WOODBURY FORMER MAIN DISPOSAL AREA
CONSTRUCTION COMPLETION CERTIFICATIONS

- Construction mobilization commenced the week of August 31, 2009. Excavation activities were completed on October 16, 2009 and November 25, 2009 for Area EF and Area A, respectively. Site decommissioning activities were completed in December 2009. Re-vegetation was deemed sufficient, the exclusion zone fencing was removed, and the construction was completed on April 29, 2010.

- The limits of removal as specified in the April 2009 Remedial Design / Remedial Action (RD/RA) Plan for the Woodbury Site were met or exceeded.

- 806 truckloads, equaling 11,075 cubic yards (19,096 tons) of material, were hauled to SKB Landfill in Rosemount, Minnesota.

- 185 truckloads, equaling 2,750 cubic yards (4,146 tons) of material, were hauled to the EQ Landfill (Wayne Disposal, Inc.) in Belleville, Michigan.

- The work was performed with no lost time, injuries, or near misses.

1. INTRODUCTION

On behalf of the 3M Company (3M), Weston Solutions, Inc. (WESTON®) has prepared this Construction Completion Report (CCR) for the former Main Disposal Area (MDA) at the 3M Woodbury, Minnesota Site. 3M is submitting this document to the Minnesota Pollution Control Agency (MPCA) in compliance with the May 2007 Settlement Agreement and Consent Order (Agreement) between 3M and the MPCA and requirements of the approved Remedial Design/Response Action Plan for the Woodbury Site (RD/RA Plan). All construction activities were completed in accordance with the RD/RA Plan submitted to the MPCA in April 2009 and information provided in this report.

1.1 BACKGROUND

1.1.1 Site History

Since the late 1960s, 3M has worked cooperatively with state and local authorities in the investigation and remediation of the former Woodbury Disposal Site (the Site) located in Woodbury, Minnesota. The Site includes former waste disposal areas that had received industrial waste from the 3M St. Paul area facilities, including the 3M Cottage Grove, Minnesota facility, from 1960 to 1966. Municipal wastes from the cities of Woodbury and Cottage Grove were also disposed at the Site from 1960 to 1969.

Disposal of 3M materials occurred at two primary locations on the property, known as the Main Disposal Area (MDA) and the Northeast Disposal Area. The cities of Woodbury and Cottage Grove disposed of municipal waste at separate locations on the Site known as the Municipal Fill Areas, which are located in the MDA portion of the Site. The locations of the former disposal areas are depicted in Figure 1-1.

3M stopped all industrial disposal activities at the Site in 1966. Subsequently, in 1968, with the agreement of the MPCA and approval from the cities of Woodbury and Cottage Grove, 3M conducted a waste destruction program at the Site.

Four "barrier" or extraction pumping wells (B-1, B-2, B-3 and B-4) were installed on the property between 1967 and 1973 to prevent migration of volatile organic compounds (VOCs) and other substances from the Site and these wells have been operated continuously since installation. The locations of these barrier wells are shown on Figure 1-1. Monitoring data has demonstrated effective capture and removal of VOCs. In addition, hydraulic gradient evaluations in the vicinity of the Site have repeatedly demonstrated hydraulic capture.

In 1992, 3M entered the Site into MPCA's Voluntary Investigation and Cleanup (VIC) program. Under this program, 3M conducted additional investigations in 1992 and 1993 to further characterize site soil and groundwater quality. The investigations primarily showed that although there were some residual VOCs in site soils at the former disposal areas, the groundwater quality data indicated that the barrier well system continued to effectively contain VOCs on-site. In 1996, as part of an Interim Response Action, 3M re-graded and covered the former Main Disposal Area and Municipal Fill Areas and the former Northeast Disposal Area.

1.1.2 Perfluorochemical (PFC) Program

Since 2005, 3M has been working with the MPCA to assess the presence and extent of perfluorochemicals (PFCs) at the Site. Additional field activities were conducted by 3M to assess the presence of PFCs in groundwater and in former disposal area soils as part of a site remedial investigation.

3M and the MPCA also entered into a Settlement Agreement and Consent Order (Agreement) for the purpose of conducting remedial investigations and response actions to address PFCs at the Site. The Agreement became effective on May 22, 2007. It required that 3M conduct a Remedial Investigation/Feasibility Study (RI/FS) and prepare a Remedial Design/Response Action (RD/RA) Plan with respect to the release or threatened release of PFCs at and from the Site.

On February 18, 2008, 3M submitted to the MPCA the *Remedial Investigation/Feasibility Study for the Woodbury Site, Woodbury, Minnesota* (Woodbury RI/FS Report) (WESTON, 2008a). In accordance with the Agreement, the FS portion of the report provided an evaluation of various

response action alternatives which address PFCs in soil and groundwater at the Site, and a recommendation for implementation.

In a letter to 3M dated April 4, 2008, the MPCA approved the Woodbury RI/FS Report, with modifications. Specifically, the MPCA requested that additional information be provided concerning the final disposal location and handling of non-hazardous PFC-containing soil. Accordingly, in April 2008, 3M submitted an addendum to the RI/FS Report entitled *Addendum to the Feasibility Studies for the Oakdale, Woodbury and Cottage Grove Sites, Minnesota* (Addendum 1) (WESTON, 2008b), which provided a description of the off-site disposal locations reviewed and considered, along with the recommended facility. The recommended facility was the SKB Landfill in Rosemount, Minnesota, where a separate engineered cell would be constructed to contain the excavated PFC-containing materials.

In its April 4, 2008 letter to 3M concerning the Woodbury RI/FS Report, the MPCA indicated that it concurred with the FS-recommended Sitewide Alternative SW-2 and Groundwater Alternative GW-1. With respect to site soils, the MPCA indicated its intent to recommend that Soil Alternative S-3 be implemented and that the extent of soil excavation would be determined pending analysis of soil samples collected in early March 2008. Soil Alternative S-3, as presented in the FS, called for the excavation of the former Northeast Disposal Area trenches and selected areas in the former Main Disposal Area and disposal of excavated materials in an existing permitted landfill. Subsequently, on June 25, 2008, 3M and WESTON met with MPCA representatives to present a refinement of Alternative S-3, which identified the extent of soil excavation based on the results of the March 2008 soil sampling program. At the meeting, the MPCA indicated its understanding of the refined soil alternative and requested a formal submittal of the information presented. Accordingly, on July 11, 2008, 3M submitted *Addendum 2 to the Feasibility Study for the Woodbury Site* (Addendum 2) (WESTON, 2008c).

In July 2008, the MPCA issued the *Proposed Cleanup Plan for PFCs* (Proposed Plan) (MPCA, 2008a) for the Woodbury Site, issued a public notice in the Woodbury Bulletin, and held a public meeting on July 24, 2008 to present its recommended alternatives as follows:

- Sitewide Alternative SW-2: Institutional controls, access restriction, and continued groundwater monitoring.

- Groundwater Alternative GW-1: Continued groundwater recovery with carbon pretreatment prior to discharge.

- Refined Soil Alternative S-3: Excavation of the former Northeast Disposal Area trenches and selected areas in the former Main Disposal Area; disposal at an existing off-site landfill (in accordance with Addendum 2 to the RI/FS).

The MPCA also indicated in the Proposed Plan that the SKB Landfill facility meets the requirement of the Agreement for an isolated, engineered permitted facility to contain the excavated PFC-containing material. The public was given the opportunity to provide written and oral comments on the proposed remedy.

On December 22, 2008, the MPCA indicated its selection of final response actions in the *Minnesota Decision Document for the Woodbury Site* (MDD) (MPCA, 2008b). The selected final response actions were consistent with those presented in the Proposed Plan, including Sitewide Alternative SW-2, Groundwater Alternative GW-1, and Refined Soil Alternative S-3, as described above. On January 2, 2009, 3M received a letter from the MPCA dated December 23, 2008, which transmitted the signed MDD.

On April 2, 2009, 3M submitted to the MPCA the *Remedial Design/Response Action Plan for the Woodbury Site, Woodbury, Minnesota* (RD/RA Plan) (WESTON, 2009). The RD/RA Plan contains the design and plan for implementing the selected response actions in the MDD. In a letter to 3M dated June 2, 2009, the MPCA provided approval of the RD/RA Plan, with comments.

As presented in the RD/RA Plan, the major elements of the response actions at the Woodbury Site consist of the following:

- Excavation and off-site disposal of soils from the former Main Disposal Area in accordance with Refined Soil Alternative S-3.

- Excavation and off-site disposal of soils from the former Northeast Disposal Area in accordance with Refined Soil Alternative S-3.

- Implementation of response actions in accordance with Groundwater Alternative GW-1 as well as Sitewide Alternative SW-2.

Due to the length of time required for implementation and completion of the entire RD/RA Plan program, it was agreed between 3M and MPCA that Construction Completion Reports (CCRs) would be prepared for each major response action element when completed. Thus, three CCRs would be submitted to MPCA, one each for: the former Main Disposal Area soils, the former Northeast Disposal Area soils, and site groundwater and institutional controls.

The excavation and off-site disposal of soils from the former Main Disposal Area was performed in fall 2009. Final grading and revegetation of backfilled and disturbed areas was completed in spring 2010. Thus, this CCR provides documentation of the completion of the former Main Disposal Area response action activities under Refined Soil Alternative S-3.

1.2 REFINED SOIL ALTERNATIVE S-3: FORMER MAIN DISPOSAL AREA

With regard to the former Main Disposal Area, the following is a description of Refined Soil Alternative S-3 as presented in Addendum 2 to the FS and in the RD/RA Plan. Based on characterization sampling, potentially accessible soils (i.e., soils from 4 to 12 ft below ground surface (bgs) [MPCA, 1998]) with concentrations greater than the MPCA's PFC Industrial Soil Reference Values (SRVs) were identified in the former Main Disposal Area in parts of Areas A, E and F, as shown on Figure 1-2. It is important to note that SRVs for PFOA and PFOS were revised on June 22, 2009 after the RD/RA Plan was submitted to MPCA. The Industrial SRV for perfluorooctanoic acid (PFOA) was revised from 23 to 13 milligrams per kilogram (mg/kg) (or parts per million [ppm]). The Industrial SRV for perfluorooctane sulfonate (PFOS) was revised from 12 to 14 ppm. As a result of the SRV revisions, the soil analytical data for the Woodbury Site were reviewed. This review indicated that there were no additional areas where PFC concentrations were greater than the SRVs other than those already presented in Addendum 2 to the FS and the RD/RA Plan.

Based on a review of the analytical data, historical knowledge and field observations, the soil cap materials (i.e., accessible soils from approximately 0 to 4 feet bgs [MPCA, 1998]) or material until waste was encountered, clearly did not contain PFC concentrations greater than the Industrial SRVs; therefore, these soils would be removed and stockpiled on-site for subsequent backfill. Soils between 4 and 12 feet bgs that exceeded the PFC Industrial SRVs would be removed for off-site disposal as shown on Figure 1-3. Within the former Main Disposal Area,

additional localized excavation to a depth of 18 feet bgs would occur in Area A near boring location GPA04 to increase PFC mass removal. Clean backfill would be brought to the Site to replace the volume of excavated soils. The clean fill will also provide appropriate grading across the Site. Approximately 6 inches of topsoil would cover the area, and the area would be seeded and stabilized after completion of backfill cover activities.

