1 THE VIDEOGRAPHER: We're on the record at
2 9:15 a.m. The date is December 8th of the year
3 2009. We're at the offices of Husch Blackwell
4 Sanders. The address is 190 Carondelet in
5 St. Louis, Missouri.

6 This begins videotape No. 1 in the
7 deposition of Dr. Robert G. Kaley in the matter of
8 Solucia, Incorporated, and Pharmacia Corporation
9 versus McWane, Incorporated, et al., currently
10 pending in the United States District Court for the
11 Northern District of Alabama, Eastern Division, case
12 No. CV-03-PWG-1345-E.

13 At this time, could I ask counsel to
14 identify themselves for the record, please?

15 MR. MERRILL: Yeah. I'm Charlie Merrill
16 representing the plaintiffs, Solucia and Pharmacia.

17 MR. SCHICK: Bob Schick on behalf of Phelps
18 Dodge with Vinson & Elkins.

19 MR. LIPPARD: Ben Lippard also with Vinson &
20 Elkins on behalf of Phelps Dodge.

21 MS. LAVEY: Wendy Lavey with Squire, Sanders
22 & Dempsey on behalf of Defendant MeadWestvaco
23 Corporation.

24 MR. SCHICK: And on the phone?

25 MS. LEMMER: This is Julie Lemmer with

1 Alston & Bird on behalf of U.S. Pipe & Foundry.

2 MR. SCOTT: John Scott with Scott, Dukes &
3 Geisler for Huron Valley Steel Corporation.

4 MS. SMITH: Lynette Smith at Troutman
5 Sanders for Scientific Atlanta.

6 MS. McADAM: Allison McAdam at Hunsucker
7 Goodstein & Nelson for Southern Tool.

8 MR. NICHOLS: Brian Nichols from Maynard,
9 Cooper & Gale on behalf of McWane, Inc., BAE Systems
10 Land and Armaments, LP, and FMC Corporation.

11 MR. HEISTER: Michael Heister on behalf of
12 DII Industries.

13 THE VIDEOGRAPHER: Was that all counsel?
14 Thank you.

15 Would the court reporter please swear the
16 witness?

17 (Witness sworn.)

24

25

1 ROBERT KALEY, Ph.D.,

2

3 of lawful age, having been first duly sworn to
4 testify the truth, the whole truth, and nothing but
5 the truth in the case aforesaid, deposes and says in
6 reply to oral interrogatories propounded as follows,
7 to-wit:

8 EXAMINATION

9 QUESTIONS BY MR. SCHICK:

10 Q Would you state your full name, please, sir?

11 A Yes. It's Robert George Kaley, II.

12 Q Dr. Kaley, my name is Bob Schick. I
13 represent Phelps Dodge in a lawsuit that Solucia has
14 brought against a number of other defendants that's
15 pending in Birmingham, Alabama.

16 You're familiar with that lawsuit, are you
17 not?

18 A Yes.

19 Q In fact, you've given your deposition in
20 that lawsuit in the past?

21 A Yes.

22 Q You know that in today's deposition you are
23 being presented on behalf of the company as what's
24 referred to under the federal rules as a 30(b)6
25 witness; do you understand that?

1 A Yes, I do.

2 Q And do you know that what that means is that
3 you're speaking on behalf of the company -- that is,
4 Solucia -- in connection with the testimony you're
5 giving here today?

6 A Yes, I understand.

7 Q Okay. Fair enough. What I'd like to do
8 just so that we know the parameters of what you're
9 being offered for here today is show you what's been
10 marked as Deposition Exhibit No. 1 to your
11 deposition.

12 Do you have that in front of you?

13 A Yes, I do.

14 Q And in particular on page 7, this is a
15 letter from your counsel, Mr. Merrill, and it
16 outlines the topics on which you intend to give
17 testimony today.

18 Is that your understanding?

19 A Yes, it is.

20 Q Am I correct in understanding, then, that
21 you will give your testimony today with respect to
22 whatever knowledge you have about the mobility or
23 motility of PCBs in the environment, volatilization
24 of PCBs contained in soil, sediments, and surface
25 waters, weathering of PCBs, dechlorination of PCBs,

1 and adsorption of PCBs in particles in air or water?

2 A Yes, I understand.

3 Q All right. There is a note that your
4 counsel provided underneath No. 12 saying that
5 testimony on this topic and its subparts will not
6 cover facts known or opinions held by experts other
7 than you, Dr. Kaley, who may testify.

8 And my question to you is: Have you spoken
9 with any experts who have been retained on behalf of
10 Solucia with respect to these topics?

11 I'm not asking --

12 A Yeah, I understand. I'm trying -- I'm
13 looking at the topics to see. To some extent, yes.

14 Q And without telling me what you discussed,
15 can you tell me which experts you talked with?

16 A Dr. Menzie.

17 Q Other than Dr. Menzie?

18 A With respect to these topics, I don't
19 believe so, no.

20 Q Okay. Fair enough. You can take that down.
21 Thank you.

22 Am I correct in understanding that you are
23 now employed by the Husch Blackwell Sanders law
24 firm?

25 A No.

1 Q Okay. I was under the impression that in
2 2005 you actually became a technical advisor to the
3 law firm.

4 Is that not correct?

5 A No. I'm an independent consultant.

6 Q Okay. And you charge on an independent
7 basis for the time that you put in on a particular
8 matter?

9 A Yes.

10 Q Can you give me an approximation as to --

11 A Well, that's not correct. I'm on retainer
12 through the Husch law firm to Pharmacia in support
13 of whatever they need on -- on various issues. So
14 I -- I don't charge by the hour for particular
15 activities. I'm on retainer.

16 Q And are you still on retainer at the \$13,500
17 a month?

18 A No. It's actually 15,000 now.

19 Q And does your paycheck come from the Husch
20 Blackwell firm or from Solucia?

21 A It's drawn on Husch Blackwell.

22 Q Okay. Fair enough.

23 Dr. Kaley, what is a PCB?

24 A Well, a PCB is -- PCB isn't an A. It's a --
25 it's a term that encompasses 209 materials known as

1 chlorinated -- polychlorinated biphenyls.

2 Q What is an Aroclor?

3 A Aroclor is a Monsanto tradename for a line
4 of polychlorinated polyphenols that were
5 manufactured by the company.

6 Q And they were manufactured by the company
7 during what period of time?

8 A From 1935 through 1977.

9 Q You're familiar with the various Aroclors
10 that were manufactured by Monsanto, Solucia's
11 predecessor, in Anniston, Alabama?

12 A Yes, I am.

13 Q And are you familiar generally with the
14 production of Aroclors in Anniston over that period
15 of time?

16 A Yes, I am.

17 Q For example, are you familiar with the
18 fact -- and we can look at documents later -- that
19 approximately 59 percent of the production was of
20 Aroclor 1242, for example?

21 A I don't know the percentages offhand.

22 Q Okay. Fair enough. We'll take a look at
23 that later.

24 What is a homologue, as that term is used in
25 connection with PCB?

1 A A homologue is a term that has been used to
2 describe -- well, let me -- let me step back and say
3 that PCBs can have either 1 up to 10 chlorines on
4 the biphenyl molecule, and a homologue is a way of
5 describing the polychlorinated biphenyls as to the
6 number of chlorines on the monologue -- on the
7 molecule. So there are 10 homologues of PCBs.

8 Q And the 10th is referred to as
9 decachlorobiphenyl?

10 A That's correct.

11 Q Okay. What is a congener, as that term is
12 used in connection with PCBs?

13 A As I mentioned, there are 209 individual
14 chemical compounds that fall under the rubric of
15 PCBs, and a congener is any single one of those
16 compounds.

17 Q And is a congener based on its location on
18 one or the other of the biphenyl rings?

19 A Well, I mean, the congener -- each congener
20 is defined basically by the number of chlorines and
21 the position of the chlorines on that ring.

22 Q Then what's the difference between a
23 congener and a homologue?

24 A Well, a homologue is just the number of
25 chlorines. So, for example, if we think about a

1 material with three chlorines on the ring, the
2 trichloral homologue, there are actually 24
3 individual compounds, individual congeners, that
4 have three chlorines on the ring; but they are in
5 different positions.

6 Q Fair enough. And let me ask you this:
7 What's the basis of your knowledge about these
8 things that we've been talking about, congeners and
9 homologues and polychlorinated biphenyls?

10 A Well, I'm trained as an analytical chemist,
11 and I was in the laboratory for a dozen years. And
12 after that I've maintained a reading knowledge and
13 literature knowledge of PCBs in general.

14 Q And did you actually work with PCBs in the
15 laboratory?

16 A Yes, I did.

17 Q Was that a part of your employment at
18 Monsanto?

19 A Yes, it was.

20 Q And just to refresh my memory, during what
21 years were you employed by Monsanto?

22 A From 1973 until 1997 when Solucia was spun
23 off.

24 Q Then you went with Solucia until what year?

25 A 2003.

1 Q Okay. In addition to review of literature,
2 your personal experience, and your training in
3 chemistry, have you also learned about congeners,
4 homologues, and PCBs in discussing them with other
5 individuals?

6 A Well, with regard to those particular terms,
7 no. I mean, I've known what those terms have meant
8 since basically the beginning of my career at
9 Monsanto. So, no.

10 Q With respect to the ways in which PCBs act
11 in the environment -- that is, either in air or in
12 water or in sediment -- did you derive any of your
13 knowledge in those areas from anything other than
14 your own personal experience and literature reviews?

15 A Well, attendance at meetings and listening
16 to presentations by other persons.

17 Q Meetings primarily of Monsanto/Solucia or
18 meetings, for example, of the American Chemical?

19 A Well, that would be an example. The
20 American Chemical Society meetings are not among
21 those that I've attended, but that's -- that's an
22 example of the kind of meeting -- technical outside
23 meetings.

24 Q Is there an individual with Solucia or --
25 and I mean either an employee or a consultant like

1 you are today -- who you believe knows more than you
2 do about the -- the ways in which PCBs act in the
3 environment in air, water or sediment?

4 A That's a trap question.

5 Q Yeah. In a way it is.

6 A I suppose there are certainly persons out
7 there who may know more on specific general
8 technical areas, but I think I have as good an
9 overview of that as anybody I know, I guess.

10 Q Does Dr. Menzie know more than you? And if
11 so, in what area?

12 A He may know more on the details of fate and
13 transport, but I don't -- I don't consider that he
14 knows all that much more than I do. He may know
15 more on a technical basis, but certainly he's very
16 knowledgeable. I'm not questioning his knowledge.
17 He's a very knowledgeable man.

18 Q What is meant by fate and transport?

19 A Well, basically the terms fate and transport
20 describe the behavior of any chemical as it's
21 introduced, primarily into the environment. It
22 doesn't have to be in the environment, but that's
23 generally the way the terms are used.

24 And basically the fate is what happens to
25 that chemical. Does it stay as the chemical as it

1 was introduced or does it change somehow?

2 And then the transport is how is that
3 chemical moved about the environment.

4 Q What information does Monsanto or Solucia --
5 by the way, can I use those terms interchangeably in
6 this deposition?

7 A Yes. If -- Monsanto is fine.

8 Q Okay.

9 A That's the way I think.

10 Q Okay. Fair enough. What information does
11 Monsanto have that you know of in its possession
12 regarding the behavior of -- of various forms of
13 PCBs in the environment?

14 A I assume there are business documents that
15 might address that particular -- particular aspect,
16 and I assume there are people who have scientific
17 publications on that. I don't know specifically
18 what they have in their possession.

19 Q Are there -- is there scientific literature
20 that's been developed by Monsanto or its people, its
21 employees, that you've relied on in learning about
22 the behavior of PCBs in the environment?

23 A There is some of that.

24 Q Can you identify what literature in
25 particular you rely on?

1 A Well, there -- when I joined Monsanto in
2 1973, I joined a company that was -- a company -- a
3 group that was actively involved in measuring some
4 of the environmental properties of PCBs and the
5 behavior of PCBs, the biodegradation of PCBs. So --
6 and some of that work has been published.

7 So through my interaction with that group
8 and learning what went on before me and
9 participating in the group after I got there, I've
10 certainly learned many of the things that are
11 addressed on these topics.

12 Q What was the name of that group that you
13 joined?

14 A It was a group called applied sciences in
15 the industrial chemical company.

16 Q And that was a part, a department, of
17 Monsanto?

18 A Yes.

19 Q And was that research that was done by that
20 group and the review that that group did of the
21 activities of PCB in the environment -- was that
22 broken down into the behavior of Aroclors and the
23 behavior of homologues?

24 A It was primarily the behavior of Aroclors at
25 that time frame. Really the analytical chemistry to

1 analyze congeners and then subsequently homologues
2 had not fully been developed. So it was primarily
3 focused on the behavior of the products.

4 Q When was the technology developed to follow
5 homologues and congeners?

6 A Well, it was beginning to be developed in
7 the 1970s. Really continued to develop through the
8 1980s and really only came into fruition in the
9 1990s.

10 Q And what are the techniques for following
11 congeners and homologues and their activity in the
12 environment that came about really in the 1990s?

13 A The -- there are two techniques that are
14 used in conjunction. One is gas chromatography
15 which is a separation technique, and the other is
16 mass spectrometry which is an identification
17 technique. And that -- that combination has really
18 led to the development of the ability to do the
19 analyses as we know it today.

20 Q What are those two scientific techniques
21 able to do with respect to the identification of
22 congeners and homologues?

23 A Well, the first technique, gas
24 chromatography, takes a complex mixture of
25 chemicals, including PCBs, and separates them on

1 a -- basically a class column so that the individual
2 compounds are separated from one another in time as
3 they leave the instrument. And then the mass
4 spectrometer can be used in two ways. It can be
5 used to identify the particular compound as it comes
6 out of gas chromatograph, or in a more sensitive
7 mode, it can be used to measure the amount of that
8 compound as it comes out of the chromatograph.

9 Q And what does that tell you, then, about
10 what you're looking at with respect to either an
11 Aroclor or a homologue?

12 A Well, at that point it doesn't tell you very
13 much about whether you're looking at an Aroclor,
14 but -- or a -- but it tells you basically which
15 individual PCB congener is coming out of the
16 chromatograph at that individual time. So you have
17 a -- you have a specific identification of one of
18 the 209 congeners or a measurement of how much that
19 congener is present in the sample.

20 Q Does it also tell you how much of a
21 particular homologue you have in that sample?

22 A No. That's a subsequent calculation.
23 Basically you just, through the computer, add up all
24 of the totals for individual -- for instance, the 24
25 trichlorobiphenyl congeners, you just select those

1 out of your instrument output and add them up to get
2 the homologue number.

3 Q Okay. Fair enough. And how long has that
4 technology been available? You said the '90s.

5 A Well, that's when it really has reached
6 perfection. I mean, the techniques were beginning
7 to be developed in the 1980s and probably even the
8 late 1970s, but it's -- it's a -- it's a moving
9 target; and the techniques and the abilities to
10 measure lower levels and the abilities to separate
11 the congeners more effectively have continued to
12 develop even today.

13 Q And am I correct in understanding the extent
14 to which you've been able to measure congeners then
15 translates into an ability to identify homologues?

16 A Well, you really don't identify homologues.
17 They are basically defined as the particular groups
18 of congeners. So, I mean, to some extent what
19 you're saying is true, but it's -- it's really a
20 homologue is a derivative concept from the ability
21 to measure congeners.

22 Q Have you or others at Monsanto to your
23 knowledge performed studies or experiments with
24 respect to the reliability of these sorts of tests
25 in identifying congeners?

1 A Well, we certainly -- during my time in the
2 laboratory, which basically ended about 1985, we --
3 we certainly did those kinds of measurements with
4 techniques that were available at the time and
5 certainly did measure -- you know, had some way of
6 assessing the reliability of those analyses.

7 Q For what purpose would you do those sorts of
8 analyses?

9 A Well, primarily to look at, I guess, in
10 general at that time frame, the presence and
11 identification of the PCBs in environmental samples.

12 Q But why would you want to know what
13 particular congener or what mix of congeners was in
14 a particular sample of a PCB?

15 A Well, it's -- it's just -- part of it is
16 just a desire to have as much information as
17 possible. PCBs change when they get into the
18 environment. So an Aroclor 1242 that may have been
19 introduced in the environment 10 or 15 years down
20 the road may or may not be identifiable as Aroclor
21 1242. It changes.

22 So really the information is -- is much more
23 full for a particular analysis if you know the
24 congeners rather than trying to look for a
25 particular Aroclor which may no longer be there in

1 that form.

2 Q And by doing the congener analysis, are you
3 able to determine whether that 1242 that you've
4 identified just as sort of the general Aroclor was
5 indeed something different when it was first
6 introduced in the environment?

7 A Well, that -- that question cannot be
8 answered in the general, because it depends on the
9 particular site and what you know about that site
10 and the time frame and a lot of things. So I don't
11 really think there's a general answer to that
12 question.

13 Q Then why do it? Then why do the gas
14 chromatograph or the --

15 A Well, because each --

16 Q -- mass spectrometer?

17 A I'm sorry. I didn't mean to interrupt.
18 Well, at each particular site, if you have a reason
19 for doing particular analyses, the information you
20 get from congener-specific analysis will provide you
21 a better basis to make judgments about that -- about
22 that particular sample, as to amounts, as to
23 potential sources, as to potential toxicity, for
24 example. There's just so much more information
25 available on a congener-specific analysis.

1 Q So you're still having to make a judgment
2 even after these tests as to, for example, what that
3 Aroclor was when it was first introduced into the
4 environment?

5 A Well --

6 Q It is not scientifically verifiable?

7 A I'm not quite sure how to answer that. I
8 suppose that if -- if in the context of the analyses
9 you know -- that you are doing that you know that it
10 was Aroclor 1242 that was introduced into the
11 environment and you can measure the particular
12 congeners in the sample as it was -- as it was used
13 and introduced and compare it to what you're finding
14 now, you may be able to do that.

15 But just to randomly go out and take a
16 sample and say, Oh, I know that's Aroclor 1242, I
17 don't think that's really possible.

18 Q So if you identify as an Aroclor today in
19 2009, an Aroclor 1242, and you do your congener
20 analysis through a gas chromatograph and mass
21 spectrometry, what help does it give you in
22 determining what that Aroclor was when it was first
23 introduced in the environment?

24 A Well, it may not give you any. If that's
25 the question you're asking, then you have to think

1 about how you would use that information. Typically
2 that's not the question you're asking. Typically
3 the question you're asking is: What is there as we
4 sit here today?

5 Q Okay. Now, with respect to doing these
6 sorts of tests, the two tests that we've been
7 talking about -- and that's gas chromatograph and
8 mass spectrometry --

9 A Uh-huh.

10 Q -- did Solucia, Monsanto, perform those
11 sorts of tests in connection with various reporting
12 that it's done in Anniston to the EPA?

13 A At that time frame, the analyses were done
14 by outside contractors. They were not done by
15 Monsanto or Solucia, per se.

