIVE DEVICES
Case histories where use, or correct use of respirators, would have prevented injury and death *(Fawcett)*. 8:26, 31.
Epoxy resins and catalysts hazards *(Lampe)*. 2:9.
An outline for selecting respiratory protective devices *(Fawcett)*. 5:22.
Respiratory protective devices, their limitations, and the training and maintenance necessary for safe and effective use *(Fawcett)*. 5:14-22.
Types of protection to wear when working with insecticides and fungicides in greenhouses or conservatories *(Williams)*. 7:44.
Visualizing ammonia hazards, protection during rescue work *(Anderson)*. 10:17.

RESUSCITATION
Handling problems of asphyxia in industry *(Dunne)*. 21:12-13.

REWARDS
Awards won by the employees at the New Orleans Public Service company *(Little)*. 28:31.
Be positive in using incentives, pros and cons for cash, merchandise plans, and bonuses *(Warp)*. 20:8-10.
Ike, Ida awards of the Pressed Metal Institute *(Workmen)*. 14:108.
Incentive awards for good safety records in the mining industry *(Smith)*. 12:36-38.
Presentation of first annual Paul Gray Hoffman award to Herbert J. Stack *(Hoffman)*. 1:28-30.
The pros and cons of safety merit award programs. 17:9-15.
a) Inland Steel *(Hidinger)*. 17:11-12.
b) Jones & Laughlin Steel *(Maiser)*. 17: 13-15.
Safety pays off in cash and prizes at Homestake mining company *(Greene)*. 19:37.
Setting up a merchandise award plan based on the positive issuance of prize points *(Warp)*. 20:8-10.
Turkey dinners given by Abitibi to camps having best (or) time accident record *(Mebbs)*. 20:10.
See also Bonuses.

REWARDS—NATIONAL SAFETY COUNCIL
Be positive in using safe driver awards *(Hughes)*. 20:10-12.
The four national awards of the National Safety Council given to companies *(Hidinger)*. 17:10-11.
The national school bus program (a symposium). 20:116-120.
Report of the National Plant Safety Contest Committee *(Cox)*. 20:27; 28:27.
Rich, F. M.
Safety performance . . . the barometer of good supervision. 17:7-8.
Richetts, C. B. E.
Electrical hazards in aluminum reduction. 17:32-36.
Ridinger, J. L.
Off-the-job accidents hurt industry too. 12: 41-42.
The pros and cons of safety merit award programs. 17:9-15.
Rinderknecht, Warren
Disciplining for safety. 11:10-12.
Roberts, Kenneth A.
A congressman looks at traffic safety. 27: 5-7.
Robinson, Paul Minnich
The invitations for the annual council meeting. 1:35.
Rommel, A. Rose
The petroleum industry's stake in the public support effort. 22:27-29.

ROOF CONTROL
The effects of corrosive electrolysis on metallic roof bolts *(Muskrook)*. 6:8-12.
Mining with the coal planer including safety aspects *(Morre)*. 6:12-13.
1,000 miners enrolled in the National Safety Council campaign to reduce roof-fall accidents *(Sabelle)*. 6:25.
Process in cementation of coal-mine roof *(Meise)*. 6:4-7.
Safety features in the design and development of Ireland Mine *(McCoy)*. 6:26-31.
What we are doing to prevent falls-of-ground accidents *(Greene)*. 19:34-36.
When doubtful roof is encountered in modern haulage system, steel "H" beams are used *(Robbins)*. 6:16.
Rosenfeld, Harry N.
School bus accident in the courts. 28: 108-108.
Rosenstein, J. L.
Human relations and man-management. 20: 3-44.

THE ROYAL SOCIETY FOR THE PREVENTION OF ACCIDENTS
United for safety in the United Kingdom *(Young)*. 1:26-28.

RUBBER INDUSTRY
Accident—cause, investigation, and prevention *(Turner)*. 12:30-32.
Communications in safety (roundtable discussion). 12:28.
Good communications help safety *(Scrivens)*. 18:31-34.
Heart disease in industry *(McCausland)*. 12:28-34.
The human factors in safety *(Crane)*. 12: 29-30.
Off-the-job safety (roundtable discussion). 12:27.
Radiation exposure in the rubber industry and control measures *(Manning)*. 12: 25-27.
Report of the statistics committee *(Hart)*. 12:13-18.

RUBBER SECTION
Minutes. 12:18-20.
Officers and committees. 12:23-24.
Report of the statistics committee *(Hart)*. 12:18-19.
Ruddick, Clyde C.
The value of good records and how to use them. 3:5-8.

RULES
Disciplining for safety *(Rinderknecht)*. 11: 11-12.
Learning the plant rules, part of the training sessions for supervisors at Goodyear *(Crane)*. 12:29-30.
Plant safety rule books used in employee indoctrination *(Crousbore)*. 12:8.

RUPTURE DISCS
The importance of the size and location of frangible safety discs in high pressure systems *(Kiefer)*. 8:7.

RURAL COMMUNITIES
Small town traffic courts and their administration *(Rushing)*. 27:34-36.

RURAL TRAFFIC
Cowboy highway safety in Wyoming *(Dodge)*. 9:13-14.
Road design and its relation to traffic accidents; comparisons between rural freeways and conventional routes *(Frisk)*. 27:56-57.
Rural enforcement problems as they relate to speed *(Bly)*. 27:28-34.
Rushing, O. G. (Mrs.)
Small town traffic courts. 27:34-36.
Russo, James N.
What's my line in safety, a safety director speaks. 11:40.
Ryan, E. M.
North Dakota takes safety to the small communities. 15:35-39.
Ryan, Ralph W.
The emergency treatment of chemical injuries to the eye. 14:77-80.

S

Saacke, F. C.
Safety in the uses of cylinder gases in oxy-fuel gas welding and cutting. 8:36-39.

SAFETY COUNCILS, see Community Safety; National Safety Council

Safety award systems mining industry (Hecker), 19: 5-8.

SAFETY EDUCATION

A critique of selected research studies in safety *(Bookwalter)*. 26:30-38.

Distinction between safety education and safety training made *(Pearce)*. 24: 59: 29:38.

The Elementary School Section's viewpoint on safety education *(Mann)*. 26:58-59.

Education must redesign *the* "nut" *behind* the wheel *(Abramoski)*. 26:47-48.

Farm safety makes sense, its achievement must begin with safety education programs *(Butz)*. 9:7-10.

The fifteen point safety education program of the Oregon State Industrial Accident Commission *(Callahan)*. 18:30-33.

Meat, potatoes and dessert in your safety menu *(Gaymon)*. 26:43-45.

Practical safety education and training *(Reeve)*. 2:30-32.

Protecting school bus passengers through education *(Lemon)*. 26:98-100.

Protecting school bus passengers through education *(Smith)*. 26:96-99.

Responsibilities of colleges for safety preparation *(Drake)*. 26:87-88.

Ways of encouraging a continued interest in a shipboard safety program on passenger vessels *(Reuchen)*. 18:30-32.

SAFETY EQUIPMENT

AERO safety exchange questionnaire results. 2:11-15.

Motor vehicle safety measures and devices—what can the safety engineer support and recommend? *(Matheeson and Severy)*. 14:14-21.

Safety equipment installed in several areas of water department in Philadelphia *(Appleyard)*. 8:35.

Ways of securing acceptance and use of safety equipment, job methods and operating techniques *(Coleman)*. 3:20-21.

What is the industrial safety engineer's responsibility for motor vehicle safety equipment? *(Brown)*. 14:10-13.

See also Seat belts

SAFETY MOVEMENT

Have we failed? (the president's report) *(Deerborn)*. 1:16-18.

The inadequacies of our present systems of workmen's compensation, factory inspection, and occupational disease legislation *(Hayes)*. 18:18-21.

