Date: November 15, 1966

c.c.

To: J. L. RICHMOND
WORKS MANAGER
CHAMBERS WORKS

ATTENTION: WAYNE MURPHY

From: L. V. THATCHER
SAFETY ENGINEER

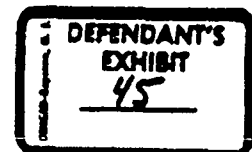

Subject: ASBESTOS

- 1) List of Construction Insulators attached.
- 2) We occasionally use some mechanics from other crafts (Carpenters, etc.) If necessary, we could go back over time sheets to get the names; however, this would be laborious.
- 3) "Unibestos," "Thermasil," and "Fibreglass Wool" are among our most common insulating materials.
- 4) We spray some insulation; the usual respirator and ventilation devices are employed when we do this work.
- 5) Special safety measures include a special room for all power driven cutting machines. The atmosphere is exhausted by a Torit Cyclone Collector. Air analysis reveals we are well below the present established threshold safety limits of concentration.

It is worthy to note that practically all mechanics get some exposure to asbestos during field work. There is constant handling, cutting, and installation going on to varying degrees.
