

POTENTIALLY CARCINOGENIC SUBSTANCES

The highest priority of Category I substances contained in materials used by the Company or generated as a result of Company operations, is shown in Figure 6, along with exposure limits and typical usage. The complete listing is provided in Exhibit I. The substances are presented in order of priority as established by Task Force consensus.

The development of a capability for managing the elimination/control of Category I potential carcinogens was determined by evaluating the scope of usage of asbestos, hexavalent chromium compounds and benzene (priority ranks 1, 2 and 3, respectively) as test cases.