The philosophy of the beaded shoes *(Ferguson)*. 1:52-53

Safety — a national necessity *(McCarthy)*. 22:11-13

Safety—a moral responsibility *(Hall)*. 18: 12-16

Safety—a retreat or a challenge *(Foulger)*. 10:8-10

The union's role in safety *(Brown)* 18:9-11.

SAFETY MOVEMENT—FOREIGN

Does safety training pay? Abitibi campaign proved what sustained efforts can do *(Mobbs)*. 29:14-17.

Incentive awards for good safety records in the mining industry in Canada *(Smith)*. 12:20-22.

Rehabilitation in Ontario, Canada *(Young)*. 24:46-50: 29:22-26.

United for safety in the United Kingdom *(Young)*. 1:26-28.

SAFETY SHOWERS

Emergency showers necessary in pulp bleaching plants *(Peterson)*. 24:21.

Safety showers in caustic plant *(Bunch)*. 24:18.

SAFETY STUNTS

Gimmicks used in North American Aviation's off-the-job program *(Wilkins)*. 2:6.

Promotional idea exchange in traffic safety (Panel discussion) *(Bennett)*. 27:85-86.

SAND STORMS

Sand storms *(Dunwiddie)*. 7:54-56.

SAWMILLS

Developing safe work habits *(Hale)*. 29: 13-15.

Safety in the small sawmill *(Malcolm.)* 29: 9-12.

Severy, Raymond (Mrs.)
Our role in safety leadership. 1:37.

SCATTERED OPERATIONS

Flexibility and feedback programming for a multi-location operation *(Devine)*. 13: 45-47.

Schapiroschy, A. F.
The 1956 home safety inventory. 13:33-34.

Scheer, C. F.
Do it yourself sound slidefilms. 14:89-92.

Schmeig, Anthony L.
Are scientific devices improving traffic enforcement? 27:30-31.

SCHOOL AND COLLEGE CONFERENCE

The Elementary School Section's viewpoint on safety education *(Mann)*. 26:58-59.

New Higher Education section. 26:121.

Officers, sections, and committees. 26:129-136.

SCHOOL AND COLLEGE DIVISION

Minutes. 26:6-120.

SCHOOL BUSES

The national school bus program (a symposium). 26:115-120.

a) What it is *(Prince)*. 26:115-118.

b) What it means to a state department of education *(Dana)*. 26:118-119.

c) What it means to a state motor vehicle department *(Hyde)*. 26:119-120.

SCHOOL BUSES

New safety problems from the expanding use of school buses in urban areas *(Hayes.)* 26:108-115.

Protecting school bus passengers through education *(Lemon)*. 26:98-100.

Protecting school bus passengers through education *(Smith)*. 26:96-99.

Protecting school bus passengers through protection *(Heath)*. 26:100-101.

School bus accidents; how much do we know about them? How can we find out more about them? *(Myers)*. 26:101-108.

School bus accidents in the courts *(Rasenfeld)*. 26:108-108.

SCHOOL SAFETY

An analysis of graduate theses in school safety in the United States from 1926-1956 *(Yost)*. 26:13-17.

The changing world in which our elementary school children are living *(Utley)*. 26:89-93.

Education must redesign the "nut" behind the wheel *(Abramoski)*. 26:47-48.

The Elementary School Section's viewpoint on safety education *(Mann)*. 26:58-59.

Meat potatoes and dessert in your safety menu *(Gaymon)*. 26:43-45.

Oregon Industrial Accident Commission and Bureau of Labor have school training program relating safety and employment opportunities *(Callahan)*. 18:32.

Safety for school personnel *(Wasserburger)*.

School responsibilities for ski safety (Judd). 26:83-86.

What are the facts of population mobility today (a symposium). 26:62-67.

What the Boy Scouts' Safety Good Turn means to schools and colleges (discussion session report). 26:10-11.

SCHOOL SHOPS

"Case" method of teaching safety, supplemental device in teaching shop safety *(Ingram)*. 26:9.

Findings of graduate theses in school safety in various areas *(Yost)*. 26:16.

Schoolman, Steve
Remarks on the Boy Scout safety good turn program. 9:18.

Schowalter, E. J.
The prescription safety goggle problem. 14:81-83.

Schuler, Louis W.
Safety Division, United Mine Workers of America. 6:34-36.

Schulz, Kurt
Commercial vehicle safety can be improved. 14:8-9.

SCRAP

Spontaneous-heating hazards in metal storage bins *(Brown)*. 14:30.

Scriven, George
Good communications help safety. 18:21-24.

SCRUBBERS

Diesel exhaust gas conditioners will dissolve some of the aldehydes, but have no effect on other constituents, nor on values of air needed for ventilation *(Holtz)*. 19:12-13, 19.

SEAT BELTS

Congressional Special Subcommittee on Traffic Safety held hearings on the crashworthiness of seat belts *(Roberts)*. 27:6.

Motor vehicle safety measures and devices —what can the safety engineer support and recommend? *(Matheeson and Severy)*. 14:15-19.

What is the industrial safety engineer's responsibility for motor vehicle safety equipment? *(Brown)*. 14:10-11.

SEISMIC EXPLORATION

Evolution of seismic explosives *(Cochran)*. 22:27-31.

SELLING SAFETY

Can safety be sewn? *(Wenar)*. 22:9-12.

A clinical approach to retraining transit operators *(Kennedy)*. 22:30-32.

Educational tools for selling traffic safety in industry *(Schulz)*. 14:8-9.

How to interest people in what they don't want to know (symposium). 18:5-12.
1) Remarks of Fairfax M. Cone. 18:5-6.
2) Remarks of Pierre Martineau. 18:7-10.
3) Remarks of Victor M. Ratner. 18:10-12.

How women can help build public understanding and support for our traffic courts *(Weston)*. 27:38-41.

Initiating and maintaining interest in safety *(Woodward)*. 2:26-28.

The opportunities for local safety councils and chapters of AERO to promote safety activities among business and trade associations *(Kaplan)*. 14:104-106.

Orientation—the beginning of driver supervision *(Carter)*. 25:41-44.

The pros and cons of safety merit award programs (discussion). 17:5-15.

Quality control the key to top management's interest in and support of a vision testing program *(Simpson)*. 24:35-36.

Reducing traffic accidents by use of group discussion-decision *(Ferries)*. 26:28-12.

Safety and semantics for selling safety to management by reducing maintenance expenditures) *(Simpson)*. 23:13-15.

Safety is a state of mind *(Paxton)*. 24:5-8.

Safety to sell—the how of organizing a safety program in a retail food store *(Porter)*. 11:49-51.

Selling safety to the passenger *(Baker)*. 23:15-17.

Specific suggestions and the individual approach more effective than emotional appeals *(Fryer)*. 7:24.

The traffic safety fight—assessing our success or failure *(Stratton)*. 17:33-35.

Useful and usable safety meeting techniques (a demonstration) *(Hannaford)*. 22:21-30.

Ways of encouraging a continued interest in a shipboard safety program on passenger vessels *(Reuchen)*. 18:30-32.

When personal contact with road and yard train service employees is essential to safety *(Winterrowd)*. 23:9-12.

Severy, D. M. and J. M. Matheeson
Motor vehicle safety measures and devices —what can the safety engineer support and recommend? 14:14-21.

SERVICE STATIONS

Restrictive regulations at service stations *(Woodsworth)*. 22:32-35.

Traffic patterns and safety problems at service stations *(Splein)*. 22:25-27.

Seward, Harold A.
Accident investigation. 24:8-9.

Shanklin, John F.
Safety training for fire protection foresters. 24:50-56; 29:26-32.

SHOCK, ELECTRIC, see Electricity:

Grounding

Shuler, Linda
This question of speed. 27:58-59.