Based on this information, the Refined Soil Alternative S-3 includes the following components at the former Main Disposal Area:

- Stockpiling soil removed from 0 to 4 feet bgs.
- Excavating soils in delineated areas from 4 to 12 feet bgs at Areas A, E and F, with localized excavation from 12 to 18 feet bgs near boring location GPA04 (as shown in Figure 1-3).
- Backfilling the excavations with the stockpiled cover soil, clean fill and topsoil, and grading the area to facilitate stormwater drainage.
- Transporting excavated soil and other debris to an existing permitted off-site landfill to provide engineered isolation and containment of PFCs for these materials.

Excavated soils would be transported to the SKB Environmental (SKB) Landfill in Rosemount, Minnesota, subject to the landfill's acceptance criteria. Soil not meeting SKB's permit criteria would be segregated and disposed at a separate and appropriate off-site facility.

1.3 PURPOSE OF THE CONSTRUCTION COMPLETION REPORT

The purpose of this CCR is to document the response actions that have been completed at the former Main Disposal Area at the Woodbury, Minnesota Site. This CCR will be followed by a CCR for response actions at the former Northeast Disposal Area and a CCR for groundwater and sitewide response actions as they are completed in accordance with the RD/RA Plan.

1.4 RESPONSE ACTION OBJECTIVES

In accordance with the MDD, the objectives of the response actions at the Woodbury Site are:

- To reduce unacceptable exposures to PFCs in groundwater.

- To reduce PFC concentrations in the soil and groundwater.
- To reduce PFC concentrations in discharges to surface water.
- To maintain an open space as a natural asset to the community.

2. INTERIM RESPONSE ACTION – SOIL VAPOR EXTRACTION (SVE) AT THE FORMER MAIN DISPOSAL AREA

2.1 BACKGROUND

Refined Soil Alternative S-3 includes excavation of PFC-containing soil from the former Main Disposal Area as depicted in Figure 1-3. Considering the history of the Site and analysis of soils as part of the RI, it was expected that soils containing VOCs, as well as the targeted PFCs, would be encountered during excavation activities. In accordance with Alternative S-3, the excavated PFC-containing soils were to be disposed at the SKB Landfill in Rosemount, Minnesota. However, the presence of VOCs in the soils at concentrations greater than the Minnesota Industrial SRVs (for VOCs) could have potentially prevented their acceptance at SKB.

3M and the MPCA discussed the benefits of installing a temporary Soil Vapor Extraction (SVE) system to remove VOCs from the subsurface soils targeted for excavation. SVE is a proven technology for removing VOCs from vadose zone soils and reducing soil VOC concentrations. Figure 2-1 depicts the basic components of SVE. As shown, vents are installed into the unsaturated zone soils within the treatment area and these vents are connected via manifolds to the suction (inlet) side of a blower. The subsurface portion of the vents is screened so that the induced vacuum draws in vapor from the surrounding soil. Soil vapor containing VOCs is drawn by the blower through a knockout pot to remove moisture, and the vapor-laden air is treated to remove VOCs with activated carbon prior to its discharge to the atmosphere.

In a letter to MPCA dated December 5, 2008, 3M requested permission to install and operate a temporary SVE system in the former Main Disposal Area as an Interim Response Action, which would facilitate the planned soil excavation. The MPCA forwarded comments on the SVE system, and 3M addressed the comments in an e-mail to MPCA on December 29, 2008. Final approval for installation and operation of a temporary SVE system in the former Main Disposal Area was received from the MPCA in a letter to 3M dated December 31, 2008. The temporary SVE system was installed and operated in accordance with MPCA's approval as discussed in the following sections.

2.1.1 Temporary SVE System Installation

From January 12 through January 22, 2009, 39 SVE vents were installed in the central portion of former Main Disposal Area A at locations shown in Figure 2-2. SVE vent logs and construction details were provided in the RD/RA Plan for the Woodbury Site.

Following completion of the vent construction, PVC piping was installed aboveground to connect individual vents to the trailer-mounted SVE treatment system. The SVE treatment system consisted of a moisture knockout pot inside the trailer to remove moisture from the extracted soil vapor, two blowers inside the trailer enclosure to draw the air through the piping and SVE equipment, and two 5,000-lb vapor phase granular activated carbon (GAC) units connected in series (lead and lag configuration), initially containing GAC and zeolite, to treat the extracted soil vapor, for removal of VOCs, prior to discharge to the atmosphere. Installation of the SVE system was completed on February 11, 2009. Figure 2-2 shows the layout of the SVE vent system and the location of the trailer enclosure containing the blowers and associated equipment.

2.1.2 Temporary SVE System Operation

Startup and shakedown of the SVE system were conducted from February 12 to 17, 2009. After startup and shakedown, except for periodic maintenance and downtime, the SVE system was in operation 24 hours/day, 7 days/week. On August 21, 2009, the SVE system was shut down. The following is a summary of the key SVE operational parameters for the period of operation:

- The SVE system operated approximately 3,500 hours.
- The average flow rate was approximately 575 cfm.
- The approximate mass of VOCs removed was 14,400 lb.
- There were six carbon changeout events and 60,000 lbs of GAC were exhausted. The carbon was sampled by WESTON and determined to be non-hazardous. Spent carbon was removed off-site by Carbonair, Inc. for regeneration.

During SVE operation, operational parameters were measured to track system performance. These included flow and VOC measurements. Periodic measurements of soil vapor total VOC concentrations were obtained by using a PID to collect readings at the individual vents. PID and flow rate measurements were collected at the system inlet and the system's discharge into the lead GAC unit. In addition, PID readings were collected between the lead and lag GAC units and at the discharge of the lag GAC unit. PID measurements from between the GAC units were used to determine the need for GAC unit changeout. When the lead unit was spent, it was replaced.

Air samples also were collected periodically using a Summa canister prior to the GAC units to track VOC removal and to quantify specific organic compound concentrations, which included BTEX compounds, 1,1,1-trichloroethane, 1,1,2-trichloroethane, cyclohexane, heptanes, trichloroethene, and vinyl chloride. Summa canister samples were collected during the time period the SVE system was in operation and demonstrated a decrease in VOC concentrations over time (Figure 2-3).

In June 2009, 3M requested permission to disconnect the emission control system (i.e., the GAC units) on the basis that during the period of operation a decreasing trend in the extracted soil vapor VOC concentration had been observed from initial concentrations, and hazardous air pollutant (HAP) emissions were below regulatory thresholds. In an e-mail to 3M dated June 9, 2009, the MPCA approved 3M's request to disconnect the GAC units with the understanding that collection of Summa canister samples, PID and flow measurements would continue and would confirm that the extracted soil vapor concentrations remained below the HAP and VOC emission thresholds.

2.2 SOIL DISPOSAL PROFILE SAMPLING

In preparation for the shutdown of the SVE system and commencement of excavation activities, soil disposal profile sampling was conducted for non-PFC parameters in accordance with the Construction Sampling Plan (CSP) (Attachment 2 to the RD/RA Plan). On June 15 and 16, 2009, 19 soil borings were drilled throughout the former Main Disposal Areas A, E and F. As shown in Figure 2-4, borings were located within an approximate 50-ft sampling grid over the areas to be excavated. One boring was constructed within each grid area, and vertical samples

were collected from the boring to represent the 4 to 8 ft bgs interval, the 8 to 12 ft bgs interval and the 12 to 18 ft bgs interval (where applicable). As noted in the RD/RA Plan, cover soil in the former MDA would be removed to a depth of 4 feet and stockpiled for use as backfill. This cover material in the 0 to 4 ft bgs interval was sampled previously and did not contain PFCs greater than the Industrial SRVs. The analytical data is provided in Addendum 2 to the Feasibility Study for the Woodbury Site, submitted to the MPCA in July 2008.

Based on these in situ sampling results, soil blocks were classified as requiring additional ex situ sampling or as a solid waste. In each soil block classified as requiring additional ex situ sampling (shown in purple in Figure 2-5 and Figure 2-6), at least one soil sample collected within the block meets one of the Resource Conservation and Recovery Act (RCRA) characteristic criteria, or contained a PCB concentration greater than 50 ppm, or contained certain waste constituents at concentrations greater than their Industrial Tier 2 SRVs. As discussed in the CSP, these soil blocks were placed in approximately 100 cubic yard stockpiles and sampled (ex situ) for further disposal profiling.

For each of the soil blocks classified as solid waste (shown in yellow in Figures 2-5 and 2-6), none of the soil samples collected within the blocks met or exceeded the RCRA characteristic criteria, none contained a PCB concentration greater than 50 ppm, and none contained waste constituent concentrations greater than the Tier 2 Industrial SRVs.

In a letter dated July 15, 2009, 3M requested from the MPCA a determination as to whether the SKB Landfill would be able to accept such soil classified as solid waste as well as stockpiled soils subjected to additional ex situ sampling and demonstrated to meet solid waste criteria. MPCA responded to 3M in a letter dated July 29, 2009 with the following comments:

- "The assumption here is that the analytical results presented for each grid are representative of the soil in that grid. If there are indications that it is not, additional samples should be collected."

- "In making a hazardous waste determination, it is not appropriate to compare just those VOCs listed under the F001-F005 listing to the Industrial SRVs. The comparison should extend to those VOCs listed under MN Rules 7045.0135 and their basis for listing and the hazardous constituents under MN Rules 7045.0141. However, the only other VOCs under this extended list of VOCs to exceed the Industrial SRV is vinyl chloride and 1,2-dichloroethane. That means that the

following grids, when excavated, should be stockpiled for further sampling: A1-3(4'-8'), A1-8(4'-8'), A1-1(4'-8'), A1-6(4'-8'), A1-14(4'-8'), EF1-1(4'-8'), and A2-15(8'-12')."

- "Soils identified by the in situ sampling as being below the Industrial SRVs, below 50 ppm PCB, and showing no characteristics of a hazardous waste can be managed as a non-hazardous waste and disposed at the SKB Landfill as approved by SKB."

- "Soil to be stockpiled should be stockpiled in the area of contamination (AOC) prior to ex-situ sampling and managed in a way to prevent further release."

- "For the stockpiled soil, all stockpiles that exceed 50 ppm PCB based on ex-situ sampling should be managed as hazardous waste."

- "Stockpiled soil may be treated in the AOC to lower VOC concentrations below the Industrial SRV or to remove the hazardous waste characteristic. 3M should inform the MPCA how they intend to treat the soil if necessary prior to treatment. It is likely that excavation and stockpiling of soil will decrease VOC levels in most cases. If ex-situ sampling results indicate the stockpiled soil is below the Industrial SRVs, is no longer characteristic, and contains less than 50 ppm PCB, the soil may be managed as a non-hazardous waste if disposed at the SKB Landfill as approved by SKB."

Based on MPCA comments, the soil block figure for Area A was revised to include ex situ sampling for soil blocks A1-1, A1-3, A1-6, A1-8, A1-14, and A2-15 as shown in Figure 2-7. 3M added soil blocks A1-2 and A2-8 as the data for these blocks indicated that vinyl chloride was detected at its Industrial SRV in block A1-2 and 1,2-dichloroethane was detected at its Industrial SRV in block A2-8. Ex situ sampling was already planned for soil block EF 1-1 so Figure 2-5 did not need to be revised.

3. CONSTRUCTION COMPLETION

The following sections contain a summary of the activities that were conducted to implement the components of Refined Soil Alternative S-3 pertaining to Woodbury Site Former Main Disposal Area A and Area E/F as presented in the MDD and the MPCA-approved RD/RA Plan. The numbered photographs referenced throughout the text of this Construction Completion Report (CCR) can be found in the photograph log provided in Appendix A.

