As we talked about yesterday, 26 March, 1969, no provision has been made for filtering Aroclor 5460 before flaking. This had been brought up before and I assumed it was included in CEA 2080.

United Resins has been complaining about black specks in 5460 for years now. The black specks are carbon and most likely come in with Santowax R and could be filtered out with a Cuno type of filter.

I am sure Cumming Paton can add emphasis to the need for this filter.