Shuman, George E.
How I train my employees for job safety. 11:36.

SHUTDOWNS
Is "hot" electrical work necessary? The program of Chambers Works dovetailed in with production outages, and maintenance work *(Lippincott)*. 25:5-8.

Shute, David T.
Safety 'round the clock—an extended health and safety program for industry. 23:5-10.

SIGNS AND SIGNALS
Aircraft warning lights installed to top masts of berthed vessels near airports *(Tarr)*. 16:29.

Automatic block signal systems improve haulage efficiency and safety at TCI's mines *(Evans)*. 19:23-24.

Block signal lights aid production and safety in a modern haulage system in coal mine *(Lobdell)*. 8:12.

Communication improved on highway, tests show by use of "Merging Traffic" sign which illuminates as two vehicles approach *(Frank)* 27:27.

Distress signals used on interstate *(Nash)*. 16:60.

Highway signs need standardization of design and wording *(Case)* 12:5.

Men entering a tank or compartment should be attached to the watcher with safety line tied around the waist *(O'Donnell)*. 18:34.

Ship abstains from signs that say WARNING, because of opposite psychological effect *(Vander Clute)*. 16:21.

Signals as used by mine rescue teams based on OATH, should be employed in situations requiring use of respiratory equipment *(Fawcett)*. 5:22.

Whistle lights installed on inland vessels prevent collisions *(Persell)*. 16:9.

Yellow glare signal lights installed along the line in coal face mining *(Morris)*. 6: 14.

Simpson, Karl F., Jr.
Safety and semantics. 23:13-15.
What good vision can mean to industry. 24:25-26.

Sirois, Patrick S.
We can do more with accident statistics. 28:25-27.

SKI SAFETY
School responsibilities for ski safety *(Judd)*. 26:32-33.

SKITS
A planned gas job (a skit). 17:39-42.
Skits for safety say scat to accidents *(Hansford)*. 14:98-100.
Trial by survival (a skit). 29:37-41.

SMALL PLANTS
Inventory of occupational accident prevention activities *(Crossshore)*. 12:5-10.
North Dakota takes safety to the small communities through its Workmen's Compensation Bureau *(Eyan)*. 18:35-38.
Off-the-job accident control in a single location company *(Mansfield)*. 12:13-14.
The Oregon safety story—the safety program of the State Industrial Accident Commission *(Cadahan)* 18:29-32.
Report of the statistics committee on rubber industry figures *(Barr)* 12:29-30
The role of the trade association in industrial safety *(Cleland)*. 24:13-16.
Safety in the small sawmill *(Malcolm)*. 29: 9-12.
The small business program of the Greater Los Angeles Safety Council *(Kaplan)*. 14: 104-108.

Smith, A. P. Jr.
Protecting school bus passengers through education. 26:36-39.

Smith, Hubert C.
Top management's responsibility for safety. 17:36-38.

Smith, John McKenna
Incentive awards for good safety records in the mining industry. 19:30-32.

SMOKING
Disciplining for safety *(Manderscheid)*. 11: 13.
Smoking a main cause of fire aboard ship, and most difficult safety policing job *(Tarr)*. 16:26.

Smothers, Frank
The highway safety program of the Governor's conference. 27:13-14.

SOCIO-ECONOMIC AND CULTURE PATTERNS
Accidents are a function of the hazards to which people are exposed, and a function of people's way of living *(Tabrum)*. 13: 17-18; *(Goddard)* 13:29.
The changing world in which our elementary school children are living *(Utley)*. 26:58-59.
Social adaptations and value systems of the individual will give some clues about his safety attitudes and behavior *(Turrell)*. 20:22.
The traffic problem *(Hill)*. 1:43-46.
The true psychological measure of every man, are the pictures he has of himself. these are his standards of value *(Rosenstein)*. 30:9.
What are the facts of population mobility today? (symposium). 26:62-67.

Snyder, James H.
Can you wait for the fire department? (symposium on fire prevention. control). 11:17-19.

SODIUM CHLORATE
Fire hazard of sodium chlorate in pulp bleaching plant *(Metzger)*. 24:20.

SODIUM HYDROXIDE, see Caustic Soda

SOLVENTS
AERO safety exchange questionnaire results. 2:14.
Electrician, using 1,1,1,-trichloroethane, experience poisoning symptoms *(Fawcett)*. 5:26.
The emergency treatment of chemical injuries to the eye *(Ryan)*. 14:78-79.
Freons and Genetrons, if heated in degreasing operations, give off toxic decomposition products *(Fawcett)*. 6:15.
The new solvent extraction plants NFPA code No. 30-T *(Steel)*. 11:9-10.

SPEED
The engineer's viewpoint on speed *(Berry)*. 27:29-30.
The question of speed *(Ehasler)*. 27:33-39
Research in vision and traffic safety *(Bryan)*. 27:35-36.
Rural enforcement problems as they relate to speed *(Sig)*. 27:33-34.
"Speed check" 1958 style *(Schmeig)*. 27: 29.
Urban enforcement problems as they are related to speed violations and their apprehension *(Warner)*. 27:27-28.

Spieler, W. H.
Traffic patterns and safety problems at service stations. 28:25-27.

SPONTANEOUS COMBUSTION
Fire control of some of the new pyrophoric metals *(Evans)*. 14:29-31.

SPORTS
Parks maintenance safety *(Williams)*. 7: 40-41.
School responsibilities for ski safety *(Judd)*. 26:32-33.

Stack, Herbert J. (author)
A tribute to H. Louise Cottrell, 1886-1957, a pioneer in research for elementary school safety. 26:39-53.

Stack, Herbert J. (subject)
Presentation of first annual Paul Gray Hoffman award to Dr. Stack *(Hoffman)*. 1: 22-25.

Stack, James H.
The role of national surgical organizations in public safety. 13:21-24.

STANDARDS
Control of electrical hazards in an aluminum reduction plant meets legal problems and interstate policy conflicts *(Richards)*. 17:15-17.
"Plant Engineering for Hazardous Materials," book developed by General Motors, includes section on heat treatment *(Jaffe)*. 18:36.
Safety standards in Great Britain fixed by means of the Factories Act *(Young)*. 1: 36.
Standards (a symposium). 18:14-19.
a) Trade association standards *(Lamb)* 18:14-15.
b) Corporate standards *(Churchill)*. 18: 15-17.
c) Fire standards *(Cobb)*. 18:18-19.

STARCH FACTORIES
Changes in the NFPA code for the prevention of dust explosions in starch factories *(Gerwig)*. 11:5-7.
Disciplining for safety *(Manderscheid)*. 11:10-13.

Starr, Frank W.
Potential hazards of fuselage & component pressurization testing. 2:16-18.

STATE PROGRAMS
The Indiana Joint Committee for Coal Mine Safety (Purcell). 6:33-34.
The highway safety program of the Governor's Conference (Smothers). 27:13-14.
U. S. Public Health Service assists states in home safety activities *(Goddard)*. 13:29-30.

STATIC ELECTRICITY
Changes in the NFPA code for the prevention of dust explosions in starch factories *(Gerwig)*. 6:5.
Hazard of shock from charged electric field at high voltages, eliminated by use of metal ladders and conductive soled shoes *(Carter)*. 8:21.
Jet ground handling hazards *(Dyment)*. 2:26.

Steel, George H.
The new solvent extraction plants NFPA code No. 30-T. 11:9-10.

Steere, Norman V.
Making student accident records work. 26: 60-66.

Stockdale, Earl H.
How do you investigate an accident? 3:9-12.

STORIES
The philosophy of the beaded shoes, and two other stories *(Ferguson)*. 1:32-36.

