Dear Jack:

Enclosed is a draft of a proposed letter to Mr. Sherman of the California Division of Industrial Safety. Please review it carefully, make such corrections as appear appropriate and arrange to have it retyped in the corrected form on SMMA stationery, with the appropriate copies, so that this might be reviewed by the Directors of our group on January 4th at our meeting in Newark before it is signed and released.

If you have any question concerning it don't hesitate to call me. By copy of this letter to the Directors, may I ask that it serve as a reminder of our meeting at the Essex House in Newark, 10:00 a.m., Wednesday, January 4th.

Very sincerely,

J. P. Verhalen,
President

DRAFT

December 27, 1966

Mr. George Sherman, Chief
Division of Industrial Safety
Department of Industrial Relations
3460 Wilshire Boulevard
Los Angeles, California 90005

Gentlemen:

The Sprayed Mineral Fiber Manufacturers issued that a notice was issued by the Department of Industrial Engineers, outlining procedures to follow in the spray proofing materials which contain asbestos. A copy of communication, dated September 21, 1966, on the subject: "Application of Fireproofing", was sent to the Los Angeles Building and Trades Council, it being understood to have resulted from and "investigation" which they requested.

On September 29, 1966, the Los Angeles Building and Trades Council issued a Bulletin to Business Representatives, Affiliated Local Unions and Craft Councils, quoting the inter communication and elaborating further upon the potential health hazard that may exist.

Since all members of the Sprayed Mineral Fiber Manufacturers Association issue detailed instructions to their contractors recommending the use of suitable protective masks by workmen directly involved in the sprayed fireproofing operation, statements concerning this are not questioned.

We should like to inquire, however, concerning the extent of the investigation and the data developed which prompt the cautions that "all other workmen should be kept out of the spraying area," and "as soon as the spraying is completed, require the area to be cleaned up thoroughly before it dries out."

We should like to point out that the Hygienic Guides Series on Asbestos, promulgated by the American Industrial Hygiene Association, establishes the Threshold Limit Value at 5.0 million parts per cubic foot, which represents conditions under which it is believed that nearly all workers may be repeatedly exposed day after day through a lifetime of work without adverse affect. We understand that the Federal Government and most State Agencies have accepted this recommended maximum atmospheric concentration.

To our knowledge, the only extensive testing done by a State Agency was performed recently by the Division of Safety and Hygiene of the Industrial Commission of Ohio, and a copy of their report dated June 21, 1966 is enclosed. This report concluded that the exposure to other workers is well below the Threshold Limit Value.

Because unnecessary cautions, which cause undue alarm, can create a hardship for our industry and, because we are concerned to know that adequate cautions are properly stated as they are necessary to protect the interests of
