1.0 SUMMARY

Test System:

8-2 Telomer B Alcohol, $C_8F_{17}CH_2CH_2OH$, was used to determine its vapor pressure as a function of temperature.

Findings:

The vapor pressure at 23°C is approximately 3 Pa (0.022 Torr).

Conclusions:

The vapor pressure of 8-2 Telomer B alcohol ranged from 3 Pa at 23°C to 101kPa at 201°C.

2.0 GENERAL STUDY INFORMATION

Study Objectives

The objective of this study was to determine the vapor pressure of 8-2 Telomer B Alcohol, $C_8F_{17}CH_2CH_2OH$, under defined conditions between 25°C and 200°C.

Test System Justification

The test system was determined by the sponsor.

Study Personnel

Vapor Pressure Determination: 8-2 Telomer B Alcohol

Management:	Marianne Marsi, Ph.D.
Study Director:	Mary A. Kaiser, Ph.D.
Principle Investigator:	Daryl P. Cobranchi, Ph.D.
Technical Personnel:	Barry W. Wolstenholme

Study Execution Dates

Study Initiation Date:	15-Jun-2001
Experimental Start Date:	15-Jun-2001
Experimental Completion Date:	28-June 2002
Study Completion Date:	12-July 2002

3.0 MATERIALS AND METHODS

3.1 Test Guidelines

The vapor pressure of a substance is defined as the saturation pressure above a solid or liquid substance. At thermodynamic equilibrium, the vapor pressure is only a function of temperature. The SI unit of pressure which should be used is the Pascal (Pa, Newton/m²). Units which have been employed historically are 1 Torr (mm Hg) = 1.33×10^2 Pa; 1 atmosphere = 1.013×10^5 Pa; 1 bar = 10^5 Pa. A modified OECD Guideline 104 (modified) was used for this measurement.

3.2.1 Chemical System

3.2.1.1 Test Substance

The test substance was obtained from Clariant GmbH (Germany) and was shown to be 99.2% pure via gas chromatography. No other alcohol or iodide impurities were detected. The major impurity (0.8% by area) is tentatively identified as C₇F₁₅CF=CH₂OH based on the mass spectral fragmentation pattern.

Name:	8-2 Telomer B Alcohol
Synonym:	(Perfluorooctyl)ethanol
Active substance(s)	8-2 Telomer B Alcohol, 99.2%
CAS Name:	1-Decanol, 3,3,4,4,5,5,6,6,7,7,8,8,9,9,10,10,10- heptadecafluoro-
CAS Number(s):	678-39-7

Vapor Pressure Determination: 8-2 Telomer B Alcohol

Structure:

H Number	H-24691
Lot Number:	P.00/001
EMSE Sample Number:	E93386-63
Concentration, nominal:	99%
Concentration, analyzed:	99.2%
Certificate of Analysis Date:	03-Apr. 2001
Date Received:	15-June -2001
Solubility at 25°C.:	~140 $\mu\text{g L}^{-1}$
Vapor pressure:	TBD via this report
Stability:	Stable at ambient room temperature
Appearance/Color:	White solid
Storage Conditions:	Room temperature; keep tightly closed

3.2.1.2 Test Vehicle

The test substance was the 8_2 Telomer B alcohol.

3.3 Test Conduct

Two techniques were used to obtain the vapor pressure. The first method was based on a dynamic measurement procedure by Scott¹ where the equilibrium temperature is measured at a controlled pressure. Approximately 30 grams of alcohol was placed in a boiler. The pressure was held constant to 0.01% (0.01kPa) and measured to an accuracy of 0.01%. The apparatus consisted of a Mensor (San Marcos, TX) PCS400 pressure controller, a Paroscientific (Redmond, WA) 740 pressure transducer, and a Hart Scientific (American Fort UT) stack base unit for

Vapor Pressure Determination: 8-2 Telomer B Alcohol

temperature measurement. The temperature varied from 80 to 200°C. A diagram of the apparatus is given in Figure 2. Table 1 shows the individual data points.

The second procedure was based on the EPA OPPTS gas saturation method². This second procedure is intended to confirm the linearity of the curve obtained at the higher temperatures from the Scott method. The alcohol was placed directly in a glass thermostated tube. Gas-chromatographic grade helium (99.999%) flowed over the powder. The flow was controlled by a flow controller on a Hewlett Packard (now Agilent, Little Falls, DE) model 5890 gas chromatograph. Due to the adsorptive properties of the alcohol, the vapor pressure was calculated from weight loss rather than from the weight of trapped material downstream. The vapor pressure at 21°C was 0.02 Torr. Figure 3 gives the vapor pressure curve obtained from both sets of measurements.

3.3 *Parameters Observed*

With the Scott apparatus, pressure and temperature are observed.

With the GC/MS apparatus, peak height and peak area are observed.

3.4 *Result Analysis*

With the GC/MS apparatus the peak height or area is compared to the same parameter of a standard carefully prepared in methanol.

3.5 *Validity Criteria of the Study*

For GC/MS the peak areas of standards run before and after the test substance are compared. The results must agree within 5%.

4.0 RESULTS AND DISCUSSION

The vapor pressure of the Telomer B 8-2 alcohol varied continuously from 3 Pa at 21°C to 101 kPa at 201°C. The results from the single point taken at 21°C were aligned with the results from the 11 points taken at elevated temperatures taken by the Scott method.

5.0 CONCLUSIONS

The vapor pressure of the Telomer B 8-2alcohol is 3 Pa at 21°C and 101 kPa at 201°C.

6.0 RETENTION OF RECORDS

Study documents and materials will be stored in the archives of the DuPont Experimental Station including but not limited to:

- study protocol;
- any protocol and/or report amendments or addenda or deviations;
- all raw data;
- one original signed copy of the final report;

Vapor Pressure Determination: 8-2 Telomer B Alcohol

- laboratory-specific or site-specific raw data such as personnel files, instrument, equipment, refrigerator, and/or freezer raw data.

7.0 DISPOSAL OF TEST ITEM

After issuance of the final report, the remaining test substance will be stored at the DuPont Glasgow site until its expiration date and then destroyed by burning, unless other arrangements are made between the sponsor and the Test Facility.

Appendix A

Chemical Analysis Summary 2-Perfluorooctyl ethanol : $C_8F_{17}CH_2CH_2OH$ H-24691

Analysis Summary

The subject material was analyzed by gas-chromatography using a standard method to assess its composition. This analysis showed that the material comprised 99.2% of the subject material. The balance, 0.8%, was not another Telomer B alcohol, or Telomer B iodide at a limit of quantitation of 0.02%. Further analysis by GC/MS suggests that the 0.8% is a single impurity, whose chemical structure is $C_7F_{15}CF=CHCH_2OH$.

Finally, the subject material was evaluated by High Performance Liquid Chromatography - Tandem Mass Spectrometry (LC/MS/MS) for the presence of perfluorooctyl sulfonic acid and perfluorooctanoic acid at a detection limit of 0.1ppm. Neither material was observed to be present.

Based upon these analyses, we conclude that methods are in hand to determine and confirm the composition of H-24691 to be as follows:

<u>Material</u>	<u>Wt. % (+0.3)</u>
$C_8F_{17}CH_2CH_2OH$ 2-Perfluorooctyl ethanol	99.2
$C_7F_{15}CF=CHCH_2OH$	0.8
