

CHEMICALS

INTEROFFICE / LAKE CHARLES

TO Dave Angell

DATE Sept. 7, 1976

FROM James C. Lafleur

SUBJECT VCM Manual

The following are the only comments I have. The rest of it looks O.K.

SEC II Page 9 C-2 Pocket escape mask is all that we use.

C-3 We do not use respiratory protection when sampling for oxygen content. We do use airline mask when taking liquid samples.

SEC II Page 10 (2) If vessel has been cleared to 1 ppm VC or less, all we require is hard hat, glasses (or visor-gogs) and gloves. The only time we would use protective clothing or rubber boots would be when washing down or hydro blasting must be done. Here it's more for protection against water than VC.

SEC II (Page 14) We permit eating lunches in the loading shacks, at both the docks and tank car areas. Historically we have shown no VCM present while loading is in progress. The principal exposure potential is during hook-up and disconnect. Normally the first 4 cars come off before lunch time and cars are ready to switch out. The loading area is not regulated unless actual loading is in progress, so we have a real gray area.

SEC III B (5) Should read the same as SEC III (C) II Page 1 (5)

Notify guards (phone 216) of Fire, (potential fire or injuries). Bracketed portion was omitted.
