asbestos4see remarks

A preliminary visit was made to determine exposure time and detailed use of asbestos at charging operation. Plant is in process of winding down all operations, as facilities are to be removed to 165 Wambold Rd., Harleysville, Pa. (Montgomery County) (landsale exit of turnpike, west on Rt. 63) by end of August.

No asbestos in use currently. Counties notified, file card changes made.

Asbestos4see remarksRemarks

Asbestos survey was intended for asbestos containing dust at the mixer charging operation. At time of inspection, Mr. Hertrick, asst. plant mgr., did not know duration of asbestos exposure. Mr. Pacheski indicated that this duration was 5 or 10 minutes for once or twice a day. No asbestos was being used this day.

Note

Discussed this with R. Heller and reviewed various aspects of asbestos exposures. A return visit will be made to review the operations in detail to decide whether or not a survey should be made.

Attention: Mr. Raymond Dronsfeld
Plant Engineer

Gentlemen:

A survey was conducted in your plant to evaluate employees' exposure to asbestos dust. Because of our findings, the following recommendations are made.

1. Continue the program of requiring employees to wear approved-type respirators whenever engaged in mixing operations.
2. Continue the program of providing annual chest X-ray examinations for all employees exposed to dust.

A copy of the survey report, our booklet entitled "Dust", our Hygienic Information Guide entitled "Asbestos" and Article 432, as amended, are enclosed.

Very truly yours,

Jan Lieben, M. D., Director
Division of Occupational Health

DIVISION OF OCCUPATIONAL HEALTH

Report of Survey

Pecora, Incorporated
300 West Sedgley Avenue
Philadelphia, Pennsylvania

Following a plant inspection, a survey was conducted on 24 June 1964 to evaluate employees' exposure to asbestos dust. Arrangements for the survey were made with Mr. Raymond Dronsfield, plant engineer.

DETAILED FINDINGS

This plant is engaged in the manufacture of adhesives. Asbestos is blended in batch mixers with various fillers and vehicles and packed in cans and drums.

The batch mixers are equipped with local exhaust ventilating systems. When charging the mixers, the operators are required to wear respirators approved by the U. S. Bureau of Mines for protection against pneumoconiosis-producing dusts. The operators spend approximately two hours a day at the mixing operation. The balance of the workday is spent performing duties not involving the use of asbestos.

Atmospheric samples were collected at the operator's breathing level and in the general work area with midget impingers using ethyl alcohol as the collecting medium. Dust counts were made microscopically using a standardized light-field technique, and the results given in the attached Table.

The threshold limit value for asbestos-containing dust is 5 million particles per cubic foot of air (m. p. p. c. f.), based on an eight-hour workday. Dust concentrations ranged from 1.4 to 4.1 m. p. p. c. f. with an average of 2.5 m. p. p. c. f.

To keep dust exposures at a minimum, the practices of exhausting^{Ventilating} the batch mixers and requiring employees to wear approved-type respirators when charging the mixers should be continued.

It should also be emphasized that cases of lung disease have occurred among workers exposed to low dust concentrations. The program of giving annual chest X-ray examinations to all employees engaged in dusty operations should also be continued.

A Table of dust concentrations follows.

Table Dust Concentrations

* Threshold limit value for asbestos-containing dust - 5 million particles per cubic foot of air.

Maurice Bordoni
Industrial Hygienist