16 Q And when you say at that time, which time
17 frame are you talking about? Is this the early
18 2000s?

19 A Well, beginning in the -- basically the
20 early 1990s actually.

21 Q And were those outside consultants using gas
22 chromatographs or mass spectrometry?

23 A One or other or both, yes.

24 Q Okay. How do you know that?

25 A I, in many cases, spoke with the analysts,

1 and I've seen -- in the course of my employment, saw
2 many results from those -- those analyses and had an
3 understanding of how they were done.

4 Q And what did those analyses provide in the
5 way of scientific verifiability as to whether the
6 Aroclors had changed over time or what the source
7 was?

8 A Basically none.

9 Q Okay. Okay. Let's talk a little bit about
10 mobility of PCBs in the environment, okay?

11 A All right.

12 Q What are the mechanisms by which PCBs can
13 move through the environment, Dr. Kaley?

14 A Well, generally I guess we think of -- of
15 the three states of matter as being solid, liquid,
16 and vapor. So with regard to vapor, PCBs can be in
17 a vapor state and move through the environment that
18 way, or they can in kind of a combination of solid
19 and vapor be attached to particles which can move
20 through the environment.

21 With regard to water, PCBs, although they're
22 very sparingly soluble in water, can actually
23 dissolve some PCBs to a -- to a given extent and be
24 carried as mole -- or as molecules dissolve in that
25 water, or again they can be transported by water as

1 adsorbed to parallel material.

2 And then with regard to soils or sediments,
3 solids, PCBs adhere very strongly to those kinds of
4 materials. Generally don't move from -- from where
5 they were originally deposited.

6 Q Unless there was material --

7 A Unless, unless, by other -- the other two
8 mechanisms we've talked about before. Unless
9 they're moved by wind, as in the air process, or
10 moved by water.

11 Q Okay. And -- and more generally let me ask
12 this: Can PCBs travel via air?

13 A To some extent, yes.

14 Q All right. And we know that PCBs can travel
15 via water bodies?

16 A Via moving water, yes.

17 Q Okay. And PCBs can also travel through
18 sediment migrating downstream in bodies of water?

19 A Yes.

20 Q PCBs also can be transported by storm
21 runoff? And that may be redundant, if we're talking
22 about the movement of water.

23 But if there's storm runoff and that -- that
24 water can pick up PCBs and move the PCBs?

25 A Generally picking up particles that have

1 PCBs on it, yes, that's true.

2 Q All right. Unless the PCBs are of the sort
3 that are soluble or can become soluble in water?

4 A Well, I wouldn't say unless. PCBs are
5 very -- you know, to -- in the -- in the general
6 vernacular, PCBs are very, very, very insoluble. So
7 even if certain congeners or certain portions of
8 products do have some slight water solubility, by
9 far the greatest amount is still going to be
10 adhering to particles. So it's not an either/or.
11 It's a -- it's a major -- or the major amount of
12 PCBs are going to be on solids, and some minor
13 amount may be in water or in air.

14 Q Okay. So generally speaking, most movement
15 of PCBs will be through the attachment of those PCBs
16 to particulate matter?

17 A That's correct.

18 Q All right. Now, is that different, that
19 statement, about most move as a function of their
20 attachment to particulate matter, for different
21 Aroclors? That is, is it going to be different for
22 a 1268 versus a 1242?

23 A Well, I'm going to go -- I'm going to go
24 back to the congener argument again.

25 Q Okay.

1 A One of the reasons you do congeners is
2 because the actual properties of the individual PCBs
3 depend on the congeners. So that the lower
4 chlorinated congeners typically will have higher
5 water solubility.

6 Now, to the extent that an Aroclor 1242 has
7 more of those lower chlorinated congeners than, for
8 example, an Aroclor 1260, your statement is true.
9 But you really can't talk about Aroclors in that
10 particular manner. You're really talking about the
11 congeners that make up those particular Aroclors.

12 Q Because the Aroclor is a mixture of a number
13 of four, five, six different congeners?

14 A More like 50 to 100.

15 Q Okay. And what about with respect to
16 homologues; can you look at homologues to understand
17 a difference in terms of the mechanisms of movement
18 through the environment?

19 A To a certain extent, yes. Because
20 homologues as we've discussed is basically an
21 agglomeration or a combination of the various -- of
22 the various congeners. So in general the congeners
23 of the same level of chlorination have generally the
24 same properties, although not necessarily exactly
25 the same properties.

1 So trichloral biphenyls as a whole, the
2 homologue trichloral biphenyls, is in general going
3 to be less soluble than the hexachlorobiphenyls.

4 Q Okay. What about with respect to movement
5 via air; any difference among the homologues?

6 A Yes. Even -- probably even more so, in that
7 the lower chlorinated congeners are typically, you
8 know, more exaggerated in their ability to enter the
9 gas phase than are the higher chlorinated materials.
10 But again, in either case, it's very -- we're
11 talking about very, very, very small amounts
12 entering into the gas phase.

13 Q And when we talk gas phase, we're talking
14 vapor?

15 A Yes, primarily, yes. At this point, yes.

16 Q All right. And so what you're saying is the
17 lower chlorinated congeners will vaporize more
18 easily than the higher chlorinated congeners?

19 A Exactly.

20 Q Have you done any or are you aware of any
21 studies that have been done with respect to the
22 percentage of the lower chlorinated congener that
23 can become vaporized under certain conditions?

24 A Well, I know there are vapor pressure kinds
25 of measurements that I think you can back calculate

1 that. As I sit here, I don't -- I can't give you a
2 number. But it's a very, very small number.

3 Q Okay. Now, I think what you've told me is
4 that when PCBs are admitted to the -- are emitted to
5 the atmosphere, it's either going to be in a vapor
6 or particulate phase?

7 A That's correct, yes.

8 Q And am I correct in understanding you that
9 what you're saying is it's more likely to occur in
10 the particulate phase than in a vapor phase?

11 A Well, again, I think that depends on the
12 system you're talking about. I don't think there's
13 necessarily a general answer to that. You have to
14 talk about --

15 Q A specific congener?

16 A Well, a specific congener and a specific
17 scenario.

18 Q And what do you mean by scenario?

19 A Well, I mean, are you talking -- if you're
20 doing an air measurement of PCBs, are you -- are you
21 measuring PCBs in the atmosphere over the Arctic, or
22 are you measuring PCBs next to a junkyard where
23 there's soil contaminated with PCBs and you're in a
24 wind storm? I mean, it really depends. There's
25 no -- you know, it depends on the scenario.

1 Q Okay. Wind certainly plays a factor in --
2 in determining the transport of PCBs, whether in the
3 vapor phase or a particulate?

4 A Sure.

5 Q Okay.

6 A I mean, wind defined as movement of air,
7 yes.

8 Q Now, given your understanding of the various
9 properties of the different Aroclors, which Aroclors
10 or their homologues, whichever is most comfortable
11 to you, are more likely to be released in a vapor
12 form?

13 A Well, the Aroclors with the lower
14 chlorinated congeners is their primary constituent.
15 So to the extent if you're looking at the -- at the
16 materials that were commonly manufactured by
17 Monsanto, Aroclor 1221 would be the most likely to
18 be found in the vapor form, and Aroclor 1260 or
19 higher would be the least likely.

20 Q Okay. And that's sort of the continuum,
21 from a 1221 to 1260 or 1260-A?

22 A Right. I'm sure you know that the last two
23 numbers designate the percentage of chlorine in the
24 molecules, and that percentage of chlorines is
25 basically dependent on the number of chlorines on

1 the individual PCB molecules. So the higher
2 percentage and the higher numbers in the Aroclor
3 series are going to have the more highly chlorinated
4 compounds.

5 Q Okay. And the more highly chlorinated, the
6 less likely to vaporize?

7 A Correct.

8 Q All right. Now, which Aroclor or their --
9 its homologue is more likely to be emitted to the
10 atmosphere in a small particulate versus a large
11 particulate? And I guess I'm talking about less
12 than 10 microns.

13 A Well, when I'm talking about PCBs on
14 particulates, I'm not talking about individual PCB
15 molecules or particulates being emitted. I'm
16 generally talking about PCBs being adsorbed onto a
17 soil or sediment particle which is subsequently
18 moved by the air transport system. So to that
19 extent, there's really no difference. Any of them
20 are going to adsorb to the soil and could be moved
21 by that mechanism.

22 Q And is that true for any homologue; that any
23 homologue can be adsorbed into (sic) the soil and
24 can then be moved, whatever size the particulate
25 matter is?

1 A As long as it remained adsorbed to that
2 soil. Now, again, there are other processes going
3 on which will change the amount that may or may not
4 be adsorbed to the particular soil particle,
5 depending on the -- basically the chlorination level
6 again. But in general, that's true, yes. Any PCB
7 can adhere to soil.

8 Q Now, tell me what the differences are that
9 affect that adsorption?

10 A Well, it's many of the things we've talked
11 about. If you -- if you take a PCB molecule and put
12 it on a particulate of soil, it's going to adhere to
13 it. It's going to stick to it. However, if it has
14 water solubility, if water runs over that soil
15 particulate, it may absorb that PCB molecule or may
16 not. I mean, it's -- if you're looking at an
17 individual molecule, it's hard to say.

18 But in the agglomeration, if you have lower
19 chlorinated -- excuse me. I'm talking too fast.

20 If you have lower chlorinated materials and
21 water passes over them, then some of those lower
22 chlorinated materials are going to dissolve in that
23 water and be moved away, leaving less on the soil.
24 The same is true if that soil particulate is sitting
25 out in the hot sun and there's a lower chlorinated

1 material on it. It's more likely that some of that
2 is going to evaporate into the air, and so there
3 will be less on the soil.

4 Q And what remains on the soil would be the
5 more heavily chlorinated homologue?

6 A That's correct.

7 Q Did I say that correctly?

8 A You said it very precisely, yes.

9 Q All right.

10 A I mean, that's a general statement, but that
11 is a true general statement.

12 Q Okay.

13 A I mean, that's basically one of the
14 things -- number C is weathering. And that's
15 basically the concept of weathering right there.

16 Q Okay. And when you talked about the lower
17 chlorinated homologue being washed off in the water,
18 it's actually removed from the particulate matter,
19 the piece, the speck of soil, and it's adsorbed into
20 (sic) the water then?

21 A Well, absorbed, yes. But now, again, I'm
22 not talking about, you know, if you've got --
23 obviously molecules are very, very, very small. So
24 I'm talking about things in the conglomerate. Some
25 of those molecules may -- of that particular

1 homologue may be absorb -- ad -- may dissolve into
2 the water and be move that way or may evaporate.
3 But the bulk of those molecules of that homologue
4 are going to stay right where they are.

5 Q Okay. The bulk being the heavier ones?

6 A No. The bulk being the mass of that
7 particular homologue.

8 Q Because mass is what really controls its
9 sticking ability to the particle?

10 A Well, now we're kind of talking past each
11 other. I'm talking about mass in the sense of the
12 weight of the Aroclor that's on there. So what I'm
13 saying is if you have a -- some soil and it has --
14 I'm just going to say a pound. That's a really big
15 number.

16 But you have a pound of -- of a trichloral
17 homologue, let's say PCB 11, on that -- on that soil
18 and it'll be mixed in with a whole bunch of other
19 homologues and congeners. Then water rushes over it
20 and the sun is shining on it. Then some of those
21 PCB 11s are going to evaporate, a very, very small
22 amount. A very, very small amount of those PCB 11s
23 are going to move with the water that's moving.
24 Most of those PCB 11s are going to stay right on the
25 soil where they were.

1 Q And the only ones that are going to move are
2 going to be the lightest chlorinated or the least
3 chlorinated --

4 A It's a --

5 Q -- more than likely?

6 A It's a gradation, yes. I mean, it's -- you
7 know, those are the most likely to move. But even
8 the higher can move to some, you know, increasingly
9 small extent.

10 Q Have you done research with respect to
11 the -- we've talked -- let me start over.

12 We talked about both water, but you also
13 have mentioned temperature. Have -- have you done
14 or to your knowledge has Monsanto done studies about
15 the extent to which certain temperatures release or
16 volatilize certain homologues?

17 A I don't know that the term is experiment. I
18 know Monsanto at some point generated vapor pressure
19 curves for PCBs, how much PC -- different PCBs
20 evaporate at different temperatures and drew a graph
21 of that. So, I mean, they have done work in that --
22 in that line, yes. But primarily at elevated, very
23 elevated, temperatures that are more relevant to the
24 manufacture or use situation rather than the
25 environmental situation.

1 Q Let's talk about vapors for a minute.

2 When -- when PCB vapors are emitted to the
3 atmosphere, do they recondense?

4 A Yes.

5 Q How quickly do they recondense?

6 A Generally very quickly, but again that
7 depends on the temperature and -- and what the state
8 of the system is and where they are.

9 Q And the speed at which they've been emitted?

10 A Sure, to some extent I would think, yes.

11 Q When they do recondense, what size particle
12 is formed?

13 A Well, it's not really. I mean, usually when
14 something recondenses, it's going to recondense from
15 a vapor phase as more of a film than a -- than a
16 particle. I mean, it may -- it may be a film on a
17 particle, but it's likely to condense as a film.
18 It's going to -- once you get enough of them
19 condensing, it's going to revert to its liquid
20 state. I mean, it's basically the same as dew
21 forming in the morning. You have water vapor in the
22 air. As the temperature cools, those water vapor
23 molecules start adhering to grass or whatever, and
24 it gets wet. It's the same concept.

25 Q And condensing into?

1 A A film. In general, you won't see -- I
2 mean, with PCBs you're not going to see a droplet
3 because there's not that much in the -- in the vapor
4 phase to begin with. But you'll see or be able to
5 measure a film that would be -- that would be
6 condensing onto whatever surface was available or
7 onto the soils.

8 Q Does the ability to condense or the
9 likelihood of condensation vary by congener or
10 homologue?

11 A Sure. It's --

12 Q In what way?

13 A Well, again, the lower chlorinated congeners
14 are more likely to remain in the vapor phase, and
15 the higher chlorinated are more likely to condense
16 out as the temperature drops.

17 Q And what happens to those that remain in the
18 vapor phase for a longer period of time?

19 A Well, I mean, in the ultimate if you read
20 the literature, you know, some teeny amount of them
21 make it to the Arctic. Eventually they're going to
22 condense out or, you know, remain. There's probably
23 a give and take. There are, you know, PCBs that are
24 being condensed at the same time there are being --
25 PCBs that are being evaporated. So you have an

1 interchange of molecules, but in general they can --
2 you know, I mean, it's claimed in the literature
3 they can at some trace levels move globally in the
4 atmosphere.

5 Q And does that ability to condense also vary
6 based on the temperature?

7 A Sure.

8 Q So in addition to chlorination, temperature
9 would be a variable?

10 A Absolutely.

11 Q All right. When PCBs are present in the
12 atmosphere, do they or can they adhere to particles
13 that are in the atmosphere that they come across?

14 A Yes.

15 Q Okay. And what's the mechanism by which
16 they do that? Is it just mechanical?

17 A Yes, basically.

18 Q Huh?

19 A Basically. I mean, they'd rather be
20 attached to something than -- than in the vapor
21 phase. So, yeah, they basically -- it's basically a
22 mechanical.

23 Q Does that mechanical attachment to
24 particulate matter vary by -- by Aroclor?

25 A Good question. I don't know that the

1 attachment varies, but certainly by Aroclor the --
2 the tendency to remain attached varies because of
3 the different things we've talked about: vapor
4 pressures and water solubility.

5 Q Again --

6 A They all want to be attached to soil
7 particles, but the higher chlorinated Aroclors or
8 homologues are going to be more firmly attached,
9 more tenaciously attached, than the lower
10 chlorinated materials.

11 Q Harder to disattach, revaporize, the heavier
12 chlorinated homologues or congeners?

13 A Right.

14 Q Is it possible for air transport to disperse
15 Aroclors or any of their homologue or congener
16 components within the Anniston area?

17 A Well, I mean, Anniston is no different than
18 the rest of the world. So, yeah, I mean.

19 Q They're going to get in the environment, in
20 the air?

21 A If PCBs -- I mean, I'm sure there are PCBs
22 in the air in Anniston as well as they are in
23 St. Louis. So, yes.

24 Q Okay. Are certain Aroclors going to migrate
25 in the air further than others?

1 A I'm just -- not necessarily further but more
2 of them may. So it -- so the answer to your
3 question may look like they're migrating further,
4 but it's primarily a more quantitative thought than
5 it is a qualitative thought. I mean, a vaporized
6 molecule in the air is going to move however it's
7 going to move. And so it -- it doesn't necessarily
8 because of its, you know, individual molecular
9 makeup make it move further. It's just more likely
10 that some of them are more likely to be in the vapor
11 phase and to redistribute into the vapor phase. So
12 it will look like they're moving further; let's put
13 it that way.

14 Q Okay. Well, but if we go back to your
15 comments about finding PCBs in St. Louis or PCBs in
16 the Arctic, I mean, that clearly demonstrates an
17 ability to disperse some --

18 A Yes.

19 Q -- major distances, true?

20 A No question.

21 Q And I just need to understand from you
22 are -- is it your view that it is the lower
23 chlorinated congeners or homologues that are going
24 to disperse greater distances than the heavier
25 chlorinated homologues and congeners?

1 A And I understood that.

2 Q I thought we were saying the same thing.

3 A And the reason I'm hesitating a little bit
4 is that if -- if you measure the air in Anniston,
5 which has been done -- that's not a surprise to
6 anyone -- and you look at those results -- basically
7 they've all been reported as homologues, I think --
8 what you see are the lower chlorinated homologues.
9 There's no question about that. So that's -- that's
10 what seems to be in the air in Anniston, generally
11 true in other cities that have had air measurements
12 done. Recently in Chicago, for example. The lower
13 chlorinated materials are what you see.

14 However, when you go up to the Arctic and
15 start looking for PCBs in snow or whatever, you
16 don't necessarily see only the lower chlorinated
17 materials, surprisingly to me. And so eventually
18 all of them manage to make their way up there one
19 way or another, and they more -- they seem to more
20 reflect the normal environmental distribution of
21 PCBs in sediments and soils than they do the air
22 distribution that we see when we measure them in
23 air.

24 Q Well, how would --

25 A Am I making sense?

1 Q Well, I'm not sure.

2 A I think it's just because it's an
3 integration over time that the materials, the
4 heavier, once they get up there, they tend to stay
5 put better so that it kind of evens out the
6 distribution.

7 Q But how would heavier chlorinated PCBs or
8 congeners, homologues, get to the Arctic?

9 A Well, they can -- they can be in the vapor
10 phase. They're just not as likely to be in the
11 vapor phase.

12 Q I see.

13 A So as -- you know, over time once they get
14 up there, they're more likely to stay there while
15 the lower chlorinated materials, even in Arctic
16 conditions, are more likely to come back off those
17 soil particles or stuff and get back into
18 circulation. So I'm not sure it's totally
19 understood, and I certainly don't totally understand
20 it. But that's -- that's my understanding.

