

TECH DATA BULLETIN

You wouldn't believe the compounds we are asked to do.

The #3500 does not do sulfuric acid or lead dust. Please be sure your customers and distributors understand the following points:

- (1) We only do the compounds specified on the Analysis Service List. This is not the same as the Compound Guide - only those compounds in **BOLD** type in the new Sampling Guide (R-35SG).
- (2) The full chemical name from the Analysis Service List should be used. Abbreviations can cause trouble.
- (3) We will analyze a maximum of eight (8) compounds per individual monitor. We have had people ask us for up to fifteen.

If the above points are followed, we can process requests immediately. If not followed, we have to track down the customer, and the fast turnaround time disappears.

TECH DATA BULLETIN

Is the age life (or shelf life) unlimited on #3500?

No, even though it may seem logical to expect.

The #3500 OVM has a shelf life of one year prior to use for the purpose of defining the span of time we stand behind the performance of the monitor.

For the last year, we have been supplying the #3500 in clear plastic pouches to prevent possible contamination by the outer package. Some of the old foil-wrapped monitors may still be in distributor stock. These units should not be sold.

Please check your distributor stock for boxes that have four digit code numbers between 0001-0131. The four digit code will be followed in all cases by the number 003. If any of these are found, return an RGM for credit, and be sure the monitors are returned to Technical Service for credit verification.
