...better call Garlock

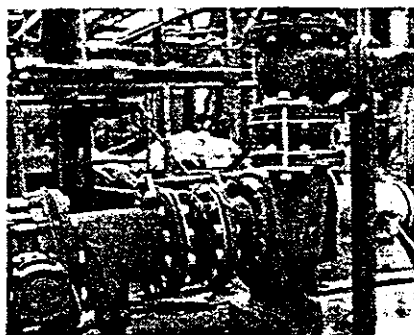

Somebody did call—and found a better way to contain hot hydrogen

gaskets they used before occasionally let slip a jet of hydrogen at 100 psi and 450° to 600°C. When the air, fwoom—flame. So they called Garlock and put in our Teflon-filled GUARDIAN® Gaskets. No more leaks. No more frequent tightening. After a year of trouble-free service, two Guardian Gaskets were pulled for inspection during a shutdown. They looked so good-to-new, our customer left all the gaskets in place and marked his calendar for another inspection another year in the future. Typical good results from calling Garlock in search of better gasket performance. Try it and see.

Somebody did call—and solved a \$3,600 a year problem

This customer was spending \$900 every 90 days to replace mechanical seals that were supposed to hold organic liquids at 50 psi and atmospheric temperature, but didn't. Our man found that the rigid pipes, close to the tanks, were vibrating, setting up chatter at the seals. He suggested our FEP-lined expansion joints for the suction and discharge sides of the pump. These soaked up the vibration, kept the seals on stream for six months or more. Problem solved, big dollars saved. Shouldn't you call your Garlock representative?

Somebody did call—and extended agitator packing life from 48 hours to six months plus

That call brought them our new GARFITE™ "100" treated graphite filament packing.* We helped them put it in an agitator that mixes nitrogen and sulfuric acid fumes with a catalyst at temperatures to 120°F. Six months later, that packing was still in service. Best previous packing life time: 48 hours. Mechanical seals had lasted only 24 hours. For new products to meet the toughest problems, call Garlock.

Will you call?

We hope so. Any time you have a sealing problem. Big or small. Routine or unusual. Check with your local Garlock representative. You'll find he has more answers to sealing problems than anybody else around... simply because he has more seals and sealing materials at his disposal—and yours. We're sure you'll find him helpful.