STORMS
Digging out after mother nature goes on a rampage (a symposium). 7:50-56.
a) Hurricanes—those wild women of the Atlantic *(Guilmartin)*. 7:50-52.
b) Hurricanes and government *(Flowers)*. 7:53-54.
c) Sand storms *(Dunwiddie)*. 7:54-56.
d) Lessons learned by giving service during and after the recent flood *(Lydell)*. 7:57-58.
e) Organization *(McDonald)*. 7:59.
f) Snow and ice control *(Murphy)*. 7:59.
No 345 Kv. hot line maintenance done in inclement weather *(Carter)*. 8:21.

Stratton, William G.
The traffic safety fight—assessing our success or failure. 1:28-35.

Stubbs, Claude C.
What makes a good plant inspection? (symposium on fire prevention. control). 11: 14-17.

Studt, A. C.
Brainstorming for safety. 11:22-26.

SUGGESTION SYSTEMS
Inventory shows that plants favor suggestions with varying compensation *(Crossshore)*. 12:10.
Safety communications in the foundry *(Burns)*. 17:30.
Suggestion system at Homestake, offers monthly cash prizes for best suggestions *(Greene)*. 19:37.

SULPHUR OXIDES
Chemical hazards of pulp bleaching (mist, gas). 24:20.
Hazards from toxic and irritating sulfur dioxide or trioxide, can be controlled by limiting the sulfur content in diesel fuel *(Holtz)*. 19:7, 9.

SUPERVISION, see Engineers, Foreman; Management

SURVEYS
AERO safety exchange questionnaire results. 2:11-15.
Inventory of occupational accident prevention activities *(Crossshore)*. 12:5-10.
Nautical charts for safe navigation *(Kore)*. 16:32-35.
The Ohio story—a rural accident survey. 9:11-12.

Pilot study of vision deficiencies in box industry reveals need of vision testing program *(Simpson)*. 24:34-36.

Research in vision and traffic safety *(Bryan)*. 27:31-36.

Surveys show that drivers deliberately violate highway regulations and safe driving practices; factors contributing to this attitude *(Johnson)*. 27:46-47.

Traffic educational activities being, or not being carried out by companies in the oil industry *(Schulze)*, 14:8-9.

What are the standards for off-campus housing? *(Holland)*. 26:78-80.

See also Inventory.

SWITCHES

Door-switch interlock one part of an effective protection for a radio transmitter *(Lippincott)*. 8:12.

New ideas in safety switches *(Burt)*. 28: 8-9.

Press safety features of Harris-Seybold products *(McConnaughey)*. 22:11.

Switzer, Raymond A.
Use of visual tests in driver training. 7: 26-27.

T

TANKS AND TANKERS

Case histories of death and injury from inert gas used in tanks and kettles *(Fawcett)*. 8:27.

Chemical hazards of alkaline pulp liquor making *(Busch)*. 24:19.

Employees washing chlorine tank car, passed out due to oxygen deficiency *(Fawcett)*. 8:26.

Exposure to oxygen deficient atmosphere *(Dunne)*. 21:11.

Glass furnace repairs *(Ballinger)*. 12:11-12.

Man who fell into tank and would-be rescuer, both suffocated in oxygen deficient atmosphere *(Fawcett)*. 8:28.

Mucking tanks made less hazardous with hard hats and plastic buckets; deck educator tried out *(Vander Chute)*. 16:30.

Protecting oil tanker crews from accidents *(Vander Chute)*. 16:17-21.

Restrictive regulations at service stations *(Woodworth)*. 22:28-29.

Safing of storage tanks by the absorption method *(Colbert)*. 22:13-16.

Setting the stage for safety in ship tank repair includes watching for the "human elements" of safety *(O'Donnell)*. 16:28-34.

Two men pinned between hatch and opening to compartment when safety device ignored *(Farrell)*. 16:8.

Tarr, Robert J.
Prevention of accidents to crew aboard freighters. 16:22-28.

Taylor, Wallace C.
Driver safety grows with your interview. 20:34-35.

TEACHERS

Evaluating observation time as a part of driving instruction *(Campbell)*, 22:56-66.

Responsibilities of colleges for safety preparation *(Dratz)*. 26:67-68.

TELEPHONE INDUSTRY

The developmental method of training for safe pole climbing, "you learn before you go aloft" *(Orth)*. 8:22-26.

Flexibility and feedback programming for a multi-location operation *(Devine)*. 18: 45-47.

Safe at home *(Kahler)*. 18:96-97.

Women in industry—the safe driving crusade of the New York Telephone Company *(Fryer)*. 1:22-23.

Temple, Fred E.
Proposed ASSE program for colleges and universities. 26:76-78.

TETRAFLUOROETHYLENE RESIN

Control of health hazards of electrical insulating materials *(Meiter)*. 8:16.

TEXTILE SECTION

Minutes. 29:37-41.

Officers and committees. 29:45-46.

TEXTILE INDUSTRY

Trial by survival (a skit). 29:37-41.

Thayer, Louis M., Jr.
Radar plotting on merchant ships. 18:43-48.

THESES (GRADUATE)

An analysis of graduate theses in school safety in the United States from 1926-1950 *(Yost)*, 25:13-17.

A critique of fifty-five research studies in safety *(Workweiler)*. 25:30-32.

Effects of driver education on driver knowledge and attitudes in secondary schools (M.S.D. thesis) *(Loyd)*. 28:17-22.

Relationship between driving records, selected personality characteristics and biographical data of traffic offenders and non-offenders (Ph.D. thesis) *(Heath)*, 26: 22-26.

Significance of safety attitudes in industrial accident prevention (Ph.D. thesis) *(Hammford)*. 26:26-29.

Thomas, Chester A.
Why personal contact with road and yard men is essential to train service employees in safety. 28:7.

Thomsen, Vernon W.
Letter on public education as related to traffic law enforcement. 27:44.

Tjensvoll, Arvid
Fatalities in the cement, quarry and mineral aggregates industries 4:6-7.

TIME OF ACCIDENTS

Commercial driver accidents at Consolidated Freightways—percentage high for first four hours of driving *(Owen)*. 20:15.

The peak of fatal electrical shocks occurs early during May, June, July and August, reflecting the effect of perspiration of men involved *(Brown)*. 24:38.

TIRES

Seventy-five pounds of air in a truck tire can kill *(Brown)*. 14:12.

Todd, E. V. (Mrs.)
The General Federation of Women's Clubs' traffic court program. 27:32-34.

TOOLS

Cleaning gloves and tools contaminated with epoxy resin components *(Lange)*. 2:9.

Grounding portable tools or stationary electrical equipment *(Brown)*. 24:38-40.

Increased use of power saws in wood cutting resulted in systematic inspection in Alfibi division *(Mobbs)*, 20:18.

Machine tools and principles of guarding *(Moore)*. 2:16-18.

Parks maintenance safety—tree trimming—brush handling and related subjects *(Williams)*. 7:27-28.

Use of wood-stick insulated tools on 345 Kv. hot line maintenance *(Carter)*. 8: 20-22.

TOXICOLOGY

A bibliography of toxic chemicals (Toxic Chemicals Committee, National Safety Council). 8:44-51.

Toxic Chemicals committee of the laboratory sub-section of the Chemical Section of the National Safety Council studying problems of toxicology *(Mendello)*. 8: 43-44.

TRACKS

The importance of safety in mechanization —track maintenance *(Villella)*. 25:11-12.

Improvement to underground haulage system at TCI's ore and coal mines *(Evans)*. 19:31-34.

Mine track installation at the Mathies Mine Mine *(Kobbah)*. 6:15-16.

TRADES AND SERVICES

The role of the trade association in industrial safety *(Cleland)*. 24:13-15.

Trade association standards *(Lamb)*. 18: 14-19.

TRADES AND SERVICES SECTION

Minutes. 14:41-52.

