300 LB.
AIR TESTED
MALLEABLE IRON
UNIONS

Plainly Marked for
Your Protection

When you buy unions, look for the cast-in-metal marking of the word "JEFFERSON" and the figures denoting rated working pressure and size. Such marking is for your protection to assure you that you are getting genuine "Jeffersons" and to help you select the proper size for use in the service intended.

"JEFFERSONS" have Underwriters' approval for ratings of 2000 psi non-shock O.W.G. in sizes from 1/4" to 2-in. inclusive and 1000 psi in 2 1/2, 3 and 4-in. sizes.

These ratings have been achieved through Jefferson design and construction including such features as: air furnace malleable iron of 55,000 psi average tensile strength, heat rings of seamless drawn brass tubing, a ground joint that is truly spherical and the exclusive Jefferson Recessed Brass Seat.

Jefferson also manufactures: AAR male and female unions, Enduro 3000, Ecol 1500 and Master 1500 unions. All types are also available with oil-iron seats.

tion automatically in response to fringe changes should be investigated if the fringe load variations limit the maximum scheduled power transfer on the ties to neighboring areas, or if the rate of change of generation in response to sustained load changes approaches the rate of change of the fringe load variations. If it is necessary to control automatically in response to fringe load changes, it is highly desirable from an operating standpoint that the percentage of fringe action assigned to the regulating stations and units be adjustable independently of the percentage of the sustained control action assigned to these stations and units. AIEE Paper No. 53-147.

Electric Distribution and Control for Lighting Systems. By W. H. Kahler, Westinghouse Electric Corp. and R. N. Bell, E. I. du Pont de Nemours & Co. Higher illumination levels and new lighting sources make it necessary to re-examine possible methods of power distribution and control for lighting loads. As a result of the higher lighting density and versatile lighting sources, the designer must now exercise a considerable amount of engineering judgment in planning a distribution system. New design techniques make it possible to provide maximum convenience and reliability at minimum cost and with a minimum use of critical materials. Some of the requirements of the different lighting sources and modern trends in power distribution and control for lighting loads are discussed and analyzed.

Conclusions are reached that the investment in the distribution system for supplying lighting loads can be considerably reduced by installing a combined power and lighting arrangement in which the lights are supplied directly from the 460-v supply. The reluctance of many individuals to go to voltages higher than 120 for lighting, plus the failure of most distribution engineers to recognize the inherently lower cost and copper savings in this type of system, is apparently responsible for the 460-v supply to lighting load not being more widely used.

The line to neutral connection of the lights on 460-v systems appears to be the most practical method at the present time. Connecting the lights line to line on either 460-v delta or a 460-v grounded wye system is feasible and offers the advantage of slightly lower cost branch circuits from the panel board. However, line-to-line connections of lights make it necessary to use either 2- or 3-pole breakers in the lighting

FUELS AND COMBUSTION HANDBOOK

Comprehensive data covering the full range of commercial fuels and their combustion. Gives practical aid in the selection and use of fuels and all types of fuel combustion equipment. Applies rapid computation techniques of alignment charts and one-minute nomograms to show advantages, disadvantages, average performance, etc., of optional equipment and methods. Edited by A. J. Johnson, Comb. Eng., and G. H. Smith, Williams Coll. 818 pp., 402 illus., \$14.00.

MECHANICAL ENGINEERS' HANDBOOK

Here are quick answers to your most troublesome questions—over 2,500 pages of data in every branch of mechanical engineering—from aerodynamics to chemical refrigeration. From power generation to welding, from metal-cutting machines to hoisting and conveying. This handbook covers theory, design, and practice, and has been compiled by over 100 experts, such as specialists in fluid mechanics, aircraft jet propulsion, television, solar heat transfer, and many more. Edited by L. B. Marks, Prof. of Mech. Eng., Emeritus, Harvard Univ. 2422 pp., 1600 illus., \$18.00.

PLANT ENGINEERING HANDBOOK

Brought to the men responsible for the "designing" of American industry a portable, handy, comprehensive in quality and thoroughness of treatment to the best available to other engineering specialties. This is the first of a series of handbooks of facts, carefully aimed at the particular needs of plant operating personnel. From its pages and pages of descriptions, definitions, tables, charts, diagrams, methods, and pointers you can get the answer to question after question—the matter what area of plant engineering is concerned. Edited by W. Stanley. 2007 pp., 1400 illus., \$15.00.

CRUSHING UNLIMITED!

the story of 61,000,000 tons of coal
crushed at less than 1¢ per ton!

American
rolling ring
COAL CRUSHERS

The facts are in! The story of American Crusher performance—rugged, long-life-low-cost performance—is now available for your careful study. Not just one case history, or a few reports—but a thorough survey of American installations (power plants, central stations, and mines) across the country. Here are the "crushing" facts:

Total Tonnage Handled 61,000,000 Tons
Average Age of Crushers 8.5 Years
Replacement Parts (Including Standby Parts)
1/10 of 1¢ per Ton

There can be no better proof of American's superlative efficiency and economy of operation!

Typical Survey Results

LOCATION	CRUSHER	TONNAGE	PARTS REPLACEMENT COST
N. J. Central Station	42-S	6,000,000 Tons	\$0.0025 per ton, 20-year-old installation!
W. Va. Industrial Power Plant	38-S	10,000,000 Tons	\$0.0008 per ton, 10 years in service!
Illinois Coal Mine	AC3-E	4,000,000 Tons	\$0.0003 per ton for 10 years service!
W. Va. Coal Mine	38-S	2,514,000 Tons	\$0.0007 per ton, 23 years old!
Ill. Power Plant	42-S	2,950,000 Tons	\$0.0004 per ton, 6 years in service.
		10,000,000 Tons	\$0.0001 per ton for 10 years!