21 Q I think I understand that. So what you're
22 saying is, is that once they -- as we would say in
23 Texas, once they light on something, on particulate
24 matter, the heavier chlorinated congeners are less
25 likely to continue movement thereafter?

1 A Correct. I would agree with that.

2 Q All right. And the lighter chlorinated
3 congeners, though, may settle once and then be blown
4 in the wind, settle a second time, and this may go
5 on for years and years and miles and miles?

6 A Yeah. I would agree with that generally,
7 yes.

8 Q Okay. All right. And -- and as a
9 consequence, then, it's possible, then, for both
10 wind erosion and air to redistribute soils that --
11 on which congeners have fallen?

12 A It's possible, yes.

13 Q Or adhered?

14 A Correct.

15 Q And that's true even if we look at an area
16 as definitive and -- and -- and small as the
17 Monsanto plant in Anniston, Alabama?

18 MR. MERRILL: I'm going to object to the
19 form of the question.

20 A Yeah, and I'm not sure exactly what you
21 mean.

22 Q (By Mr. Schick) Okay. I'll restate it.

23 A I mean, are they being re -- go ahead. I'll
24 let you restate it.

25 Q Aroclors or congeners that are on the soil

1 in the plant around the Monsanto plant there in
2 Anniston, after that soil's dried, they can be
3 picked up by the wind and -- and moved, correct?

4 A Assuming there are PCBs on those soils, that
5 is -- that's a concept, yes.

6 Q Sure. Okay. All right. Now -- and in
7 fact, what you're telling me, then, is that once
8 they're moved, it's the lighter chlorinated
9 homologues or the lighter chlorinated congeners that
10 may move a second, third, fourth, fifth time?

11 A Well, not -- okay. Now, but you're going by
12 other mechanisms, not by wind blowing particulates?

13 Q But it could be by wind blowing
14 particulates, couldn't it?

15 A No. Because the wind blowing particulates
16 is not discriminating by the particular congeners
17 that are on those particulates. I mean, they're
18 there as such trivially small amounts that it's not
19 changing the characteristic of that particulate. So
20 to a particulate and wind blowing that particulate,
21 it doesn't matter whether it's a monochlorobiphenyl
22 or a hexachlorobiphenyl.

23 Q Or a decachlorobiphenyl?

24 A Or a deca, you know, right. It doesn't
25 really matter as long as -- if it's on there and

1 that soil particle is moving, it's going to move it.

2 It doesn't matter which one it is.

3 Q Okay. All right. Are you aware of studies
4 suggesting that PCBs are present in tree bark in the
5 Anniston area?

6 A Yes.

7 Q You're familiar with the Hermanson study?

8 A Yes.

9 Q How do you explain how those PCBs detected
10 in tree bark got there?

11 A Well, let me first of all say that you have
12 to assume that the analyses were done correctly and
13 that they actually represent what they're purported
14 to represent. But given that assumption, I -- I
15 think it's they probably to some extent or a
16 complete extent are adsorbed from either airborne
17 vaporized PCBs or dust that had lit on -- had lit on
18 those trees, and then the PCBs transferred to the --
19 to the tree bark, unless it's still on the dirt
20 that's on the tree bark. I don't know.

21 Q Okay. If PCBs come to rest on the ground,
22 they can re-evaporate into the atmosphere under the
23 right conditions, true?

24 A Again, depending, right, where the rate
25 would depend on the amount of chlorine on the

1 molecules.

2 Q Okay. Dr. Kaley, there's some sampling data
3 that's in the EPA's database that indicates that
4 there are properties that have been identified where
5 there's 12 -- Aroclor 1260 and Aroclor 1268 present,
6 and they're outside the floodplain?

7 A Yes.

8 Q And in those properties there's been no
9 finding that Solucia has made any note of, at least,
10 of any foundry material being present.

11 So my question to you is: How would
12 Aroclors 1260 and 1268 get to properties in the
13 Anniston area outside the floodplain?

14 A I don't know.

15 Q I'm sorry?

16 A I don't know. I mean, it's going to
17 depend -- each one is going to have an individual
18 answer, and I don't necessarily have an answer for
19 any particular one of them as I sit here.

20 Q Anything other than an air pathway that you
21 can think of?

22 A Well, other mechanical transport that -- I
23 mean, if you're going to exclude foundry
24 specifically, it could be transport from some other
25 source other than the foundries.

1 Q Sure. You could have dredged material that
2 was placed there from a waterway?

3 A That's conceptually correct, yes.

4 Q But we could also go back to what we were
5 discussing earlier about wind picking up and not
6 discriminating with respect to homologues or blowing
7 that soil elsewhere?

8 A Well, I think conceptually that's true, but
9 I don't think in reality that mechanism makes sense
10 in the Anniston situation, because if that were the
11 case, you would have a -- a plume or a smooth
12 distribution of those materials over a wider area
13 rather than an isolated finding of those particular
14 Aroclors in a property where there's nothing next
15 door.

16 So it's conceptual again, and I would also
17 say that the levels found are inconsistent with that
18 because the transport by air, whether higher
19 chlorinated or lower chlorinated, is moving very
20 small amounts of materials. You're not going to be
21 able to accumulate, you know, parts per million of
22 PCBs in soil from parts per trillion of PCBs in air.
23 So I don't really -- as I sit here, don't believe
24 that's a logical mechanism.

25 Q But, of course, this air movement would take

1 place over a period of time in Anniston, at least,
2 from 1935 until 1970, true, 35-year period?

3 A Yes.

4 Q You're familiar with the Anniston area?

5 A Yes.

6 Q Hilly?

7 A Some of it, yes.

8 Q Do you know whether the wind blows in -- in
9 consistent patterns and whether there are downdrafts
10 anywhere?

11 A Well, I'm sure there are. I haven't studied
12 the meteorological conditions, but I'm sure it
13 doesn't blow in the same direction every day at the
14 same speed.

15 Q Have you seen any air modeling that's been
16 done?

17 A I don't think I've seen any actual modeling,
18 no. I've seen the -- you know, the measurements and
19 things, but I don't know that I've actually seen any
20 modeling results.

21 Q If you have PCBs greater than 1 part per
22 million on a particular yard and not on the next
23 door yard, is it equally plausible that it had been
24 in the yard where it's no longer detectable and rain
25 over the years has washed it onto the downstream

1 yard?

2 A Again, I suppose in a -- one particular
3 situation, if that describes that particular yard,
4 you could consider that as a possible mechanism.
5 I -- you know, I don't know that that's a general
6 explanation for all the findings in Anniston.

7 Q But -- but we do know that PCBs can be
8 transported through sediment moved by water?

9 A Sure.

10 Q How are PCBs transported when they're
11 present in soils?

12 We've talked a little bit about air. And
13 they do tend to stick to -- stick in place when
14 they're released?

15 A Right.

16 Q I think I heard you say. When they're
17 spilled -- when they're located in soils, do they
18 have a low mobility in the environment?

19 A I believe as a general concept that's true,
20 yes.

21 Q Okay. By the way, what's the difference
22 between -- and maybe there isn't one -- but
23 adsorption with a D, as in dog, and absorption with
24 a B, as in boy?

25 A Adsorption with a D is generally considered

1 as onto, okay? And absorption is generally
2 considered as into.

3 Q Okay. Similar to solubility?

4 A So water -- water would -- water would
5 absorb, with a B, into a sponge; but it would adsorb
6 onto a blade of grass when the dew hits it, because
7 it stays on the surface and sits there.

8 Q And is that why you used adsorb with -- when
9 referring to various congeners and homologues
10 because they tend to stick and because of their low
11 solubility?

12 A It's a surficial attachment to the soil
13 particles. They're not actually -- you know, again
14 depending on what particular soil or solid you're
15 talking about, in general they're not absorbed into
16 the interior of those materials.

17 Q Okay. Dr. Kaley, how are PCBs transported
18 via water?

19 A Well, I think we talked about that. Some --
20 some small amount -- or very small amount may be
21 transported as dissolved PCBs in the water, and to
22 the extent there's particulate matter with PCBs on
23 it, a larger amount will be transported by movement
24 of those particulates in the water system.

25 Q And they can actually be moved in the water

1 itself, or they can become attached to soil in
2 the -- in the waterway?

3 A Correct. The second is by far the biggest,
4 the most significant, mechanism of transport. The
5 transport by water, dissolved in water itself, is
6 really very, very small.

7 Q But if it's not absorbed in the water, it
8 can still flow in the water? Those molecules of
9 heavier chlorinated homologues can still flow in the
10 water?

11 A If they're dissolved in the water. But the
12 more heavily the chlorinated -- the more heavily
13 chlorinated they are, the far less likely they are
14 to be absorbed or dissolved in the water. We're
15 really moving into a different concept of dissolved
16 versus absorption.

17 Q Okay. But is that because they fall to the
18 sediment?

19 A Well, that's -- that would be -- yeah, I
20 mean, that would be the eventual outcome. If they
21 were there, they're more likely to adhere to any
22 particle, whether it's a sediment or whatever it
23 might be or a plant material or something that's in
24 that water phase. The heavier chlorinated materials
25 want to be out of that water a lot more than the

1 lighter chlorinated materials.

2 Q And you're aware from the work that you've
3 done over the years that PCBs can be transported a
4 number of miles downstream?

5 A Certainly.

6 Q All right. Do the different congeners of
7 PCBs tend to have the same rates of mobility through
8 soil deposition and storm water runoff, or does it
9 vary?

10 MR. MERRILL: I'm going to object to the
11 form of the question.

12 Q (By Mr. Schick) Let's take them one at a
13 time. Do the various congeners of PCBs tend to have
14 the same rates of mobility through soil deposition?

15 A By movement of soils in a water stream?

16 Q Yes, sir.

17 A Sure. If they're -- if a PCB, no matter
18 what congener level is adsorbed to a soil parallel,
19 it's going to go with the soil parallel. It
20 doesn't -- I think we've talked. It doesn't matter
21 which -- which congener it is.

22 Q Right.

23 A The transport is determined by the transport
24 of the soil particle, not by what PCB is adsorbed to
25 it.

1 Q It doesn't matter whether it's deca or
2 tetrachlorobiphenyl?

3 A Correct.

4 THE VIDEOGRAPHER: Pardon me, Counsel. We
5 have about 3 1/2 minutes.

6 Q (By Mr. Schick) Okay. What about with
7 respect to rate of mobility in storm water runoff or
8 surface water transport; does it depend on
9 chlorination level? Does it vary by chlorination
10 level, by homologue?

11 A No. Again, I mean, it's going to be
12 determined by what's moving and how fast it's
13 moving, not by what the chlorination level is.

14 Q Okay. So one congener doesn't have any
15 greater mobility really than another, in --

16 A In the terms --

17 Q -- the --

18 A -- that we've just --

19 Q -- water?

20 A -- been discussing as a congener adhered to
21 a soil particulate and the soil is being moved by
22 water, there's no difference in congener. Now, the
23 term mobility involves a -- is a general -- more
24 general term that talks about some of the other --
25 that includes some of the other things we've talked

1 about before: vapor pressure, water solubility. So
2 in general they have -- the lower chlorinated have
3 greater motility but not in the sense we've just
4 been discussing where we have a particle that's
5 being moved by water.

6 MR. SCHICK: Okay. Good time for a break.

7 Thank you very much.

8 THE WITNESS: You're welcome.

9 THE VIDEOGRAPHER: We're off the record at
10 10:12. This ends tape one.

11 (Off the record.)

12 THE VIDEOGRAPHER: We're back on record at
13 10:20. This begins tape No. 2 of the deposition of
14 Dr. Robert Kaley.

15 Q (By Mr. Schick) Dr. Kaley, when we took our
16 break, I had asked you about the mobility of PCBs
17 through water and -- and runoff. And -- and you
18 were emphasizing the difference between mobility and
19 motility. What is meant by motility?

20 A Well, I'm not -- I just wanted to -- I
21 was -- my discrimination was based to make sure we
22 were talking about the same thing. I'm not sure
23 there is any difference between mobility and
24 motility.

25 Q And you don't mean anything different when

1 you use one --

2 A No.

3 Q -- instead of the other?

4 A No.

5 Q Okay. Fair enough. Now I want to talk
6 about something that you've already mentioned and
7 we've talked a little bit about, which is
8 weathering. And what do you mean by the term
9 weathering as relates to PCBs?

10 A Well, in the overall view, the simplest
11 definition is weathering describes the process or by
12 processes or really the outcome of the processes by
13 which different either physical or biological
14 activities change the composition of a particular
15 PCB mixture that is present -- present -- is
16 present in some typically environmental system.

17 Q And when we talk about weathering with
18 respect to PCBs, are we talking about loss of
19 chlorination?

20 A There are a number of processes that -- that
21 are encompassed in the term, and we've talked about
22 most of them. Weathering includes volatilization;
23 it includes solubility and removal from that
24 particular site; it can involve biodegradation; it
25 can involve dechlorination, or other degradation

1 processes.

2 Q And -- and I assume that weathering is
3 something that -- as you've just articulated the
4 universe of weathering, something you've studied
5 over your time with Monsanto?

6 A Yes.

7 Q And subsequently?

8 A Yes.

9 Q And are there formal studies that have been
10 done, either by you or by others at Monsanto, about
11 weathering?

12 A Not particularly about weathering in
13 general. I mean, certainly we've looked at things
14 like water solubility and things like that. But as
15 far as actually studying weathering itself and those
16 processes, there was some work done on
17 biodegradation of various Aroclors, which is a
18 con -- which is a constituent of the weathering
19 process. But to go out and say we actually were
20 studying weathering, not really, no.

21 Q Have you done any kind of analysis on a
22 particular homologue or congener with respect to the
23 circumstances under which it dechlorinates or
24 vaporizes?

25 You've mentioned vapor pressures, but beyond

1 that, what other analyses are you familiar with?

2 A Well, as far as anything done at Monsanto,
3 there's nothing. As far as the literature, I mean,
4 I've continued to read a lot of things. I mean,
5 there's a lot of work been published by, for
6 instance, General Electric researchers on
7 dechlorination processes in the Hudson River or
8 things and then just general studies of weathering
9 in general.

10 Q Have any of those studies that you just
11 mentioned, the GE and the Hudson River, changed your
12 view of the weathering of Aroclors or particular
13 congeners?

14 A Yes, to a certain extent.

15 Q In what way?

16 A Well, I think just the fact that certain
17 PCBs under anaerobic conditions can be dechlorinated
18 in environmental systems leading to lower
19 chlorinated congeners being detected than were
20 originally there. I think it's a concept that's
21 developed over the past 20 years, and certainly when
22 I was doing the analytical chemistry, the concept
23 was always that the homologue mixture or the
24 congener mixture would progress to higher
25 chlorinated congeners.

1 Q In what -- I'm sorry.

2 A But I was going to say: Again, the
3 dechlorination only occurs under very specific and
4 not all that usual conditions. So it's certainly
5 had an impact on my thinking, but I don't know that
6 it's changed my general view of how Aroclors
7 weather.

8 Q And -- and just not to repeat all that we've
9 done in the last hour, but how do they in general
10 weather?

11 A In general the lower chlorinated -- if you
12 look at a specific site, the lower chlorinated
13 congeners tend to disappear over months to -- weeks
14 to months to years, and the heavier chlorinated
15 materials tend to remain there to be measured.

16 Q And when they remain there, they're sticking
17 to particulate?

18 A Generally, yes.

19 Q But when you say the lighter ends disappear,
20 they don't truly disappear from the universe;
21 they're somewhere, aren't they?

22 A No. I mean, certainly a lot of them, the
23 lower chlorinated, are biodegraded into carbon
24 dioxide and water. They're gone. So, no.
25 Certainly some of them absolutely -- absolutely do

1 disappear. Even heavier chlorinated will biodegrade
2 to a certain extent over some period of time. And
3 the dechlorination process, of course, if you're
4 taking a heavier chlorinated material, removing
5 chlorine, making a lighter chlorinated material,
6 then under proper conditions the other kind of
7 biodegradation can occur and those disappear, too.
8 They're basically what they call mineralized, and
9 they're gone.

10 Q When a particular Aroclor is deposited in
11 the environment, over time and with weathering, can
12 it appear to be a different Aroclor?

13 A That is -- yes. The answer to that is yes,
14 but that's an oversimplification. It's basically a
15 function of the analytical chemistry that's used to
16 measure Aroclors.

17 Q And that analytical chemistry is the mass
18 spectrometry and gas chromatograph we talked about
19 earlier?

20 A In that case it's primarily just a gas
21 chromatograph, not a mass spectrometer. Because
22 you're looking at, what we call, an Aroclor
23 analysis, where you're only characterizing by
24 Aroclor. You don't need a mass spec to do that.

25 Q Well, if we want to characterize by

1 congener, what do we need?

2 A Well, you can do it with just a GC, with
3 what they call an electron capture detector, but the
4 mass spec is more sensitive and more precise. But
5 you can do it with just by separation in a gas
6 chromatograph.

7 Q What about mixtures of PCBs that aren't a
8 specific Aroclor mixture; anything you can tell
9 about those by any kind of test after weathering?

10 MR. MERRILL: Object to the form of the
11 question.

12 A Yeah. Again, I think depending on what
13 you're studying and what you're trying to learn by
14 your analyses, you may be able to find some
15 information. But other than that, I'm not sure I
16 understand the question.

17 Q (By Mr. Schick) Well, let me put it this
18 way: Is weathering always going to make a PCB
19 appear to be less chlorinated than it was
20 originally?

21 A No. I would say subject to some anaerobic
22 dechlorination, it's always going to make it appear
23 to be more chlorinated.

24 Q Because the lower chlorinateds have
25 volatized or have disappeared?

1 A Right.

2 Q But it does depend on the nature of the
3 environment or the media in which the PCB is located
4 as to how much weathering takes place, true?

5 A Sure, yes.

6 Q More weathering, for example, say, on the
7 surface of the soil than subsurface?

8 A Yes.

9 Q More -- more weathering -- that is, more
10 dechlorination -- of a PCB in heat than in less
11 heat?

12 MR. MERRILL: I'll object to the form of the
13 question.

14 A Probably not. I need to emphasize
15 dechlorination is really a very rare process.
16 Dechlorination only occurs in what they call
17 anaerobic conditions.

18 Q (By Mr. Schick) Okay. We're talking about
19 two different things, then. I'm sorry. I used it
20 incorrectly.

21 A Okay.

22 Q Tell me what dechlorination means.

23 A Well, dechlorination is the removal of
24 chlorines, okay? De, removed. So if a -- if a
25 particular congener is being dechlorinated, it will

1 end up with fewer chlorines on it. So, for
2 instance, it can move from a hexachlorobiphenyl -- a
3 hexachlorobiphenyl that is dechlorinated could end
4 up as a trichlorobiphenyl. So it's removal of
5 chlorines. All right?

6 The only place that occurs in nature is in
7 anaerobic conditions, conditions where no oxygen is
8 present. The only place that occurs in nature is
9 deeply buried sediments. All right? So it's only
10 in water systems that have deeply buried sediments,
11 basically stationary systems, that that
12 dechlorination is occurring.

