This memo (attached) is background info. Paul Bensmen phoned Ed Raab GE today and with info supplied by Ray Brandenburg yesterday (via Walt Mayfield) Esso Research has a high flash point oil and a secrecy agreement via Bob Amrath GE with GE Battelle to look at this new oil in certain high temperature transformers.

According to Raab, these oils would not replace askarels

because of the arc formed? gas – explosivity & fuel feature and their AIT. GE is interested in them for certain applications and they are also looking at some of the alkyl benzene samples we sent earlier.

PGB realizes he and the ANSI group must educate the utilities on the differences between askarels + high flash point oils!