3.1 CONSTRUCTION CHRONOLOGY

Excavation of Areas E/F and Area A at the Woodbury Site commenced in August 2009. A timeline of preconstruction and construction activities is as follows:

- February 13, 2009 – Temporary SVE system (in Area A) startup.
- June 1, 2009 – Approval of the RD/RA Plan by MPCA.
- August 21, 2009 – Shutdown of temporary SVE system.
- August 31, 2009 – Construction activities begin in Areas E/F.
- September 14, 2009 – Construction activities begin in Area A.
- September 30 to October 16, 2009 – Backfilling of Areas E/F.
- November 16 to November 25, 2009 – Backfilling of Area A.
- November 30 to December 18, 2009 – Decommissioning activities.
- April 19, 2010 – Final site walkthrough.
- April 29, 2010 – Removal of silt fencing and project completion.

The MPCA provided approval of the RD/RA Plan with comments on June 1, 2009. In July and August 2009, 3M conducted procurement activities and selected a contractor, Carl Bolander and Sons, Inc. (Bolander), to conduct soil excavation and hauling followed by backfill and restoration. As indicated in the RD/RA Plan, WESTON would perform construction and environmental oversight, sampling, survey control and verification, perimeter monitoring activities and documentation.

The temporary SVE system in Area A was shut down on August 21, 2009. The SVE system was decommissioned by disconnecting the system from the power source, removing the SVE equipment trailer from the site, and removing the aboveground piping connecting the vents. The SVE subsurface vents and the historic vapor monitoring wells located within the area of excavation were removed as part of the soil excavation in Area A.

There were no groundwater well abandonments during construction activities. However, eight historic soil-vapor extraction vents were removed from the Site. Six of these vents were originally installed as part of a 3M Investigation Work Plan in 1993 (VW-5U, VW-5L, VW-6U, VW-6L, and VW-7U, VW-7L) and two were unmarked vents, located in the northeast portion of Area A. As per the project specifications, the steel casing and 1 inch PVC piping was removed from each vent and hauled with non-hazardous landfill material to SKB for disposal.

Site preparation activities by Bolander, consisting of clearing the excavation areas, placement of the construction trailers and sanitary facilities, set up of exclusion zones, installation of sediment and erosion controls, installation of stockpile staging and load-out areas, and improvement of the existing access road, were conducted in August 2009. WESTON and their contractor TKDA (a Minnesota licensed surveyor) set up survey control and delineated excavation areas. The meteorological monitoring station was installed by WESTON on site on August 23, 2009.

Additionally, WESTON and TKDA performed all of the verification and certification surveying for delineation of areas and limits of excavation. The contractor performed operational surveying for their crews and operators.

3.1.1 Former Main Disposal Area E/F

Construction activities in Area E/F commenced the week of August 31, 2009. After surveying and delineating the limits of excavation, soils in Area E/F were stripped to 4 feet below ground surface (bgs) or until waste was visible as determined by WESTON, whichever came first, and staged. This cover soil was stockpiled south of the excavation limits within the exclusion zone. Removal of PFC-containing material from Area E/F began on September 2, 2009 with the excavation of soil block EF 1-1. As-built survey verification shots were measured by WESTON after each soil block was excavated.

Preparation for hauling began on September 11, 2009 with the installation by Bolander of a truck weigh scale and load-out zone fencing. Hauling soil off-site for disposal began on September 17, 2009. Removal of PFC-containing materials from Area E/F was completed with excavation of soil block EF 2-3 and verified on September 25, 2009 with the final as-built survey of the excavation limits. Backfilling of Area E/F began on September 30, 2009 by Bolander and was completed on October 16, 2009.

3.1.2 Former Main Disposal Area A

Stripping and staging of the cover soil to 4 feet bgs or until waste was encountered, whichever came first, in Area A commenced on September 14, 2009 after WESTON surveyed and delineated the limits of excavation. The cover soil was stockpiled within the exclusion zone, to the east of the excavation. Removal and hauling of PFC-containing materials from Area A commenced on September 29, 2009 with the excavation of soil block A1-7 and was completed on November 18, 2009 with the excavation of soil block A3-5. As-built survey verification shots were measured by WESTON after each soil block was excavated, with the final soil block as-built survey on November 18, 2009.

Backfilling Area A began on November 16, 2009 on eastern side of the excavation where the depth of excavation was 12 feet bgs. The western side of the excavation, where soil block A3-5 was excavated to a depth of 18 feet bgs, was not backfilled until after WESTON's survey verification of soil block A3-5. Backfilling of Area A was completed on November 25, 2009.

Decommissioning activities were conducted from November 30, 2009 to December 18, 2009 and included break down of the stockpile staging areas and the stripping and backfilling of the haul traffic areas, within the exclusion zone.

The backfilled and disturbed areas were graded to surrounding contours and seeded with winter rye grass. A site inspection was conducted on April 19, 2010 to identify any further activities, such as erosion repair or reseeding that needed to be performed to complete the site construction activities. Re-vegetation was deemed sufficient and the silt fence was removed on April 29, 2010.

The following sections provide a detailed description of the activities that were completed at Areas A and E/F to facilitate the removal and off-site disposal of PFC-containing materials in accordance with the MPCA-approved RD/RA Plan.

3.2 APPROVAL AND PERMITS

The RD/RA Plan was submitted to the MCPA in April 2009 and the MPCA provided approval of the plan with comments in a letter to 3M dated June 1, 2009. While the existing Deed Restriction prohibits grading, excavating, boring, drilling, construction or demolition at the former Main Disposal Area, the MPCA approval of the RD/RA Plan constituted approval to conduct the activities described in the Plan. The following permits also were filed and obtained:

- Land Disturbance Permit - On July 29, 2009 TKDA, on behalf of 3M, submitted to the City of Woodbury, a land disturbance permit application for the planned excavation activities. A copy of the submitted permit application is provided in Appendix B.

- NPDES Construction Stormwater Permit - On August 24, 2009 3M submitted to the MPCA a Permit Modification Form for the existing National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Permit (ID # C00027543). The existing permit had been issued on May 12, 2009 for construction excavation associated with replacement of the force main piping from the barrier wells to the main conveyance line, which was completed in the spring/early summer 2009. The purpose of this modification was to add the Site excavations and the contractor, Bolander, on to the existing 3M NPDES permit. A copy of the completed Permit Modification Form is provided in Appendix B.

- Obstruction Permit – Bolander, on behalf of 3M, submitted to the Washington County Public Works Department, an application for an obstruction permit to post "Truck Hauling" signs along Woodbury Drive (County Road 19). On September 8, 2009, the Washington County Public Works Department approved the obstruction permit. A copy of the permit is provided in Appendix B.

- Contractor Construction Documents – Prior to construction activities, Bolander submitted to 3M a HASP, Decontamination Plan, and Excavation Plan for review and comment. 3M and WESTON reviewed the plans and provided comments which were then addressed by Bolander.

3.3 SITE PREPARATION

Bolander's site preparation consisted of establishing the exclusion zone around the excavation areas, construction of two load-out zones, installation of a truck weigh scale, and construction of the stockpile staging areas at the locations shown in Figures 3-1 and 3-2. Removal (stripping) of cover soil and surveying the delineated excavation limits/soil block grid were then conducted.

The exclusion zone was delineated with orange construction fencing and identifying signs. Photographs Nos. 1-3 (provided in Appendix A) show the established exclusion zone fencing. The exclusion zone included the limits of the excavation, the boundary for movement of excavation equipment, soil stockpile areas for sampling, and soil load-out locations. This ensured that excavation equipment contacting the PFC-containing soil remained in the exclusion zone at all times unless it was decontaminated. Additionally, the exclusion zone marked the boundary to which non-excavation equipment could approach the excavation limits. This prevented the haul trucks and other equipment from coming into contact with PFC-containing soil. The boundary of the exclusion zone was adjusted twice during the excavation and backfilling progress. In both instances, the exclusion zone was expanded to incorporate the clean sand pile, for backfilling into the completed excavations.

Anyone entering the exclusion zone was required to wear the appropriate Personal Protective Equipment (PPE) in accordance with the site Health and Safety Plan (HASP). The HASP called for Level D PPE for anyone on site and a Modified Level D for anyone entering the exclusion zone. The requirements of the site-wide Level D PPE was long pants, a t-shirt, safety shoes, safety glasses, a hard hat, hand protection (as necessary), hearing protection (as necessary) and a class 2 safety vest. Within the exclusion zone and the contaminant reduction zone, the additional PPE requirements included chemical-resistant coveralls, chemical-resistant outer boots or boot shoe covers, chemical-resistant gloves, and a air purifying respirator (optional). It should be noted that Level C PPE, which includes an air purifying respirator, was required by the HASP

for initial intrusive work in the exclusion zone. An upgrade to Level C PPE would have been required if the action levels set in the HASP were exceeded; however, an upgrade to Level C PPE was never required on-site based upon action levels.

Upon preparing to exit the exclusion zone the proper decontamination procedures were required. A Contamination Reduction Zone (CRZ), the area surrounding and inside the decontamination trailer (Figure 3-1 and Figure 3-2), was set-up on site. Detailed decontamination procedures were outlined in the Decontamination Plan submitted by Bolander to 3M along with their Work Plan. Additional information is included in the WESTON Decontamination Plan, included as an attachment in the RD/RA Plan.

Two load-out zones were built along the exclusion zone fencing next to the haul road. The load-out zones consisted of a ramp within the exclusion zone and a tarp wall at the edge of the exclusion zone (Photograph Nos. 4 – 5, provided in Appendix A). This allowed trucks, located outside of the exclusion zone, to be loaded using equipment inside the exclusion zone (Photographs 6-7, provided in Appendix A). The tarp was stretched across the width of the load-out zone ramp to make a banner approximately the height of a truck bed. It was installed to prevent any spillage of soil dumping during load-out from falling outside the exclusion zone.

As shown in Figures 3-1 and 3-2, the truck weigh scale was installed outside of the exclusion zone and load-out areas. It was installed by Bolander to determine the net weight of soils for each load to be hauled to the EQ Disposal facility in Michigan and to ensure that the trucks were within their legal limit for hauling. Photograph Nos. 8 - 10 show the weigh scale.

The stockpile staging areas, used for staging and sampling of soils for disposal profiling, were constructed by placing 10-mil poly liner on the prepared ground surface and covering the liner with six inches of clean sand. Per project specifications, the liner was placed under the complete footprint of the stockpiled material with liner edges overlapping by at least 12 inches. The purpose of the liner was to prevent contact between the excavated PFC-containing soils and the underlying ground surface. Bolander constructed and maintained the staging areas. If a staging area was compromised, showing rips in the 10-mil poly liner or washout of the berm, the staging area was patched or removed. Photograph Nos. 11 & 12, provided in Appendix A, show a newly

constructed soil stockpile staging area and a row of soil stockpiles on an approved stockpile staging area.

Also as part of site preparation activities, a meteorological station ("met station") was installed by WESTON directly northeast of the construction trailer (southwest of the excavation areas). The location of the met station is included in Figures 3-1 and 3-2, and a more detailed discussion of the met station is provided in Section 3.8.2.

3.4 SURVEY CONTROL

TKDA, a registered land surveyor in the State of Minnesota, performed survey verification for the excavation activities. TKDA acted as an independent surveyor contracted to WESTON. Prior to the start of excavation activities, TKDA staked the excavation boundaries as well as boundaries of the sloped excavation sidewalls. Throughout the duration of the project, surveying was performed on an as-needed basis to guide the excavation and to confirm when delineated limits of each soil block were reached.