13 Q Okay. Otherwise in the nonanaerobic
14 environments, we're looking at more heavily -- after
15 weathering the congener looks more heavily
16 chlorinated than it was earlier?

17 A No. The mixture taken as a whole looks more
18 heavily chlorinated. You're not -- you're never --
19 I don't think you're ever -- I'd have to think about
20 it. But in the environment, you're probably never
21 adding chlorines to a congener. It's just that the
22 heavier chlorinated congeners tend to stay longer so
23 that's what you're seeing relative to the lower. So
24 it's a mixture concept. It's not an individual
25 congener concept. You're not changing the congener.

1 You're changing the overall mixture.

2 Q Are you changing the homologue?

3 A Well, you're changing -- again, a homologue
4 is just a -- is an accumulation of -- or an addition
5 of congeners. So you're changing the homologue
6 distribution, but you're not changing -- I mean, you
7 can't really change a homologue because it's a
8 mixture itself. So you're changing the homologue
9 distribution of a -- of a mixture. So you're going
10 to more highly chlorinated -- I mean, the very fact
11 that you're going to more heavily chlorinated
12 congeners left in the sample means you're going to
13 have more heavily chlorinated homologues, because
14 that's all the homologue is, is adding up the
15 congeners.

16 Q Is a decachlorobiphenyl less likely to
17 weather than a tetrachlorobiphenyl?

18 A Yes. Again, the individual -- and again,
19 I'm not sure you can talk about weathering --
20 weathering is a -- is a concept of mixtures. But
21 the things that cause weathering are -- are less
22 likely to occur with decachlorobiphenyl than with a
23 tetrachlorobiphenyl.

24 Q All right. So weathering does vary by
25 congener or homologue?

1 A The effect of weathering, yes, I will agree
2 with that. I'm not going to quibble about that.

3 Q And it also varies, I presume, based on the
4 nature of the environment in which it's located?

5 A That's correct.

6 Q Are there established half-lives for various
7 Aroclors or congeners or homologues?

8 A There are certainly published half-lives for
9 Aroclors, which is kind of a meaningless concept
10 actually, and for congeners, yes. I don't know if
11 they're established, but there are -- there are some
12 that are published.

13 Q Does weathering actually change the
14 structure of the PCB molecules?

15 A No. Well, now, that's not true. If you
16 have dechlorination, you are changing the structure
17 of the PCB molecules.

18 Q That's in the anaerobic environment?

19 A Right. But in the general -- what I
20 generally consider weathering, solubility,
21 vaporization, that -- those are not changing the
22 structure. Now, biodegradation, of course, is
23 changing the structure of the molecules. It's
24 either, you know, changing the -- you know, well, in
25 some way or another. So, yeah, I mean, after

1 biodegradation, you no longer have a PCB. You have
2 some subsequent product of that biodegradation.

3 So, again, you have to differentiate -- I
4 guess the differentiation is between the physical
5 processes that lead to weathering which don't change
6 the molecule and the biochemical or bio -- you know,
7 biological processes which do change the molecules.

8 Q And what are those biological processes?
9 Are those the anaerobic?

10 A Well, it can be anaerobic dechlorination or
11 it can be aerobic biodegradation where the molecule
12 is basically oxidized, like food is oxidized in your
13 body.

14 Q But that requires some other chemical to
15 oxidize?

16 A Generally it requires little beasties. I
17 mean, at biodegradation it's being --

18 Q Bugs?

19 A Bugs, yeah.

20 Q Let me ask it this way: Can you tell me
21 whether between 1242 and, say, 1248 which one would
22 degrade more quickly in, say, a shallow soil?

23 A Well, because Aroclor 1242 has more of the
24 lower chlorinated materials, those are more likely
25 to degrade. So 1242 will in general degrade more

1 quickly as a mixture than Aroclor 1248.

2 Q Okay. And will the weathering of Aroclors
3 within a landfill similarly differ based on -- based
4 on the amount of heavier end homologues or
5 congeners?

6 A Well, to the extent that you could
7 hypothesize there would be weathering in a landfill,
8 the answer would be yes. But my guess would be that
9 in a landfill, very little weathering is occurring,
10 because the molecules are not exposed to those
11 forces that -- that encourage weather.

12 Q Unless they rise to the surface somehow?

13 A Well, if you can hypothesize a mechanism for
14 that, yeah. I guess if they got to the surface, I
15 wouldn't consider them in the landfill anymore.
16 But, yeah, I mean, obviously if they get to the
17 surface where they can be acted upon by water, you
18 know, bugs, whatever, then sure.

19 Q Okay. Or taken off by water, as you say,
20 from a landfill?

21 A If they're exposed, yes.

22 Q So am I correct, then, in understanding that
23 what might have been originally emitted, let's say,
24 as 1242 can after weathering appear to be more like
25 1260, Aroclor 1260?

1 A I'm not sure I would go that far. I might
2 go to a 1248 or a 1254. And the key word is appear.
3 Yes, it could appear or be misidentified as a
4 heavier chlorinated mixture.

5 Q And why do you not go so far as to go from
6 1242 to 1260?

7 A Well, if you look at the congener
8 distribution of those two materials, they don't
9 overlap very -- weathering depends on an overlap of
10 congeners. Again, we're not changing the congeners.
11 All we're doing is changing the relative amounts
12 that are present. And there's so little overlap in
13 the congener makeup of Aroclor 1242; in other words,
14 it has such low levels of the higher chlorinated
15 congeners --

16 Q Right.

17 A -- that for it to go all the way to look
18 like 1260 is probably not going to happen.

19 Q Can 1254 weather to look like 1260?

20 A That's more likely, yes.

21 Q Can 1254 weather to look like 1268?

22 A Probably not.

23 Q Why not?

24 A Again, I think it's a question of which
25 congeners are present in the -- in the particular

1 materials. I think the congeners that are present
2 in Aroclor 1268 are so -- at such low levels in
3 Aroclor 1254, plus the fact the congener -- that
4 it's not going to change for that reason. Plus the
5 congeners in 1254 tend to be a lot more stable. So
6 they're going to stay there, so it's not going to
7 change as much as a 1242 would.

8 Q Okay. So 1254 is less likely to weather?

9 A Absolutely.

10 Q 1268 is less likely to weather?

11 A Yes.

12 Q Okay. So it is not likely that more heavily
13 chlorinated Aroclors after weathering appear to be
14 less chlorinated?

15 A Only in anaerobic subsediment situations.

16 Q Okay. Could any of the Aroclors, any of the
17 Aroclors that were produced at the Anniston plant,
18 weather to such an extent that the analytical
19 methods being used to identify them misidentify them
20 as 1268?

21 A As 1268?

22 Q Yes, sir.

23 A Specifically?

24 Q Yeah.

25 A If you're -- if you're strictly talking

1 about Aroclors, probably not.

2 Q Because of the weathering effect -- and I
3 understand what you're saying about the heavy ends
4 like the 1254, 1260, 1268, but with respect to those
5 lighter ones, the 1242s, for example, are there
6 analyses beyond just Aroclor-specific analyses that
7 can be performed to -- to fingerprint or identify
8 what was it originally?

9 A In the context of a specific situation, you
10 may be able to do, I mean, some -- what's called
11 fingerprinting, if you're looking for source
12 identification.

13 Q Yeah.

14 A You have to have some -- some previous
15 knowledge. Source identification or fingerprinting
16 really depends on knowing what you started with
17 here, what you started with there, and how they
18 contributed to what you ended up with someplace
19 else. Okay? So it can help, but you can't -- it's
20 not something you can do, you know, just out in
21 the -- you know, ab novo. You can't just look at a
22 sample and say it came from that or something that
23 came from that. There's no -- there's no marker in
24 Aroclor 1242, for example, that say it came from
25 Aroclor 1242.

1 Q Okay. Well, but I guess I need to know what
2 kind of sources or specific situations you're
3 talking about. Are you talking about, you know, was
4 it close to XYZ Foundry, or are you talking about it
5 was in surface soil and it was located, you know, so
6 far from a waterway; that helps me determine it?

7 A No.

8 MR. MERRILL: I'll object --

9 Q (By Mr. Schick) Okay.

10 MR. MERRILL: -- to the form of the
11 question.

12 Q (By Mr. Schick) What are you referring to
13 as a specific situation that you have to know?

14 A Let me think of -- let me describe what I'm
15 talking about when -- when I hear the term
16 fingerprinting, and it may not be the same thing
17 that you're thinking about.

18 But fingerprinting to me is if you go out in
19 the environment and you have -- you take a sample
20 and you get -- I don't care whether it's an Aroclor
21 analysis or a congener analysis or something. Okay?
22 And you want to know -- okay, I know it's here. I
23 want to know where it came from. Maybe it came from
24 source A or maybe it came from source B. All right?

25 To really do fingerprinting, you have to

1 know what the original output from source A was and
2 know what the original source output from source B
3 was and then compare, with concepts of weathering
4 and other things in mind, whether it's more likely
5 than not that the sample you're looking at in the
6 environment came from either A or B. All right?

7 Q So you're making judgments about what you
8 know about source A versus B?

9 A Right. You have to -- right. You have to
10 have some foreknowledge of -- of what the source
11 looked like to contribute to that ultimate outcome
12 in the environment.

13 Q But you can't just take a sample of Aroclor
14 1254, what you currently say is that's 1254, and say
15 when this thing was originally produced, it was
16 1242? Can you do that much?

17 A No. That's -- that's probably as far down
18 the line of what you can't do as you can get.

19 Q Okay.

20 A Because when it -- when an analytical
21 chemist -- and this is a source of much confusion
22 and not much understanding. An analytical chemist
23 or computer system, when it does an Aroclor
24 analysis, it's basically doing a pattern
25 recognition. It's looking at the chromatogram.

1 Q Yeah.

2 A I assume you've seen chromatograms?

3 Q Yes.

4 A It's looking at a chromatogram and the
5 peaks, and it's saying, Okay, to me today this
6 accumulation of peaks looks more like 1254 than it
7 does 1242 or 1248 or 1260. So I'm going to call it
8 Aroclor 1254. But it isn't Aroclor 1254. It's a
9 sample from the environment that looks more like
10 Aroclor 1254 than it does anything else. So you
11 can't tell whether that sample originated as Aroclor
12 1242, Aroclor 1248 or Aroclor 1254, because --

13 Q It won't tell you where it's been?

14 A No. All the things -- all the things
15 that -- that are in there, you know, could have come
16 from any of those things. It won't tell you where
17 it's been unless you have some foreknowledge in a
18 fairly simple system.

19 Q Fair enough. Tell me which Aroclors have
20 decachlorobiphenyl in them. Is there any besides
21 Aroclor 1268?

22 A Aroclor 1260 may have some. I'd have to
23 check to be sure, but Aroclor 1260 may have some.

24 Q If you see a decachlorobiphenyl in a -- in a
25 sample, does that mean that that had to have been

1 there in the original, whenever it was originally
2 produced; in that original source, in other words?

3 A Again, I don't know the answer to that. The
4 reason I don't know the answer to that is because
5 combustion processes can create higher chlorinated
6 materials, and -- and I don't want to -- I don't
7 know whether there's any objection to saying the
8 word dioxin or not.

9 But if you look at -- there's been a lot of
10 work done on it -- on looking at incineration and
11 leading to chlorinated dioxins in the environment,
12 whether it's backyard burning or medical
13 incinerateds or whatever. Well, when you look at
14 that, the bulk of materials you see are the most
15 highly chlorinated dioxins. In that case, there's
16 eight, octachlorodibenzodioxins. All right. And we
17 know it didn't start there.

18 So in combustion processes, it appears
19 that -- certainly it does more than appears. It's
20 true that you get more highly chlorinated materials
21 through that process. And I don't know the studies
22 that have been done, and I'm not aware of any, but
23 it's certainty conceptual that decachlorobiphenyl
24 could be created. And we know PCBs are created in
25 incineration processes; that decachlorobiphenyl

1 could be created in an incineration process.

2 Q Are you aware of any of those incineration
3 processes that took place in the Anniston area?

4 A Well, since I'm not aware of any studies, I
5 don't know specific -- I can't point you to any
6 specifics. I'm talking right -- to be honest I'm
7 strictly talking conceptually. But I think there
8 are certainly other, you know, sources of deca that
9 could be hypothesized.

10 Q Other than combustion, though, and looking
11 in the Anniston area, if I see a decachlorobiphenyl,
12 is it more likely than not that the original was --
13 had contained that decachlorobiphenyl?

14 A With the -- you know, with the proviso that
15 you say, I think it's more likely than not that it
16 occurred -- it contained it, yeah.

17 Q Okay. Are there any particular congeners or
18 homologues that are not affected by the weathering
19 process? I mean, we talked a little about --

20 A Well, it depends on how -- how --

21 Q It's a continuum?

22 A -- how low you want to go.

23 Q Okay.

24 A I mean, to zero, no. But clearly the more
25 highly chlorinated materials -- once you get to

1 seven or eight or higher, there's not much going to
2 be going on weathering with those chlorination
3 levels, other than back to our friendly
4 dechlorination in deep sediments. That does seem to
5 occur for some of those.

6 Q In the Anniston area, is there any
7 particular Aroclor, homologue, or congener that
8 would be a unique identifier for a particular
9 source?

10 A No, not that I know of.

11 Q Okay. If PCBs are emitted as vapors during
12 the production process itself --

13 A Yes.

14 Q -- would there be preferential emissions of
15 particular Aroclors or particular congeners?

16 A Well, the emissions at the immediate source,
17 there probably wouldn't be any preferential emission
18 of given congeners. I mean, the Aroclor is going to
19 depend on what you're making. So if you're making
20 1242, that's what you're going to emit. Or if
21 you're making 1254, that's probably what you're
22 going to emit.

23 But the congener profile as you move away
24 from that immediate source at the manufacturing site
25 is going to change very, very rapidly depending on

1 the congeners, because as we discussed earlier, the
2 more heavily chlorinated are going to condense
3 faster. They're going to -- you know, all those
4 things that determine their environmental mobility
5 are going to start kicking in. So they're going
6 to -- the higher chlorinated are going to be removed
7 from that profile a lot more rapidly than the lower
8 chlorinated materials which are more likely to
9 remain in the vapor phase.

10 Q And those that remain in the vapor phase,
11 it's the lighter homologues that are going to remain
12 in the vapor phase for longer?

13 A That's generally correct, yes.

14 Q We talked a little bit earlier about the
15 fact that PCBs that are released into the
16 environment and end up in soils can -- can -- they
17 can actually migrate back into the atmosphere, be
18 blown. I mean, we talked about that in connection
19 with the Arctic.

20 A At very low levels, yes, correct.

21 Q That would also be true of, say, the
22 floodplain where a flood occurs that washes PCBs out
23 of a waterway onto a floodplain; and when it dries
24 out, those PCBs attach to particulate matter; if
25 sufficiently dry, could be picked up by the wind?

1 A At some level, yes.

2 Q Okay. My colleague here is a lot smarter
3 than I am. Asked me to ask you this follow-up.

4 A I noticed. Not that he was more smarter
5 than you. Just I noticed he asked -- he wants you
6 to ask this question.

7 Q Trust me. He's smarter than I am.

8 MR. LIPPARD: I'm nowhere close to as smart
9 as Bob is.

10 Q (By Mr. Schick) When decachlorobiphenyl is
11 created during combustion -- you were talking about
12 combustion -- what particular materials have to be
13 present to create a heavier chlorinated homologue?

14 A Well, again, I'm going to -- I'm
15 hypothesizing to a certain extent, but I'm going to
16 go back to my dioxin experiment and my dioxin
17 knowledge; and it is that you have to have carbon
18 and chlorine and heat. If you have a combustion
19 system where you have carbon, chlorine, and heat,
20 you're going to generate dioxins and presumably
21 PCBs.

22 Q Can PCBs present in surface waters of a
23 waterway be lifted into the air?

24 A Yes. There is -- again, we're talking about
25 very, very small amounts, but there is an

1 interchange between air and water -- dissolved PCBs
2 in water and the air, yes.

3 Q Okay. And is that through volatilization,
4 or is it either volatilization or through attachment
5 to a particulate that just gets picked up?

6 A Well, I'm -- well, I think in the case
7 you're discussing, it's going to be volatilization.
8 I mean, because otherwise -- I don't -- I don't know
9 other than if -- if you're in a hell of a storm, I
10 guess you could have particulates spewing into the
11 air, but in a quiescent lake situation, it's going
12 to be volatilization.

13 (Defendants' Exhibit Kaley 2
14 marked for identification.)

15 Q (By Mr. Schick) Let me hand you what I've
16 marked as Exhibit 2 to your deposition. And just to
17 sort of set the stage here, this is a December 19,
18 2005, letter that was sent to the EPA.

19 I assume you've seen this before?

20 A It's possible but I don't know whether I
21 have or not, frankly.

22 Q I just want to ask you about a couple of
23 questions here. Turning to page 4.

24 A Okay.

25 Q There's a statement that, Because of the

1 physical properties of PCBs, low volatility --

2 A I'm sorry. Where are you?

3 Q I'm sorry. I apologize.

4 A I'm going to try to look at my document.

5 Q Yeah, you're really better off doing that.

6 A I'm with you. I found it.

7 Q Because of the physical properties of PCBs,
8 low volatility at ambient temperatures, essentially
9 all of the PCBs discharged from leaks or vents in
10 the process would condense close by in the
11 manufacturing facility itself.

12 Do you agree with that statement?

13 A Yes.

14 Q And is that saying that PCB vapors can't
15 condense onto particles or particulates that keep
16 them suspended, or is this just vapor?

17 A I think it's both. And it says essentially
18 all. It doesn't say all. So I mean, clearly a
19 molecule or two -- and I'm exaggerating in the other
20 direction -- could -- could remove from the site.
21 But I agree that essentially all of the materials,
22 no matter what the chlorination level or the dust,
23 are going to drop out very close to the -- in the
24 manufacturing facility itself.

25 Q Have any --

1 A Because they're being emitted at elevated
2 temperatures. And as soon as they get to the
3 ambient temperature, all those processes are going
4 to kick in.

5 Q And we talked about the filming. Is this
6 where you're going to get that filming, the
7 condensation?

8 A Sure.

9 Q Have any studies been done to determine the
10 extent to which when condensation occurs, how
11 quickly and over what area?

12 A Not that I'm aware of.

13 Q So -- and you acknowledge that you were
14 going in the other direction when you said a couple,
15 you know, one or two molecules can get off. You
16 really don't know how many might continue moving for
17 a greater distance?

18 A No. But it would be a very small number
19 compared to a pure Aroclor fluid.

20 Q And certainly PCBs are going to be more
21 volatile at elevated temperatures?

22 A Yes.

23 Q And that's true regardless of how highly
24 chlorinated they are?

25 A Yes.

1 Q Take a look at page 10, if you would,
2 please.

3 A (Witness complies.)

4 Q Says, Figures 4 through 7 in the NewFields
5 memorandum all indicate that a PCB mixture with a
6 dominant Aroclor 1268-like pattern not only exists
7 in the soils near the former Monsanto facility, but
8 also in soils elsewhere in Anniston.