Officers and committees. 14:55-62.

TRAFFIC

Are traffic accidents crippling your industrial safety program? 14:5-22.

A congressman looks at traffic safety *(Roberts)*. 27:5-7.

Findings of graduate theses in school safety in various areas *(Yost)*. 25:16.

Highway—railroad crossing safety. 28: 20-22.

Human behavior and its relation to traffic accidents *(Busch)*. 27:47-48.

The petroleum industry's stake in the public support effort *(Beesmal)*. 22:37-38.

A practical approach to police training *(Warren)*. 27:19-22.

Presentation of first annual Paul Gray Hoffman award to Herbert J. Stack *(Hoffman)*. 1:33-36.

Promotional idea exchange (Panel discussion) *(Bennett)*. 27:52-54.

Reducing traffic accidents by use of group discussion-decision *(Ferriss)*. 26:36-42.

Report of the Traffic and Transportation Conference *(Boots)*. 27:15-18.

Report on plans for 1957 public officials traffic safety conference *(Marsh)*. 27:8-12.

Research in vision and traffic safety *(Bryan)*. 27:31-33.

Road design and its relation to traffic accidents *(Trisk)*. 27:54-58.

The role of national surgical organizations in public safety *(Stark)*. 19:21-26.

Rural enforcement problems as they relate to speed *(Sly)*. 27:23-24.

Sand storms *(Dunseddle)*. 7:54-56.

The traffic problem *(Hill)*. 1:41-50.

The traffic safety fight—assessing our success or failure *(Stratton)*. 1:28-35.

United for safety in the United Kingdom *(Young)*. 1:36-37.

Urban enforcement problems as they are related to speed violations and their apprehension *(Werner)*. 27:27-28.

Women in industry *(Fryer)*. 1:20-34.

See also Drivers and driving; Highways; Rural traffic.

TRAFFIC COURTS

Promoting public relations of traffic courts (panel discussion). 27:23-44.

a) The GFWC traffic court program *(Todd)*. 27:32-34.

b) Small town traffic courts *(Rushing)*. 27:34-36.

c) How women can help build public understanding and support *(Seaton)*. 27: 36-41.

d) The driver improvement schools of our traffic courts *(Krueger)*. 27:41-44.

TRAFFIC PROGRAMS

The highway safety program of the Governor's Conference *(Smothers)*. 27:12-16.

Inventory—a tool for improving traffic programs *(Butler)*. 27:26-28.

Time for decision *(Johnson)*. 1:38-41.

The traffic problem—activities and organizations who have contributed to a better traffic record *(Hill)*. 1:42-50.

TRAFFIC SECTION

Minutes. 27:5-66.

Officers and committees. 27:67.

TRAINING

Accident investigation brings out need for job instruction *(Reilly)*. 24:10-11.

Better safety meetings through training courses for chairmen and secretaries *(Malloy)*. 22:43-44.

Bureau of Mines courses in Accident Prevention and First Aid and Rescue given at Ireland Coal Mine *(McCue)*. 6:31.

Bureau of Mines courses in first aid and accident prevention aids to mine safety program *(Schuler)*. 6:28; *(Westfield)* 6: 26-27.

Case method of teaching safety, a supplemental device used in school shop safety *(Ingram)*. 28:8.

A clinical approach to retraining transit operators *(Ramsey)*. 28:30-32.

The developmental method of training for safe pole climbing, "you learn before you go aloft" *(Orth)*. 8:22-26.

Distinction between safety education and safety training made *(Pearse)*. 24:39; 28:23.

Does safety training pay? Abifibi campaign proved what sustained efforts can do *(Mobbs)*. 22:14-17.

Driver training and/or refresher courses (a panel discussion). 7:23-26.

a) Driver training *(Adams)*. 7:22.
b) Selling the driver on the need for driver training *(Hoyes)*. 7:23-26.
c) Use of visual tests *(Switzer)*. 7:26-27.
d) Remarks *(Witt)*. 7:28.

Education—the foundation of driver supervision *(Lake)*. 20:44-46.

Emergency first aid programs in industry *(Braun)*. 27:7-9.

Employee safety training at the New Orleans Public Service company *(Little)*. 22:30-32.

Freighter crew given instruction and demonstrations immediately following fire and boat drills *(Terr)*. 16:28.

How I train my employees for job safety (panel discussion). 13:31-36.

How to set up an industry safety training conference *(Orsel)*. 24:56-58; 29:32-34.

The human factors in safety—a program presented to 2,000 supervisors in 15 Goodyear plants *(Crane)*. 12:29-30.

Human relations course for supervisors and foremen at Allied Kid company *(Russo)*. 11:40.

Inventory of occupational accident prevention activities *(Croushore)*. 12:8-9.

Iowa driver improvement schools course of study *(Woodcock)*. 27:60-65.

Job training and placement for public employees (a panel discussion). 7:29-33.

Mine safety film shown to employees of two months employment, at period when overconfidence may be developing *(Graves)*. 19:36.

Mobile classroom trailer used by workmen's compensation bureau to make personal contact with smaller employers and their employees *(Ryan)*. 15:27.

Oil tanker officers attend schools for fire-fighting, damage control, and radar *(Vander Clute)*. 16:21.

Operator selection and training in developing material handling safety *(Fuder)*. 14: 33-35.

Orientation and training programs intensified at Butte District of the Anaconda Company *(Wendel)*. 19:43-45.

Orientation—the beginning of driver supervision *(Carter)*. 20:41-44.

Plant construction and maintenance *(Coleman)*. 2:19-21.

A practical approach to police training *(Warren)*. 27:19-21.

Practical safety education and training *(Reeve)*. 2:30-32.

Reducing motor vehicle accidents in public utilities through driver control *(Weaver)*. 8:17-20.

Road Safety Training Center and Exhibition at RoSPA House in London *(Young)*. 1:27.

Safety in vocational and industrial arts education *(Ingram)*. 26:8-9.

Safety needs communicating, too *(Thrig)*. 29:4-7.

Safety performance . . . the barometer of good supervision *(Rich)*. 17:7-9.

Safety through the eyes of a camera *(Muir)*. 22:30-32.

Safety training for fire protection foresters *(Shanklin)*. 24:50-56; 29:32-37.

Sawmill safety courses and clinics conducted by Forest Products Laboratories *(Malcolm)*. 29:10-12.

Selling passenger safety to the operator *(Ward)*. 22:17-19.

Suggestions on creating safety awareness on part of employees (Insulating and roofing round table discussion). 24:44-46.

Supervising the youthful worker *(Herpress)*. 18:4-6.

Training courses, basic and advanced, offered by Oregon State Industrial Accident Commission *(Callahan)*. 18:30-31.

Training for safety attitudes *(Griffin)*. 29: 17-19.

Training in use of respiratory protective devices offered by Bureau of Mines *(Fencett)*. 8:23-26.

Training materials for overhead power line safety *(White)*. 7:20.

Training programs lacking for unlicensed marine personnel *(Parnell)*. 16:5.

Training to control unsafe acts *(Nelson)*. 24:40-42.

Using American Standards in safety training *(Lamb)*. 29:20-21.

Visual training aids. 14:94-100.

When personal contact with road and yard train service employees is essential to safety *(Winterrowd)*. 22:9-11.

Why industrial plants burn (symposium). 11:13-23.

TRANQUILIZING DRUGS, see Drugs

TRANSIT INDUSTRY

Can safety be news? *(Howat)*. 22:8-12.

A clinical approach to retraining *(Rowsey)*. 22:30-32.

Employee safety *(Little)*. 22:30-32.

"Gus, the Bus," personalized safety coach used in Atlanta, to intensive passenger safety program *(Baker)*. 22:16.

