VAPOR EXPOSURE OF RATS TO VINYL CHLORIDE

Rats of both sexes (12 each) are being exposed to 50,000 ppm of vinyl chloride. The exposure will continue for four weeks (5 days/wk, 7 hrs./day). Exposure started October 1.

At time of sacrifice (October 26), pre-starved rats will be killed, organ weights taken and kidney and liver samples saved for histopathology. If any other organs show pathological changes, these should also be taken.