9 A Yes, I see that.

10 Q And do you know what that 1268-like pattern
11 is referring to?

12 A I believe I do.

13 Q What -- what -- what do you understand that
14 to be referring to?

15 A In some of the samples that have been taken
16 in the Anniston area, there are a group of congeners
17 in the 8, 9, and 10 level of chlorination that have
18 been seen and reported as Aroclor 1268 in some of
19 those samplings.

20 Q A little further on it says, Therefore, they
21 would not be preferentially transported with
22 distance through the air.

23 What does preferentially transported mean?

24 A I'm sorry. Where are you again?

25 Q I'm sorry. It's in the next paragraph,

1 starting with the word therefore.

2 A Okay. All right. I'm sorry. What's your
3 question again?

4 Q My question is: What does that mean,
5 preferential transfer --

6 A Well, I mean --

7 Q -- or transport?

8 A -- I'm not the writer, but I assume it means
9 that it's not more likely that the heavier
10 chlorinated materials are -- there's no reason that
11 the heavier chlorinated materials would be
12 transported more efficiently or farther or anything
13 than other lower chlorinated materials.

14 Q Okay. But that's not to say that Aroclor
15 1268 doesn't -- isn't capable of being transported?

16 A Well, yeah, it doesn't say that. But, I
17 mean, again, because of all the things we've talked
18 about this morning, it's Aroclor 1268. And again,
19 I'm going to say Aroclor 1268-like congeners are
20 going to move very, very slowly compared to other
21 materials.

22 Q Certainly with respect to vapors, but with
23 particulate matter they can move --

24 A Right.

25 Q -- like others?

1 A Exactly. That's correct.

2 Q And by the way, what Aroclors would the 8,
3 9, and 10 chlorine congeners be located in or be
4 present in?

5 A Well, there's certainly some in Aroclor
6 1260. I don't recall whether there's some in 1254.
7 There probably are small amounts. But anything
8 higher chlorinated than 1260 certainly is going to
9 have some of those congeners.

10 Q Okay. And we do know that 1268 can travel
11 through the air as well? I mean, that was noted on
12 the tree bark.

13 A Well, okay. I understand that that has been
14 reported on tree bark, assuming that those analyses
15 were done correctly and they stand for what they
16 purported to stand for. It appears that there was
17 some mechanism to get them to that tree bark,
18 whether it was by volatilization or dust, yes.

19 Q Okay. I want to turn now to page 16. And
20 there's a discussion in the middle paragraph on this
21 page about an EPA analytical Method 8082. Are you
22 familiar with that?

23 A Yes.

24 Q Do you -- do you believe that that method
25 can be used to identify Aroclor mixtures present in

1 the environment; that is, Method 8082?

2 A I believe that that method can be used to
3 report as Aroclor mixtures the presence of PC --
4 certain PCB congener -- certain PCB mixtures in the
5 environment. It is -- again, I think we discussed
6 it's -- the computer is looking at the sample, the
7 results of the analysis, and saying it looks more
8 like this than it does any of the other Aroclors.
9 So it certainly reports them out as Aroclors. So it
10 certainly reports them out as Aroclors, but it is
11 not identifying them or saying they are that
12 Aroclor.

13 Q And in fact the last sentence here says, The
14 identification of a particular Aroclor on
15 chromatogram is an analytical tool, not a true
16 identification.

17 A I agree with that statement. I'm not sure I
18 would use those words, but I agree with the import,
19 the impact, of that statement.

20 Q And in fact this is the same technique that
21 Monsanto has used in identifying Aroclors in the
22 Anniston area, true?

23 A For some of their samples, yes.

24 Q Okay. Well, I mean, are there -- are there
25 other techniques that have been used besides this

1 methodology?

2 A There's been some congener -- this is not
3 congener-specific analysis.

4 Q What congener specific --

5 A I mean, it's not -- well, it is a
6 congener-specific analysis. I don't want to say
7 that. It is -- it's not as congener specific as
8 some others, but it's -- it does do a fairly good
9 job of separating. But it's -- but the point is
10 that the results are not reported by congener. They
11 are reported by Aroclor.

12 Q Right. What more specific-congener analysis
13 has been done by Monsanto or Solucia in Anniston?

14 A Well, my -- I'm not sure. My understanding
15 is there have been some that just report what the
16 particular levels of the congeners are. So, for
17 instance, it's so much 125; it's so much 137; it's
18 so much 196. Rather than trying to characterize it
19 as an Aroclor. Because these things out in the
20 environment -- and we're back to weathering.
21 They're no longer in general Aroclors, unless
22 they're recently emitted. They're not Aroclors.
23 They're the result of a complex longtime effect of
24 weathering on these materials. And they look like
25 something, but that doesn't mean they are that

1 thing.

2 Q Right. They're just a mixture of some
3 congeners?

4 A Right. And they look more like one Aroclor
5 than another. That's all the computer is looking to
6 say. It looks more like this than it does that.

7 Q And then we have to apply our judgment with
8 respect to what we know about a specific situation
9 and the AB example that you gave later in order to
10 get to any kind of a source supposition?

11 A If that's what you're trying to do, yes. I
12 mean, in general -- I know I'm not supposed to
13 answer questions that weren't asked. In general the
14 purpose of all these analyses was to measure the
15 total amount of PCBs were there, not to identify
16 which Aroclors were there. So that's why that
17 method was used. It was used to get a total PCB
18 count, and just that's how the method reports it
19 out.

20 Q If you would turn to page 19 of this Exhibit
21 2. And up at the top of the page, we have some
22 historic Anniston Aroclor production percentages of
23 the various Aroclors.

24 Do you know whether that's accurate or not?
25 Have you ever looked at that?

1 A It roughly comports with my understanding,
2 but I haven't necessarily looked at it nor compared
3 it to the source materials to see if it's true or
4 not. It makes sense.

5 Q Okay. And then if you'll look at what I've
6 highlighted here in that paragraph beginning in the
7 middle of the paragraph, Even accounting for severe
8 weathering that could have eliminated lower
9 chlorinated PCB homologues, it is not physically,
10 chemically, and biologically feasible for selective
11 weathering of the higher concentration Aroclor 1254
12 and 1260 components to be less dominant than Aroclor
13 1268. Instead profiles heavily weighted with PCBs
14 that resemble Aroclor 1268 are indicative of a
15 specific source not related to emissions from the
16 ongoing manufacturing process that occurred during
17 approximately 44 years of production.

18 Now, what does it mean when we talk about it
19 is not physically, chemically, or biologically
20 feasible for selective weathering of the 1254 and
21 1260 to be less dominant than 1268?

22 A Well, I think it goes back again to an
23 earlier discussion we had that -- and I think
24 specifically I was asked could Aroclor 1254 weather
25 to 1268. And I think -- or to something that looks

1 like Aroclor 1268. And I think the answer is no
2 because by the time you get up to 54 and 60, the
3 primary dominant congeners in those mixtures are
4 going to stay put, too. You're not -- you're not
5 going to get rid of them. You're not going to push
6 them down so far that what looks like 1268 pops up.

7 Q So 1254, 1260, and 1268 are going to remain
8 looking like 1254, 1260, and 1268?

9 A Pretty much so, yes. I think that's pretty
10 consistent with what's been seen throughout the
11 world.

12 Q This letter also, because we saw that at the
13 top of this page you have the listing of production
14 over time, kind of makes the assumption that
15 concentrations in the environment would be roughly
16 proportional to what was actually produced at the
17 Anniston plant. Do you agree that that's the case?

18 MR. MERRILL: I object to the form of the
19 question. I'm not sure it adequately characterizes
20 what the letter says.

21 Q (By Mr. Schick) Let me ask you this. We're
22 looking at the top of page 19 of Exhibit 2, Aroclor
23 production over time. Is it your view that what is
24 found in the environment should look similar in
25 terms of percentages in Anniston to what was

1 actually produced at the plant?

2 A No.

3 Q Okay. And that's because we've got
4 weathering?

5 A That's correct.

6 Q And so we would expect to see, from the
7 Monsanto plant itself, a lot more of the 1254, 1260,
8 and 1268 than was actually produced at the plant?

9 A More of 1254 and 1260 possibly. Again, I
10 think the 1268 question goes back to what we
11 answered before. I don't think you're going to see
12 that pushed up for two reasons.

13 Number one, it was present at very low
14 levels anyway, apparently based on this chart. And
15 No. 2, the 54s and 60s aren't going to change enough
16 to make that any kind of a predominant congener mix.
17 So I would think they're going to look mostly like
18 somewhere in the 48 to 54 to 60 range which is what
19 you see everywhere else in the environment
20 throughout the country and the world really, because
21 it's kind of an averaging process.

22 Q If you take a look at page 21 of Exhibit 2,
23 a discussion goes on about, NewFields argues that
24 there was a large amount of PCB losses to the
25 atmosphere. And then the reply is, This statement

1 is erroneous. Subsequent calculations are
2 erroneous. And then the sentence reads, The error
3 comes from a memo dated January 18, 1971, from a
4 retired employee of former Monsanto, Mr. L.G. (sic)
5 Wright.

6 Are you familiar with Mr. Wright's
7 calculation and what he did showing that PCB
8 concentrations were present in the air near the PCB
9 production process?

10 A I've certainly seen it. I know what you're
11 talking about. I don't remember the details.

12 Q But you wouldn't disagree with the fact that
13 PCBs in the air can remain suspended for some
14 certain -- some length of time under certain
15 circumstances?

16 A Some small amounts at the points where these
17 measurements were taken possibly would not have
18 condensed immediately and could be moved. It's -- I
19 don't know what the amounts were. And I don't -- I
20 don't know really -- this is -- obviously this is
21 based on a NewField statement, and I don't remember
22 the context under which they made that statement.

23 But I don't think there would be -- to the
24 extent you're talking about atmosphere, meaning off
25 the plant site, I think that large -- it is not

1 possible that large amounts of PCBs would be
2 contributed to the atmosphere based on those --
3 those measurements, again, because they're right
4 at -- as I recall, they're right at leaks or source
5 emissions to the atmosphere in a heated
6 manufacturing process, and those levels are not
7 going to be maintained for any distance whatsoever
8 away from that manufacturing process.

9 Q And, again, it's hard for you and for me to
10 discuss intelligently the quantification because we
11 don't know what we're starting with?

12 A Absolutely. You're absolutely correct.

13 Q We don't know what our temperatures are. We
14 don't know what our wind speeds are. And those are
15 all factors that go into this, right?

16 A I would agree with that.

17 Q But we do know, as we discussed earlier,
18 that once vaporized you've got the condensation
19 possibility that's going to happen at some point,
20 and you also have the possibility either before or
21 at condensation attachment to particulate that may
22 spread that molecule beyond the plant site?

23 A Yeah. In the context of these particular
24 measurements, I think the particulate movement is
25 less likely, I mean, because you're right in the

1 process. I don't think there's going to be a lot of
2 particulates there. But to the -- you know, again,
3 to the extent that they deposit on soils and were
4 later moved by wind, some amount is possible.

5 Q Do you know about any studies done over time
6 about the amount of particulate matter in the air
7 around Anniston and in particular the Monsanto
8 plant?

9 A Not specifically. Although -- well, I don't
10 know. I think when some of the air measurements
11 were done, they actually tried to discriminate
12 between PCBs on particulates and PCBs in air. But
13 that discrimination is -- is questionable at best.
14 So I don't know whether anybody tried to quantitate
15 the particulates at that time or not.

16 Q You recall that you gave an affidavit --
17 you've given several affidavits. You gave an
18 affidavit, though, in connection with Solucia's
19 104(e) response?

20 A Yes.

21 (Defendants' Exhibit Kaley 3
22 marked for identification.)

23 Q Let me show you a copy of if. I've marked
24 it as Exhibit 3 to your deposition.

25 A So it was an exhibit? It wasn't actually an

1 affidavit in the --

2 Q Yeah, it was an exhibit to the response.

3 A -- in the response? It was an exhibit to
4 the response. Yes, I'm familiar with this
5 affidavit.

6 Q Okay. And I want to direct your attention
7 to page 23, paragraph 37.

8 A Okay.

9 Q And the affidavit that you provided
10 described some air sampling that was conducted by
11 Solucia, true?

12 A Yes.

13 Q And this particular paragraph, No. 37,
14 explains that PCBs were detected in the ambient air
15 at the Mars Hill Missionary Baptist Church?

16 A Yes.

17 Q Do you know; from having been there before,
18 where is the Mars Hill church located?

19 A It's properties just east of Monsanto.

20 Q Okay. And certainly you agree that the
21 levels that were identified there in 1998 or 1999
22 were certainly higher than background, true?

23 A Yeah. I could say 80 nanograms per cubic
24 meter is higher than background, yes.

25 Q Okay. So -- so in this -- this is an

1 instance we have in which PCBs can be present in
2 ambient air, correct?

3 A Yes.

4 Q And would you say that the likely source of
5 those PCBs was the Monsanto plant itself, just west,
6 I guess, of the Mars Hill's Missionary Church?

7 A You mean at the time the measurements were
8 taken?

9 Q Yes, sir.

10 A No. I would think it's probably surface
11 interchange and contaminated soils in the area of
12 that particular church.

13 Q So the PCBs might have come from Monsanto
14 years earlier, but they were deposited in soils and
15 picked up by the atmosphere, and that's what's being
16 read in '98 or '99?

17 MR. MERRILL: I'll object to the form of the
18 question.

19 Q (By Mr. Schick) Is that what you meant?

20 A Basically, yes.

21 Q Okay. How -- when I say basically, my
22 wife --

23 A Well --

24 Q -- always says --

25 A I'm sorry.

1 Q -- what did I get wrong about that?

2 A Yes, yes. I'm sorry. I shouldn't have said
3 that. You're absolutely correct. That is correct.
4 That is my -- my understanding of that level would
5 have been that it's from PCBs that were in the soils
6 in the general area of the church and were not being
7 wafted over from the existing Monsanto facility in
8 that time frame.

9 Q Sure. Because this is 20 years after
10 production has ceased, right?

11 A Yes. Well, almost 30, yes.

12 Q Right. Do you know whether the air sampling
13 that was done there made any attempt to analyze
14 specific congeners or homologues?

15 A I'm 99.9 percent sure it was reported as
16 homologues. If this is our -- I don't remember
17 whether this is our sampling or --

18 Q I think it says --

19 A -- the plaintiffs' sampling.

20 Q I'm sorry. It says, The results of air
21 sampling --

22 A Conducted by Solutia.

23 Q -- conducted by Solutia.

24 A Okay. So in that case the reports were
25 reported by homologues. So there would have been a

1 congener-specific analysis that was reported after
2 the congeners were grouped into homologues. So,
3 yes, it was reported by homologues.

4 Q So when you refer to an Aroclor here in the
5 paragraph, you're just guessing -- you're just
6 saying it most resembles or the homologue mixture
7 most resembles Aroclor 1242?

8 A No. All I'm saying is the OSHA PEL for PCBs
9 of lower chlorinated materials is based on Aroclor
10 1242, and that's what that PEL is.

11 Q I'm sorry. I misread it.

12 Do you know where the results are reported?

13 A Do I know where the results are reported?

14 Q Yeah. The homologue results, because
15 they're not reported in this paragraph.

16 A Well, they're reported in a -- in one of a
17 number of reports from the company that was doing
18 the air analyses for Monsanto in that time frame.

19 Q Which one; do you know?

20 A ENSR, I would guess, E-N-S-R, all caps.
21 Would be my guess they were the ones doing it.

22 Q Okay.

23 (Defendants' Exhibit Kaley 4
24 marked for identification.)

25 Q (By Mr. Schick) Speaking of which, let me

1 show you Exhibit 4 to your deposition which is from
2 ENSR dated July of 2004.

3 A Okay.

4 Q You've seen this before, have you not?

5 A I'm not sure whether I have or not.

6 Q Oh, is that right?

7 A This was after my retirement, and I may or
8 may not have seen it. So I don't know.

9 Q Okay. By the way, meant to ask you.
10 Forgot. What did you do to get ready for your
11 deposition here today?

12 A A conversation with Charlie on just
13 general -- make sure I understood what the
14 parameters of my presentation were and possible
15 areas for -- for questioning.

16 Q Did you review anything, look at any
17 documents, pick up anything?

18 A I skimmed my old depositions in this case.
19 And I didn't -- I clearly didn't read them. I just
20 leafed through them to see if anything jumped off
21 the page. And then I did review some -- some
22 depositions, parts of depositions, from other --
23 Jerry Brown and others.

24 Q Okay. That's it?

25 A I think I did -- I think there was one

1 analytical method that -- on measurements of PCBs in
2 air that Charlie asked me to take a look at.

3 Q Which one was that?

4 A It was an old method from -- I don't even
5 know when it was. It was undated. So, I mean --
6 but it was a very old method for measuring Aroclors
7 in air that really wasn't measuring Aroclors in air.
8 It was measuring chloride. So I just looked at
9 that. He thought that might come up.

10 Q Okay. Was that it?

11 A Yeah, that was it.

12 Q Okay. Did you talk to anybody other than
13 Charlie or any other lawyer for Solucia --

14 A No.

15 Q -- in getting ready for your deposition?

16 A I'm sorry. No.

17 Q Okay. So let me ask you to turn to page 4-9
18 of this report.

19 A Okay.

20 Q This comes under a heading Identification of
21 PCB Source Locations; do you see that?

22 A I do.

23 Q And it says, In addition to off-site
24 influences, the data also suggest influence from
25 onsite PCB source areas. During one session -- and

1 they reference November 17, 2003 -- two monitors
2 downwind of the facility showed the highest PCB
3 concentrations. A second session, which is
4 September 10, 2003, showed PCB concentrations
5 increasing across the plant along the
6 upwind/downwind vector.

7 Do you agree that the Solucia facility
8 remains an ongoing source of PCBs to the atmosphere,
9 even as of 2003?

10 A Well, again, I don't -- I don't know where
11 these samplers were located. So I don't know
12 whether they're onsite or offsite. And again, so
13 apparently wherever these were based on this
14 paragraph, which says what it says, that there were
15 evidences of higher levels of PCBs consistent with
16 that being -- you know, being a source on those
17 particular days.

18 Q And there can certainly be a source of PCBs
19 on the -- on the Monsanto property there in Anniston
20 if PCBs remain in any of the surface soils and get
21 picked up by -- by wind?

22 A Yeah. Again, that's a reasonable -- I don't
23 know the levels. I don't know what we're talking
24 about here. So I don't know whether the question of
25 significance comes into it. But based on -- on this

1 particular paragraph, I would say that that's a fair
2 inference.

