

Mr. C. R. Eckert - Bound Brook

Sept. 3, 1947

Mr. W. G. Cowan

PREVENTION OF SETTLING OF CALSILITE SLURRY

I am enclosing my file copy of U. S. Pat. No. 2,426,140 of August 19, 1947, to A. R. Bollaert, which may furnish a clue as to what steps to take to prevent the settling of the aqueous Calsilite slurry, which I understand is responsible for some of the difficulties at Gloucester.

This, you will note, involves the incorporation of a small percentage of ammonium chloride, ammonium sulfate or ammonium phosphate into the mixture of bentonite and silica.

It might be interesting for you to have the laboratory make some experiments along these lines to ascertain whether any advantages will accrue.

President