Copies of the survey documentation produced by TKDA throughout construction activities are provided in Appendix C. Additionally, the site operations maps (Figures 3-1 and 3-2) show the locations of the on-site benchmark and survey control points that were used.

3.5 COVER SOIL REMOVAL

The start of excavation activities commenced with stripping the cover soil. The cover soil was stripped to 4 feet bgs, or until visual waste was encountered, whichever came first as overseen by WESTON. The stripped cover soil material was previously found to contain no PFCs greater than the Industrial SRVs. Therefore, this material was not required to be staged in the constructed and lined stockpile staging areas. The stripped cover soils were placed in one stockpile within the exclusion zone and set aside for use as backfill after the excavations were completed. The stripped cover soils from Area E/F were temporarily staged south of the excavation limits and the stripped cover soils from Area A were temporarily staged to the east of the excavation limits. Photographs 13 & 14 (provided in Appendix A) show the cover soil staging areas for Area E/F and Area A respectively.

3.6 EXCAVATION ACTIVITIES

To conduct excavation activities, Bolander removed individual soil blocks one at a time within the delineated excavation area. This was done by establishing the corners of each soil block using survey coordinates. Lathe survey stakes were labeled and placed in the ground marking the corners of the individual soil blocks as well as the edges of the slopes. Picture 15 (provided in Appendix A) shows the staking in Area E/F prior to digging. Bolander then dug out each block relying upon the survey markers.

Soil material was excavated from the side slopes of the excavation at a 1-1/2:1 slope per the project specifications This slope material was outside the RD/RA Plan specified limits of removal and did not have to go off-site for disposal, but it was impracticable to segregate it from other soils. Therefore it was combined with the excavated material from the adjacent soil block and stockpiled or direct hauled with the respective soil block material. No unexpected suspect material/debris was encountered in the sideslopes.

The soil block figures (Figures 3-3 and 3-4) were referenced to determine the depth for each soil block excavation and whether, based on in situ sampling results and MPCA's waste determination, the soil block could be direct-loaded for off-site disposal (direct load soils) at SKB or was required to be stockpiled for ex situ sampling (stockpile soils) in smaller piles for disposal profiling. This methodology was described in detail in the Construction Sampling Plan (CSP) which was approved in the RD/RA Plan.

During excavation activities, the excavated materials were managed in the AOC to reduce the VOC concentrations (refer to Section 2.2). Bolander managed the material by handling the material multiple times to allow for increased aeration. During excavation activities, the material was placed into the back of an off-road haul truck and dumped onto a stockpile staging area. Later, the material was handled a second time as the excavator was used to shape the individual stockpiles. After stockpiles were formed, they were typically left to sit for a couple days. It should be noted that while off-gassing of VOCs likely occurred, no action levels were exceeded during excavation activities (refer to Section 3.8.3).

3.6.1 Direct Load Soils

On the soil block figures (Figures 3-3 and 3-4), yellow blocks indicated soil that could be directly loaded onto haul trucks for disposal at the SKB nonhazardous industrial waste landfill in Rosemount, Minnesota. The in situ disposal profile sample results for soils represented by a yellow block indicated that none of the samples within the block met the RCRA characteristic criteria, none contained a PCB concentration greater than 50 ppm, and none contained VOC constituent concentrations greater than the applicable MPCA Industrial SRVs.

To minimize the movement of equipment into and out of the excavation limits, Bolander placed each direct load soil block into a single stockpile. The direct load stockpile was constructed within the lined stockpile staging area. From this stockpile, the soil was loaded out into haul trucks. Photograph 16 (provided in Appendix A) depicts a large stockpile of direct load material placed in close proximity to a load out zone. A description of the soil loading/unloading activities is provided in Section 3.6.3.

As shown in Figure 3-3, Soil Block EF2-4 was the only direct load block from Area E/F approved by MPCA for disposal at SKB based on the in situ sampling results. As shown in Figure 3-4, the following soil blocks from Area A were approved by MPCA for direct load and disposal at SKB: A1-7, A1-9, A1-12, A1-15, A2-1, A2-2, A2-5, A2-6, A2-7, A2-9, A2-12, A2-14, and A3-5. A tabular summary of the in situ sampling results for these direct load soil blocks is provided in Appendix D.

Documentation was maintained for each truckload of soil leaving the site to track it to its final disposal location. A manifest and a haul truck inspection sheet were prepared by WESTON for every truck prior to the departure of the truck from the Site. For direct load soils, a SKB shipping manifest and a SKB haul truck inspection sheet were used. The SKB shipping manifest, as with all manifests used during this project, was produced by the landfill (assisted by WESTON), signed by a 3M representative (as the generator), completed by WESTON personnel, and signed by the transporter. Each SKB manifest consisted of 4 carbon copies, each to be maintained in the respective files of the waste generator (2 copies), transporter and landfill, creating a documentation trail for all excavated wastes from the point of generation through disposal at the landfill. The SKB haul truck inspection was developed and completed by WESTON personnel.

The haul truck inspection sheet was a pre- and post-loading checklist that documented the adherence to hauling procedures as proposed Soil Transportation Plan, included in the project specifications.

A sample SKB shipping manifest (generator copy) and a sample truck inspection sheet for direct load soils are provided in Figures 3-5 and 3-6, respectively. A complete set of all SKB shipping manifests and truck inspection sheets are maintained by 3M and WESTON in the project files.

Each SKB shipping manifest has a unique ID number and the shipping manifest is the primary document used for tracking each truck load of soil. Recorded on the manifest is the soil block from which the load was excavated and the load number. For example, as shown in Figure 3-5, "EF2-4 Ld# 004" was recorded on SKB shipping manifest #710923 to indicate that the manifest represented the fourth load of soil from excavated Soil Block EF2-4.

Additionally, a unique container ID, soil block source, and load number were recorded on the truck inspection sheet for each load. The unique container ID is a combination of the trailer number and the manifest number. For example, as shown in Figure 3-6, the unique container ID was recorded as "116-710923" to indicate that trailer #116 contained the load associated with SKB shipping manifest #710923. Soils that were shipped to SKB, such as the direct load soils, were not weighed on-site, but were weighed at the SKB facility. When the weigh ticket for each load was received by Bolander from SKB, the load weight was recorded on the inspection sheet.

The SKB accepted load summary list provided in Appendix E-1 contains the manifest number for each load accepted at the landfill, as well as the net weight in tons. This list was provided by SKB at the conclusion of all trucking activities. This load summary is slightly greater than that provided on the certification statement (806 truckloads) because it includes additional incidental loads from final decommissioning activities that were not required or planned as part of the PFC material removal. The SKB manifests are included as Appendix E-3 (provided on CD).

3.6.2 Stockpiled Soils

On the soil block figures (Figures 3-3 and 3-4), purple blocks indicated that certain soil blocks, based on in situ sampling results and MPCA's waste determination, were required to be

stockpiled for ex situ sampling for disposal profiling. These soils were excavated in accordance with the CSP and placed in approximately 100 cubic yard stockpiles in the lined stockpile staging areas. Each approximately 100 cubic yard stockpile was split into two sub-piles, approximately 50 cubic yards each.

Stockpiles were named by the soil block from which the material originated and then each 100 cubic yard stockpile was numbered in ascending numerical order. Each half of the 100 cubic yard stockpile was denoted with either a "-1" or a "-2". For example stockpile "EF 1-1 001-2" refers to material that originated in soil block EF 1-1 and is the second half of the first 100 cubic yard stockpile removed from that soil block. Photographs 17 – 19, provided in Appendix A, demonstrate both the construction and the naming scheme of the stockpiled material.

The stockpiles were sampled in accordance with the CSP to determine the disposal destination for the particular stockpile or sub-pile. The analyses selected for the ex situ sampling of the stockpile were dependent upon the parameters that exceeded the non-hazardous criteria during the in situ sampling. Since all of the in situ samples tested for ignitability and reactivity were found to be negative for these RCRA characteristics, none of the ex situ samples required ignitability or reactivity analyses.

Sampling procedures were conducted in accordance with the CSP and Quality Assurance Project Plan (QAPP). Copies of the field sampling sheets for all soil stockpiles are provided in Appendix F. The complete set of data packages are maintained in WESTON project files.

Stockpiles or sub-piles with ex situ analyses that met the nonhazardous criteria (i.e., soil concentrations less than the applicable VOC Industrial SRVs, soil leachate concentrations less than the VOC Toxicity Characteristic Leaching Procedure (TCLP) limits, soil leachate concentrations less than the metals TCLP limits, and/or soil PCB concentrations less than 50 mg/kg [ppm]) were managed as nonhazardous and sent to SKB.

Stockpiles or sub-piles with ex situ analyses that did not meet the nonhazardous criteria (i.e., soil concentrations greater than than the applicable VOC Industrial SRVs and/or soil PCB concentrations greater than 50 mg/kg [ppm]) were managed as potentially hazardous and sent to the Environmental Quality Company (EQ) hazardous and PCB waste landfill, also known as the

Wayne Disposal, Inc. Landfill, in Belleville, Michigan. It is important to note that none of the ex situ soil stockpile samples tested for VOC TCLP or metals TCLP exhibited leachates that exceeded TCLP limits.

As shown in Figure 3-3, the following soil blocks were excavated from Area E/F and stockpiled for ex situ sampling: EF1-1, EF1-2, EF1-3, EF1-4, EF2-1, EF2-2, and EF2-3. As shown in Figure 3-4, the following soil blocks were excavated from Area A and stockpiled for ex situ sampling: A1-1, A1-2, A1-3, A1-4, A1-5, A1-6, A1-8, A1-10, A1-11, A1-13, A1-14, A2-3, A2-4, A2-8, A2-10, A2-11, A2-13, and A2-15.

Sampling parameters for stockpiles from each soil block are indicated in Figures 3-3 and 3-4 and were based on the in situ sampling results for the soil block as discussed above. A tabular summary of the ex situ sampling results for each stockpile and sub-pile is provided in Appendix D. The analytical results for each stockpile and sub-pile were forwarded to the disposal facilities for review and approval prior to shipment.

3.6.2.1 Stockpile Management

Stockpiles were managed in the exclusion zone using wooden survey stakes and a colored flagging system. A lathe survey stake with the soil block and stockpile number written on it was placed into the west side of the stockpile for identification. After the stockpile was sampled, a red flag was tied to the stake. The red flag signified that the pile was sampled and analytical results were pending. It served as a visual sign that the stockpile was not approved for hauling.

After the analytical results were obtained for each stockpile, the flag was changed. If, based on the stockpile sampling results, the stockpile was approved for disposal at SKB, the red flag was removed and replaced with a green flag. A blue flag was also tied to the stake. The green flag was a visual sign that the pile was approved for hauling. The blue flag indicated that the disposal destination for the stockpile was the SKB landfill.

If, based on the stockpile sampling results, the stockpile was approved for disposal at EQ, the red flag was removed and replaced with a green flag. A yellow flag was also tied to the stake. The green flag was a visual sign that the pile was approved for hauling. The yellow flag indicated

that the disposal destination for the stockpile was the EQ landfill. Photographs 20 – 22, provided in Appendix A, demonstrate the stockpile flagging system.

As the stockpiles were marked for load-out, WESTON personal monitored the operation to assure that the stockpiles were being manifested and handled according to the flagging system.