3 Q Okay. And it would also be a fair
4 inference, would it not, that to the extent there is
5 any sign of some PCBs being generated in the
6 downwind concentrations, as they are there, those
7 concentrations would have been heavier when
8 production was actually ongoing --

9 MR. MERRILL: Object to the form of the
10 question.

11 Q (By Mr. Schick) -- back in the '60s?

12 MR. MERRILL: Object to the form of the
13 question.

14 A Yeah, I -- I was going to give you a smart
15 answer. I won't.

16 Q (By Mr. Schick) More likely than not?

17 A It's possible, yeah. We don't know, but...

18 Q But it's certainly more likely than not that
19 they would have been?

20 A Yeah. But, again, I don't know where these
21 samplers were, whether they were places that were
22 right next to where the facility used to be or
23 whether they're, you know, on the other side of
24 Anniston. I just don't know. So it's hard to say
25 what impact that would have off the plant site. I

1 mean, clearly if you're measuring PCBs in the air at
2 the site of manufacture, they're going to be higher
3 levels than other places. So I just don't know the
4 answer.

5 THE VIDEOGRAPHER: Excuse me, Counselor. We
6 have four minutes of tape.

7 Q (By Mr. Schick) Have you ever estimated
8 fugitive air emissions from an industrial process?

9 A Me personally?

10 Q Yes, sir.

11 A No.

12 Q We talked about the Hermanson tree bark
13 report earlier. And you said -- you told me what
14 you understood it to reflect and then told me that
15 there were -- assuming analytical something or other
16 and something else -- the record will reflect what
17 you intelligently said as opposed to my dim
18 recollection.

19 A That's fine.

20 Q And I just wanted to follow up with that.

21 (Defendants' Exhibit Kaley 5
22 marked for identification.)

23 Q (By Mr. Schick) This is Exhibit 5 to the
24 deposition. And you see right there in the -- in
25 the abstract the last sentence says, We believe that

1 high-temperature Montar disposal released high
2 molecular mass PCBs into the gas phase which were
3 dissolved into older tree bark lipids.

4 And that was your understanding of this
5 report, correct? We talked about how would -- how
6 would PCBs get to tree bark 5 miles downstream, and
7 you mentioned on dust particulates or vapor phase, I
8 thought.

9 A Okay. I'm not sure how that relates to the
10 sentence you just read, but...

11 Q Okay. Well --

12 A My understanding is that the conclusion that
13 that sentence is based on are trees that were
14 basically on the landfill.

15 Q Okay. But he also took a look at trees down
16 like 5 miles away; you know that?

17 A Yes.

18 Q And you know that that is -- that he did
19 identify PCBs in tree bark 5 miles away from the
20 plant?

21 A Yes.

22 Q Now I need to know what criticisms you have
23 of the analytical method he used or the conclusions
24 he drew, if you have any.

25 A I don't know that -- I don't know that those

1 relates to the procedure. There are several things.

2 Number one, I never seen -- I have never
3 seen any analytical method validation from his --
4 his laboratory that he uses. Maybe it exists, but I
5 haven't seen it.

6 Number two, a lot of his results are based
7 on lipid-based analyses of tree bark and the lipid
8 levels -- do you want me to stop? The lipid levels
9 in tree bark are vanishingly small so there's a huge
10 room for error there. I'm not necessarily
11 questioning whether PCBs were measured in that -- on
12 that tree bark. But it's possible that you could go
13 outside this building and find PCBs on tree bark.
14 So it's really the interpretation of the results.

15 And for this -- I got to say this: The
16 sentence you have highlighted, I think, is a total
17 misunderstanding on his part on how Montars are
18 disposed.

19 MR. SCHICK: Okay. And we'll come -- when
20 we get back on the record, we'll talk a little bit
21 about Montars. Thank you.

22 THE VIDEOGRAPHER: We're off record at
23 11:19. This ends tape two.

24 (Off the record.)

25 THE VIDEOGRAPHER: We're back on record at

1 11:28. This begins tape three of the deposition of
2 Dr. Robert Nelson.

3 MR. SCHICK: Dr. Kaley.

4 THE VIDEOGRAPHER: Excuse me.

5 Q (By Mr. Schick) That's okay. Dr. Kaley,
6 when we took our break, we were looking at Exhibit 5
7 of your deposition, this report from Dr. Hermanson
8 and Johnson and this sentence you pointed out to me
9 that I actually highlighted, We believe that
10 high-temperature Montar disposal released high
11 molecular mass PCBs into the gas phase which were
12 dissolved into older tree bark lipids. And you said
13 you thought he didn't understand the Montar disposal
14 method.

15 Would you tell me what you mean by that?

16 A Okay. I've --

17 MR. MERRILL: I'm going to object to the

18 question only to the extent that it is really
19 testimony that's beyond the scope of the 30(b)6
20 designation. And he may certainly go ahead and
21 answer it, but the answer is not necessarily being
22 offered as 30(b)6 testimony.

23 MR. SCHICK: Fair enough.

24 A All right. I've heard Dr. Hermanson speak a
25 number of times and in addition have read his

1 publications, and my understanding is that when he
2 wrote this, he believed that PCB still bottoms were
3 trucked up to the landfill in a hot state and dumped
4 out of those containers into the landfill and that
5 was releasing these high molecular mass PCBs.

6 And number one, I've never seen anything
7 which substantiate that method of disposing of PCB
8 still bottoms. And number two, it's my
9 understanding, I think at least, that even
10 Dr. Hermanson has recognized that his original
11 assumptions were not correct.

12 Q (By Mr. Schick) Okay. So we'll come back
13 to Montars in a second, but whatever he found in
14 those tree barks, you're saying, didn't come from
15 Montars. It came from some other vaporization or
16 particulate methodology or mechanism?

17 A To the extent that they were correctly
18 identified in there, yes, I agree with that.

19 Q All right. Now let's talk about Montars a
20 minute. There -- as I understand it, there are at
21 least 10 Montars. Maybe there are a whole bunch
22 more. And you've spoken in other depositions about
23 the nonchlorinated Montars, the still bottoms that
24 would come from the biphenyl process, the benzene
25 through the lead pot process making biphenyls.

1 And as I understand it, the still bottoms or
2 Montars from that process were -- were referred to
3 as Montars 9 and 10?

4 MR. MERRILL: I'm going to object to the
5 form of the question, again for the -- for the same
6 reason. Can I have a running objection to the
7 questions on Montars?

8 MR. SCHICK: Absolutely. But what I do
9 intend to get to, though, Charlie, and what I want
10 to be asking Dr. Kaley about is the possibility of
11 emissions either through air, water, soil of Montars
12 1 through 8.

13 MR. MERRILL: I figured you might bring it
14 around. And I wouldn't --

15 MR. SCHICK: Right.

16 MR. MERRILL: -- object to it when you get
17 into these topics. But I didn't -- since I don't
18 know where you're going, that's why I wanted to --

19 MR. SCHICK: Fair enough.

20 MR. MERRILL: -- raise that objection.

21 MR. SCHICK: Fair enough. That's okay.

22 A All right. As I sit here today, I don't
23 know which were which. So if you know you're right
24 and we can assume that you're right, I'll try to
25 answer your questions. But I don't -- without

1 seeing a list of Montars and what their source was,
2 I'm uncomfortable talking about individual Montars.

3 Q (By Mr. Schick) Fair enough. There were
4 Montars, regardless of numeric designation, that
5 came about in the chlorination process that were the
6 still bottoms after the chlorination process, true?

7 A That is true.

8 Q Okay. And I don't believe you've been asked
9 this before, and that's why it was important to me
10 to ask you this. What was the process for disposing
11 of the Montars generated in the chlorination
12 process; that is, Montars that would contain
13 chlorinated biphenyls?

14 A My understanding is that they were drummed
15 at the site of the distillation columns and then
16 transported to the landfill.

17 Q In the drums?

18 A In the drums. In sealed drums.

19 Q And not poured out into the landfill?

20 A That's correct.

21 Q Now, is it also correct that when those
22 Montars were poured into the open drums at the
23 facility, that they were at 300 degrees or so?

24 A I don't know the temperatures. If you -- if
25 you eventually have a source that says that's the

1 temperature, I'm not going to disagree with that. I
2 don't know the temperature.

3 Q Do you know that in the process they would
4 have been poured out while still hot?

5 A Oh, they were hot. I'm not arguing whether
6 they were hot or not.

7 Q And is it also a fair description of the
8 process that the drums would not have been covered
9 until after they had cooled somewhat?

10 A I don't know.

11 Q You just don't know the answer to that?

12 A I just don't know.

13 Q All right. Now, is it -- do you -- well, if
14 Montars from the chlorinated biphenyl process were
15 placed in drums at a higher temperature well above
16 ambient, there would have been vaporization taking
17 place off those -- off the tops of those Montars,
18 true?

19 A To some extent or another, yes.

20 Q And we'd have the same kind of vaporization
21 going there that we have from any other process
22 around the plant as we've discussed, true?

23 MR. MERRILL: I'm going to object to the
24 form of the question.

25 A I'm not sure what you mean. But, I mean,

1 vaporization is vaporization. So, I mean, to the
2 extent we've talked about the higher chlorinated
3 materials are going to drop out faster and condense
4 faster are much less likely to be transported any
5 considerable distance, yes.

6 Q (By Mr. Schick) Okay. And then, of course,
7 after landfilling, if those -- if the integrity of
8 those drums was somehow compromised, water could
9 pick up those Montars and they could be released in
10 the environment, true?

11 A I don't believe that could occur at a
12 measurable -- those things are solids. I mean,
13 they're basically a solid mass. So to the extent
14 that any water -- you know, assuming they were
15 punctured, which obviously I don't have any evidence
16 they ever were, I don't think very much would --
17 measurable amounts would be picked up.

18 Q Okay. In the west -- it was the west
19 landfill that Alabama Power had for a while, right?

20 A That's correct.

21 Q And didn't they do some grading and digging
22 at some point?

23 A Yes.

24 Q And they punctured some drums in the process
25 of doing all that, didn't they?

1 A I'm not -- I don't recall whether they
2 punctured drums or whether just stumbled on some
3 basically semisolid materials. I don't recall
4 whether it was a drum puncture or not. I don't --
5 as I sit here, I don't think it was. But clearly
6 they did by one mechanism or another uncover some
7 semisolid materials.

8 (Defendants' Exhibit Kaley 6
9 marked for identification.)

10 Q (By Mr. Schick) Dr. Kaley, let me show you
11 what I've marked as Exhibit 6 to your deposition,
12 and so you know, this comes from Exhibit 14 which
13 was the EPA Exhibit No. 14; and this is just one
14 page from the document that I pulled out. But it
15 talks about Aroclor collection and disposal of
16 chlorinated Montar, amount of wastes, 1971, and it
17 shows Montar 1 million pounds per year, Montar 1;
18 Montar 5, 10 million pounds per year.

19 Do you know one way or another whether those
20 look to be accurate figures?

21 A No.

22 MR. MERRILL: And, again, I'm going to
23 object to the -- this line of questioning as being
24 outside the scope of the designation.

25 A And I have no idea.

1 Q (By Mr. Schick) Assuming that any of those
2 solid Montars did find their way into the
3 environment in waterways or in sediments, it would
4 certainly be possible for them to be transported in
5 the same distances as any other PCB once entrapped
6 in sediment, true?

7 MR. MERRILL: I'm going to object to the
8 form of the question.

9 A All right. That's a mighty big assumption,
10 because as I said, the physical state of those
11 Montars is not conducive to them either themselves
12 breaking up into small particles or any measurable
13 amount of chlorinated material somehow being
14 separated on a molecular basis and re-adsorbing to
15 soil. So having said that, if what I consider to be
16 either of those very unlikely occurrences occurred,
17 then they would be moved, yes.

18 Q Okay. By the way, I had understood that
19 there was a clay-like material that was used to
20 filter PCBs after -- in the chlorination process
21 after the reaction of the biphenyl with chlorine
22 under heat and, I think, the presence of a catalyst.

23 What happened to that clay that was used?

24 A My understanding is it was drummed and
25 landfilled.

1 Q Okay. In the same way as Montars?

2 A Well, the same ultimate outcome, not the
3 same way. But yes.

4 Q Sure. Because it wouldn't be hot?

5 A Right.

6 Q And that clay would have contained PCBs,
7 true?

8 A Yes.

9 Q And it's your understanding that was also
10 placed in drums and taken to the landfill?

11 A Yes.

12 Q Do you have any idea what kind of volume
13 we're talking about of that clay?

14 A Not really.

15 Q Would it be in the same mag -- order of
16 magnitude as the Montars?

17 A I have no idea.

18 Q Okay.

19 (Defendants' Exhibit Kaley 7
20 marked for identification.)

21 Q (By Mr. Schick) Exhibit 7 to your
22 deposition is -- I'm sorry.

23 A I'm sorry. I just didn't reach for it. No,
24 that's fine.

25 Q -- a study that was done in a different

1 location, but what I want to ask you about is on
2 page 1231 of this document.

3 A Okay.

4 Q And I believe this was done of the Sauget
5 facility. You're familiar with the Sauget
6 facility --

7 A Yes.

8 Q -- of Monsanto's?

9 A Yes.

10 Q It says, Referring again to Table 1, the
11 higher PCB concentrations are apparently at points
12 closer to the facility with concentrations generally
13 decreasing with increased distance.

14 That's your belief with respect to airborne
15 transport of PCBs, true; that it's -- the
16 concentrations decrease with increased distance?

17 A Yeah. That -- that comports with my
18 understanding of how air transport would occur, yes.

19 Q The next sentence, This distribution
20 suggests airborne transport of the PCBs, including
21 decachlorobiphenyl, from the manufacturing facility,
22 with subsequent deposition onto the surrounding
23 landscape.

24 Do you have any reason to disagree with that
25 conclusion?

1 A The only reason I would disagree with that
2 conclusion is that decachlorobiphenyl or Aroclor
3 1268 weren't manufactured at Sauget after about
4 1958. So I doubt -- I would really question the
5 results with regard to decachlorobiphenyl.

6 Q Okay. Do you know who --

7 A In fact, I think it's 1948 actually.

8 Q Do you know who did this study?

9 A No. I'm not -- I'm embarrassed to say I'm
10 not sure I've ever seen this study.

11 Q Okay. Okay. Fair enough.

12 A Can I have a copy to take with me?

13 Q Sure. Yeah, I'll give you -- I'll give you
14 mine.

15 On the preceding page, here's this table
16 that they referred to.

17 A Yes.

18 Q Oh, you know, it says of the -- no. It's
19 the same place, right. Table 1 lists distance from
20 the facility in meters, and then it has Aroclor
21 1242, 1260, decachlorobiphenyl, then total PCBs.

22 A Yeah.

23 Q And I just -- the way I read this: It
24 showed that there were 1.6 decachlorobiphenyls part
25 per million picked up 1050 meters or just over a

1 kilometer from the facility. Is that how you would
2 read that?

3 A Yes. But it doesn't say it came from
4 Monsanto.

5 Q Understood. Understood. Although that --

6 A I mean, I just -- like I say, that whole
7 finding doesn't comport with my understanding. And
8 why would it be higher farther away than it was
9 closer? It doesn't -- if you look, the Aroclor
10 12 -- decachlorobiphenyl doesn't fit the pattern of
11 the other Aroclors. For the other Aroclors, the
12 highest are 250 and 400 meters, and here it's, you
13 know, 1050. And I -- that -- that's entirely
14 inconsistent with my understanding of how the whole
15 system works.

16 Q Could it be that the decachlorobiphenyl
17 attaches itself to particles that somehow wind up
18 being transported by air more?

19 A Why would those particles be transported
20 further than particles with any other Aroclor?

21 Q By the way, you personally haven't ever done
22 any air deposition modeling, I assume? That's not
23 an area of your expertise?

24 A That is a fair assumption.

25 Q Okay. And you haven't actually done any of

1 that kind of air modeling?

2 A Not officially no.

3 Q Done it unofficially?

4 A Well, I've thought about it. I haven't done
5 it officially. I haven't plugged it into a model.
6 I thought about what a model ought to look like.

7 Q Okay. But you haven't designed and haven't
8 been asked to design and haven't talked to experts
9 about designing one?

10 A You're correct.

11 (Defendants' Exhibit Kaley 8
12 marked for identification.)

13 Q (By Mr. Schick) Let me hand you what's been
14 marked as Exhibit 8 to your deposition. And this is
15 an old one. Appears to be 1935 diphenyl and
16 chlorinated diphenyl derivatives, diphenyl being
17 just a synonym for biphenyl, true?

18 A Yes.

19 Q And this report talks about Aroclor
20 No. 1269. And the first sentence there says,
21 Aroclor 1269 is the product distilled from
22 chlorinated diphenyl with a chlorine content of 69
23 percent.

24 So we know it's talking about the same kind
25 of percentage we've always talked about with respect

1 to PCBs?

2 A Yes.

3 Q Are you familiar with 1269?

4 A I mean, I know that it was manufactured at
5 some low level or another by Swann. I'm not -- I
6 don't think it was ever manufactured by Monsanto. I
7 mean, this is a Swann document. It's not a Monsanto
8 document.

9 Q I see.

10 A I think.

11 Q This is before --

12 A Well, it was right at the -- it was right at
13 the cusp when Monsanto was purchasing Swann. So
14 maybe it is a Monsanto document. I don't recall.
15 But it's -- it's basically from the Swann era. I'm
16 not aware that 1269 was ever manufactured by
17 Monsanto, at least after -- much after this time.

18 Q But it may have been manufactured by -- at
19 least at the Anniston facility? I mean, that's what
20 this demonstrates?

21 A Right.

22 Q Perhaps before Monsanto purchased it?

23 A Right. I don't disagree with that.

24 Q Then there's discussion on page -- if you
25 look up at the top right-hand corner, a handwritten

1 41.

2 A Okay.

3 Q And it says, The room housing this equipment
4 should be well ventilated both because the stills
5 are hot and as an extra safeguard against dust.
6 Operators in contact with such dust may develop a
7 severe form of dermatitis.

8 And I think you've testified in previous
9 depositions that dermatitis is a known human
10 reaction to contact with PCBs?

11 MR. MERRILL: And, again, I'm going to
12 object to this line of questioning to the extent
13 it's beyond the scope of the 30(b)6 notice or
14 designation.

15 Q (By Mr. Schick) But did I get that part
16 right?

17 A Generally, yes, it can be.

18 Q Okay. And -- and are you familiar with the
19 fact that the manufacture of 1268 created dust?

20 A 1269?

21 Q I'm sorry. 1269.

22 A Well, to the extent that it says so in this
23 document, yes.

24 Q Okay.

25 A I have no reason to doubt the document.

1 Q And then the next paragraph or the last
2 paragraph there says, Another factor complicating
3 operations is the sudden decomposition that occurs
4 at the end of the distillation. The gas evolved
5 contains large amounts of acid-forming vapors and
6 also some of the Aroclor 1269 as an extremely finely
7 divided dust which is discolored and decidedly acid.
8 Efforts made to collect this dust and rework it have
9 not been successful. Our operations at present are
10 to discharge these decomposition products through an
11 exhauster and into the atmosphere. Such a procedure
12 in a more populous community might create a
13 nuisance.

14 Have you seen this before today?

15 A Yes.

16 Q Are you familiar with this dust and how it
17 was exhausted into the atmosphere?

18 A Not -- nothing over and above what it says
19 here.

20 Q Do you know what volumes of this dust that's
21 referred to in Exhibit No. 8 were discharged into
22 the atmosphere?

