SUBJECT: SAMPLING STRATEGY

DATE: SEPTEMBER 30, 1991

In order to get more reliable sample results, it may be necessary to lower the total volume or LPM of some samples. We are striving to eliminate Less Than LOQ sample as these do not give accurate F/CC. In some cases, like PDM'S, lowering the volume for the time a sample is run may not change the F/CC as very few fibers are found in these samples.

To achieve an accurate F/CC we may have to go outside of Reynolds Asbestos Abatement Specifications May 91. By having a F/CC instead of Less Than LOQ, we will know the exposure to workers and Reynolds personnel.