It isn't the coach, it's the team *(Dittmer)*. 22:5-7.

The mechanical department's role in safety *(Feldman)*. 22:26-29.

Selling passenger safety to the operator *(Ward)*. 22:17-19.

Selling safety to the passenger *(Baker)*. 22:12-17.

We can do more with accident statistics *(Stroh)*. 22:25-27.

We're keeping too many accident records *(Butler)*. 22:22-24.

TRANSIT SECTION

Joint session with Commercial Vehicle Section. 22:33-37; 29:33-37.

Minutes. 22:5-97.

Officers and committees. 22:39.

Report of the National Fleet Safety Contest Committee *(Cox)*. 22:37; 29:37.

TRANSPORTATION

Improvements to underground haulage system at TCI's ore and coal mines *(Evans)*. 19:30-39.

New law regulates transportation of migrant workers *(Hiatt)*. 25:28.

Togetherness in transportation *(Urban)*. 25:4-6.

See also Air transport; Motor transportation; School buses.

TREES

Case history of salesman demonstrating a boom equipped truck for tree trimming, killed when bucket touched volt line *(White)*. 7:12-20.

Parks maintenance safety—Chicago Park District *(Williams)*. 7:37-39.

TRICHLOROETHYLENE

Incident of mass hysteria and unconsciousness due to anaesthetic action of trichloroethylene *(Fawcett)*. 8:18.

TRUCKS—INDUSTRIAL

The fork lift operator training program of the materials handling department of E. I. du Pont *(Fuder)*. 14:33-35.

Tuck, E. F.
Final session address. 25:34-36.

Tucker, John
Demonstration of television techniques for driver education. 26:96-98.

TUMBLING BARRELS

Control of noise at the source *(Young)*. 14:89.

Turner, Ed
Accident—cause, investigation and prevention (roundtable discussion). 12:26-32.

Turrell, Eugene S.
Why industrial plants burn (symposium). 11:13-23.

The positive approach to driver physical requirements—emotional factors. 20: 20-23; (panel forum) 20:34.

U

UNITED MINE WORKERS OF AMERICA

How the Safety Division of the U.M.W.A. has aided the accident prevention program of coal mines *(Schuler)*. 6:24-26.

U. S. BUREAU OF INDIAN AFFAIRS

The Red Hat program of the Bureau, a fire fighting protection and training activity *(Shanklin)*. 24:54; 29:30.

U. S. BUREAU OF MINES

Bureau of Mines courses in Accident Prevention and First Aid and rescue, given at Ireland Coal Mine *(McCoy)*. 6:21.

Process in cementation of coal-mine roof *(Mains)*. 6:4-7.

Resume of gas ignitions and fires in coal mines since enactment of the Federal Coal Mine Safety Act; recommendations to prevent recurrences *(Weaver)*. 6:26-28.

Two visual aids used in Bureau of Mines safety demonstrations *(Hintz)*. 14:94-96.

Accident prevention training course for workers and supervisors *(Bradbury)*. 6:33.

Fire control of some of the new pyrophoric metals *(Brown)*. 14:28-31.

U. S. BUREAU OF PUBLIC ROADS

Road design and its relation to traffic accidents *(Frick)*. 27:54-62.

U. S. COAST GUARD

Current developments in inflatable liferafts *(Nash)*. 16:38-41.

U. S. DEPARTMENT OF AGRICULTURE

Safety in the small sawmill aided by Forest Products Laboratories *(Malcolm)*. 29: 9-12.

U. S. DEPARTMENT OF COMMERCE

Nautical charts for safe navigation *(Kero)*. 16:35-38.

U. S. DEPARTMENT OF INTERIOR

Safety training for fire protection foresters *(Shanklin)*. 24:50-56; 29:36-42.

U. S. DEPARTMENT OF LABOR

Role of the U. S. Department of Labor in occupational safety *(Butcher)*. 15:34-36.

U. S. MILITARY SERVICES

Air Force interested in reducing traffic accidents by use of group discussion-decision *(Ferriss)*. 26:36-41.

The new nuclear-equipped, guided missile navy *(Witt)*. 16:46-48.

Population mobility—the military family *(Hall)*. 26:65-67.

U. S. PUBLIC HEALTH SERVICE

The accident prevention program of the Public Health Service *(Goddard)*. 19: 27-31.

Urban, J. T.
Togetherness in transportation. 25:4-6.

Utley, Clifton M. (Mrs.)
The changing world in which our elementary school children are living. 26:59-62.

V

VALVES

Clutch—brake control valving *(Huntington)*. 16:26-30.

Frequent inspection of check valves on pressure vessels imperative *(Kiefer)*. 8:8.

No relief valves on ammonia cylinders *(Anderson)*. 10:16.

Van Atta, Floyd A.
Occupational health control through engineering. 18:11-12.

Vander Clute, Carl F.
Protecting oil tanker crews from accidents. 16:17-21.

VENTILATION

Dust collection at the coal mine face with continuous mining operations *(Weakt)*. 6:32-35.

Epoxy resins and catalysts hazards *(Lange)*. 2:9.

Factors in exhaust ventilation system design for the safety engineer *(Morse)*. 14: 42-46.

Five foot aerodyne fan for underground work of surface mine plant *(Bruns)*. 19:37.

Metal scoops replaced by safer rubber wind scoops on freighter passageways *(Terr)*. 16:26.

Portable vent blowers provided for freighter crew when working in tanks or drums *(Terr)*. 16:26.

Positive ventilation must be supplied in mines using diesel equipment, to dilute and remove exhaust gases and maintain safe concentration of oxygen *(Heitz)*. 19: 10, 14-19.

Positive ventilation without the use of line curtains, keeps methane percentage below ½ of one per cent in coal planer mining *(Morse)*. 6:12.

Ventilation necessary on operations using tetrafluoroethylene resin when it is heated above 400 degrees F. *(Meiser)*. 8:18.

VENTRICULAR FIBRILLATION

Electric shock symptoms *(Dunne)*. 21:12.

Hazards of 110 and 220 voltage in industrial operations *(Brown)*. 24:37-38.

Physical aspects of low voltage electric shock *(Koeneneboen)*. 14:40-41.

Villella, L. A.
The importance of safety in mechanization —track maintenance. 22:11-13.

VIOLATORS

Grade-crossing violations reported *(Kiesele)*. 26:26.

Of the 82 coal haulage fatalities, 44 per cent were violating the Federal Mine Safety Code *(Kebbish)*. 6:15.

Promoting public relations to traffic courts through *Driver Improvement* schools *(Krueger)*. 27:41-44.

Relationship between driving records, selected personality characteristics, and biographical data of traffic offenders and non-offenders *(Heath)*. 26:22-26.

Surveys show that drivers deliberately violate highway regulations and safe driving practices; factors contributing to this attitude *(Johnson)*. 27:46-47.

Traffic killers begin on bikes *(Guyman)*. 26:43-44.

VISION

Be positive in driver testing *(Hauck)*. 20:7.

Eye screening programs in industry *(Marshall)*. 24:28-32.

The positive approach to driver physical requirements—visual factors *(Payne)*. 20: 17-20; (panel forum) 20:34-36.

Research in vision and traffic safety *(Bryan)*. 27:51-52.

Responsibilities and limitations of the industrial nurse in the vision program *(Harpweed)*. 14:74-77.

Use of visual tests in driver training *(Switzer)*. 7:26-27.

What good vision can mean to industry *(Simpson)*. 24:32-36.

VISUAL EDUCATION

Abitibi produced two films dealing with mill and woods operations *(Hobbs)*. 20:16.

Atlas Power Company issued film "How to handle women and explosives" *(CocAran)*. 22:20.

Company made films *(Hess)*. 14:26-27.