23 A No.

24 Q Do you know over what period of time 1269
25 was manufactured?

1 A Well, as I said before, I'm not aware of it
2 being manufactured after the date of this document.
3 I don't know when it stopped or started, but I don't
4 know specifically.

5 Q The -- if you turn to the last page of the
6 document, they're talking about what they can do to
7 collect this material. And they say, The material
8 is acid and the fineness of particles approach that
9 of fog particles.

10 And those would certainly be particles that
11 could be picked up by -- by air and sent some
12 distance if we knew more about its weight, etc.,
13 true?

14 A That's -- that's a fair inference, yes.

15 Q Do you know anything about a fire occurring
16 in the drumming and flaking Aroclors facility?

17 A Just a little bit.

18 Q What do you know about that?

19 MR. MERRILL: Again, I'm going to object to
20 the question to the extent it's beyond -- and of
21 this line of questioning to the extent it's beyond
22 the scope of the 30(b)6 designation.

23 A Not much other than I think it occurred and
24 I think it was just -- I think it was diphenyl. I
25 don't believe it was chlorinated diphenyls.

1 Q (By Mr. Schick) Okay. It's your
2 understanding it was die -- it was -- it was not
3 chlorinated?

4 A I don't know what you're looking at, but it
5 seems to me there's a document that says the
6 diphenyl flaking operations. So that's my
7 recollection.

8 Q Similar question. There's been testimony
9 about pumping of Montars into Cleghorn Lake. Do
10 you -- but it may have been with respect to biphenyl
11 Montars. Do you know whether chlorinated Montars
12 were ever deposited in any waterway?

13 A Well, Cleghorn's Lake wasn't really a
14 waterway. Cleghorn's Lake was a disposal pit on the
15 Monsanto Anniston plant site. It was called a lake
16 more as a light-hearted joke than anything else,
17 first place. Second place, my understanding is
18 those were all nonchlorinated Montars. They were
19 from the polyphenol manufacturing process.

20 (Defendants' Exhibit Kaley 9
21 marked for identification.)

22 Q (By Mr. Schick) Let me give you Exhibit 9
23 to your deposition. This is a memorandum from
24 Mr. Papageorge. Do you know Mr. Papageorge?

25 A I do.

1 Q And it's dated August 17 of 1970. And he
2 talks about an inspection in Anniston that he did,
3 and he said, I was, however, disappointed that we
4 are still using considerable quantities of sand to
5 keep the floors in the department partially dry.

6 At the bottom of that page, he says, I have
7 concerns regarding the containment of Aroclors from
8 the bulk storage, drumming, tank car and tank truck
9 loading areas. The amount of Aroclor on the
10 drumming area floor appeared excessive and could
11 overload the small sump which is in the present
12 drainage channel from this area.

13 My question to you is: Does this
14 demonstrate another way in which Aroclors could
15 either find their way into a waterway or onto soil
16 and the atmosphere?

17 A Well, I'm not -- again, with atmosphere, I
18 don't think it would be of a significant -- because
19 it's basically ambient temperatures, I don't think
20 there would be a significant contribution. But my
21 understanding of the operation is that materials on
22 the floor would eventually make their way to one of
23 the dischargers of the plant and probably be
24 discharged through the same process that the -- the
25 HCl waste would discharge.

1 Q Are you talking about discharged into
2 wastewater area?

3 A Well, discharged into probably -- my
4 understanding would be probably into the -- the 01
5 discharge into the creeks eventually.

6 Q Okay.

7 A I don't know that. But, again, I don't know
8 that for sure. I don't know where these areas are
9 specifically, but that's -- that would be my
10 understanding.

11 Q Okay. By the way, how does an acidic
12 condition affect weathering?

13 A Probably doesn't. I mean, PCBs are
14 generally resistant to acid. The acidity in this
15 process comes from the hydrochloric acid that's
16 generated during the manufacturing process.

17 Q Which you then solve as muriatic acid?

18 A Right, yeah. The PCBs generally are not
19 susceptible to any kind of change by acids.

20 (Defendants' Exhibit Kaley 10
21 marked for identification.)

22 Q (By Mr. Schick) Let me show you what I
23 marked as Exhibit 10 to your deposition. And if you
24 could, look at the page numbered 3 at the bottom.
25 It's just the third page there.

1 A Okay.

2 Q And this is just a summary and it says, The
3 Aroclor vapor concentration was found to vary widely
4 depending on several factors.

5 And then it says, The actual Aroclor vapor
6 concentrations varied from .35 milligrams per cubic
7 meter to about 5 milligrams per cubic meter under
8 the most severe conditions.

9 Then the next paragraph says, It was found,
10 however, that the Aroclor vapor concentration in the
11 air at the sample points is seldom below the .5 to
12 1.0 milligrams per cubic meter level, which is the
13 maximum tolerable concentrations, and often is as
14 high as 3 to 5 milligrams per cubic meter.

15 Those are also concentrations in the air
16 that can wind up being dispersed beyond the plant
17 facility itself, true?

18 A Well, again, there -- as I can recall this
19 document -- and I congratulate my counsel for --
20 this is the one I mentioned earlier that he thought
21 might come up.

22 Q Ding, ding, ding, ding, ding. It's always
23 nice to get one right.

24 A That's right. It's my understanding that,
25 again, like some of the other measurements, these

1 are right at positions within the manufacturing
2 process itself. So all those processes that we
3 talked about are going to occur. You know, they're
4 at elevated temperature. It's going to condense.
5 But that said, yes, I think it is a potential source
6 of some level of PCBs of unknown concentration
7 leaving the plant site.

8 Q And -- and certainly if that were in a part
9 of the facility that was open to the environment, if
10 it just had a roof, didn't have sides, even a
11 greater likelihood of being dispersed into the
12 atmosphere, true?

13 A Assuming there was some sort of wind blowing
14 or something, yes.

15 Again, if I may, this is the -- this method
16 I don't think is necessarily reliable for PCBs
17 because it's a very old method which isn't actually
18 measuring PCBs in the sense that we understand it.
19 It's basically degrading the PCBs into chlorine and
20 measuring the chlorine. So any chlorinated material
21 present, HCl or anything present in those samples,
22 would give a positive result. So they have to be
23 taken with a grain of salt, but I'm not going to
24 argue that it doesn't represent some atmospheric
25 presence of PCBs.

1 (Defendants' Exhibit Kaley 11
2 marked for identification.)

3 Q Exhibit No. 11 to your deposition is a
4 September 1970 memo. The subject is, Aroclor Losses
5 to the Atmosphere at the HCl Scrubber Jet. And
6 there is a reading of 64.9 pounds per day of PCB
7 passes the HCl knockout tank.

8 Do you see that?

9 A I do.

10 Q And then it talks about, Assuming 100
11 percent contact at the jets, .47 pounds per hour or
12 11.84 per day of PCB is sewerred with the remaining
13 .11 pounds per year or 2.4 pounds per day -- that
14 was .11 pounds per hour or 2.6 pounds per day being
15 lost to the atmosphere. Poor efficiency at the jets
16 increases the loss of PCB to the atmosphere
17 considerably.

18 Again, this is an indication of PCBs that
19 can wind up in the atmosphere, true?

20 A Yes. But, again, at the site of
21 manufacture. No indication of how far they're
22 moving away. But, yes, there's clearly -- it
23 clearly says PCBs are being discharged to the
24 atmosphere.

25 Q Sure. And I guess all I'm just talking

1 about here -- this is all being thrown up into the
2 air, and then we go, as you point out, to our what
3 are the congeners, how heavy are they, how long do
4 they stay vaporized, how far do they go, true?

5 A Correct, yes.

6 Q Okay.

7 A Thank you.

8 (Defendants' Exhibit Kaley 12
9 marked for identification.)

10 Q (By Mr. Schick) Exhibit No. 12 to your
11 deposition is the EPA's preliminary assessment of
12 PCB air emissions, and I just wanted to go through
13 kind of a listing that they have. And it's --
14 you've got to flip through this. It's page 3 of
15 Exhibit -- or Attachment A, I think. So if you flip
16 through, the third page says Attachment A. Go to
17 three pages beyond that.

18 A Got you.

19 Q And it has this listing. Do you see that?

20 A Yes, I do.

21 Q And these purport to be, if you look, what
22 the EPA refers to as a good summary of important
23 factors for understanding the atmospheric transport
24 of PCBs. Number one, atmospheric transport is a key
25 mechanism for the global dispersion of PCBs.

1 And we've talked about that, true?

2 A Yes.

3 Q The second, Lower chlorinated congeners tend
4 to be in the gas phase and therefore dominate in the
5 atmosphere while heavier congeners adsorb to
6 particulates.

7 True or not true? Would you qualify that?

8 A Well, I think we discussed this in some
9 detail.

10 Q Yeah.

11 A I don't think they -- they necessarily
12 preferentially adsorb the particulates --

13 Q Right.

14 A -- but the lower chlorinated come off those
15 particulates more readily. So I think, yeah,
16 that's --

17 Q And the truth is lower chlorinated congeners
18 don't remain forever in the gas phase. At some
19 point they're going to condense, and they can also
20 adsorb to particulate?

21 A Well, but there's a continual exchange.
22 There's a -- it's an ongoing exchange that continues
23 to affect the levels, yes.

24 Q Okay. The next -- next point says, During
25 transport, atmospheric PCBs can be deposited to soil

1 and water via wet deposition -- that is, rain or
2 snow -- dry deposition, settling of particles with
3 PCBs adsorbed, or gas absorption.

4 You agree with that?

5 A Gas absorption. I'm not sure what gas
6 absorption means, but I'll agree with the first two.

7 Q Okay. Can PCBs be absorbed into water
8 molecules picked up and deposited as rain somewhere
9 down the road?

10 A Well, I think that's what the first part of
11 that third bullet says. I mean, it's not really
12 that they're --

13 Q That's not the gas absorption; that's --

14 A That's -- well, it says deposited to soil
15 and water versus wet deposition. So they're
16 basically adsorbed onto the rain or snow and
17 deposited that way.

18 Q But that's how it's done, is it's adsorbed?

19 A Yes, yeah, yeah. It's not getting into the
20 molecules themselves. It's being -- it's kind of like
21 being washed out in the same way that, you know,
22 kind of dust is washed out. It's just -- yeah, it
23 adsorbs.

24 Q PCBs can also volatilize in the gas form
25 into the atmosphere from soil and water or resuspend

1 in the air on particulate matter.

2 And that's true? We've talked about that,
3 true?

4 A Yes, that's correct.

5 Q It is estimated that the atmosphere is a net
6 recipient of PCBs from these reservoirs.

7 Do you know what that means?

8 A Well, to me it means more is going into the
9 atmosphere than is coming out. I don't know whether
10 I agree with that or not, but...

11 Q Okay. The atmosphere --

12 A Let me just qualify that. The reason I
13 don't believe that is I think worldwide PCB levels
14 are decreasing in the atmosphere, and if this were
15 true, they'd be increasing. So I don't think -- I
16 don't -- I just don't -- I don't agree with this
17 statement.

18 Q Decreasing in the air?

19 A Uh-huh.

20 Q Worldwide?

21 A Uh-huh.

22 Q Is that yes?

23 A Yes.

24 Q It says, The atmosphere half-lives of PCB
25 congeners range from weeks to years.

1 Do you agree -- are you able to agree or
2 disagree with that?

3 A No. As I sit here today, I don't -- I don't
4 know enough to say one -- whether that's correct or
5 not.

6 Q Okay. And then this next one tries to, I
7 guess, kind of shave this a little bit closer. It
8 says, Biphenyls with 0 to 1 chlorine atoms remain in
9 the atmosphere and degrade first. Those with 1 to 4
10 chlorines migrate toward polar latitudes in a series
11 of volatilization/deposition cycles. Those with 4
12 to 8 chlorines remain in mid-latitudes, and those
13 with 8 to 9 stay close to the source of
14 contamination.

15 Agree or disagree?

16 A Okay. I --

17 Q Or is it too general?

18 A Well, I -- I kind of addressed this earlier,
19 and my answer would disagree with this. Now, I
20 didn't do a literature search, which they say they
21 did. So I'm going to say that both with regard to
22 my earlier answer and with this -- regard to this
23 question, I don't have enough information as I sit
24 here to -- to agree or disagree.

25 Q Yeah. And I thought one of the things we

1 talked about earlier was even in the Arctic you can
2 find some decachlorobiphenyl?

3 A Well, I would -- that's not necessarily
4 deca. But I would say 1254- or 1260-like materials.

5 Q Fair enough.

6 A Higher chlorinated materials. So...

7 (Defendants' Exhibit Kaley 13
8 marked for identification.)

9 Q (By Mr. Schick) Let me show you Exhibit 13.
10 This is a February 11, 1959, Monsanto document that
11 contains discussion about expansion of the Aroclor
12 department.

13 You're familiar with this, are you not?
14 You've seen it before?

15 A I don't think I have. I don't know. As I
16 sit here, I don't recognize it, but given time to
17 read it, I might. But I don't know for sure.

18 Q Here's what I wanted to ask you about: It
19 says, In the past, there was room for expansion in
20 the Aroclor still room.

21 Then under overall plan for the department,
22 it looks like, 27, A, Disposal of Still Residue,
23 present disposal of still residue is uneconomical
24 and takes much of the available material handling
25 space. In the future, Aroclor still residue will be

1 pumped into trash skips located east of the Aroclor
2 still room and removed by truck. This will provide
3 more room for material handling and eliminate the
4 necessity of drumming Aroclor still bottoms for
5 disposal.

6 So what they're talking about here is
7 chlorinated still bottoms, what we called earlier
8 Montars, true?

9 MR. MERRILL: I'm going to object to this
10 line of questioning, again for the reason that it's
11 beyond the 30(b)6 designation.

12 A Yes. They're talking about Aroclor still
13 bottoms.

14 Q (By Mr. Schick) Okay. And the way I read
15 the first sentence and I put that note there, does
16 that mean that the still bottoms were kept around
17 for some period of time before they were taken to
18 the landfill, or do you know?

19 A I don't know, but that's not the way I would
20 read it.

21 Q How would you read it?

22 A I would read it that having a lot of drums
23 there takes up a lot of space.

24 Q Fair enough. Next section talks about solid
25 Aroclors 5460 and 1268. It says, A multi-purpose

1 flaker will be installed on the second floor of the
2 Aroclor still room, as shown in the attached sketch.
3 The finished product will be packaged in bags and
4 placed on pallets.

5 Do you know whether -- when those were being
6 placed in bags whether there -- whether dust was
7 generated during that process of loading up the
8 bags?

9 A Can I preference that with a statement?
10 That I don't know that either one of these were ever
11 done. I mean, these are plans. I don't know that
12 either one of these were ever implemented. And in
13 fact, I know a flaker was placed, but it was not
14 placed where it says here. So I don't -- I don't
15 know that any of this was ever done.

16 Q Did the flaker permit emissions to the air?

17 A I believe there could have been dust
18 emissions, yeah.

19 Q And would those have been of the heavier
20 Aroclors, like a 1268?

21 A Well, they would have been solid Aroclors.

22 Q Solids.

23 A You can't flake liquids.

24 Q Was 1268 run through the flaker?

25 A For some period of time, yes.

1 Q Okay. Do you know what period of time?

2 A Not specifically.

3 (Defendants' Exhibit Kaley 14

4 marked for identification.)

5 Q (By Mr. Schick) Let me show you Exhibit 14

6 to your deposition. This is a September 5, 1969,

7 memorandum that appears to be minutes of the Aroclor

8 ad hoc committee and its first meeting, and I wanted

9 to direct your attention to page 3 of this document.

10 It says, Air pollution reduction has not

11 been considered by the plants to date except as

12 incidental prevention of product contamination

13 during tank car and drum loading operations.

14 Now, tank car and drum loading operations

15 would include the loading of chlorinated biphenyls,

16 right?

17 A Oh, I think that's all this is talking

18 about.

19 Q Yeah, right. And, well, I guess my point

20 just was: You're going to get some emissions into

21 the air during those processes as well, true?

22 A Some unknown amount of emissions, yes.

23 Q Okay. Then it says, Long range, 1 to 2

24 year, improvements at Anniston are planned to reduce

25 product contamination and air emissions in the car

1 loading operations. It was agreed that a
2 comprehensive air sampling and testing program would
3 be very expensive and is probably not justified at
4 this stage of the problem.

5 And then with respect to customers, the next
6 paragraph says, Our in-plant problems are very small
7 versus problems of dealing with environmental
8 contamination by customers. In one application
9 alone, highway paints, one million pounds per year
10 are used. Through abrasion and leaching, we can
11 assume that nearly all of this Aroclor winds up in
12 the environment.

13 What do you know about Aroclors in highway
14 paints?

15 A Well, not much more than what it says. I
16 know they were used there. I know my friend Bill
17 Papageorge always says, That's why the lines don't
18 stick to the highways anymore, because they quit
19 using Aroclors.

20 But, I mean, yes, they were clearly used in
21 highway paints.

22 Q All over the world?

23 A Well, I don't know that.

24 Q All over the country?

25 A In sections of the country. Again, I don't

1 know what the distribution was, but it was a -- it
2 was a known usage, and I would guess most highway
3 departments used it, yes. But, again, those --
4 those PCBs are going to be attached to that paint,
5 and they're not going to be readily available for
6 other kinds of distribution. In fact, it's even
7 going to be more than like on a soil particle
8 because they're going to be in that paint matrix.
9 So they're not going to volatilize very easily --

10 Q Right.

11 A -- or be leached very easily.

12 Q Okay.

13 (Defendants' Exhibit Kaley 15
14 marked for identification.)

15 Q (By Mr. Schick) Exhibit 15 to your
16 deposition is a December 29, 1970, memorandum to
17 Mr. Papageorge, and it says, Listed below is the
18 data which has been collected to date on PCB losses
19 to the atmosphere in Anniston. And it has a listing
20 here of a test done November 24 of the Montar hood.

21 Do you see that?

22 A Yes, I do.

23 Q Was the Montar hood discharged into the
24 atmosphere?

25 A I don't know the answer to that.

1 Q Okay. It appears, though, that the highest
2 concentrations of PCB levels in the ambient air were
3 of or off the Montar hood, if you look at that
4 column PCB concentrations milligram per meter, true?

5 A Yes. While it was drawing Aroclor 1242
6 bottoms. So, again, those are the more highly
7 chlorinated Aroclors. I don't know that that would
8 be true for -- for other Aroclors. But based on
9 this piece of paper, that's true.

10 Q Because -- and what you're referring to is
11 the last column? What you believe they were drawing
12 on November 24 of this year were 1242s?

13 A That's what it says, yes.

14 Q Yeah, okay. Of course, if the Montar hood
15 vented those materials to the atmosphere, they could
16 then be transported via the air mechanism we've
17 talked about earlier, true?

18 A Right. Subject to all the provisos we've
19 talked about, yes.

20 Q Fair enough.

21 (Defendants' Exhibit Kaley 16
22 marked for identification.)