3.6.2.2 Disposal at SKB Nonhazardous Landfill

After receiving SKB approval for disposal acceptance, stockpiles or sub-piles with ex situ analyses meeting the nonhazardous criteria were shipped to SKB via the highway route described in the RD/RA Plan. As with the direct load soils, an SKB shipping manifest and a haul truck inspection sheet were completed by WESTON for each truckload before leaving the site. On both documents, the load's source soil block and stockpile number were indicated. For example, "EF1-4 003-1" indicates that the load was from Soil Block EF1-4, Stockpile 003-1. A sample SKB shipping manifest and a sample truck inspection sheet for direct load soils are provided in Figures 3-5 and 3-6, respectively. A complete set of SKB shipping manifests and truck inspection sheets are maintained in the project files by WESTON and 3M.

Other materials disposed at SKB after receiving approval from SKB included asbestos cement pipe (ACP) that was removed during the previous excavation during the piping replacement project and soil boring cuttings from the installation of the temporary SVE system at Area A. The ACP material was bundled in plastic and stored on site from a partial replacement of the water line piping in spring 2009. The pre-bagged ACP material was staged on-site prior to the start of construction activities, to the southwest of the excavation areas near Building 324. The ACP material remained untouched until it was hauled to SKB on November 18, 2009 and November 24, 2009. The ACP was loaded onto the bed of the truck and completely surrounded and covered by non-hazardous stockpiled soils from blocks A2-8 and A2-10 to prevent disturbance or aeration of the ACP material. Each load left the site with the general SKB shipping manifest as well as with an additional SKB asbestos shipping manifest. Photographs 23 – 26 (provided in Appendix A) show the staging and removal of the bagged ACP material.

When the temporary SVE system vents were installed in January 2009, the soil boring cuttings were containerized in 26 drums and stored on wooden pallets at the site. These drums were

emptied into one stockpile (approximately 7 cubic yards) and the stockpile sampled for disposal profiling. A summary of the results is provided in Appendix D and the results indicated that the soils met the nonhazardous criteria as solid waste and could be shipped to SKB. After review of the results by SKB and receipt of approval to send, the soils were hauled to SKB on December 7, 2009 as well as the crushed and emptied drums and the wooden pallets.

3.6.2.3 Disposal at EQ Hazardous and PCB Landfill

After receiving EQ approval for acceptance and disposal, stockpiles or sub-piles with ex situ analyses that did not meet the solid waste criteria were managed as hazardous and sent to the EQ landfill in Belleville, Michigan via the route described in the RD/RA Plan. An EQ Manifest and a haul truck inspection sheet were completed for each truckload before leaving the site. The EQ Manifest used was generated from a standard Uniform Hazardous Waste Manifest. A sample EQ Manifest and a sample truck inspection sheet for stockpiled soils that were shipped to EQ are provided in Figures 3-7 and 3-8, respectively. A copy of all the EQ Manifests are provided in Appendix E2. Additionally a complete set of EQ Manifests and EQ haul truck inspection sheets are maintained in both 3M and WESTON project files.

It is important to note that, like the SKB shipping manifests, each EQ Manifest has a unique ID number. Recorded on the manifest is the soil block and stockpile from which the load was derived. For example, as shown in Figure 3-7, "EF2-1 002-2" was recorded on EQ Manifest #006160005 to indicate that the manifest represented a load of soil from Soil Block EF2-1, Stockpile 002-2. Also recorded on the manifest and the truck inspection sheet is the unique container ID, which is a combination of the trailer number and the manifest number as described previously. WESTON personnel, who monitored load-out activates and stockpile management, recorded this information specific to each load on the manifests. The EQ shipping manifests were produced by the landfill (assisted by WESTON), signed by a 3M representative, completed by WESTON personnel, and signed by the transporter.

Loads that were shipped to EQ, were weighed on-site before leaving the site. As shown in Figure 3-8, the weight information (i.e., tare, gross, and net weights) was recorded on the truck inspection sheet as well as the soil block and stockpile from which the load was composed.

The EQ accepted load summary list provided in Appendix E-1 contains the manifest number for each load accepted at the landfill, as well as the net weight in tons. This list was provided by EQ at the conclusion of all trucking activities. It should be noted that the weights reported by the landfill and those recorded on the manifest are slightly different. The weights reported by EQ are considered accurate as the scale used at that facility is certified.

3.6.3 Truck Loading/Unloading Operations

The haul trucks consisted of an 18-wheel truck tractor and an aluminum dump trailer, with the occasional usage of a straight truck and a steel trailer. All haul trucks were inspected by WESTON upon arrival and departure from the Site to ensure that trucks were properly prepared to haul soils and that excavated materials were loaded properly and secured. The inspections were documented on the Haul Truck Inspection Sheets (Figures 3-6 and 3-8).

Some trucks would be hauling clean sand/imported fill from SKB for use as backfill for the excavations. Upon arrival at the Site, trucks hauling sand would proceed to a drop area to unload, while the trucks arriving empty would proceed to the lining station. At the lining station the trucks pulled up to a scaffold and were visibly inspected by WESTON to ensure that there was no sand or waste material in the truck bed. The truck bed was then lined with disposable, 6-mil poly sheeting to prevent the truck bed from contacting the excavated soil and to ensure that liquids (if present) could not leak out of the tailgate. The poly sheeting was tied to the rails of the truck bed to keep it in place during loading and shipment. On several occasions WESTON followed trucks hauling soils to SKB to ensure liner integrity throughout the hauling process. Even though trucks hauling soils to EQ never carried clean soils back to the Site a bed liner was still installed prior to being loaded with hazardous material. Photographs 27 – 30, provided in Appendix A, document the lining procedure. Based on WESTON's observations during the loading and hauling operation there was no evidence of ripping or tearing problems with the bed liner and the 6-mil thick poly sheeting was satisfactory.

A truck preparing to be loaded with materials to be handed to EQ would proceed from the lining station to the weigh scale for a tare weight, and then to the load-out zone. After loading, the truck returned to the weigh scale for a gross weight and then returned to the lining station. The trucks were inspected by WESTON to ensure the liner was in good condition, the liner remained in

place in the bed of the truck and that the height of the soil was lower than the sides of the truck. A Bolander employee then secured the tarp cover over the bed of their truck, updated the required placarding and signed the associated manifest before departing from the Site. The trucks loaded with material for SKB followed the same general procedure with the exception of the weigh scale. Trucks transporting material to SKB were not weighed until they arrived at the SKB landfill. All trucks were weighed at the respective landfills using a certified weigh scale.

3.6.4 Water Management

After heavy rain events in early and mid October, a significant volume of water collected in the excavation. The two main precipitation events requiring management actions by the contractor occurred on October 2nd and October 7th. On both of these occasions the daily precipitation levels exceeded 1.25'' in the 24-hour period. On October 2nd Bolander scraped the traffic areas to remove the soft mud and reach compacted ground. Less than a week later, during the October 7th rainfall event, removal of construction water from the limits of the excavation was required. Approximately 54,000 gallons of non-contact rainwater was pumped from the excavation limits. Rainwater pumped from the excavation was considered "non-contact" because it was not perched water, and it was in contact with soils from solid waste, direct load soil blocks only.

On October 16th, a week after the second of the two major storm events, a minor storm event occurred in which precipitation levels reached 0.39''. Approximately 1,500 gallons of non-contact construction water was pumped from the excavation. Throughout construction there were three additional storm events which saw daily precipitation levels close to 0.5''. However, only the event on October 16th required pumping as the ground was saturated from the two preceding major storm events.

The water was removed by Warwick Construction, Inc., a 3M subcontractor, and disposed at the on-site 3M Cottage Grove wastewater treatment plant (WWTP). In total, approximately 56,000 gallons of non-contact water were transported to the WWTP. A copy of the 3M Cottage Grove Wastewater Treatment Operations "Non-Routine" Hauled Wastewater Disposal Forms is provided in Appendix E-4. Photographs 31 to 33, provided in Appendix A, show the water removal activities.

At the conclusion of the project the decon water was handled according to project specifications. All equipment was decontaminated directly over the Area A excavation, thus no water was required to be contained, collected and removed from the Site. Additionally, at this time any water used for decontamination, and temporally stored in the poly tank near the contamination reduction zone was poured into the Area A excavation limits as well. The heavy equipment was decontaminated after the completion of backfilling of Area A and scraping of the traffic areas, but prior to the spreading of the top soil.

3.7 SURVEY VERIFICATION OF EXCAVATION LIMITS

Verification surveying was performed by TKDA, a Minnesota-licensed surveyor, as a contractor to WESTON. This arrangement provided the "third party" verification that the removal requirements specified in the RD/RA Plan were being met. Surveying was conducted regularly during the excavation activities to confirm that the required horizontal and vertical excavation limits had been reached for each soil block. After the final excavation limits were verified to the lateral and vertical limits specified in the approved RD/RA Plan, backfilling was allowed.

It should be noted that soil block quantities for direct load and stockpiled soil blocks were surveyed differently, as per project specifications. The direct load soil block quantities were in-place volumes calculated from as-built shots of the excavation. In order to better quantify the volumes of these soil blocks four corner survey shots were collected along with four interior ground check shots per soil block.

To quantify the amount of soil excavated from the potentially hazardous soil blocks the stockpile quantities were surveyed. Stockpile quantities were surveyed by collecting several survey shots around the base of the stockpile, as well as one or two shots at the top of the stockpile. As-built survey shots were taken at the four corners of each of the potentially hazardous soil blocks, but the corner shots were only used to confirm the excavation met the required limits.

3.7.1 Areas E/F

Figures 3-9, 3-10, and 3-11 provide the plan view results of final verification surveys for the base of each layer in Area E/F (i.e., base of stripped cover material - 0 to 4 ft bgs, base of Layer 1 – 4 to 8 ft bgs, and base of Layer 2 – 8 to 12 ft bgs, respectively), which includes the corners of each

soil block. Figure 3-12 shows cross sections of the Area E/F design excavation limits as well as the actual final excavation limits. The figure demonstrates that the design excavation limits for Area E/F were achieved and that the actual excavation limits met or extended slightly beyond the RD/RA Plan specified limits.

Table 3-1 provides a tabular summary of the Area E/F soil excavation volumes and soil stockpile final disposal location. The total volume of soil removed from Area E/F was approximately 3,164 cubic yards. Of that, approximately 2,300 cubic yards were transported to EQ and approximately 864 cubic yards were transported to SKB.

3.7.2 Area A

Figures 3-13 through 3-16 provide the plan view results of final verification surveys for the base of each layer in Area A (i.e., base of stripped cover material - 0 to 4 ft bgs, base of Layer 1 – 4 to 8 ft bgs, base of Layer 2 – 8 to 12 ft bgs, and base of Layer 3 – 12 to 18 ft bgs, respectively), which includes the corners of each soil block. Figure 3-17 shows cross sections of the Area A design excavation limits as well as the actual final excavation limits for Layers 1 and 2. Figure 3-18 shows cross sections of the Area A design excavation limits as well as the actual final excavation limits for Layer 3. Figures 3-17 and 3-18 demonstrate that the design excavation limits for Area A were achieved and that the actual excavation limits met or extended slightly beyond the RD/RA Plan design limits.

Table 3-2 provides a tabular summary of the Area A soil excavation volumes and final disposal location. The total volume of soil removed from Area A was approximately 10,661 cubic yards. Of that, approximately 449 cubic yards were transported to EQ and approximately 10,211 cubic yards were transported to SKB. Please note that the total volumes do not reconcile due to rounding.

