PLAINTIFF'S EXHIBIT

MON-1061

On a recent Safety Contact visit in Dept. 35, L. K. Hannah's topic concerned building scaffolds to reach three diverter valves on the east side of the 35F structure. Eight or more sections have to be erected to reach the valves and it requires four carpenters a considerable length of time. I understand that instrument personnel are concerned about their safety in having to use the scaffolding to work on the valves.

There is a platform, reached by a stair, 15 or 20 feet from the valves, on the north side of the structure. It is recommended that consideration be given to providing an access platform for these valves.