23 Q (By Mr. Schick) Exhibit No. 16 to your
24 deposition is a May 12, 1969, memorandum. And I
25 don't need to dwell on -- there's one statement on

1 page -- I think it's 3 at the top. Work to minimize
2 losses at Anniston and then it says, External to
3 plant, that a problem exists at Anniston is evident
4 because, quote, free globules of Aroclors can be
5 seen in Snow Creek.

6 And here's my 30(b)6 question to you: When
7 you have free globules of Aroclors, you've got
8 something that can be volatilized still into the
9 air, true?

10 A Well, possibly eventually. I mean, these
11 are in Snow Creek.

12 Q Right.

13 A So they're in the bottom of Snow Creek. So
14 because PCBs sink, they don't float. So, again, for
15 them to be volatilized, they're going to have to
16 dissolve in the water, which is a very slow and
17 inefficient process. And then further they're going
18 to have to volatilize from the water into the
19 atmosphere. So, again, I think, although
20 theoretically, what you described in your question
21 could occur, it's not going to be a very efficient
22 process for getting PCBs into the air. It's going
23 to be a very inefficient processes, which is, you
24 know, maybe unfortunate because that's why they were
25 still globules in the bottom of the creek.

1 Q Yeah. And, of course, so what that does
2 demonstrate to us, though, what this exhibit does
3 demonstrate to us, though, is that discharge of
4 Aroclors into the wastewater, into the creeks, was
5 certainly an issue at this time?

6 A Yes.

7 Q And would you -- are you able to say whether
8 you would expect the relative percentage of Aroclors
9 in the water discharge to be comparable to the
10 production of various Aroclors?

11 MR. MERRILL: Object to the form of the
12 question.

13 Q (By Mr. Schick) We talked about this
14 earlier. You know, you had your percentage of --

15 A Yeah. My presumption would be that at the
16 immediate point of discharge, it would be reflective
17 of the materials that were being produced, so that
18 that chart would be approximately correct at the
19 point of discharge.

20 Q And -- and the globules, those certainly
21 could be deposited on the -- on the floodplain in
22 the event of a flood? I mean, if you have some
23 flood event that picks up that sediment, it can go
24 into the floodplain or wherever that sediment goes?

25 A Yeah, I believe that's correct. But let me

1 add another thing here. I think those globulars --
2 globules are more likely to be the lower chlorinated
3 materials.

4 Q Why is that?

5 A Because the higher chlorinated materials,
6 even starting at 1254, are almost solid. So my view
7 of a globule is a little droplet of something on the
8 bottom of the stream. Aroclor 1254 or 1260 would
9 not be that. 1260 would be a resonance material at
10 ambient temperatures underneath water. Plus those
11 heavier chlorinated materials are more likely to
12 have been trapped in the limestone beds just because
13 of their physical properties. So to the extent that
14 this is correct, my -- my understanding of the
15 properties of PCBs, they would be more 1242-like
16 materials.

17 Q Okay. But, of course, depending on the
18 flood event and --

19 A Yeah. I'm not -- that's in addition to your
20 question.

21 Q -- and the volume of water?

22 A I agree with your question. That if you've
23 got PCBs in a globular form and you have a flood
24 event, they could certainly be transported to some
25 extent by that event.

1 Q Regardless of which Aroclor it is, depending
2 on --

3 A Yes.

4 Q -- flow, speed, volume, etc.?

5 A I would agree with that.

6 (Defendants' Exhibit Kaley 17

7 marked for identification.)

8 Q (By Mr. Schick) Exhibit 17 to your
9 deposition, Dr. Kaley -- and I just want to ask you
10 to -- page 8. This is an EPA document by the way.
11 I don't mean to be obtuse with you here about these
12 things. It says, The sources of P -- and I'm sorry.
13 I'm looking at page 8.

14 A Yeah, I'm with you.

15 Q Did you get it?

16 A Yes.

17 Q The sources of PCB effluents including --
18 included the hydrochloric acid, chlorinator, still
19 room, and warehouse sewers. At times the
20 chlorinator and still room sewers had an Aroclor
21 phase. The major losses from the warehouse sewer
22 were due to spills while drumming or flaking. These
23 spills were swept to the sewer during floor cleanup.
24 The HCl scrubber jets sewerred -- and I think we saw
25 a document earlier that talked about this 11.84

1 pounds per day of PCB in 1970. These sewers
2 discharged into the Snow Creek, Choccolocco Creek
3 watershed.

4 And then it says, About 1.8 million pounds
5 of PCBs are estimated as discharged by the sewers
6 from the production of Aroclors at the Anniston
7 plant.

8 And my question is: Do you agree that the
9 discharges over time were in that range?

10 A I have no idea as I sit here.

11 Q Okay. Are you aware of any studies that
12 show the air-water exchange of PCBs has the
13 potential to be a significant source of PCBs into
14 the atmosphere?

15 A Well, I certainly know that it occurs, and I
16 guess that depends on your definition of
17 significant.

18 Q Fair. Okay. Fair enough.

19 (Defendants' Exhibit Kaley 18
20 marked for identification.)

21 Q (By Mr. Schick) I wanted to ask you if you
22 have seen Exhibit No. 18, which is a 2002 article
23 that appeared in Environmental Science Technology.

24 A Yes.

25 Q You've seen that before?

1 A Yes.

2 Q And what they did suggest that there's an
3 air-water exchange of T or total PCBs that has the
4 potential to be a significant source of PCBs to the
5 rural atmosphere.

6 Do you see that?

7 A I see that that's what their conclusion is,
8 yes.

9 Q Do you agree with that or do you agree that
10 their study concluded -- that their study
11 demonstrated that?

12 A Well, I'm not sure, without reading the
13 article, I could really make an intelligent decision
14 or an answer to that question. But if you look at
15 the rest of the abstract, I mean, 120 micrograms per
16 square meter per year, I mean, those aren't huge
17 numbers, you know, into the whole total atmosphere,
18 because, you know, the atmosphere is very big.

19 So I don't -- I don't know whether that --
20 you know, I'd be more interested in how that
21 contributed to a measured level in the atmosphere
22 rather than just how much they're measuring coming
23 off the soils.

24 Q But you don't disagree that this is a
25 phenomenon that --

1 A Oh, no. Clearly a phenomenon that occurs.

2 Bless you.

3 MR. SCHICK: Thank you.

4 THE WITNESS: Bless you.

5 MR. SCHICK: Thanks.

6 (Defendants' Exhibit Kaley 19

7 marked for identification.)

8 Q (By Mr. Schick) Let me give you Exhibit 19.

9 And, again, what I'm looking at here is an amount of
10 discharge that may be -- may have been free for
11 being taken up either by waterways or by ambient
12 air. This is an August 7, 1970, document. At the
13 top it says, Confidential - FYI and destroy.

14 And then status says, We are presently
15 discharging to Snow Creek about 16 pounds a day of
16 PCBs, down from 250 pounds per day in '69.
17 Measurements of departmental waste streams show a
18 total loss of only 2 pounds per day. The
19 discrepancy is believed due to, A, sampling problems
20 in departmental waste streams where two-phase
21 systems of water and free Aroclors may be present;
22 and B, possible pickup of PCB by leaching previously
23 deposited PCB from the limestone neutralization pit
24 which also acts as a settling basin.

25 Now, is that limestone neutralization pit

1 the same one you were referring to earlier for
2 Montars --

3 A Not for Cleghorn.

4 Q -- Lake Cleghorn?

5 A No, no, no. The -- these are -- the
6 limestone pits were actually just prior to the
7 discharge into the waterways that eventually led to
8 Snow Creek. Cleghorn's Lake was in the middle of
9 the plant and, again, wasn't a lake. It wasn't a
10 body of water.

11 Q Right. Okay. But what this document
12 indicates in 1970 is that PCBs were apparently being
13 leached out of that neutralization pit?

14 A Well, that was --

15 Q And taken to a waterway?

16 A That was the possibility that was being
17 considered here, yes.

18 Q And, in fact, one of the ways they thought
19 about reducing those losses was to install a sump?
20 You see that in paragraph A underneath there, Work
21 to further reduce.

22 MR. MERRILL: Again, I want to object to
23 this line of questioning to the extent that it's
24 beyond the 30(b)6 designation. It's skirting around
25 it and may get into it, but...

1 MR. SCHICK: Fair enough. Fair -- you know
2 what? I'll withdraw that question.

3 Q (By Mr. Schick) I want to go back to
4 paragraph 1 again. It says, A, sampling problems in
5 departmental waste streams where two-phase systems
6 of water and free Aroclors may be present.

7 What does that mean?

8 A Well, that's kind of like the globular
9 things in Snow Creek. You've got a -- you've got an
10 organic Aroclor phase because PCBs don't dissolve in
11 water, and then you've got the water phase. So if
12 you -- if you drop a drop of PCBs into water, it's
13 going to sink to the bottom, remain as a globule.
14 That's the two-phase system. You have a water phase
15 and an aqueous phase. It's the oil and vinegar
16 story.

17 Q Understood. And this is actually happening
18 in the process plant at that time?

19 A According to this document, yes.

20 Q Okay. And do you know how far downstream
21 those PCBs would be taken?

22 A You know, I don't. I don't know how -- what
23 that two-phase system -- how far it persists --

24 Q Yeah.

25 A -- or persisted at the time.

1 (Defendants' Exhibit Kaley 20
2 marked for identification.)

3 Q (By Mr. Schick) Exhibit 20 to your
4 deposition is an October 1969 report of the Aroclor
5 ad hoc committee. You've seen this document before?

6 A Yes.

7 Q And some of the recommendations, if you turn
8 to page 3 of the document, for losses of Aroclors in
9 liquid wastes -- and I assume when we talk about
10 liquid wastes, those are wastes made available to
11 the waterways in Anniston, true?

12 A Yeah.

13 Q And the goal was to try to reduce those to
14 less than 5 parts per billion?

15 A That's what's written on here, yes.

16 Q At least for -- it says -- it looks like
17 1254 and maybe 12 -- it says 126 and then -- you see
18 that off to the side?

19 A Yes, I see that. I assume it's 1260.

20 Q Okay. And then determine extent of
21 atmospheric losses from Aroclors from Anniston and
22 WGK plants and develop plans for control.

23 So clearly there was an understanding of
24 losses to atmosphere?

25 A Well, from this document, you would say

1 there was an understanding of the potential for
2 losses from the atmosphere. I mean, it basically
3 says we don't know what the extent of those losses
4 are, but the potential is clearly there, yes.

5 Q If you'll turn to page 8, under 4 it says,
6 Investigation has shown that the waters in receiving
7 streams below the Anniston plant contain
8 significant, parentheses, parts per million,
9 concentrations of PCB. More ominous perhaps is the
10 fact that sediment in the bottom of these streams
11 miles below our plants may contain up to 2 percent
12 Aroclor.

13 You don't have any reason to disagree with
14 those findings, do you?

15 A No.

16 Q And then it says, To prepare for the
17 eventual publication in the press of the discharge
18 of PCBs in Alabama and to the Mississippi River, a
19 significant effort must be made to determine the
20 present levels and determine the levels of
21 contamination as cleanup procedures begin.

22 I didn't understand the Mississippi River.

23 MR. MERRILL: I'm going to object to this
24 line of questioning to the extent it's beyond the
25 scope of the designation, 30(b)6 designation.

1 Q (By Mr. Schick) Do you have any knowledge
2 about transport of PCBs from Anniston to the
3 Mississippi River?

4 A No. The Sauget plant that made PCBs is on
5 the Mississippi River.

6 THE VIDEOGRAPHER: We have about 4 minutes,
7 Counselor.

8 MR. SCHICK: You know, if I can take a
9 5-minute break, I'll finish in less than 10 minutes,
10 if that's okay with y'all.

11 THE WITNESS: It's your day.

12 THE VIDEOGRAPHER: We're off the record at
13 12:23. This ends tape No. 3.

14 (Off the record.)

15 (Defendants' Exhibit Kaley 21
16 marked for identification.)

17 THE VIDEOGRAPHER: We are back on record at
18 12:31. This begins tape No. 4 of the deposition of
19 Dr. Robert Kaley.

20 Q (By Mr. Schick) Thank you. Dr. Kaley, I've
21 got Exhibit 21 up, which is the last exhibit I
22 intend to ask you about. This appears to be a
23 September 18, 1970, document, again referring to the
24 Anniston facility.

25 It says, In reviewing your proposed letter

1 to Joe Crockett with legal, we requested latest
2 emissions data on the flow to Snow Creek. We had
3 hoped that it might show an improvement over the
4 first week in September and thus demonstrate a
5 favorable trend to Crockett. Instead, the emissions
6 are considerably increased with 9/13/70 at 6.25
7 parts per million or about 80 pounds of PCB for the
8 day.

9 Now, do you have any idea as to what that
10 referred to in the way of Aroclor, slash,
11 homologues?

12 MR. MERRILL: Again, I'm going to object to
13 the question as being beyond the scope of the 30(b)6
14 designation.

15 A No. Without seeing the analytical data, I
16 couldn't speculate.

17 Q (By Mr. Schick) Do you know whether there
18 was any analytical data that differentiated what the
19 80 pounds consisted of?

20 A Presumably somebody made a measurement, so
21 there must have been some at some point. I have no
22 idea whether it exists.

23 Q Okay. It continues and says, There's
24 extreme reluctance to report even the relatively low
25 emission figures because the information could be

1 subpoenaed and used against us in legal actions.
2 Obviously having to report those -- these gross loss
3 multiples, enormously, our problems because the
4 figure would appear to indicate lack of control.

5 Do you ever speak with anyone who was
6 involved in doing these -- the studies back at that
7 time in 1970?

8 A Not about those studies. I mean, I've
9 clearly spoken with people that were involved in
10 them, but not -- not about this document or what
11 those studies were shown or --

12 Q Okay.

13 A -- seen the results or anything.

14 Q And you don't know over time what the
15 discharges were to various waterways in the Anniston
16 area other than what might be reflected in documents
17 like this?

18 A That's correct.

19 Q Is it -- is it your view that when PCBs
20 adhere to soil particles and then become subject to
21 movement through storm water or surface water, that
22 they tend to form a gradient with concentrations
23 decreasing as they move away from the source?

24 A Generally I would say that's true, yes.

25 Q Okay. Is it your expectation -- now, by the

1 way, when you say generally that's the case, it can
2 be different when you have varying flood events or
3 different types of flood events, true?

4 A Or, you know, there's unseen things like
5 people moving sediments mechanically and stuff like
6 that. I mean, it's not necessarily going to be a
7 smooth gradient, but it's going to be a general
8 trend.

9 Q And of course, as we discussed earlier, you
10 can have instances where PCBs carried through
11 waterway sediment lands on a floodplain and upon
12 drying it could become volatilized or at least enter
13 the atmosphere through particulate?

14 A It's possible at some level, yes.

15 Q Okay. Is it your expectation, Dr. Kaley,
16 that if there's a source of PCBs to a surface
17 waterway, you'd expect to find higher
18 concentrations -- higher concentrations of the PCBs
19 upgradient near the location of the release as
20 opposed to further away?

21 A All right. Would you read that again,
22 please?

23 Q Yes, sir. Is it your expectation that if
24 there's a source of PCBs to a surface waterway,
25 you'd expect to find higher concentrations

1 upgradient near the location of the release as
2 opposed to downgradient where you'd find lower
3 concentrations?

4 A In general that would be true, yes.

5 Q Again, with some of the exceptions that
6 we've already talked about today?

7 A Right.

8 MR. SCHICK: Those are all of my questions,
9 Dr. Kaley. But somebody on the phone might have one
10 or two or I don't know how many. I don't want to
11 speak for them. But I think we're -- thank you very
12 much.

13 MS. LAVEY: I have none.

14 MR. SCHICK: On the phone?

15 MR. HEISTER: This is Michael Heister. I
16 don't have any questions.

17 MS. SMITH: This is Lynette Smith. I don't
18 have any.

19 MS. McADAM: This is Allison McAdam. I
20 don't have any.

21 MR. SCOTT: This is John Scott. I don't
22 have any.

23 MR. NICHOLS: Ron Nichols. No questions.

24 MR. MERRILL: I have one question.

25 MS. LEMMER: Julie Lemmer. I have no

1 questions.

2 MR. SCHICK: Okay.

3 MR. MERRILL: I do have one question.

4 EXAMINATION

5 QUESTIONS BY MR. MERRILL:

6 Q We were talking -- on Exhibit 13 there's a
7 mention of the flaker, and they were discussing
8 solid Aroclor 5460.

9 A Yes.

10 Q What is Aroclor 5460?

11 A It's a polychlorinated terphenyl product.

12 Q Okay. That is not a PCB?

13 A It is not a PCB. It's three benzene rings
14 rather than two benzene rings.

15 Q Okay.

16 A So the Aroclor department was the polyphenol
17 department, meaning many phenol rings. So there
18 were PCBs and there were polychlorinated terphenyl
19 products.

20 MR. MERRILL: Okay. No other questions.

21 MR. SCHICK: Thanks.

22 THE WITNESS: You're welcome. Thank you.

23 MR. SCHICK: Off the record.

24 THE VIDEOGRAPHER: This concludes the
25 deposition of Dr. Robert Kaley. We are off record

1 at 12:36.

2 MR. SCHICK: Thank you both very much.

4 I, Pamela Watson Harrison, CBC, CRR, RPR, MO
5 CSR #557, IL CSR #084-003684, and Notary Public in
6 and for the State of Missouri, duly commissioned,
7 qualified and authorized to administer oaths and to
8 certify to depositions, do hereby certify that
9 pursuant to Agreement in the civil cause now pending
10 and undetermined in the United States District Court
11 for the Northern District of Alabama, Eastern
12 Division, to be used in the trial of said cause in
13 said court, I was attended at the offices of Husch
14 Blackwell Sanders, LLP, 190 Carondelet Plaza, Suite
15 600, St. Louis, Missouri, by the aforesaid witness;
16 and by the aforesaid attorneys; on the 8th day of
17 December, 2009.

18 That the said witness, being of sound mind and
19 being by me first carefully examined and duly
20 cautioned and sworn to testify the truth, the whole
21 truth, and nothing but the truth in the case
22 aforesaid, thereupon testified as is shown in the
23 foregoing transcript, said testimony being by me
24 reported in shorthand and caused to be transcribed
25 into typewriting, and that the foregoing pages

1 correctly set forth the testimony of the
2 aforementioned witness, together with the questions
3 propounded by counsel and remarks and objections of
4 counsel thereto, and is in all respects a full,
5 true, correct and complete transcript of the
6 questions propounded to and the answers given by
7 said witness; that signature of the deponent was
8 reserved by agreement of counsel.

9 I further certify that I am not of counsel or
10 attorney for either of the parties to said suit, not
11 related to nor interested in any of the parties or
12 their attorneys.

13 Witness my hand and notarial seal at
14 St. Louis, Missouri, this 15th day of December,
15 2009.

16 My Commission expires July 17, 2013.
