The plant feels very strongly that a concrete pad for the tank farm is a necessary and reasonable request. This would entail a maximum of 3,200 square feet to completely cover the area immediate to the tanks.

Present plans include "chat" only. Leaks, spills, and drains from piping, pump seals, tanks, filters, etc. will present an uncontrollable housekeeping problem which will necessitate repeated "cover-up" layers of "chat".

On the surface this may seem to be "Gold Plating a Chevy". However, the plant feels a concrete pad is mandatory for a long term justified solution to a "sticky" problem.

Thanks,

Lamar Faulkner
