4-10-74 Report to Dr. Gillespie (copy to record room)

CHEST PA and lateral views show fine nodularities of the lungs with the nodules measuring up to about 2 mm. in size. The mediastinal structures are in the midline without cardiac enlargement. The diaphragm, costophrenic angles and the visualized bony thorax are not remarkable.

Conclusion: Probable pneumoconiosis.

According to JLD E/C 1971 International Classification, the nodules may be classified as q and the profusion as 1/1.
No cardiac enlargement.