Demonstration of television techniques for driver education *(Burrows, Michalski, Tucker)*. 26:96-98.

Discussion-conference technique is advocated with training films such as "Hauling Logs" *(Pearce)*. 24:60; 29:36.

Do it yourself sound slidefilms *(Scheer)*. 14:36-62.

Film library part of educational program of the Oregon Industrial Accident Commission *(Callahan)*. 18:22.

Flannel board demonstration *(Meteer)*. 14: 84.

Flip charts *(Wickord)*. 14:84-86.

Identification for safety accomplished by trade association poster program *(Cleland)*. 24:18.

"Knowing's not enough"—U. S. Steel film personalizes the four Imps *(Buchanan)*. 16:4.

North Dakota Workmen's Compensation Bureau has library of training films *(Ryan)*. 18:26.

Overhead projection *(Marcoux)*. 14:92-96.

Personal contact with road and yard train service employees through National Safety Council's safety graphs *(Brahm)*. 23:3-4.

Pictures used to show unsafe operating conditions that contribute to inefficiencies and high production costs in a sawmill *(Malecka)*. 28:11.

Safety through the eyes of a camera *(Muir)*. 22:28-32.

Shipboard movies are an excellent medium for transmission of the safety message *(Reuben)*. 16:31.

Skits for safety any spot to accidents *(Hanna/ord)*. 14:98-102.

Stagette used in "The Destroyer Story." 14:97-98.

Stimulation—the framework of driver supervision (use of slides showing serious accidents) *(Nelson)*. 20:47.

Twenty-three films on the air we breathe—air contaminants and respiratory protective devices *(Fawcett)*. 8:24.

Two visual aids used in Bureau of Mines safety demonstrations *(Kiely)*. 14:94-96.

VOCATIONAL EDUCATION

Findings of graduate theses in school safety in various areas *(Yost)*. 26:18.

Safety in vocational and industrial arts education *(Ingram)*. 26:8-9.

VOLTAGES

Arcing distances of electricity *(White)*. 7: 30.

Hazards of 110 and 220 voltage in industrial operations *(Brown)*. 24:36-40.

The hazards of radio transmitters and their correction *(Carr)*. 8:9.

Physical aspects of low voltage electric shock *(KeunenAcoen)*. 14:39-41.

345 Kv. hot line maintenance *(Carter)*. 8: 20-22.

W

WALKWAYS

Gratings and hand rails extended to freighter machinery, eliminate makeshift wood planking *(Terr)*. 16:26.

Prevention of accidents to crew aboard freighters *(Terr)*. 16:23-25.

Protecting oil tanker crews from accidents *(Vander Clute)*. 16:19.

Ward, Thomas L.
Selling passenger safety to the operator. 22:17-19.

WAREHOUSES

Problems in the use of "fire-stopped" pallets as against their purported advantages *(Prince)*. 17:43-44.

Warehouse safety inspections form developed with separate check lists *(Prince)*. 17:44-48.

Why industrial plants burn *(Crosby)*. 11: 21-22.

Warner, George
Urban enforcement problems as they are related to speed violations and their apprehension. 27:27-29.

Warren, Irvin H.
A practical approach to police training. 27: 19-21.

Wapp, John H.
Be positive in using incentives. 20:9-10.

Wasserburger, Lester L.
Safety for school personnel. 26:7-8.

WASTE

Waste disposal in chemical laboratories *(Wallace)*. 8:52-54.

WATCHMEN

Maintaining a watch at all potential danger points will pay safety dividends in ship repair *(O'Donnell)*. 16:34.

Why industrial plants burn *(Crosby)*. 11: 21-22.

WATER UTILITIES

Water utility safety (symposium). 8:23-40.
a) What's new in water safety — 1957? *(Faust)*. 8:23-28.
b) How and where to get started *(Appleyard)*. 8:29-36.
c) A first line supervisor's safety program *(Roner)*. 8:36-38.
d) Safety pays off *(Webb)*. 8:39-40.

What's new in water safety—1957? *(Faust)*. 8:23-28.

WATERWAYS

Safety and heavy construction, St. Lawrence project and the highway program *(Armstrong)*. 7:9-12.

Watson, Edward
Remarks on the Boy Scout safety good turn program. 9:16.

Weaver, D. A.
Reducing motor vehicle accidents in public utilities through driver control. 8:17-20.

Weaver, H. F.
Résumé of gas inhalations and fires in coal mines since enactment of the Federal Coal Mine Safety act; recommendations to prevent recurrences. 8:36-38.

Webb, Arthur J.
Safety pays off. 8:39-40.

Webb, Jervis C.
Materials handling by conveyors without accident. 14:30-32.

WELDING AND CUTTING

Advantages of welded mine track in ore and coal mines *(Evans)*. 19:21-22.

In welding shop ten foot curtain wall protects machine shop from flash *(Brunsd)*. 19:26.

Safety in ship repair *(O'Donnell)*. 16:34.

Safety in the uses of cylinder gases in oxy-fuel gas welding and cutting *(Saacke)*. 8:26-30.

Wendel, Herbert A.
Safety program of the Butte District operations of the Anaconda Company. 19: 41-46.

Westfield, James
The Federal Bureau of Mines. 8:26-27.

White, Raymond W.
Look up and live. 7:12-26.

Wick, Harold M.
Report of the assistant general chairman (programs and conventions) of the Marine Section. 16:11.

Wickiser, Joseph F.
Parks maintenance safety—tree trimming—brush handling. 7:36-37.

Wickord, T. F.
Flip charts. 14:84-86.

Wilcox, Donald E.
Men, machines and methods. 8:14-18.

Wilkins, E.
Cost of off-the-job accidents to industry. 2:5-8.

Williamson, T. T.
Report of the membership committee of the Marine Section. 16:11.

Will, John M.
The new nuclear-equipped guided missile navy. 16:14-18.

Williams, J. H.
Women's safety councils—the best way to the men. 13:51-52.

Williams, John H.
Parks maintenance safety—tree trimming—brush handling and related subjects. 7: 37-43.

Wilson, Alan V.
Safety and the foreman. 24:36-38.

Will, Warren D.
Remarks on driver training. 7:26.
Statistical committee report for the Public Employee Section. 7:71-72.

WINTER HAZARDS

Sanding, salting, snow removal (park maintenance) *(Williams)*. 7:40.

Snow and ice control problems of public employees *(Murphy)*. 7:39.

Winterrowd, E. F.
When personal contact with road and yard train service employees is essential to safety. 23:9-11.

WOMEN'S ACTIVITIES

Fundamentals of home safety activities *(Haywood)*. 1:51.

Our role in safety leadership *(Sayre)*. 1:27.

The philosophy of the beaded shoes *(Fergusson)*. 1:53-54.

Promoting public relations of traffic courts (panel discussion). 27:39-44.

The question of speed and traffic safety *(Bailey)*. 27:52-58.

Time for decision *(Johnson)*. 1:39-41.

The traffic problem *(Hill)*. 1:41-50.

Women in industry *(Frese)*. 1:20-24.

Women's safety councils—the best way to the men *(Williams)*. 13:51-52.

WOMEN'S ACTIVITIES SESSIONS

Minutes. 1:27-62.

Wood, William S.
Flammable materials — system for rating. 8:36-41.

WOOD PRODUCTS INDUSTRY

Control of noise at the source *(Young)*. 14:60-61.

Developing safe work methods in sawmills *(Hale)*. 29:13-13.

Does safety training pay? *(Mobbs)*. 29: 14-17.
How to set up an industry safety training conference *(Oveal)*. 24:56-58; 29:83-84.
How to train loggers *(Deeley)*. 29:7-8.
Promoting woods safety *(Pearce)*. 24:58-60; 29:34-36.
Rehabilitation in Ontario, Canada *(Young)*. 24:46-50; 29:29-36.
Safety training for fire protection foresters *(Shanklin)*. 24:50-56; 29:26-33.
Using American Standards in safety training *(Lamb)*. 29:20-21.
Using American Standards in safety training *(Mobbs)*. 29:21.
Weakt, Raymond J.
Dust collection at the coal mine face with continuous mining operations. 6:21-26.