3.8 OPERATIONAL RECORDS

In addition to haul truck inspections (Figures 3-6 and 3-8), additional operational records were maintained by WESTON to document the excavation activities and ambient conditions during site activities. Such records included daily reports, meteorological station data, and perimeter monitoring as discussed in the following sections.

3.8.1 Daily Reports

The Daily Site Operations Log Form was completed for each day of site activity. The form contained a summary of key site daily information such as: activities performed, personnel on-site, soil blocks that were excavated, stockpiles that were generated, hauling information, monitoring information, and communications. All of the daily reports are maintained in WESTON's project files as part of the construction record.

Additionally, weekly construction meetings were held by 3M, typically on Mondays throughout the duration of Site Activities to review construction progress, plans for upcoming construction, and resolve construction questions or issues. These meetings were lead by the 3M project representative and were attended by 3M, Bolander, WESTON, and other parties such as AECOM (MPCA's contractor) and MPCA. Meeting minutes were e-mailed out weekly and copies are maintained in 3M and WESTON project files, as part of the construction record. Lastly, AECOM representatives periodically visited the site to observe and document excavation activities, on behalf of MPCA.

3.8.2 Met Station Data

Daily weather conditions were recorded on the Daily Site Operations Log Form, however, continuous monitoring and documentation of on-site meteorological conditions were recorded by WESTON from an on-site meteorological monitoring station ("met station"). The met station, installed prior to excavation activities, was mounted outside of the exclusion zone on an approximate 18-foot tripod. The met station was located southwest of the exclusion zone and north of the construction trailer (Figure 3-1 and Figure 3-2). The meteorological data was recorded by a data logger and downloaded daily. The meteorological variables monitored included:

- Wind speed.
- Wind direction.
- Standard deviation of horizontal wind direction (sigma theta).
- Ambient air temperature.
- Precipitation.

The met data was also used during construction activities to help foresee construction water issues. During construction activities, thirty-three daily rain events were recorded. Of the thirty-three recorded events, twenty eight were less than a third of an inch, three were between a third and two-thirds of an inch and two had precipitation totals greater than an inch. Actions were taken on site to deal with water issues depending upon the precipitation amount and the open area of excavation. The two main precipitation events requiring management actions by the contractor occurred on October 2nd and October 7th. On both of these occasions the daily precipitation levels exceeded 1.25'' in the 24-hour period, causing water to accumulate in the excavation. On October 16th, a week after the second of the two major storm events, a minor storm event occurred in which precipitation levels reached 0.39'', causing more water to accumulate in the excavation due to the already saturated soils. During both rain events water was pumped from the excavation and disposed of at the 3M Cottage Grove WWTP. The rain events and water disposal activities are discussed in more detail in Subsection 3.6.4.

The wind speed was monitored with a three-cup anemometer assembly mounted on a crossarm. Horizontal wind direction was monitored by a wind vane coupled to a precision low torque potentiometer. Precipitation was measured with a tipping bucket rain gauge. A table that provides a summary of the daily meteorological data is provided in Appendix G. Throughout the excavation activities the averaged daily directional wind originated from the south, including the southwest, south and southeast, 64% of the time. The primary residences in close proximity to the site were located southwest of the site in the City of Cottage Grove, MN. The wind data demonstrated that the winds generally originated from a southerly direction, thus were blowing away from the nearby residential communities. Therefore, any odors associated with construction activities would be carried in the opposite direction.

3.8.3 Perimeter Monitoring

Throughout the duration of the excavation activities, perimeter monitoring for VOCs, particulates, and noise was performed on a weekly to bi-weekly basis and measurements recorded on a Perimeter Monitoring Form, as outlined in the RD/RA Plan. A copy of the Perimeter Monitoring Forms is provided in Appendix H.

A total of nine monitoring events were performed and no adverse impacts were recorded along the site perimeter. Therefore, the frequency of monitoring events was considered sufficient, and did not need to be increased, due to the isolation of the excavation activities from surrounding properties and the non-detection of excavation effects during any of the performed perimeter monitoring events. The following instruments were used for monitoring:

- MultiRAE photoionization detector (PID) for VOC ambient air monitoring.
- Thermo Electron Corporation personal DataRam (pDR) for PM_{10} particulate ambient air monitoring.
- Quest Noise Pro for noise monitoring.

As shown in Figure 3-19, there were six monitoring locations surrounding the excavation area in all directions. The monitoring locations were relocated slightly from those proposed in the RD/RA Plan due to access issues. The air monitoring locations were as follows:

- Station 1 -West of the former Main Disposal Area.
- Station 2 - South of the former Main Disposal Area.
- Station 3 - Southeast of the former Main Disposal Area and the former Northeast Disposal Area.
- Station 4 - East of the former Northeast Disposal Area.
- Station 5 - North of the former Northeast Disposal Area.
- Station 6 - North of the former Main Disposal Area, west of the former Northeast Disposal Area.

Cumulatively, the readings obtained for all the monitored values, across all perimeter monitoring locations, were well below the associated action levels. The VOC concentrations were consistently 0.00 ppm for several readings and never exceeded 0.2 ppm. The Action Level set in the HASP was a reading of 2.5 ppm above background as a 15 minute time weighted average. The PM_{10} concentrations recorded across all stations ranged from 0.000 mg/m^3 to 0.029 mg/m^3. These recorded concentrations were well below the Action Level defined in the HASP of 0.1 mg/m^3 above background levels. Lastly, the Action Level for sound monitoring, as defined in

the HASP, was 65 dB near households and 80 dB near highways and street right-of-ways. The values, measured for sound were frequently less that 65 dB, with a few instances of values up to 90 dB. It is important to note that the monitoring locations 1, 4, and 6, where the noise readings were observed above 65 dB, were located along public traffic roads. Location 1 and location 6, were located along Woodbury Drive, and location 4 was along Cottage Grove Drive. Location 2, the only other location with recordings that exceeded 65 dB (65.2 dB and 75.6 dB), was also in close proximity to Woodbury Drive. The slightly higher noise levels recorded at these locations is believed to be due to normal traffic conditions and not due to construction activities. Increased road activity levels were noted on perimeter monitoring forms.

3.9 DECOMMISSIONING ACTIVITIES

At the conclusion of the construction activities, all stockpile staging areas were removed and hauled to SKB, including the poly liner, overlying sand layer, and side berms for disposal. Approximately 1,100 cubic yards of this material was removed on November 30, 2009 through December 8, 2009.

Even though reasonable care was exercised in moving soils from the excavation blocks to the stockpile areas and then to the load-out area, incidental spillage occurred in the traffic areas inside of the exclusion zone. To address these traffic areas during decommissioning, it was decided to scrape a 6 inch layer of soil from these areas for off-site disposal or on-site backfill, depending on analytical data.

This scraping of the haul traffic areas within the exclusion zone occurred on December 1, 2009 and the stockpiled scrapings were sampled (5 samples) on December 2, 2009 and analyzed for PFCs. A survey of the site elevation also was conducted on December 2, 2009, after scraping the haul traffic areas. A tabular summary of the analytical results is provided in Appendix D. None of the PFCs were detected at concentrations greater than the Industrial SRVs and therefore did not need to be removed and could be used as backfill on-site. Thus, approximately 1,500 cubic yards of scrapings were placed into the western portion of Area A. Survey of the Site elevation, after scraping the haul traffic areas took place on December 2, 2009.

Following excavation activities, Bolander decontaminated all equipment used in the exclusion zone. Decontamination activities were performed under the guidance of the decontamination plan submitted by Bolander to 3M prior to excavation activities at the Site.

3.10 BACKFILLING, FINAL GRADING, AND REVEGETATION

Backfill documentation, including the date of backfilling activities and source of backfill material, was recorded in the daily reports. Backfill material was placed in 12-inch lifts and compacted.

In Area E/F, the source of backfill material was the stripped cover soil from 0 to 4 feet bgs that had been stockpiled to the south of the Area E/F excavation (see Figures 3-1 and 3-2) and clean sand from the SKB Landfill that had also been stockpiled on-site southeast of the excavation. The imported fill source from SKB was sampled by WESTON on September 14, 2009 in accordance with the CSP for verification as clean backfill. A tabular summary of the sampling results is provided in Appendix D. These results indicated that SKB was an acceptable source of backfill material. The stripped cover soil was placed in the bottom of the excavation first per the requirements of the RD/RA Plan, and then the SKB sand was used to backfill over the cover soil to ground surface.

In Area A, the source of backfill material included the stripped cover soil from 0 to 4 feet bgs, the six inches of scraped material from the exclusion zone traffic areas, and the sand from SKB. The stripped cover soil was placed first in the east area of the Area A excavation per the requirements of the RD/RA Plan. The northwest portion of the Area A excavation, including the deeper excavation of Soil Block A3-5, was left open for placement of the scraped and stockpiled haul traffic area materials. After backfilling with the haul traffic area materials, the SKB sand was used to backfill the entire Area A excavation to ground surface.

Clean sand was backhauled from SKB for final grading activities, which occurred from December 16, 2009 through December 18, 2009. Disturbed areas were covered with approximately enough topsoil to ensure vegetative growth, and hydroseeded. Existing and Final grading surface contours are provided in Figure 3-20. Overall, the final grading contours are in close proximity to the existing contours and are of similar shape. Therefore the overall direction

of surface flow pre- and post-construction activities is likely unaffected. The final site survey was conducted on December 18, 2009 to complete the construction activities. Removal of the construction equipment and demobilization of the construction trailers occurred from December 18, 2009 to December 21, 2009.

Final inspection of the site occurred on April 19, 2010. The final inspection consisted of a site walkthrough with representatives from 3M, Bolander, and WESTON. During the site walkthrough it was determined that the backfilled excavation areas did not yet have 70% vegetative cover, as required by the Stormwater Permit, so the silt fence was not removed. On April 29, 2010 the vegetative cover was considered sufficient and the temporary erosion control measures, the silt fence surrounding the excavations, was removed. A Notice of Termination for the Stormwater General Permit was not filed at this time. The permit will remain open and will be transferred to the respective contractor for the construction activities occurring in the Northeast Disposal Area in the second half of 2010.

2300.0107

CITY OF WOODBURY

APPLICATION FOR LAND DISTURBANCE PERMIT

10. Estimated total area disturbed by land disturbing activities: 10 ACRES

11. Estimated total value of erosion and sediment control measures on site $ 25,000

12. Enclose six (6) copies of the final approved Land Disturbance Plan showing existing and proposed final contours of the site. The plan shall also indicate all temporary and permanent erosion control facilities to be installed and maintained during and following the land disturbing activities. For additional requirements, see the CITY OF WOODBURY LAND DISTURBANCE PLAN AND IMPLEMENTATION REQUIREMENTS.

13. All necessary permits form other governing agencies having jurisdiction shall be obtained prior to the commencement of land disturbing activities.

THE UNDERSIGNED HEREBY APPLIES FOR A LAND DISTURBANCE PERMIT AND ACKNOWLEDGES THAT THE INFORMATION PROVIDED ABOVE IS COMPLETE AND ACCURATE AND THAT LAND DISTURBING ACTIVITIES ARE NOT TO BEGIN WITHOUT A VALID LAND DISTURBANCE PERMIT.