WOOD PRODUCTS SECTION
Joint session with the Pulp and Paper Section. 29:23-26.
Minutes. 29:4-36.
Officers and committees. 29:42-44.
Woodcock, Bert L.
Iowa driver improvement schools course of study. 27:85-85.
Woodward, E. Clark
Initiating and maintaining interest in safety. 3:25-28.
Woodworth, M. W.
Restrictive regulations at service stations. 29:33-35.

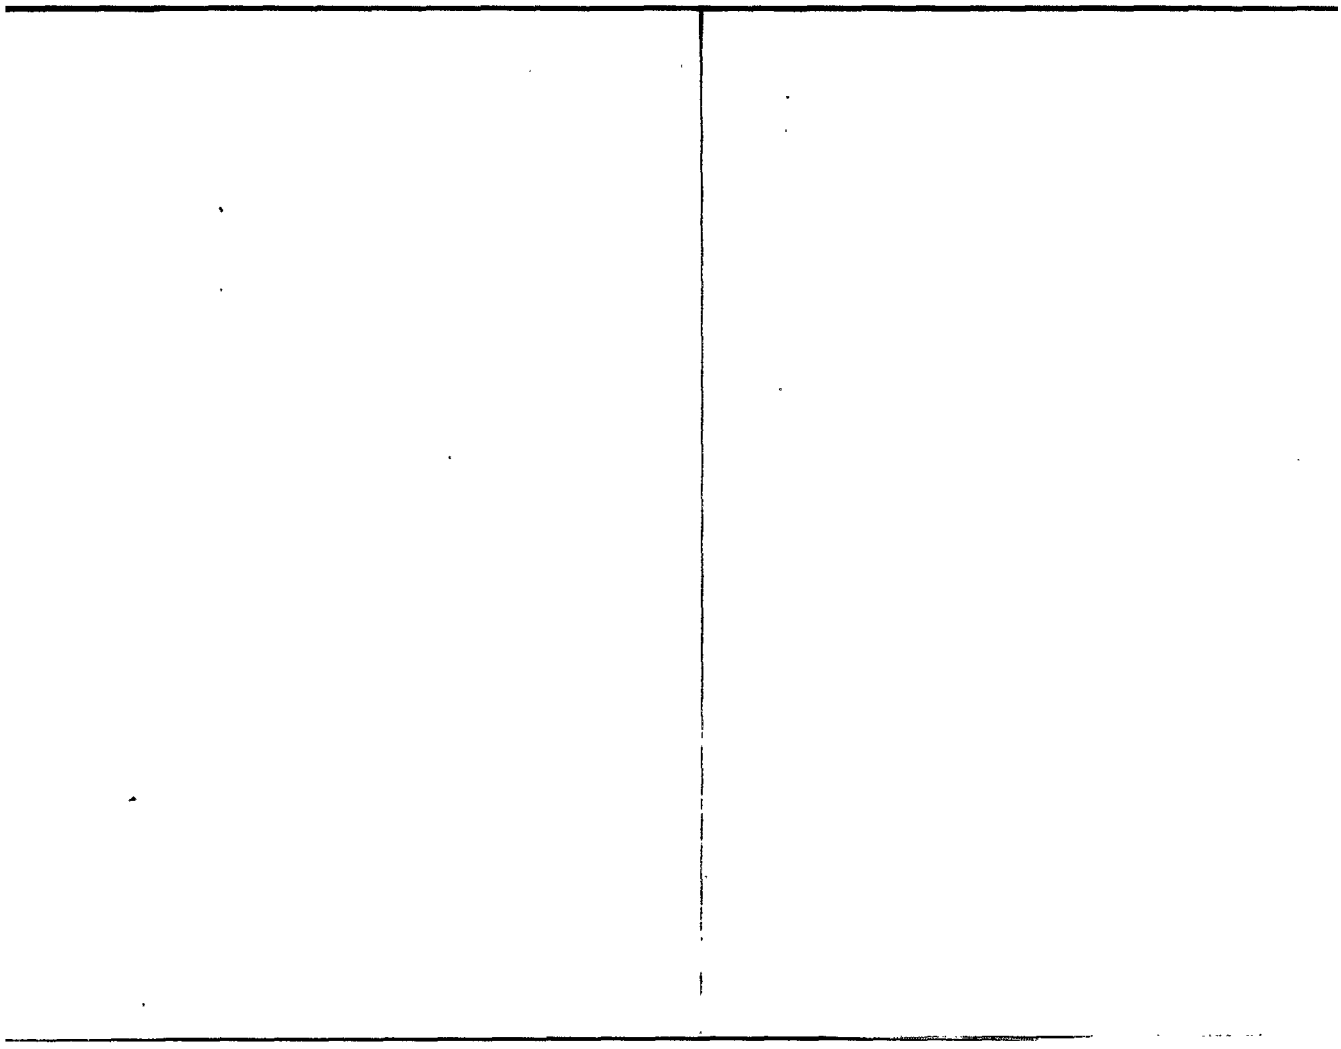
WORK PERMITS
Hot work permit system first step in prevention of welding and cutting fires *(Sascha)*. 6:30.
Work permit system for maintenance department at distillery *(Bauer)*. 11:29-32.

WORKMEN'S COMPENSATION
Comparison of accident experience, compensation and safety incentive costs for ten year period at Asbestos Corporation Limited *(Smith)*. 29:28.
Compensation premiums cut as a result of a city program of health and safety for governmental employees *(Pagnard)*. 7: 61-62.
Ontario Board permits industry safety groups, makes financial grants to assist them *(Mobbs)*. 29:14-15.
The inadequacies of our workmen's compensation legislation can only be solved on a national level *(Hayes)*. 16:12.
North Dakota takes safety to the small communities *(Ryan)*. 16:26-29.
A résumé of occupational disease control since 1937, when Workmen's Compensation recognized liability for certain diseases *(Gardiner)*. 27:14-17.

WORLD WAR II
Loss of life at sea shows need for re-evaluation of lifesaving gear *(Nash)*. 16:39.

X

X-RAYS
Back X-rays on pre-employment physicals (Examining and reading round table discussion). 24:45.
Employees receiving dental X-rays four times a year, getting more than recommended amount of radiation (discussion report) *(Allmason)*. 8:35.
Radiation exposure in the rubber industry and control measures *(Manning)*. 12:36.



Y

Yergen, Lyle F.
Noise control by acoustical treatment. 14: 81-84.
Yost, Charles Peter
An analysis of graduate theses in school safety in the United States from 1938-1950. 28:13-17.
Young, F. E.
United for safety in the United Kingdom (Keynote address). 1:35-38.
Young, Bruce E.
Rehabilitation in Ontario, Canada. 24:46-50; 29:29-36.
Young, E. L.
Control of noise at the source *(Young)*. 14: 59-61.

YOUTH
Boy Scouts of America 1958 national safety good turn program. 6:15-16.
Careers in safety *(Hill)*. 6:35-38.
Have you met Otto? (Peters). 6:15-19.
1958 national safety good turn of the Boy Scouts *(Boland)*. 1:19-20.
Supervising the youthful worker *(Hargrave)*. 18:4-6.
What the Boy Scouts' Safety Good Turn means to schools and colleges (discussion session report). 26:50-51.

Z

Zaun, Cecil (panel moderator)
Advantages and disadvantages of the Aetna Drivetrainer and multiple car plan for driver education. 26:65-67.