THE UNDERSIGNED HEREBY AGREES ALL WORK WILL BE DONE IN ACCORDANCE WITH THE APPROVED LAND DISTURBANCE PLAN AND SPECIFICATIONS, LAND DISTURBANCE PLAN AND IMPLEMENTATION REQUIREMENTS, CONDITIONS OF APPROVAL, ALL ORDINANCES OF THE CITY OF WOODBURY, AND ALL APPLICABLE LAWS, RULES AND REGULATIONS.

THE UNDERSIGNED UNDERSTANDS THAT THE PERMIT WILL EXPIRE, AND BECOME NULL AND VOID IF WORK DOES NOT BEGIN WITHIN NINETY (90) DAYS OF THE DATE OF ISSUANCE OF THE PERMIT, OR IF WORK IS SUSPENDED OR ABANDONED FOR A PERIOD OF ONE HUNDRED EIGHTY (180) DAYS ANYTIME AFTER WORK HAS COMMENCED; AND, THAT THE UNDERSIGNED IS RESPONSIBLE FOR ENSURING THAT ALL WORK IS COMPLETED AS APPROVED BY THE ISSUANCE OF THIS PERMIT.

Notice of Termination/ Permit Modification Form

NPDES Construction Stormwater Permit Program

Transfer or terminate your National Pollutant Discharge Elimination System (NPDES) Construction Stormwater Permit. Allowable changes are permit termination and permit transfer for all or a portion of the site. This form replaces the Notice of Termination (NOT), Permit Transfer, Permit Modification, and Subdivision Registration forms used under the former permit.

Instructions for this form are located on the Internet at http://www.pca.state.mn.us/publications/wq-strm2-60i.pdf.

Form will be invalid and returned to sender unless the checkbox associated with the applicable actions is checked and the corresponding signature is provided in section A-1, A-2, A-3, and or A-4.

Please submit to: **Construction Stormwater Permit Program**
Minnesota Pollution Control Agency
520 Lafayette Road North
St. Paul, Minnesota 55155-4194

Existing Permit Identification

a. Current permit ID: C000 2 7 5 4 3 or SUB00 _ _ _ _ _

b. Project name: Woodbury Soil Removal Project

Project location: East of CSAH 19 between Military Road and Dale Road

Woodbury, MN

Briefly describe where the construction activity occurs (for example. Intersection of 45th St. and Irving Ave.). Include address if available.

Select Option 1, 2, or 3

1. Notice of Termination (NOT) for entire site by existing owner

Select this option when a project has achieved final stabilization with existing owner / contractor and no part of the site is being transferred to a new owner and all construction activity is complete.

c. ☐ Notice of Termination for entire existing permitted site or a subdivided site. (Current owner and contractor must sign under the "Current" Owner and "Current" Contractor sections respectively).

Check above box and sign section A-1 and A-2 on page 2.

2. Transfer of entire site to new owner or contractor (Transfer/Modification)

Select this option if the ***entire*** site (represented by the ID above) has either a new owner and/or new general contractor. Check all the boxes below that apply.

d ☐ New Owner for entire existing permitted site.
e. ☒ New Contractor for entire existing permitted site.
f. ☐ Current Owner for entire existing permitted site.
g. ☐ Current Contractor for entire existing permitted site.

Check above box(es) and sign section A-3 and A-4 page 3 and or check above box(es) and sign section A-1 and A-2 page 2
Both "Current" and "New" Parties must sign this form (preferred), however, separate forms are acceptable.

3. Transfer of a portion of a site to a new owner or contractor (Subdivision)

Select this option if *a **portion*** of a site (permitted under the ID above) has either a new owner and/or new general contractor. Check the boxes below that apply.

h. Describe the portion of the site being transferred: Lot _____ Block _____

Project location/address: _____

City, State, and Zip: _____

Example: SW quadrant of 45th Street and Irving Avenue or Lot's 1-17 of block 20. Include list of addresses if available or include a map

i. ☐ New Owner for portion of existing site.
j. ☐ New Contractor for portion of existing site.
k. ☐ Current Owner of the portion to be transferred.
l. ☐ Current Contractor of the portion to be transferred.

Check above box(es) and sign section A-3 and A-4 page 3 and or check above box(es) and sign section A-1 and A-2 page 2
Both "Current" and "New" Parties must sign this form (preferred), however, separate forms are acceptable.

If you have questions about the administrative details of the permit process go to: http://www.pca.state.mn.us/publications/wq-strm2-60i.pdf or call the Minnesota Pollution Control Agency at **651-296-6300 or 800-657-3864** and ask for *"Construction Stormwater."* If you have technical questions, ask for the *"Stormwater Policy and Technical Assistance Unit."*

Notice of Storm Water Permit Coverage

The Construction site identified below is covered under the National Pollutant Discharge Elimination System General Permit (MNR100001) and is authorized by the Minnesota Pollution Control Agency to discharge storm water associated with construction activities.

Owner: 3M Company

General Contractor: Belair Builders, Inc.

Project Name: Woodbury Well Forcemain Replacement - CSV

Identification Number: C00027543

May 12, 2009
Date Issued

If you have questions regarding the storm water program for construction activity, please access the MPCA's storm water site at http://www.pca.state.mn.us/water/stormwater/index.html, or call the MPCA's Customer Assistance Center at 651-297-2274 or toll free at 800-646-6247.

Percent Moisture (%)			
Percent Moisture	4.8	6.8	9.1

Table Notes:

[1] Stockpile is staged in two separate sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from soils from both sub-piles.

All results reported on a "dry-weight basis".

--- = Sample not analyzed for corresponding compound.

Data Notes:

Data tabulated by D. Armstrong of WESTON on 09/14/2009.
Data tabulation QA'd by R. McLoughlin of WESTON on 09/14/2009.
Data confirmed by C. Young of WESTON on 9/15/2009.
Analytical data provided in Pace Analytical Services data package #10112028.

Compounds were not detected in the trip blank at or above the reporting limit.
There are no known quality control concerns for this data.

Table Notes:

[1] Stockpile is staged in two separate sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from soils from both sub-piles.

All results reported on a "dry-weight basis".

--- = Sample not analyzed for corresponding compound.

Data Notes:

Data tabulated by D. Armstrong of WESTON on 09/15/2009.

Data tabulation QA'd by R. McLoughlin of WESTON on 9/15/2009.

Analytical data provided in Pace Analytical Services data package #10112127.

Compounds were not detected in the trip blank at or above the reporting limit.

PCB-1248 (Aroclor 1248)	< 2.15	---	---
PCB-1254 (Aroclor 1254)	12.7	---	---
PCB-1260 (Aroclor 1260)	5.25	---	---
PCB-1262 (Aroclor 1262)	< 2.15	---	---
PCB-1268 (Aroclor 1268)	< 2.15	---	---
Total PCBs	18.0	---	---
Volatile Organic Compounds, TCLP (mg/L, ppm)			
Vinyl chloride, TCLP	< 0.02	---	---
Percent Moisture (%)			
Percent Moisture	7.7	7.9	8.8

Table Notes:

[1] Stockpile is staged in two separate sub-piles. A grab sample was collected from each sub-pile. A composite sample was collected from soils from both sub-piles.

All results reported on a "dry-weight basis".

--- = Sample not analyzed for corresponding compound.

Data Notes:

Data tabulated by D. Armstrong of WESTON on 10/16/2009.

Data tabulation QA'd by J. Savage of WESTON on 10/16/2009.

Analytical data provided in Pace Analytical Services data packages #10114467 and #10114469.

Volatile Organic Compounds (mg/kg, ppm)		
1,2-Dichloroethane	< 2.41	< 2.32
Percent Moisture (%)		
Percent Moisture	10.9	9.4

Table Notes:

[1] Stockpile is staged in two separate sub-piles. A grab sample was collected from each sub-pile.

All results reported on a "dry-weight basis".

Data Notes:

Data tabulated by J. Savage of WESTON on 11/13/2009.

Data tabulation QA'd by G. Witmer of WESTON on 11/13/2009.

Analytical data provided in Pace Analytical Services data package #10116632.

Compounds were not detected in the trip blank at or above the reporting limit.

Table Notes:

All results reported on a "dry-weight basis".

--- = Sample not analyzed for corresponding compound.

NL = No Tier 2 Industrial SRV Criteria.

Data Notes:

Data tabulated by R. McLoughlin of WESTON on 11/23/2009.

Data tabulation QA'd by D. Armstrong of WESTON on 11/23/2009.

Analytical data provided in Pace Analytical Services data package #10117136.

APPENDIX E-2
UNIFORM HAZARDOUS WASTE MANIFESTS (EQ MANIFESTS)

Please print or type. (Form designed for use on elite (12-pitch) typewriter.)

Form Approved. OMB No. 2050-0039

UNIFORM HAZARDOUS WASTE MANIFEST

1. Generator ID Number	2. Page 1 of	3. Emergency Response Phone	4. Manifest Tracking Number
			006161259 JJK

GENERATOR

5. Generator's Name and Mailing Address

Generator's Site Address (if different than mailing address)

Generator's Phone:

6. Transporter 1 Company Name — U.S. EPA ID Number

7. Transporter 2 Company Name — U.S. EPA ID Number

8. Designated Facility Name and Site Address — U.S. EPA ID Number

Facility's Phone:

9a. HM	9b. U.S. DOT Description (including Proper Shipping Name, Hazard Class, ID Number, and Packing Group (if any))	10. Containers No.	10. Containers Type	11. Total Quantity	12. Unit Wt./Vol.	13. Waste Codes
	1.	1	DT		K	
	2.					
	3.					
	4.					

14. Special Handling Instructions and Additional Information

15. **GENERATOR'S/OFFEROR'S CERTIFICATION:** I hereby declare that the contents of this consignment are fully and accurately described above by the proper shipping name, and are classified, packaged, marked and labeled/placarded, and are in all respects in proper condition for transport according to applicable international and national governmental regulations. If export shipment and I am the Primary Exporter, I certify that the contents of this consignment conform to the terms of the attached EPA Acknowledgment of Consent.
I certify that the waste minimization statement identified in 40 CFR 262.27(a) (if I am a large quantity generator) or (b) (if I am a small quantity generator) is true.

Generator's/Offeror's Printed/Typed Name — Signature — Month 9 Day 17 Year 09

INT'L

16. International Shipments ☐ Import to U.S. ☐ Export from U.S. Port of entry/exit:

Transporter signature (for exports only): Date leaving U.S.:

TRANSPORTER

17. Transporter Acknowledgment of Receipt of Materials

Transporter 1 Printed/Typed Name — Signature — Month 9 Day 17 Year 09

Transporter 2 Printed/Typed Name — Signature — Month Day Year

DESIGNATED FACILITY

18. Discrepancy

18a. Discrepancy Indication Space ☐ Quantity ☐ Type ☐ Residue ☐ Partial Rejection ☐ Full Rejection

Manifest Reference Number:

18b. Alternate Facility (or Generator) — U.S. EPA ID Number

Facility's Phone:

18c. Signature of Alternate Facility (or Generator) — Month Day Year

19. Hazardous Waste Report Management Method Codes (i.e., codes for hazardous waste treatment, disposal, and recycling systems)

1.	2.	3.	4.
H132			

20. Designated Facility Owner or Operator: Certification of receipt of hazardous materials covered by the manifest except as noted in Item 18a

Printed/Typed Name — Signature — Month Day Year

EPA Form 8700-22 (Rev. 3-05) Previous editions are obsolete.

GENERATOR'S INITIAL COPY

3M_MN05362261

APPENDIX E-4
HAULED WASTEWATER DISPOSAL FORMS

3M Cottage Grove
Wastewater Treatment Operations
"Non-Routine" Hauled Wastewater Disposal Form

This section to be completed by WWT Operations Environmental Compliance, Engineer, or Supervisor

3M Requestor and Bldg Location: Katie Winogrodzki 224-2E-55

Wastewater Source Generation: Woodbury Main Disposal Area A / Soil Block A1-7
(containment basin, sump, process equipment cleaning, etc...)

Wastewater Description by Requestor: Stormwater that has been in contact with impacted soils and debris.

Wastewater Physical Description *(if applicable and/or known)*:

1) Color: Light Brown

2) Odor: None

3) Number of Layer(s): —

5) Is the wastewater pumpable? ☒ Yes ☐ No

6) Are there visible solids? ☐ Yes ☒ No

7) If Yes to #6, estimated total solids by volume: ____ %

Estimated Volume: ~~3,000~~ Gal

Estimated Frequency/Duration: 10/7/09 1 1:00 / 2 3:15 / 3 4:30 / 4 5:40 / 5 6:45
10/8/09 1 7:35 / 2 9:20 / 3 10:15 / 4 11:57 / 5 12:50 / 6 2:13
10/9/09 1 7:40 / 2 9:30 / 3 11:03 / 4 12:30 / 5 3:15 / 6 4:30 / 7 5:40

3M WWT Approver: AT

Approved Disposal Location: Phase 2 headwork

This section to be completed by Wastewater Transporter

Transporter Name: Warnock

Date: 10/7/09

Time: 1:00 - 7:00

Wastewater Total Quantity Collected: 52-55,000 gallons
10/8/09

This section to be completed by Wastewater Operations

Received By: AT

Date: 10/9/09

Time: 13:30

Disposal Location: Bldg 122 unloading & Phase 2 headworks
Phase I Headwork, Phase II EQ basin, Phase III mix box at incinerator, etc...

Comments/Safety (PPE requirements):

Upon Completion, File WWT Compliance Files in Bldg 39 CHEM-E.5 Hauled WWT Forms

SOF-000015
Revision 1

3M_MN05363254

3M Cottage Grove
Wastewater Treatment Operations
"Non-Routine" Hauled Wastewater Disposal Form

This section to be completed by WWT Operations Environmental Compliance, Engineer, or Supervisor

3M Requestor and Bldg Location: Katie Winogrodzki

Wastewater Source Generation: Woodbury Remediation Work / Soil Bank A1-7
(containment basin, sump, process equipment cleaning, etc...)

Wastewater Description by Requestor:
rainwater runoff

Wastewater Physical Description *(if applicable and/or known)*:

1) Color: clear/brownish
2) Odor: none
3) Number of Layer(s): 1
5) Is the wastewater pumpable? [x] Yes [ ] No
6) Are there visible solids? [x] Yes [ ] No
7) If Yes to #6, estimated total solids by volume: <1% %

Estimated Volume: 3,000 GAL **Estimated Frequency/Duration:** 1 LOAD

3M WWT Approver: Tina Berg **Approved Disposal Location:** Bldg 183 unload or Phase 2 screw (headworks)

This section to be completed by Wastewater Transporter

Transporter Name: WARUSCK **Date:** 10/16/09 **Time:** 1:11

Wastewater Total Quantity Collected: 1500 gallons

This section to be completed by Wastewater Operations

Received By: Dennis Coauer **Date:** 10-16-09 **Time:** 1300

Disposal Location: PHASE II
Phase I Headwork, Phase II EQ basin, Phase III mix box at incinerator, etc...

Comments/Safety (PPE requirements):

Upon Completion, File WWT Compliance Files in Bldg 39 CHEM-E.5 Hauled WWT Forms

SOF-000015
Revision 1

3M_MN05363255

APPENDIX F
FIELD SAMPLING SHEETS

BLOCK NO:	EF1-1	**SAMPLE DATE:**	9/8/2009
STOCKPILE NO:	001	**BLOCK PARAMETERS:**	P, VC

Weather: Clear (X) Cloudy ( ) Rain/Snow ( ) Windy ( ) **TEMP.:** 78 °F

Stockpile Description (Check all that apply)
(X) Soil
( ) C&D Debris (Concrete, Asphalt, etc)
(X) Mfg. Debris
(X) Staining

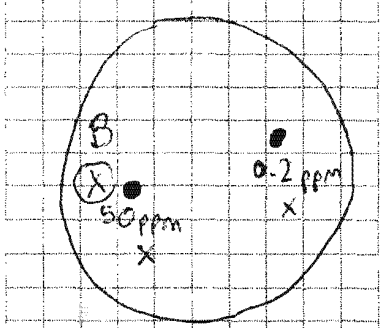
Soil Moisture:
(X) Dry
(X) Moist
( ) Wet

Odor: Strong (X) Mild ( ) None ( )

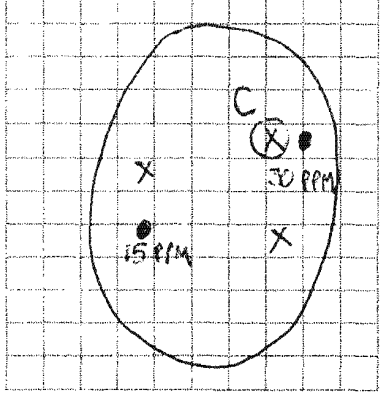
1. Sketch Stockpile, Establish Dimensions, Describe Soil, and Locate Sample Locations.
2. Screen Stockpile with PID and Record GPS Coordinates for selected sample locations.
3. Provide a Sketch of the Stockpile, indicate north, and show PID readings and Sample Stations..
4. Collect Samples, Record ALL Data, Prepare COC, Count Bottles.

Designate Sample Locations on the Sketch with Reference Letter.

EF1-1 001-1



EF1-1 001-2



● Headspace Readings (ppm)
(X) Sample Location for VOCs
X Composite Location for PCBs ("A" Sample)

STOCKPILE NO:	001	**BLOCK PARAMETERS:**	P

Weather: Clear (X) Cloudy ( ) Rain/Snow ( ) Windy ( ) **TEMP.:** 80 °F

Stockpile Description (Check all that apply)
(X) Soil
( ) C&D Debris (Concrete, Asphalt, etc)
( ) Mfg. Debris
( ) Staining

Soil Moisture:
(X) Dry
( ) Moist
( ) Wet

Odor: Strong ( ) Mild (X) None ( )

1. Sketch Stockpile, Establish Dimensions, Describe Soil, and Locate Sample Locations.
2. Screen Stockpile with PID and Record GPS Coordinates for selected sample locations.
3. Provide a Sketch of the Stockpile, indicate north, and show PID readings and Sample Stations..
4. Collect Samples, Record ALL Data, Prepare COC, Count Bottles.

Designate Sample Locations on the Sketch with Reference Letter.

6. Sound Monitoring (Action Levels - 65dB near households, 80 dB near highway and street right-of-way)

Instrument used: NOISE PRO - QUEST

Calibration performed? Y or N

Station/Sample Location	Time	Reading (provide units)
5	1815	< 65dB
2	1827	< 65dB
3	1840	< 65dB

* EXCAVATION ACTIVITIES STOPPED FOR THE DAY - NO READINGS TAKEN, DARKNESS CREATED A SAFETY CONCERN ALONG THE ROAD.

Woodbury Site - Perimeter Monitoring Form

1. Date: 12 Nov 2009 | 2. Weather: Cloudy, windy, ~52°F

3. Prepared By: Gary Witmer & Bret Missildine

OC 4. Ambient Air Monitoring - VOCs (Consult Health and Safety Plan for Action Level)

Instrument used: Mini-RAE 2000

Calibration performed? (Y or N) (Y)

Station/Sample Location	Time	Reading (provide units)
P1 / N1	1425 - 1430	0.0 - 0.2 PPM
P6 / N2	1433 - 1438	0.0 - 0.1
P4	1446 - 1450	0.0
P2	1459 - 1604	0.0
P3	1515 - 1520	0.0
P5	1540 - 1545	0.0

NOTES: ① Loc. P4 Corn now harvested. Can hear back-up alarms on equipment nearby. No Direct line of ~~site~~ sight.
② Gusts from heavy wind contributed to higher noise readings.

dust 5. Ambient Air Monitoring - PM10 (particulate monitoring) (Action Level - 0.1 mg/m³ above background)

Instrument used: MIE DataRam PDR

Calibration performed? (Y or N) (Y)

Station/Sample Location	Time	Conc, Reading (provide units) 5min TWA
P1 / N1	1425 - 1430	0.007 / 0.028 Mg/m³
P6 / N2	1433 - 1438	0.006 / 0.021
P4	1445 - 1450	0.004 / 0.018
P2	1459 - 1504	0.001 / 0.012
P3	1515 - 1520	0.000 / 0.010
P5	1540 - 1545	0.000 / 0.010

noise 6. Sound Monitoring (Action Levels - 65dB near households, 80 dB near highway and street right-of-way)

Instrument used: Quest NoisePro

Calibration performed? (Y or N) (Y)

Station/Sample Location	Time	Reading (provide units)
P1 / N1	1425 - 1430	67.3 - 81.1 dB
P6 / N2	1433 - 1438	<65 - 78.1
P4	1446 - 1450	<65 - 69.8
P2	1459 - 1504	<65 - 75.6
P3	1515 - 1520	<65 - 67.1
P5	1540 - 1545	<65 - 65.9

Woodbury Site - Perimeter Monitoring Form

1. Date: 17 Nov 2009	2. Weather: Clear, cool, slight breeze
3. Prepared By: ~~Gary Witmer~~ & Bret Missildine	

4. Ambient Air Monitoring - VOCs (Consult Health and Safety Plan for Action Level)

Instrument used: Mini-RAE 2000

Calibration performed? (Y or N) Y

Station/Sample Location	Time	Reading (provide units)
P1 / N1	1440 - 1445	0.01 ppm
P6 / N2	1450 - 1455	0.01
P4	1459 - 1504	0.00
P2	1515 - 1520	0.00
P3	1530 - 1535	0.00
P5	1545 - 1550	0.00

GENERAL NOTES:

1. Semi passed station N1 for high reading (NOT an SKB truck),
2. School bus went by Station N2 for high reading
3. Two (2) cars went by during 5 minute reading at station P4
4. Observed lower than usual readings today - instruments check OK. Attributed to recent rain & cool weather which contributed to clear conditions

5. Ambient Air Monitoring - PM10 (particulate monitoring) (Action Level - 0.1 mg/m^3 above background)

Instrument used: MIE DataRam PDR

Calibration performed? (Y or N) Y

Station/Sample Location	Time	Reading (provide units)
P1 / N1	1440 - 1445	0.002 / 0.001 mg/m^3 (conc. / TWA)
P6 / N2	1450 - 1455	0.000 / 0.000
P4	1459 - 1504	0.000 / 0.000
P2	1515 - 1520	0.000 / 0.001
P3	1530 - 1535	0.000 / 0.000
P5	1545 - 1550	0.000 / 0.001

6. Sound Monitoring (Action Levels - 65dB near households, 80 dB near highway and street right-of-way)

Instrument used: Quest NoisePro

Calibration performed? (Y or N) Y

Station/Sample Location	Time	Reading (provide units)
P1 / N1	1440 - 1445	67.3 - 84.6 dB
P6 / N2	1450 - 1455	<65.0 - 79.0
P4	1459 - 1504	<65.0 - 75.3
P2	1515 - 1520	<65.0 - 65.2
P3	1530 - 1535	<65.0
P5	1545 - 1550	<65.0
